 200 present in at least some locations within these boundaries for SGCN species, the surveys  
 201 performed within the vicinity of the federal lands found no SGCN aquatic species, suggesting  
 202 that SGCN species are likely not present on the federal lands. Conversely, occurrences of the  
 203 creek heelsplitter, an SGCN species, have been documented within the vicinity of the non-  
 204 federal lands on segments of the Pike River (downstream of Tract 1) and the Stony River  
 205 (downstream of Tract 3) as discussed in Section 4.3.6.2. The predominant sand substrate  
 206 documented in survey areas within the vicinity of these SGCN occurrence locations and the  
 207 possibility that similar substrates exist within the boundaries of Tract 1 and Tract 3 indicate the  
 208 creek heelsplitter may exist within the river segments of these non-federal lands. A qualitative  
 209 review of these data indicates the Land Exchange Proposed Action may result in the added  
 210 presence of the creek heelsplitter.

211 The USFS determined that the Land Exchange Proposed Action would not affect three RFSS  
 212 aquatic species on the Superior National Forest, which include lake sturgeon, nipigon cisco, and  
 213 shortjaw ciscoe. In addition, the Land Exchange Proposed Action may affect individuals, but  
 214 would not be likely to cause a trend to federal listing or loss of viability for the remaining six  
 215 RFSS aquatic species on the Superior National Forest. Please see the Biological Evaluation listed

216 on the USFS website (<http://www.fs.usda.gov/goto/superior/northmet>) for more information  
217 about effects on RFSS aquatic species.

218 **Table 5.3.6-9 Ecoregion SGCN Species Comparisons for the Land Exchange Proposed**  
219 **Action**

| SGCN Species                | Common Name        | Federal Land (Laurentian and Nashwauk Uplands) | Non-federal Lands (Laurentian Uplands, Nashwauk Uplands, Border Lakes) |
|-----------------------------|--------------------|------------------------------------------------|------------------------------------------------------------------------|
| <b>Fish</b>                 |                    |                                                |                                                                        |
| <i>Acipenser fulvescens</i> | Lake sturgeon      |                                                | X                                                                      |
| <i>Coregonus nipigon</i>    | Nipigon cisco      |                                                | X                                                                      |
| <i>Coregonus zenithicus</i> | Shortjaw cisco     |                                                | X                                                                      |
| <i>Cottus ricei</i>         | Spoonhead sculpin  |                                                | X                                                                      |
| <i>Couesius plumbeus</i>    | Lake chub          |                                                | X                                                                      |
| <i>Ichthyomyzon fossor</i>  | Brook lamprey      | X                                              | X                                                                      |
| <i>Lepomis megalotis</i>    | Longear sunfish    |                                                | X                                                                      |
| <b>Mussels</b>              |                    |                                                |                                                                        |
| <i>Lasmigona compressa</i>  | Creek heelsplitter | X                                              | X                                                                      |
| <i>Ligumia recta</i>        | Black sandshell    | X                                              | X                                                                      |
| Total species               |                    | 3                                              | 9                                                                      |

220 Adopted from Section 4.3.6.

### 221 5.3.6.3 Land Exchange Alternative B

#### 222 5.3.6.3.1 Surface Water Features (MIH 14)

223 Land Exchange Alternative B would result in a net increase of lake and river surface water  
224 features to the federal estate (see Table 5.3.6-10). A total of 120.7 acres of lake and 2.8 miles of  
225 rivers would be added to the Superior National Forest under this alternative. The increase in lake  
226 and river frontage would provide a net increase to the federal estate of habitat for aquatic species  
227 (MIH 14). The frontage index would increase in the federal estate for both lakes and streams as a  
228 result of Land Exchange Alternative B.

229 **Table 5.3.6-10 Frontage of Waterways for Land Exchange Alternative B**

| Parcel                      | Lake  |               |                                 | Rivers/Creeks/Streams |                                   |                                              |
|-----------------------------|-------|---------------|---------------------------------|-----------------------|-----------------------------------|----------------------------------------------|
|                             | Acres | Frontage (ft) | Frontage Index (shoreline/acre) | Miles                 | Frontage (linear ft) <sup>1</sup> | Frontage Index (shoreline/acre) <sup>2</sup> |
| <b>Lands Conveyed</b>       |       |               |                                 |                       |                                   |                                              |
| Land Exchange Alternative B | 8.9   | 1,200.0       | 0.3                             | 5.3                   | 55,968.0                          | 11.8                                         |
| <b>Lands Acquired</b>       |       |               |                                 |                       |                                   |                                              |
| Tract 1                     | 129.6 | 16,424.0      | 3.5                             | 8.1                   | 72,864.0                          | 15.3                                         |
| <b>Net Change</b>           |       |               |                                 |                       |                                   |                                              |
| Net Increase/(Decrease)     | 120.7 | 15,224.0      | 3.2                             | 2.8                   | 16,896.0                          | 3.5                                          |

230 Note: Surface water shoreline distance calculated by GIS analysis.

231 <sup>1</sup> Includes shoreline distance on both sides of streams.

232 <sup>2</sup> Frontage Index calculated by dividing total acres of parcel by total shoreline within parcel.

233 **5.3.6.3.2 Differences of Strahler Stream Orders and Habitat**

234 A quantitative comparison of the Strahler Stream Order indicates that Land Exchange  
 235 Alternative B would result in a decrease of 1.3 and 4.0 miles of first- and second-order streams,  
 236 respectively, and an increase of 8.1 miles of third-order streams to the federal estate  
 237 (see Table 5.3.6-11).

238 As with the Land Exchange Proposed Action, the net increase of third-order streams and  
 239 decrease in first- and second-order streams would likely add more habitat diversity to the  
 240 Superior National Forest. The net decrease to the federal estate of first-order streams would  
 241 slightly reduce the amount of available spawning habitat for some aquatic species as headwater  
 242 streams provide specialized spawning habitat for some species.

243 **Table 5.3.6-11 Increase or Decrease of Stream Orders from Land Exchange Alternative B**

| Parcel (Stream)                                | Stream Distance (miles) |                       |                       |
|------------------------------------------------|-------------------------|-----------------------|-----------------------|
|                                                | 1 <sup>st</sup> Order   | 2 <sup>nd</sup> Order | 3 <sup>rd</sup> Order |
| <b>Lands Conveyed</b>                          |                         |                       |                       |
| Federal Lands (Yelp Creek and Partridge River) | 1.3                     | 4.0                   | 0.0                   |
| <b>Lands Acquired</b>                          |                         |                       |                       |
| Tract 1 – Hay Lake (Pike River)                | 0.0                     | 0.0                   | 8.1                   |
| <b>Net Increase/(Decrease)</b>                 | <b>(1.3)</b>            | <b>(4.0)</b>          | <b>8.1</b>            |

244 Note: Surface water shoreline distance calculated by GIS analysis.

245 **5.3.6.3.3 Watershed Level Riparian and Aquatic Connectivity**

246 **Riparian Connectivity**

247 A comparison of the watersheds containing streams present on the federal lands (Partridge River)  
 248 and Tract 1 (Pike River) using the RCI is presented in Table 5.3.6-12. The index was developed  
 249 from GIS analysis of vegetative cover along riparian areas where agriculture and land  
 250 development have affected natural riparian vegetative cover.

251 Under Land Exchange Alternative B, there would be a slight increase to the federal estate in  
 252 watershed riparian connectivity. The streams on both the federal lands and Tract 1 are located  
 253 within watersheds with existing high quality riparian connectivity.

254 **Table 5.3.6-12 Watershed Riparian Connectivity Index Comparison**

| Surface Water                  | Tract         | Watershed  | Percent Agriculture in Riparian Zone | Percent Development in Riparian Zone | RCI Score <sup>1</sup> |
|--------------------------------|---------------|------------|--------------------------------------|--------------------------------------|------------------------|
| <b>Lands Conveyed</b>          |               |            |                                      |                                      |                        |
| Partridge River/Yelp Creek     | Federal Lands | St. Louis  | 0                                    | 5                                    | 95                     |
| <b>Lands Acquired</b>          |               |            |                                      |                                      |                        |
| Pike River                     | 1 - Hay Lake  | Vermillion | 0                                    | 1                                    | 99                     |
| <b>Net Increase (Decrease)</b> |               |            | 0                                    | (4)                                  | 4.0                    |

255 Adopted from MDNR 2015a.

256 <sup>1</sup> RCI score calculated with MDNR formula using *Percent Agriculture and Percent Development in Riparian Zone*; scale is  
257 from 0 to 100 where 100 indicates excellent riparian conductivity.

258 **Aquatic Connectivity**

259 A comparison of the watersheds containing streams present on the federal lands (Partridge River)  
260 and Tract 1 (Pike River) using the ACI is presented in Table 5.3.6-13. The index was developed  
261 from GIS analysis of structures (i.e., dams, bridges, and culverts) along stream systems in the  
262 watershed.

263 Land Exchange Alternative B would result in the Superior National Forest acquiring streams  
264 located in watersheds with significantly better aquatic connectivity values, indicating increased  
265 aquatic habitat.

266 **Table 5.3.6-13 Watershed Aquatic Connectivity Index Comparison**

| Surface Water                  | Tract         | Watershed  | Aquatic: Bridges and Culverts (miles stream/# structures) | Aquatic: Dams (miles stream/# structures) | ACI Score <sup>1</sup> |
|--------------------------------|---------------|------------|-----------------------------------------------------------|-------------------------------------------|------------------------|
| <b>Lands Conveyed</b>          |               |            |                                                           |                                           |                        |
| Partridge River                | Federal Lands | St. Louis  | 15                                                        | 6                                         | 11                     |
| <b>Lands Acquired</b>          |               |            |                                                           |                                           |                        |
| Pike River                     | 1 - Hay Lake  | Vermillion | 41                                                        | 11                                        | 26                     |
| <b>Net Increase (Decrease)</b> |               |            | 26                                                        | 5                                         | 15                     |

267 Adopted from MDNR 2015b.

268 <sup>1</sup> ACI score calculated by dividing total miles of streams and ditches per watershed by total number of culverts, bridges, and  
269 dams; scale is from 0 to 100 where 100 indicates free flowing streams (no structures) and 0 indicates one structure for every 20  
270 miles of flowing water.

271 **5.3.6.3.4 Aquatic Species**

272 As with the Land Exchange Proposed Action, a semi-quantitative comparison of the net increase  
273 or decrease to the federal estate of aquatic species was made for species located within the  
274 vicinity of the Tract 1 parcel boundaries since representative survey sites located in the vicinity  
275 of the parcel are likely similar to the existing aquatic habitats present at the parcel (see Section  
276 4.2.6).

277 **Fish Assemblages**

278 Two survey sites were analyzed within the vicinity of both the smaller federal parcel and within  
279 the vicinity of Tract 1. The smaller federal parcel and Tract 1 had six species in common. Land  
280 Exchange Alternative B would potentially result in a net decrease to the federal estate of four  
281 species, including two pollution-intolerant species (see Table 5.3.6-14). Given the fact that only  
282 representative survey sites were used for Tract 1, it is possible that some species are more or less  
283 prevalent than is noted here. The attributes of the fish assemblages located at each survey site  
284 indicate that Land Exchange Alternative B would result in minimal change to the fish habitat for  
285 the portions of the river the Superior National Forest would acquire. The dominant fish species  
286 present at each site indicate that the stream characteristics were consistent with slower-moving,  
287 glide pool features.

288 **Table 5.3.6-14 Increase or Decrease of Stream Fish Assemblage for Land Exchange**  
289 **Alternative B**

| Combined Studies Within, or<br>Within Vicinity of, Surface<br>Water | Tract         | Total Species<br>(#) | Pollution-<br>Intolerant<br>Species (#) | Pollution-<br>Tolerant Species<br>(#) |
|---------------------------------------------------------------------|---------------|----------------------|-----------------------------------------|---------------------------------------|
| <b>Lands Conveyed</b>                                               |               |                      |                                         |                                       |
| Partridge River/Yelp Creek                                          | Federal Lands | 15                   | 4                                       | 4                                     |
| <b>Lands Acquired</b>                                               |               |                      |                                         |                                       |
| Pike River                                                          | Tract 1       | 11                   | 2                                       | 4                                     |
| <b>Net Increase (Decrease)</b>                                      |               | (4)                  | (2)                                     | 0                                     |

290 Adopted from Section 4.2.6.

291 **Benthic Macroinvertebrate Assemblages**

292 Macroinvertebrate baseline surveys completed within, and in the vicinity of, the smaller federal  
293 parcel ranked macroinvertebrate assemblages as fair within the second-order stretches of the  
294 Partridge River, as indicated by the HBI pollution index (see Table 5.3.6-15). The first- and  
295 fourth-order segments of the streams within the vicinity of Tract 1 indicated macroinvertebrate  
296 assemblages ranging from good to fair. A qualitative comparison using the attributes of HBI,  
297 stream order, total families (diversity), and percent pollution-tolerant organisms indicate that the  
298 macroinvertebrate assemblages would likely be similar under Land Exchange Alternative B. This  
299 qualitative comparison assumes the habitat and associated macroinvertebrate assemblages are  
300 similar in the stream segments within the third-order segment of the Pike River on Tract 1.

301 **Table 5.3.6-15 Stream Macroinvertebrate Assemblage Comparisons for Land Exchange**  
302 **Alternative B**

| Attributes                 | Non-federal Lands |         |                                          |               |
|----------------------------|-------------------|---------|------------------------------------------|---------------|
|                            | Federal Lands     |         | (study areas within vicinity of Tract 1) |               |
| Study site                 | PR-west           | PR-east | MPCAB-05RN029                            | MPCAB-05RN077 |
| Stream order               | 2                 | 2       | 1                                        | 4             |
| HBI score                  | 6.4               | 6.0     | 5.7                                      | 5.1           |
| HBI ranking                | Fair              | Fair    | Fair                                     | Good          |
| Total families             | 11                | 10      | 11                                       | 31            |
| Percent pollution-tolerant | 8                 | 18      | 3                                        | 5             |

303 Adopted from Barr 2011b and MPCA 2011c.

304 **5.3.6.3.5 Aquatic Species of Greatest Conservation Need**

305 The smaller federal parcel includes the Laurentian and Nashwauk Uplands ecological  
 306 subsections, while Tract 1 includes only the Nashwauk Uplands.

307 As discussed in Section 5.3.6.2.5, SGCN species are associated with these ecological subsections  
 308 based on occurrence and habitat considerations. Using the approach of comparing SGCN species  
 309 by subsection association only, Land Exchange Alternative B would likely result in no net  
 310 change to the federal estate of SGCN species (see Table 5.3.6-16).

311 Regardless of the potential indicated by subsection association, no SGCN species were identified  
 312 within the boundaries of the smaller federal parcel. Habitat is present in at least some locations  
 313 within these boundaries for SGCN species. Although no surveys were completed within the  
 314 boundaries of Tract 1, occurrences of the creek heelsplitter, an SGCN species, have been  
 315 documented within the vicinity of Tract 1 on segments of the Pike River (downstream of Tract  
 316 1). The predominant sand substrate documented in survey areas within the vicinity of this SGCN  
 317 occurrence location and the possibility that similar substrates exist within the boundaries of Tract  
 318 1 indicate the creek heelsplitter may exist within the Pike River segments of Tract 1. A  
 319 qualitative review of these data indicates that Land Exchange Alternative B may result in the  
 320 added presence to the federal estate of the creek heelsplitter.

321 **Table 5.3.6-16 Ecoregion SGCN Species Comparisons for Land Exchange Alternative B**

| SGCN Species               | Common Name        | Federal Lands (Laurentian and Nashwauk Uplands) | Tract 1 (Nashwauk Uplands only) |
|----------------------------|--------------------|-------------------------------------------------|---------------------------------|
| <b>Fish</b>                |                    |                                                 |                                 |
| <i>Ichthyomyzon fossor</i> | Brook lamprey      | X                                               | X                               |
| <b>Mussels</b>             |                    |                                                 |                                 |
| <i>Lasmigona compressa</i> | Creek heelsplitter | X                                               | X                               |
| <i>Ligumia recta</i>       | Black sandshell    | X                                               | X                               |
| Total species              |                    | 3                                               | 3                               |

322 Adopted from Section 4.3.6.

323 **5.3.6.4 Land Exchange No Action Alternative**

324 Under the Land Exchange No Action Alternative, the Superior National Forest would have an  
 325 ongoing responsibility for managing aquatic resources on the federal lands in accordance with  
 326 the Forest Plan. The Land Exchange No Action Alternative would not change the USFS  
 327 responsibility for managing aquatic resources and would result in no further effects on existing  
 328 aquatic species or habitats.

329 Fish and other aquatic life on the federal lands would be exposed to the water quality,  
 330 hydrologic, and physical habitat conditions that currently exist as a result of past mining  
 331 activities. There would be no change from existing conditions, although it is expected that the  
 332 water quality of the Embarrass River may improve as a result of corrective actions potentially  
 333 required by the reissuance of existing NPDES/SDS permits in the NorthMet Project area. Future  
 334 actions conducted under the Cliffs Erie Consent Decree may also change these conditions.

335 The non-federal lands would not go into USFS ownership, and land use would be determined by  
 336 the private land owners. Effects to aquatic resources are difficult to predict given the uncertainty

337 of future potential land use. Some lands may be developed, resulting in potential effects to  
338 aquatic species at the individual and local population levels, decreases in habitat, and adverse  
339 effects on habitat connectivity.

DRAFT

DRAFT

1 **5.3.7 Air Quality**

2 Because there are no current operations or activities on the non-federal parcels that would result  
3 in a change to ambient air quality, the Land Exchange Proposed Action (and alternatives) would  
4 not result in new effects on the federal estate. Indirect effects from the NorthMet Project  
5 Proposed Action on the non-federal parcels are considered under Class I area modeling and are  
6 discussed in Section 5.2.7.

DRAFT

-Page Intentionally Left Blank-

DRAFT

### 1 **5.3.8 Noise and Vibration**

2 Evaluation of potential noise, vibration, and airblast effects in the areas of the Land Exchange  
3 Proposed Action used the same methodologies and criteria that were described previously for the  
4 NorthMet Project Proposed Action. The results of the modeling indicate that noise, vibration,  
5 and airblast levels that would be experienced at or by sensitive receptors would be below the  
6 Minnesota standards. Therefore, operations at the Mine Site and Plant Site would not have a  
7 significant effect on human receptors within the federal and non-federal lands, including people  
8 that may use the non-federal lands for recreational activities such as hunting and hiking (if the  
9 Land Exchange Proposed Action were to occur and the non-federal lands were added to the  
10 Superior National Forest). As discussed in Section 5.2.8, tribal users of archaeological sites  
11 (Spring Mine Lake Sugarbush, *Mesabe Widjiu*, and BBLV Trail; see Section 4.2.9) in the  
12 immediate vicinity of the Mine Site and Plant Site could experience some effects from noise. The  
13 non-federal land tracts are approximately 10 to 90 miles from operations at the Mine Site and  
14 Plant Site; tracts located 50 to 90 miles away from the federal lands are outside the area of  
15 analysis for noise modeling and would be not affected by noise from operations at the Mine Site  
16 and Plant Site.

#### 17 **5.3.8.1 Methodology and Evaluation Criteria**

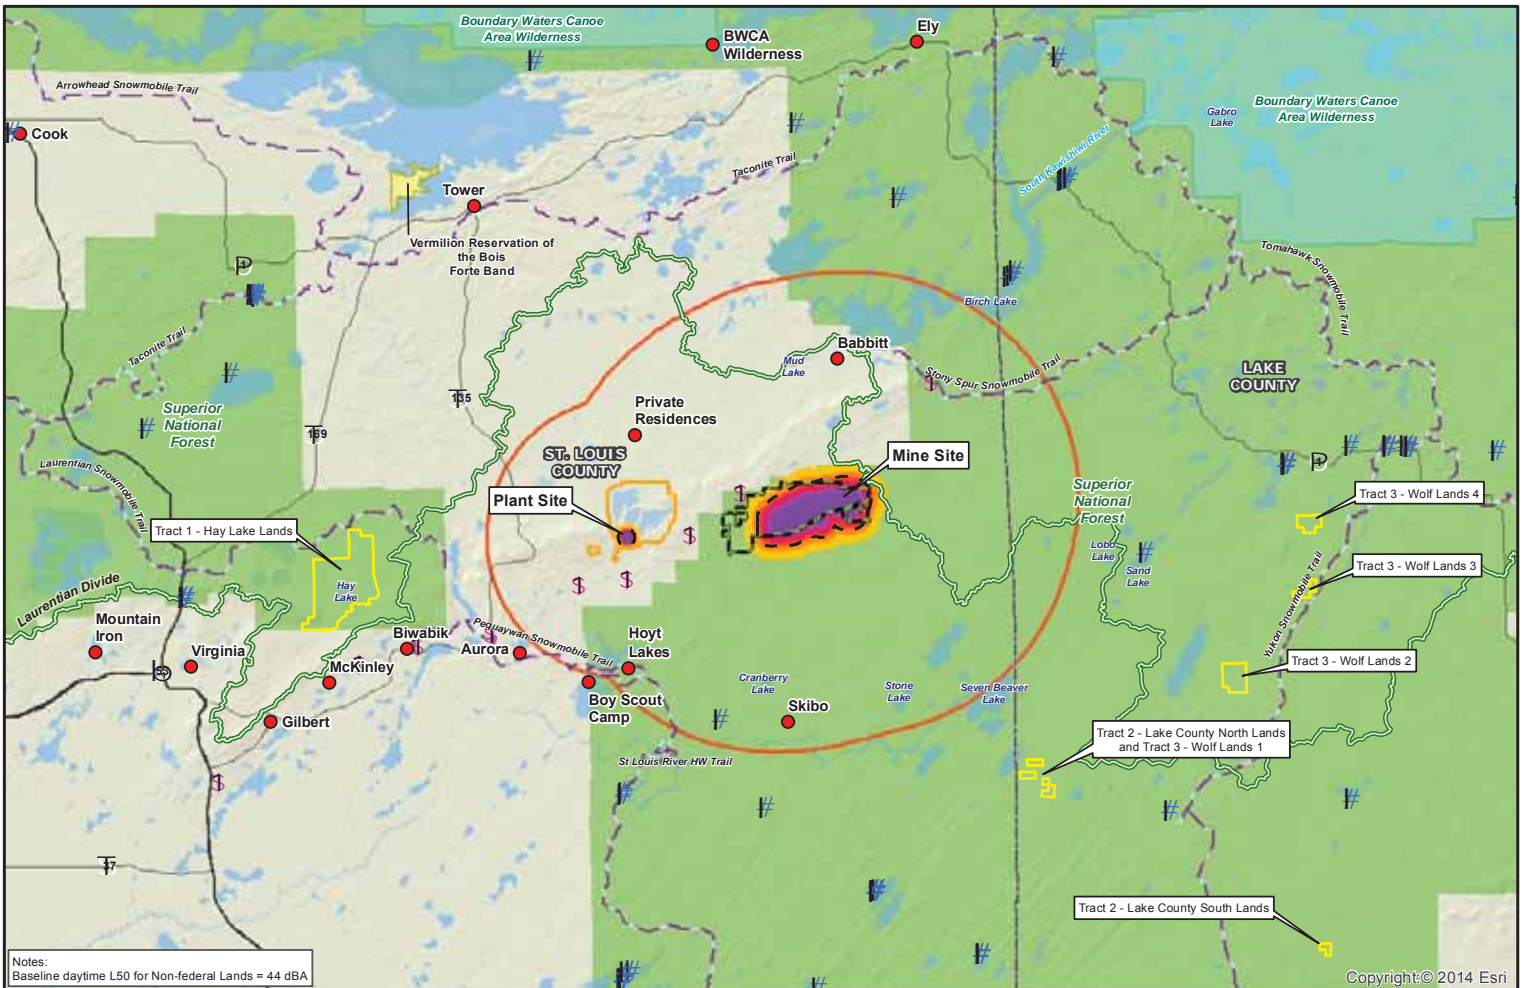

18 The noise and vibration impact assessment area for the Land Exchange Proposed Action would  
19 involve transferring 6,495.4 acres of federal lands from public to private ownership, and up to  
20 7,075.0 acres of land from private to public ownership. The spatial and temporal area of analysis  
21 assessed for noise, vibration, and airblast as part of the Land Exchange Proposed Action included  
22 the indirect effects resulting from the mining activities; therefore, the area of analysis is the same  
23 as that described in Section 5.2.8.1. As indicated before, three desktop computer models (ISO  
24 9613-2 sound-propagation model, the Site Law formula, and the Terrock model) were used to  
25 evaluate noise, ground vibration, and airblast effects, respectively, on the federal and non-federal  
26 lands.

#### 27 **5.3.8.2 Land Exchange Proposed Action**

##### 28 **5.3.8.2.1 Federal Lands**

29 The topography and land cover of the federal lands are similar to those of the Mine Site  
30 previously discussed, but include additional area to the west and northwest that are mostly  
31 wetland. NorthMet Project Proposed Action-related activities that would result in noise,  
32 vibration, or airblast would not occur on the additional federal lands (3,776.1 acres) situated west  
33 and northwest of the Mine Site, so no additional noise, vibration, or airblast effects would occur  
34 in this area. It should be noted that the federal land excludes private lands (295.2 acres) situated  
35 south of Dunka Road. There are no residential areas or individual houses within the federal lands  
36 that could be affected by the NorthMet Project Proposed Action's noise and vibration-related  
37 activities (see Figures 5.3.8-1 to 5.3.8-4). As discussed in Section 5.2.8.2, noise and vibration  
38 levels from the Mine Site would be too low to significantly affect the recreational use of the  
39 federal land (i.e., minor effects in 11,456 acres around the Mine Site).

DRAFT

Notes:  
 Baseline daytime L50 for Non-federal Lands = 44 dBA

DRAFT

#### 49 **5.3.8.2.2 Non-federal Lands**

50 The non-federal lands would be managed consistent with the adjacent forest lands management  
51 (see Section 4.3.1). No direct effects from the Land Exchange Proposed Action are anticipated  
52 since the USFS currently has no plans for operations on the non-federal lands and no NorthMet  
53 Project Proposed Action-related activity (e.g., drilling, blasting, excavation work, material  
54 haulage via trucks, and ore crushing) would occur within the non-federal lands.

55 Review of the most-up-to-date aerial maps indicates that there are no human or residential  
56 receptors within or adjacent to the non-federal lands (Tracts 1 to 5). If the Land Exchange  
57 Proposed Action were to occur and the non-federal lands were added to the Superior National  
58 Forest (i.e., if the tracts became federal lands), public recreational use such as hiking and hunting  
59 would likely occur on these tracts.

60 To determine the indirect effect of operations at the Mine Site and Plant Site on people that may  
61 use the non-federal lands for recreational activities such as hiking and hunting, the modeled area  
62 was expanded to a 20-mile radius from both the Mine Site and the Plant Site. Daytime and  
63 nighttime noise contours ( $L_{50}$  and  $L_{10}$ ) generated from the modeling are shown in Figures  
64 5.3.8-1 through 5.3.8-4. During the daytime, all potential receptors within the non-federal lands  
65 were outside the 50-dBA ( $L_{50}$  and  $L_{10}$ ) noise contours. During the nighttime, all potential  
66 receptors within the non-federal lands were outside the 40-dBA ( $L_{50}$  and  $L_{10}$ ) noise contours.  
67 This shows that the predicted daytime and nighttime noise levels at the non-federal lands due to  
68 operations at the Mine Site and Plant Site are well below Minnesota's noise standards. The  
69 results of the noise assessment indicate that operations at the Mine Site and Plant Site would add  
70 no perceptible noise (0 dBA) to the current baseline levels experienced at the non-federal lands.  
71 Non-federal Tracts 4 and 5 are approximately 50 and 90 miles away, respectively, from the  
72 federal lands and are outside the area of analysis for noise modeling; neither tract would be  
73 affected by noise from operations at the Mine Site and Plant Site.

74 Based on the information above, it is anticipated that noise from typical mining and hauling  
75 operations at the Mine Site and ore-crushing operations at the Plant Site would not affect the  
76 people that may use the non-federal lands for recreational activities such as hiking and hunting  
77 under the Land Exchange Proposed Action. However, as discussed in Section 5.2.8, tribal users  
78 of archaeological sites (Spring Mine Lake Sugarbush, *Mesabe Widjiu*, and BBLV Trail; see  
79 Section 4.2.9) in the immediate vicinity of the Mine Site and Plant Site could experience some  
80 effects from noise. The non-federal lands are far from the Mine Site and Plant Site (10 to 90  
81 miles away), so indirect vibration levels from operations at both locations would not affect  
82 potential receptors within the non-federal lands that would be acquired under the Land Exchange  
83 Proposed Action.

#### 84 **5.3.8.3 Land Exchange Alternative B**

85 Under the Land Exchange Alternative B, 4,752.6 acres would be conveyed to PolyMet. The type,  
86 quantity, and location of noise- and vibration-related sources (i.e., drilling, blasting, excavation  
87 work, haul trucks, trains, and crushers) for the Land Exchange Alternative B would be the same  
88 as that for the Land Exchange Proposed Action. Therefore, the Land Exchange Alternative B  
89 would not change noise and vibration levels experienced at the federal lands or modify noise and  
90 vibration effects on nearest receptors. If the 4,752.6 acres of land were to become privately  
91 owned, public recreational use currently associated with the smaller federal parcel would not

92 longer occur on that portion of the federal lands (i.e., the Land Exchange Alternative B would  
93 have no effects associated with public recreational use on that portion). Sections 5.2.8.2.1 and  
94 5.2.8.2.2 provide a discussion of the noise and vibration effects on the federal lands.

95 Under the Land Exchange Alternative B, Tract 1 (4,926.3 acres) would be acquired by the USFS.  
96 The type, quantity, and location of noise- and vibration-related sources (i.e., drilling, blasting,  
97 excavation work, haul trucks, trains, and crushers) for this alternative would be the same as that  
98 for the Land Exchange Proposed Action. Therefore, the Land Exchange Alternative B would not  
99 change noise and vibration levels experienced at the non-federal lands or modify noise and  
100 vibration effects on the nearest receptors.

101 As indicated above, during the daytime, all modeled potential receptors within Tract 1 were  
102 outside the 50-dBA ( $L_{50}$  and  $L_{10}$ ) noise contours (see Figure 5.3.8-1 and 5.3.8-2). Similarly,  
103 during the nighttime, all potential receptors within Tract 1 were outside the 40-dBA ( $L_{50}$  and  $L_{10}$ )  
104 noise contours (see Figure 5.3.8-3 and 5.3.8-4). The predicted daytime and nighttime noise levels  
105 at Tract 1 due to operations at the Mine Site and Plant Site are well below Minnesota's noise  
106 standards. The results of the noise assessment indicate that operations at the Mine Site and Plant  
107 Site would add no additional noise (0 dBA) to the current baseline levels experienced at Tract 1.

#### 108 **5.3.8.4 Land Exchange No Action Alternative**

109 Under the Land Exchange No Action Alternative, the transfer of lands would not occur and there  
110 would be no increase in noise and vibration levels at the federal and non-federal lands.  
111 Therefore, there would be no change in noise and vibration levels at the nearest receptors.

112

### 1 **5.3.9 Cultural Resources**

2 This section summarizes the environmental consequences of the Land Exchange Proposed  
3 Action on historic properties that are present on the federal and non-federal lands, including the  
4 potential effects, types of avoidance, effect minimization measures, and potential mitigation  
5 measures that are relevant to these historic properties. Additionally, this section summarizes the  
6 environmental consequences of the Land Exchange Proposed Action and alternatives on 1854  
7 Treaty resources—i.e., those areas and species that are traditionally or culturally important to the  
8 Bands. Under the Land Exchange Proposed Action and alternatives, the Superior National Forest  
9 would retain its ongoing responsibility for managing cultural resources on Superior National  
10 Forest lands in accordance with the Forest Plan.

11 The federal Co-lead Agencies have identified a historic property in consultation with the SHPO,  
12 Bands, and PolyMet. The federal Co-lead Agencies have also consulted with the SHPO, Bands,  
13 and PolyMet concerning NRHP eligibility of the BBLV Trail Segment. All other cultural  
14 resources identified as part of the Land Exchange Proposed Action, as identified in Section  
15 4.3.9.1.1, were determined to be not eligible for inclusion in the NRHP, and therefore will not  
16 receive further consideration under Section 106 during review of the Land Exchange Proposed  
17 Action. The federal Co-lead Agencies are currently refining statements of significance and  
18 boundaries for this property.

19 An effect determination has been drafted by the federal Co-lead Agencies for review and  
20 comment by the SHPO, Bands, and PolyMet. The federal Co-lead Agencies believe that the  
21 BBLV Trail Segment would be adversely affected by the Land Exchange Proposed Action. This  
22 determination will be used to facilitate ongoing consultation with the SHPO, Bands, and  
23 PolyMet pertaining to the application of adverse effect criteria to this property. Mitigation  
24 measures to resolve adverse effects would be developed after consultation on the effect  
25 determination and consideration of any measures to avoid or minimize adverse effects.

#### 26 **5.3.9.1 Methodology and Evaluation Criteria**

27 Effects associated with the Land Exchange Proposed Action would be the potential destruction  
28 of historic properties and the loss of the historic information and cultural significance that these  
29 properties could represent. An additional effect would be the loss of federal protection for any  
30 unknown historic properties, such as those provided under the NHPA, the Archaeological  
31 Resource Protection Act, and the Native American Graves and Repatriation Act. The  
32 methodology and evaluation criteria used to determine potential effects on cultural resources  
33 from the Land Exchange Proposed Action are similar to those used for the NorthMet Project  
34 Proposed Action (see Section 5.2.9).

35 The analysis of cultural resources was performed based on readily available information, and no  
36 additional field work was performed. Intensive analysis is only needed for the federal parcel  
37 leaving federal ownership. The non-federal lands that would be going into federal ownership  
38 would not be of primary concern since future management of these lands would be per Forest  
39 Plan direction for heritage resources.

40 The spatial area of analysis for Land Exchange Proposed Action effects on cultural resources  
41 included the boundaries of the federal tracts proposed for the exchange, while the temporal area  
42 of analysis was the point in time at which the change in ownership would occur. The geographic

43 extent is appropriate because it includes all cultural resources that would be affected by a change  
44 in site protection. In a temporal sense, the change in ownership is appropriate because this is  
45 when there would be a gain or loss of legal protections.

46 The analysis of the cultural resources affected by the Land Exchange Proposed Action was  
47 guided by effects criteria that were developed by the USFS and the USACE. The analysis  
48 included a review of known and recorded heritage resources (i.e., historic structures, artifacts,  
49 TCPs) within or immediately adjacent to the federal and non-federal lands and a qualitative  
50 assessment to determine if there were portions of the federal and non-federal lands that have not  
51 been surveyed previously and would have a high probability to yield heritage resources.

### 52 **5.3.9.2 Land Exchange Proposed Action**

#### 53 **5.3.9.2.1 Federal Lands**

54 As outlined in Section 5.2.9, the federal Co-lead Agencies, SHPO, Bands, and PolyMet agree  
55 that the BBLV Trail Segment is eligible for inclusion in the NRHP. The federal Co-lead  
56 Agencies, in consultation with the SHPO, Bands, and PolyMet, have determined effects for the  
57 eligible property and are currently working to resolve adverse effects. The federal Co-lead  
58 Agencies are currently in the process of developing a MOA, which identifies the steps the federal  
59 Co-lead Agencies would take to avoid, minimize, or mitigate the adverse effect. Cultural  
60 resources located on private lands being transferred to federal ownership would not be  
61 considered as adversely affected, but would be considered to have greater preservation protection  
62 under federal law.

63 The 1854 Treaty resources located within the Land Exchange Proposed Action would be similar  
64 to the Mine Site portion of the NorthMet Project area previously discussed in Section 4.2.9.  
65 Section 4.2.9 provides further discussion of the existing conditions on the Mine Site and  
66 associated federal lands. The Land Exchange Proposed Action represents an exchange of private  
67 and federal land, but it is also represents an exchange of access to natural resources expressed in  
68 treaties made between the United States and Bands of Ojibwe Indians in the 19<sup>th</sup> Century. Due to  
69 the nature of a land exchange, therefore, the effects would be limited to access to such resources  
70 versus direct or indirect effects, as would be the case with the Land Exchange Proposed Action.

71 An analysis of effects on 1854 Treaty resources, as described and discussed in Section 4.2.9, is  
72 limited by the lack of available information concerning the use of such resources. Determining  
73 how the Bands have traditionally conducted their usufructuary rights on or near the Land  
74 Exchange area would only be available through a detailed ethnographic study of individual Band  
75 members and their families. The cultural resources investigations included Band member  
76 interviews with Bois Forte, Fond du Lac, and Grand Portage, although only Bois Forte's results  
77 were made available. The results of the interviews and the cultural resources investigation did  
78 not find any natural resources that would be considered a TCP or other traditional cultural place.

79 There is also no quantitative analysis of current use of treaty resources in or near the federal  
80 lands. This lack of data also precludes the analysis of how Band members would be  
81 quantitatively affected socioeconomically by effects on 1854 Treaty resources, further discussed  
82 in Section 5.2.10. The primary source of data for assessing effects on treaty resources is from the  
83 analysis of the environment in other chapters of this FEIS as discussed in Section 4.2.9.4 and  
84 5.2.9.2.2.

85 As discussed above, the Land Exchange Proposed Action could have effects on 1854 Treaty  
86 resources—i.e., lack of access to those areas and species that are traditionally or culturally  
87 important to the Bands. For example, coniferous bogs contain several plant species that are  
88 tribally harvested resources (e.g., cranberries, Labrador tea, creeping snowberry, etc.). Because  
89 the non-federal lands contain fewer acres of coniferous bogs than the federal lands, the Land  
90 Exchange Proposed Action would result in a net decrease of coniferous bog wetlands on the  
91 federal estate.

92 Band members' use of the federal lands is not well-defined through research at this time and did  
93 not emerge through interviews. A good faith effort was made on the part of the federal Co-lead  
94 Agencies to identify use areas in or adjacent to the federal lands; however, those efforts resulted  
95 in little specific information concerning historic subsistence use and no information regarding  
96 recent subsistence activity within the federal lands. As such, cultural effects on the Bands would  
97 be difficult to quantify in regards to such incremental increases below standards or effects on  
98 species where appropriate mitigation is used.

#### 99 **5.3.9.2.2 Non-federal Lands**

100 There are no known cultural resources on the non-federal lands. Cultural resources located on  
101 private lands being transferred to federal ownership would not be considered adversely affected,  
102 but would be considered to have greater preservation protection under federal law.

103 The Land Exchange Proposed Action represents an exchange of non-federal and federal land, but  
104 it also represents an exchange of access to natural resources expressed in treaties made between  
105 the United States and Bands of Ojibwe Indians in the 19<sup>th</sup> Century. Due to the nature of a land  
106 exchange, therefore, the 1854 Treaty resources would be available for resource gathering and  
107 subsistence use by the Bands and would receive greater protection under federal law than they  
108 are currently receiving.

### 109 **5.3.9.3 Land Exchange Alternative B**

#### 110 **5.3.9.3.1 Federal Lands**

111 All of the cultural resources and 1854 Treaty resources identified and discussed in Section 5.3.9  
112 are located within the Land Exchange Alternative B. Effects on these resources would be the  
113 same as discussed in Section 5.3.9.

#### 114 **5.3.9.3.2 Non-federal Lands**

115 There are no known cultural resources on the non-federal lands. The non-federal lands that  
116 would be going into federal ownership would not be of primary concern for cultural resources  
117 since future management of these lands would be as per the Forest Plan direction for cultural  
118 resources. Cultural resources located on private lands being transferred to federal ownership  
119 would not be considered adversely affected, but would be considered to have greater  
120 preservation protection under federal law.

121 The Land Exchange Alternative B represents an exchange of private and federal land, but it also  
122 represents an exchange of access to natural resources expressed in treaties made between the  
123 United States and Bands of Ojibwe Indians in the 19<sup>th</sup> Century. Due to the nature of a land  
124 exchange, therefore, the 1854 Treaty resources would be available for resource gathering and

125 subsistence use by the Bands and would receive greater protection under federal law than they  
126 are currently receiving.

127 **5.3.9.4 Land Exchange No Action Alternative**

128 There would be no effects on cultural resources or 1854 Treaty resources under the Land  
129 Exchange No Action Alternative.

DRAFT

1 **5.3.10 Socioeconomics**

2 This section describes the potential socioeconomic consequences of the Land Exchange  
3 Proposed Action. Overall, the Land Exchange Proposed Action would have the following  
4 socioeconomic effects:

- 5 • positive economic effects due to the value of forestry products made available on the non-  
6 federal lands, as well as jobs and revenue due to increased visitation of the non-federal lands;
- 7 • undetermined effects for EJ populations and subsistence activities, due to the net increase in  
8 the amount of land available for subsistence activities, but unknown changes in the type and  
9 extent of subsistence resources on the federal and non-federal lands; and
- 10 • negligible effects on other socioeconomic considerations.

11 **5.3.10.1 Methodology and Evaluation Criteria**

12 As discussed in Section 5.2.10, the study area for socioeconomics differs from the study area  
13 used for much of the rest of this FEIS. It includes Cook, Lake, and St. Louis counties. This  
14 includes, where appropriate, the St. Louis County municipalities listed in Section 4.2.10. The  
15 primary issues related to socioeconomics on and near the non-federal lands, and therefore the  
16 potential for effects, would include the following:

- 17 • the amount of annual property taxes lost to the county from non-federal lands going to  
18 federal ownership;
- 19 • the potential change in payment in lieu of taxes to the county from the Land Exchange  
20 Proposed Action;
- 21 • the differences in assessed market values of federal lands compared to non-federal lands  
22 proposed for exchange;
- 23 • the difference between present values of recently harvested (past 10 years) products from the  
24 federal parcels and the value of products from the federal parcels;
- 25 • the difference between present and future values of potential forest products in Land  
26 Exchange Proposed Action parcels;
- 27 • the change in forestry employment on federal and non-federal parcels (estimated);
- 28 • a qualitative assessment of public visitation to the federal tract and estimated/potential  
29 visitation to non-federal tracts;
- 30 • the difference between present and future estimated spending on recreational tourism;
- 31 • the difference between present and future amounts of treaty resources in Land Exchange  
32 Proposed Action parcels; and
- 33 • a qualitative assessment of tribal use of the federal parcels and estimated/potential use of the  
34 non-federal parcels.

35 **5.3.10.2 Land Exchange Proposed Action**

36 This section describes the potential socioeconomic effects of the Land Exchange Proposed  
37 Action on communities in the socioeconomics study area. The Land Exchange Proposed Action  
38 would create moderate positive economic effects through increased opportunity for forestry and  
39 recreation and associated employment, earnings, and revenue. The Land Exchange Proposed  
40 Action would have negligible negative effects on other socioeconomic factors, including  
41 housing, public facilities and services, EJ populations, and subsistence.

42 **5.3.10.2.1 Economic Activity**

43 There is no current economic activity (e.g., forestry, etc.) on the federal lands, although  
44 harvesting of forest products is permitted by the Forest Plan. More importantly, the federal lands  
45 are not accessible to the public for economically measurable use, such as forestry or recreation  
46 (see Section 5.2.11). Thus, while the federal lands may hold some theoretical economic value for  
47 timber harvest, their practical economic value is zero. Table 5.3.10-1 lists data and observations  
48 relevant to the economic value of the federal and non-federal lands.

49 **Tax Payments**

50 Implementation of the Land Exchange Proposed Action would transfer ownership of the federal  
51 lands to PolyMet, and would result in an active mining operation that would generate federal,  
52 state, and local tax revenue, in addition to employment. As described in Section 5.2.10.2.3, total  
53 annual direct tax payments from the NorthMet Project Proposed Action during operations are  
54 expected to be in the range of \$37 to \$80 million, a positive economic effect, both on an absolute  
55 basis and when compared with the minimal current economic activity within the NorthMet  
56 Project area.

57 The amount of property taxes that would be paid to St. Louis County for the federal lands has not  
58 yet been determined; however, property taxes would be included in the overall taxes paid by  
59 PolyMet, shown in Table 5.2.10-3. For the non-federal lands, increases to federal payments in  
60 lieu of taxes to study area counties as a result of the Land Exchange Proposed Action would be  
61 negligible (compared to the current payment in lieu for the federal lands).

62 **Table 5.3.10-1 Economic Value of Federal and Non-federal Lands (in 2012 dollars)**

| Land                               | Acreage      | Annual Property Tax <sup>1</sup> | Annual Payment in Lieu of Taxes (PILT) <sup>2</sup> | Market Value of Land <sup>3</sup> | Other Economic Value                                                                                                                                                                             |
|------------------------------------|--------------|----------------------------------|-----------------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Federal Lands</i>               | 6495.4       | NA <sup>3</sup>                  | \$2,273.39                                          | TBD                               | NA                                                                                                                                                                                               |
| Tract 1                            | 4,926.3      | \$20,714.68                      | \$1,724.10                                          | TBD                               | Potential recreational value due to the presence of Hay Lake (boating, fishing), existing trails, evidence of ongoing hunting, and other recreational activity (see Section 4.3.11).             |
| Tract 2                            | 381.9        | \$2,563.54                       | \$133.70                                            | TBD                               | NA                                                                                                                                                                                               |
| Tract 3                            | 1,575.8      | Unknown                          | \$551.60                                            | TBD                               | NA                                                                                                                                                                                               |
| Tract 4                            | 160.2        | \$739.30                         | \$56.00                                             | TBD                               | NA                                                                                                                                                                                               |
| Tract 5                            | 30.8         | \$1,938.00                       | \$10.85                                             | TBD                               | Potential recreational value. Former site of a cabin and camp site owned by Carleton College. Adjacent to highly scenic McFarland Lake (boating, fishing, access to BWCAW) (see Section 4.3.11). |
| <i>Subtotal, Non-Federal Lands</i> | 7,075.0      | \$25,995.52                      | \$2,476.25                                          | TBD                               | NA                                                                                                                                                                                               |
| <b>Net Change<sup>5</sup></b>      | <b>579.6</b> | <b>NA</b>                        | <b>\$202.86</b>                                     | <b>TBD</b>                        | <b>NA</b>                                                                                                                                                                                        |

63 <sup>1</sup> Source: Orehek, PolyMet, Pers. Comm., April 17, 2012.

64 <sup>2</sup> Source: DOI 2012

65 <sup>3</sup> See Market Value section below.

66 <sup>4</sup> Table 5.2.10-3 describes total estimated taxes that PolyMet expects to pay for the federal lands. The amount specifically anticipated for property taxes has not been determined.

67 <sup>5</sup> Calculated as (non-federal) minus (federal).

68 TBD = To be determined

70 **Market Value**

71 Federal regulations governing land exchanges, contained in 36 CFR 254.12, require that the  
72 assessed value of non-federal land being exchanged be equal to or within 25 percent of the  
73 assessed value of the federal land being exchanged. Assessment data have been updated and are  
74 included in this FEIS.

75 **Recreation Value**

76 Tracts 1 and 5 also have the potential for recreational use (whereas the federal lands are not  
77 easily accessible for any purpose). To the degree that the USFS manages these lands (and the  
78 other non-federal lands) for active recreational activity, the Land Exchange Proposed Action  
79 could increase economic activity associated with recreation and tourism. The non-federal lands  
80 comprise less than half of 1 percent of the 2,171,603.9 acres of Superior National Forest that are  
81 managed by USFS, so any such increase would be small.

82 **Timber**

83 There is no ongoing forestry activity on the federal lands, and no evidence of recent past forestry  
84 activity. Portions of Tracts 2, 3, and 4 show some evidence of timber harvesting, and a timber  
85 harvest agreement is in place through 2013 for the Wolf Lands 3 parcel (see Section 4.3.1).  
86 Likely USFS management area designations for the non-federal lands would allow timber  
87 harvesting on 6,547.1 acres of the non-federal lands (the lands designated General Forest or  
88 General Forest – Longer Rotation; see Table 5.3.1-1). Thus, the Land Exchange Proposed Action  
89 could increase timber production in Superior National Forest.

90 On average, 1 percent of timber land in Superior National Forest is harvested each year, with an  
91 estimated value of \$400 (gross) per harvested acre (Deckard, MDNR, Pers. Comm. April 26,  
92 2012). Timber harvesting on the non-federal lands (and any other USFS lands) would occur only  
93 after completion of forest planning, when acres that are eligible for harvest are identified and the  
94 offered for sale. For planning purposes, if 1 percent of the non-federal lands would therefore  
95 generate gross proceeds of approximately \$26,188 per year. This represents approximately 2  
96 percent of the \$1,435,900 value of timber harvests in Superior National Forest in 2011 (Deckard,  
97 MDNR, Pers. Comm. April 26, 2012), although the markets for timber, and thus the value of  
98 harvested timber, can change dramatically. This additional activity would be estimated to  
99 generate fewer than 20 new jobs in the region. Minnesota averages approximately one forestry  
100 job (including logging and primary manufacturing) per 350 acres of annual harvest, and each  
101 direct forestry job generates another 3.6 indirect and induced jobs (Deckard, MDNR, Pers.  
102 Comm. April 26, 2012). Using these estimates, the Land Exchange Proposed Action could  
103 generate four direct and 12 indirect jobs. As of 2009, forestry activities employed approximately  
104 1,287 individuals in the study area (Headwaters Economics 2009).

105 **Environmental Justice and Subsistence**

106 Potential EJ populations, as well as the EJ and subsistence effects of the Land Exchange  
107 Proposed Action on the federal lands, are described in Section 5.2.10.2.7. Although tribal entities  
108 possess usufructuary rights to hunt, fish, and gather throughout the 1854 Ceded Territory, the  
109 federal lands are not easily accessible for such subsistence activities. The Land Exchange  
110 Proposed Action would involve the transfer of 6,495.4 acres of inaccessible federal lands from

111 public to private ownership, and up to 7,075.0 acres of publicly accessible land from private to  
112 public ownership. To the degree that increased availability of publicly accessible land improves  
113 property value and generates revenue (see above) in the study area, the Land Exchange Proposed  
114 Action could have positive effects on EJ populations.

115 As a result of the Land Exchange Proposed Action, the current federal lands would become  
116 unavailable for subsistence use. Resource-specific sections of the FEIS address the degree to  
117 which subsistence species and resources are likely to be available on the non-federal lands. As  
118 described in Section 5.2.9, subsistence has both economic and cultural components; for the  
119 Bands, the harvest of a particular animal or plant is intrinsically linked to the place and nature in  
120 which it was harvested. Thus, a “net change” in subsistence activity associated with the Land  
121 Exchange Proposed Action cannot be calculated in the same way as, for example, the net change  
122 in employment or income. The Land Exchange Proposed Action would result in the loss of  
123 subsistence resources and opportunities on the federal lands, and a gain in subsistence resources  
124 and opportunities on the non-federal lands.

### 125 **Other Socioeconomic Considerations**

126 The Land Exchange Proposed Action would result in slight increases in demand for public safety  
127 services to assist recreational or other users of the non-federal lands. This is a demand that  
128 currently does not exist on the inaccessible federal lands. The non-federal lands represent 0.2  
129 percent of the Superior National Forest. Thus, any such increased demand would be marginal.  
130 No new housing (and thus no increased demand for educational facilities) is anticipated on the  
131 non-federal lands. Any utilities extended to the non-federal lands (such as electricity) would  
132 likely be minimal in nature (given the ROS categories assigned to the non-federal lands—see  
133 Section 5.3.11). Thus, the Land Exchange Proposed Action would have negligible effects on  
134 other socioeconomic considerations.

135 The Land Exchange Proposed Action would result in a loss of some of the ecosystem functions  
136 provided by the forest, wetland, and other natural habitats on the federal lands, particularly the  
137 portions of the federal lands (i.e., the Mine Site) where habitat would be replaced by mine  
138 facilities. Some of these functions could be restored during the post-closure period, when the  
139 federal lands (as well as the Plant Site) are revegetated. In exchange, the Land Exchange  
140 Proposed Action would enable the USFS to directly manage the ecosystems functions on the  
141 non-federal lands.

### 142 **5.3.10.3 Land Exchange Alternative B**

143 Under the Land Exchange Alternative B, 4,752.6 acres of federal lands would be exchanged for  
144 the 4,926.3-acre Tract 1. The remainder of the federal lands would remain inaccessible by land.  
145 The Land Exchange Alternative B would create moderate positive economic effects through  
146 increased opportunity for forestry and recreation and associated employment, earnings, and  
147 revenue (see Table 5.3.10-1); however, these benefits would be less than from the Land  
148 Exchange Proposed Action. Similarly, the Land Exchange Alternative B would have negligible  
149 negative effects on other socioeconomic factors, including housing, public facilities and services,  
150 EJ populations, and subsistence, although less so than the Land Exchange Proposed Action.

151 **5.3.10.4 Land Exchange No Action Alternative**

152 Under the Land Exchange No Action Alternative, the NorthMet Project Proposed Action would  
153 not be developed, there would be no change to the federal lands, and the non-federal lands would  
154 remain inaccessible to the public (including tribal entities). Given other private ownership (e.g.,  
155 the Dunka Road and railroad), the federal and non-federal lands would remain generally  
156 inaccessible to the public. Therefore, there would be no direct or indirect effects on  
157 socioeconomics.

DRAFT

1 **5.3.11 Recreation and Visual Resources**

2 This section describes the potential environmental consequences of the Land Exchange Proposed  
 3 Action on recreational facilities and activities that typically take place on the federal and non-  
 4 federal lands. In this section, effects on the federal and non-federal lands are discussed together,  
 5 to facilitate calculation of net changes in recreation and scenic classes. Under the Land Exchange  
 6 Proposed Action and Land Exchange Alternative B, the Superior National Forest would retain its  
 7 ongoing responsibility for managing recreational resources on National Forest System lands in  
 8 accordance with the Forest Plan.

9 Overall, the Land Exchange Proposed Action would increase opportunities for recreational  
 10 activity through the acquisition of up to 7,075.0 acres of publicly accessible land (the non-federal  
 11 lands) in exchange for 6,495.4 acres of federal land that are not publicly accessible by land, and  
 12 thus cannot be practically used for recreation. The Land Exchange Proposed Action would also  
 13 increase the amount of land controlled by the USFS in the Superior National Forest with  
 14 Moderate and High SIOs.

15 The Land Exchange Alternative B would have a lesser degree of the same type of benefits for  
 16 recreation and visual resources as the Land Exchange Proposed Action, due to the reduced land  
 17 area involved.

18 Table 5.3.11-1 shows the effects of the Land Exchange Proposed Action and the Land Exchange  
 19 Alternative B on acreage of various ROS classes; Table 5.3.11-2 shows the effects on SIO  
 20 classes.

21 **Table 5.3.11-1 Net Increase or Decrease of Recreation Opportunity Spectrum Classes**

| Alternative                   | Increase (Decrease) of ROS Class (Acres) |                              |                | Total |
|-------------------------------|------------------------------------------|------------------------------|----------------|-------|
|                               | Semi-Primitive Motorized                 | Semi-Primitive Non-Motorized | Roaded Natural |       |
| Land Exchange Proposed Action | (2,243.3)                                | 2,309.9                      | 513.0          | 579.6 |
| Land Exchange Alternative B   | (2,972.7)                                | 2,162.2                      | 984.2          | 173.7 |

22

23 **Table 5.3.11-2 Net Increase or Decrease of Scenic Integrity Objectives**

| Alternative                   | Increase (Decrease) of Scenic Integrity Objective (Acres) |          |                  | Total <sup>1</sup> |
|-------------------------------|-----------------------------------------------------------|----------|------------------|--------------------|
|                               | High                                                      | Moderate | Low <sup>1</sup> |                    |
| Land Exchange Proposed Action | 136.3                                                     | 1,644.6  | (1,170.8)        | 610.1              |
| Land Exchange Alternative B   | 20.4                                                      | 1,315.4  | (1,153.2)        | 182.6              |

24 <sup>1</sup> Mud Lake would not be managed by the USFS, and therefore does not have an SIO.

### 25 **5.3.11.1 Methodology and Evaluation Criteria**

#### 26 **5.3.11.1.1 Recreation**

27 The primary issues related to recreational facilities and activities associated with the Land  
28 Exchange Proposed Action on and near the federal lands and non-federal lands include the  
29 following:

- 30 • change in areas of ROS classes within the Superior National Forest; and
- 31 • qualitative difference in recreation opportunities, as measured using ROS classes, between  
32 outgoing federal land and non-federal lands to be acquired.

33 ROS classes are defined by the USFS (1982) and ROS classes for the non-federal lands were  
34 mapped to match the existing mapped ROS Spectrum areas on surrounding adjacent federal  
35 lands. GIS analysis was employed to determine the net change in acreage by ROS class. ROS  
36 classes are discussed in Section 4.2.11.1.1.

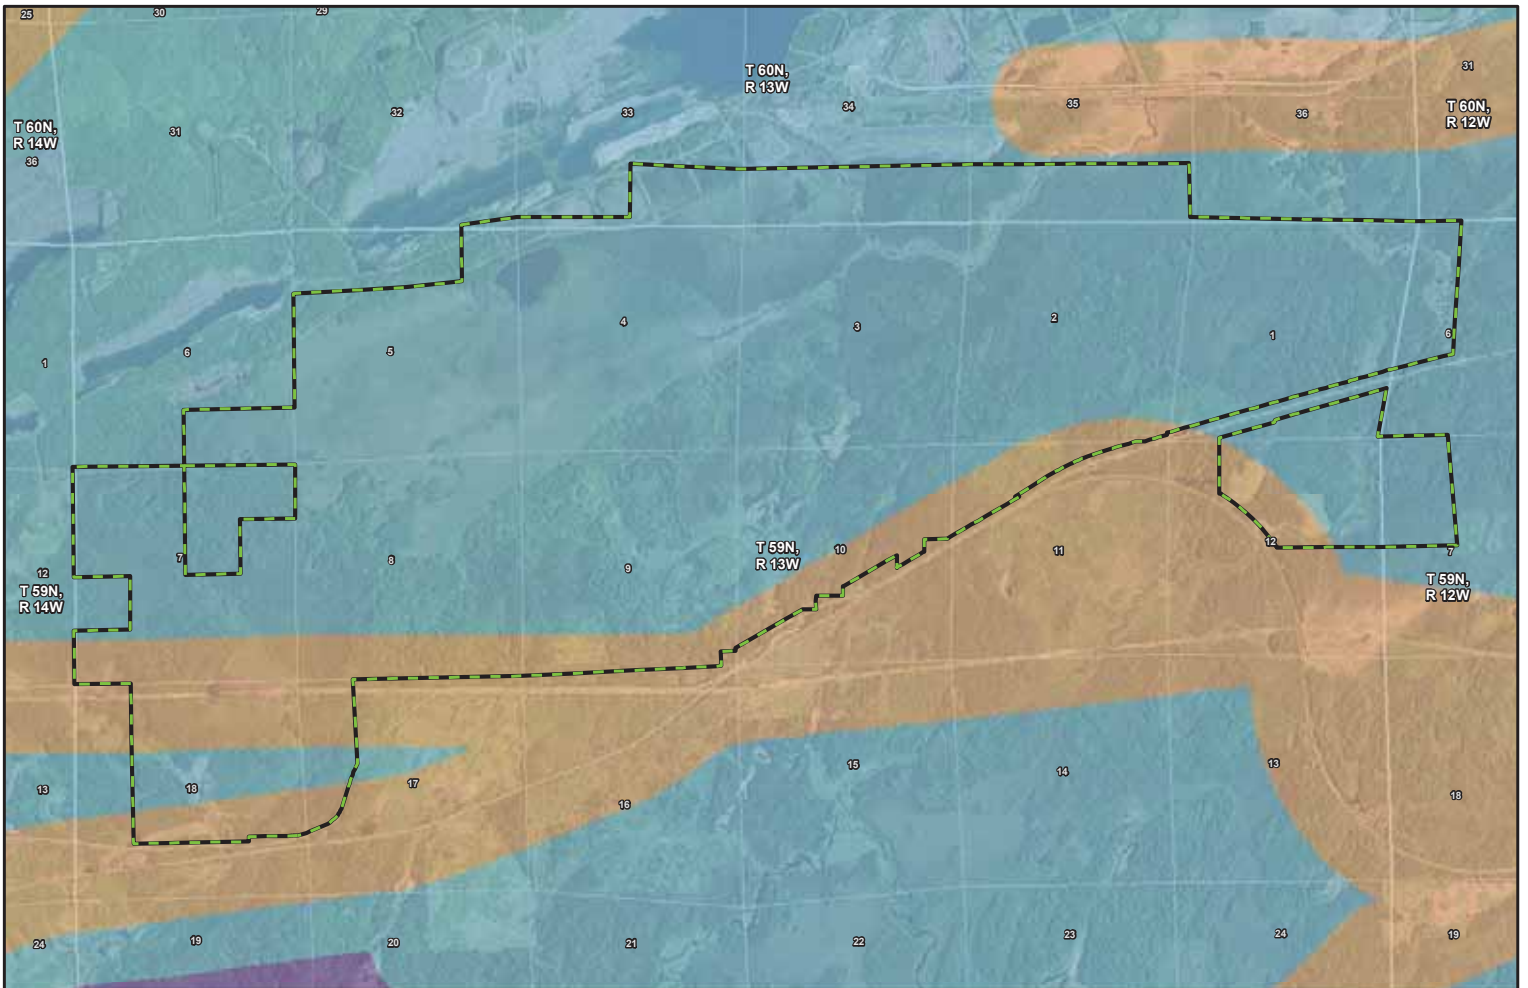

#### 37 **5.3.11.1.2 Visual Resources**

38 The primary issue related to visual resources on and near the non-federal lands is the change in  
39 acreage of High, Moderate, and Low SIO classified land within Superior National Forest lands.  
40 SIOs were provided by USFS (1995), and as with ROS classes, SIOs for the non-federal lands  
41 were mapped to match the existing mapped SIOs on surrounding adjacent federal lands. GIS  
42 analysis was employed to determine the net change in acreage by SIO. SIOs are discussed in  
43 section 4.2.11.1.2. This quantitative analysis was supplemented by a qualitative description of  
44 loss of scenery opportunities on federal lands that would be conveyed to PolyMet and the gain of  
45 scenery opportunities on non-federal lands to be acquired and managed by USFS.

### 46 **5.3.11.2 Land Exchange Proposed Action**

#### 47 **5.3.11.2.1 Recreation**

48 ROS classes for the federal lands are shown on Figure 5.3.11-1; the classes that would be applied  
49 to the non-federal lands are also shown on Figures 5.3.11-2 and 5.3.11-3. These classifications  
50 are summarized in Table 5.3.11-3. No developed recreational sites or opportunities are planned  
51 at this time. All of the tracts would be open for non-motorized, dispersed recreational activities.  
52 The federal lands in the Land Exchange Proposed Action consist of 967.0 acres designated as  
53 Roaded Natural and 5,528.4 acres designated Semi-Primitive Motorized (see Table 5.3.11-3). As  
54 described in Sections 4.2.11 and 4.3.11, the Semi-Primitive (Motorized and Non-Motorized)  
55 classes indicate areas where interaction between visitors is rare, but where human activities may  
56 be visible. The Roaded Natural class indicates an area where evidence of human activity and  
57 interactions are more frequent, and occasionally prevalent.

| Net Increase/(Decrease)     | (2,243.3)                | 2,309.9                      | 513.0          | 579.6   |

66 Source: Duffy and Ness, USFS, Pers. Comm., November 2011.

67 There is no public land access to and no practical opportunity for recreational activity on the  
 68 federal lands, and the federal lands would remain inaccessible after completion of the Land  
 69 Exchange Proposed Action. By comparison, the non-federal lands would be accessible to varying  
 70 degrees, and therefore could host recreational activities, as defined by their respective ROS class.  
 71 Tract 1 is the most accessible and therefore has the greatest potential for public recreational use.  
 72 Tract 5 would likely be accessible from adjacent Superior National Forest land and/or the lake  
 73 itself, while Tract 4 is also accessible via road and trail. Tracts 2 and 3 would be more difficult to  
 74 access.

75 As Table 5.3.11-3 shows, the Land Exchange Proposed Action would result in a net decrease to  
 76 the federal estate of 2,243.3 acres of land designated Semi-Primitive Motorized, an increase to  
 77 the federal estate of 2,309.9 acres of land designated Semi-Primitive Non-Motorized, and an  
 78 increase to the federal estate of 513.0 acres of Roaded Natural land. Although there would be a  
 79 decrease of Semi-Primitive Motorized land to the federal estate, the Land Exchange Proposed  
 80 Action overall would affect less than one-quarter of one percent of the total area of the Superior  
 81 National Forest (approximately 3 million acres), and the reduction to the federal estate of this  
 82 ROS type would be exceeded by the increase to the federal estate in other ROS types.

83 Because the federal lands are not accessible to the public by land, the Land Exchange Proposed  
 84 Action represents an addition to the amount of potential publicly accessible land in the Superior  
 85 National Forest. As a result, the Land Exchange Proposed Action would increase opportunities  
 86 for hunting, fishing, and other recreational activities.

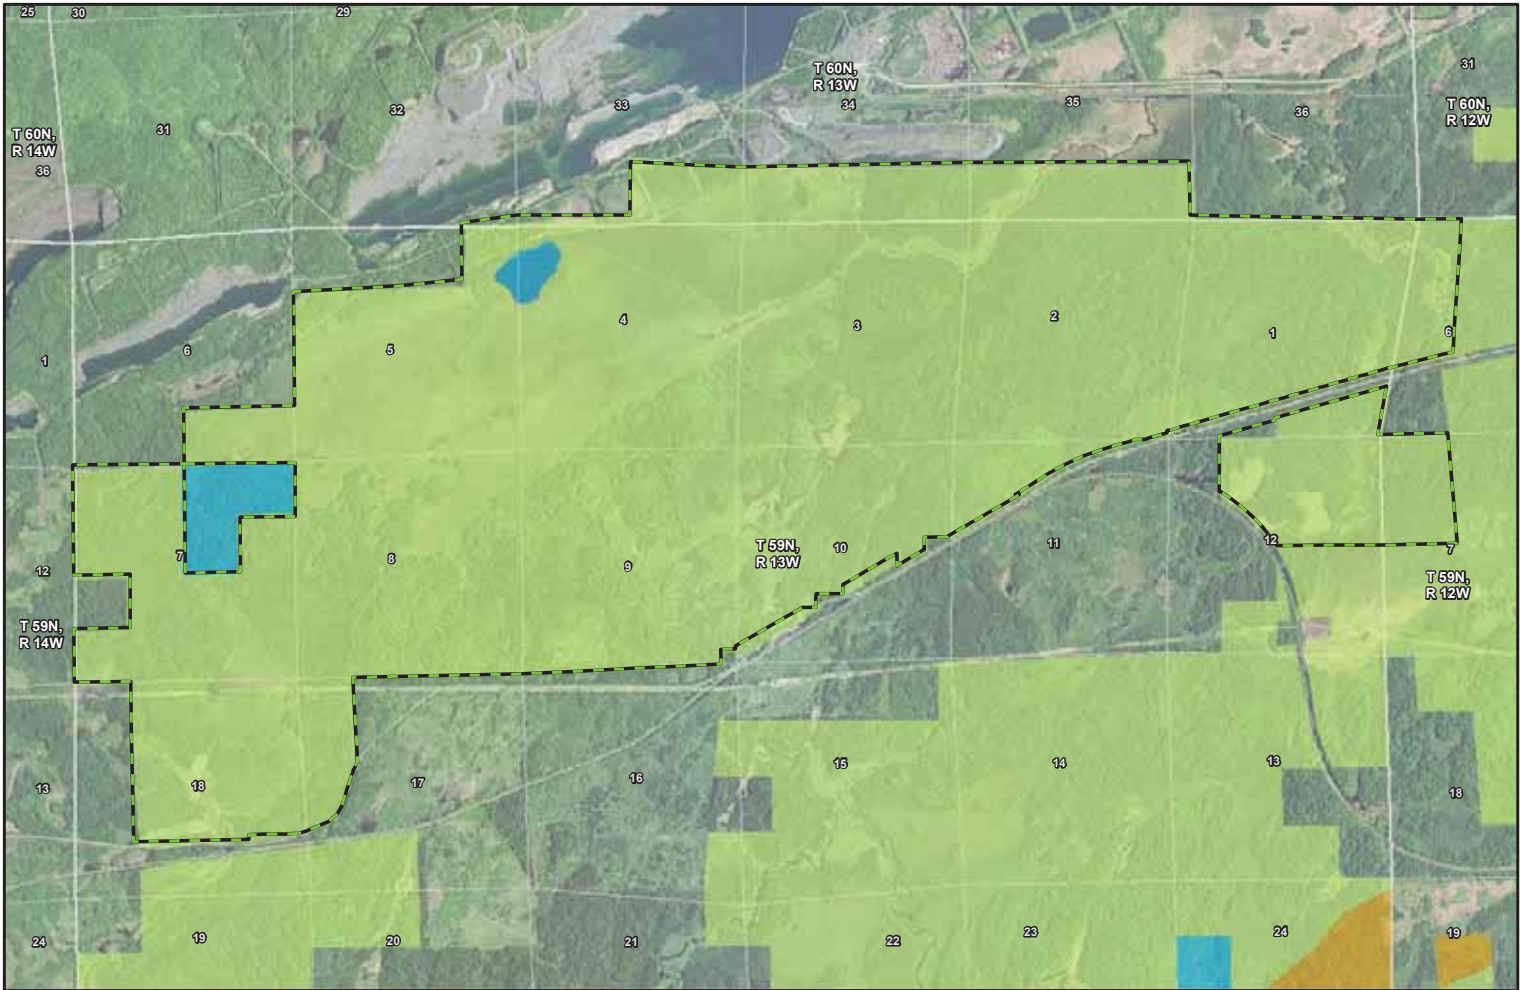

87 **5.3.11.2.2 Visual Resources**

88 SIOs for the federal lands are shown on Figure 5.3.11-4, while the SIOs that would be applied to  
89 the non-federal lands are shown in Figures 5.3.11-5 and 5.3.11-6. These are summarized in Table  
90 5.3.11-4. The Low SIO of the federal lands indicates that the area may be dominated by  
91 management activities. Effects on visual resources on the federal lands are similar to those at the  
92 Mine Site, as discussed in Section 5.2.11.2.1.

93 The non-federal lands are only somewhat visible from public roads, few of which are elevated  
94 enough to afford views of the tracts themselves. Still, transfer of the non-federal lands to  
95 Superior National Forest ownership would generally help to preserve the scenic quality of those  
96 parcels. The NorthMet Project area would not be visible from any of the Land Exchange  
97 Proposed Action parcels.

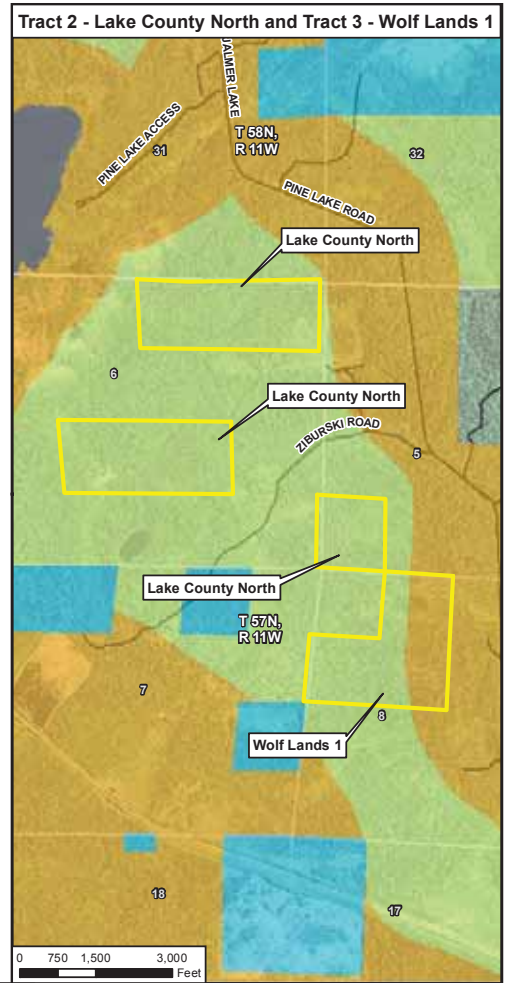

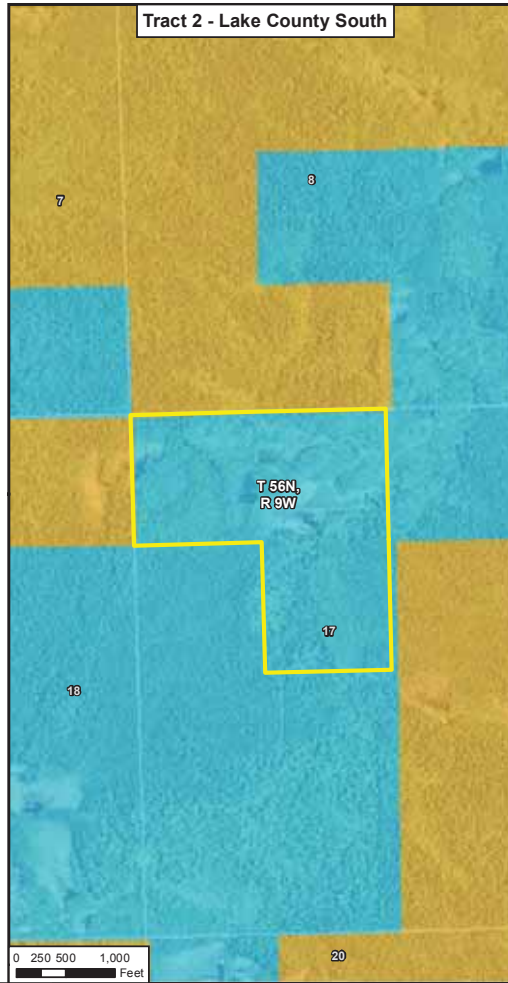

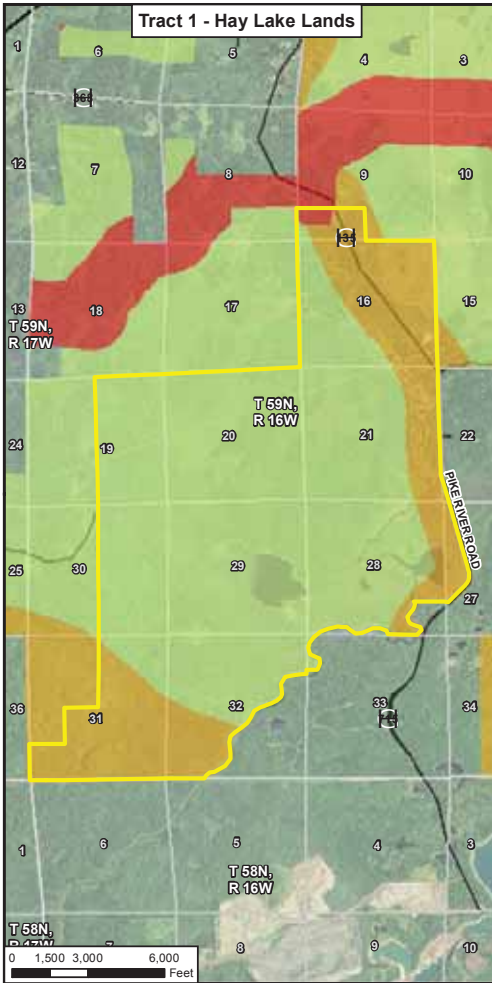

98 The Land Exchange Proposed Action would result in a net decrease to the federal estate of  
99 1,170.8 acres of land with a Low SIO and an increase to the federal estate of 136.3 acres of land  
100 with a High SIO and 1,644.6 acres of land with a Moderate SIO (see Table 5.3.11-4). This  
101 change in the composition of the visual character of the Superior National Forest, which affects  
102 less than one-quarter of one percent of the total area of the forest, would have generally positive  
103 effects. The addition of land with Moderate and High SIO (in lieu of land with a Low SIO) could  
104 affect the types of forestry and management activities that could occur on those lands. The USFS  
105 would acquire land with a wider diversity of SIOs (i.e., the addition of land with Moderate and  
106 High SIOs) and the Land Exchange Proposed Action would result in a net increase to the federal  
107 estate.

116 Source: Duffy and Ness, USFS, Pers. Comm., November 2011.

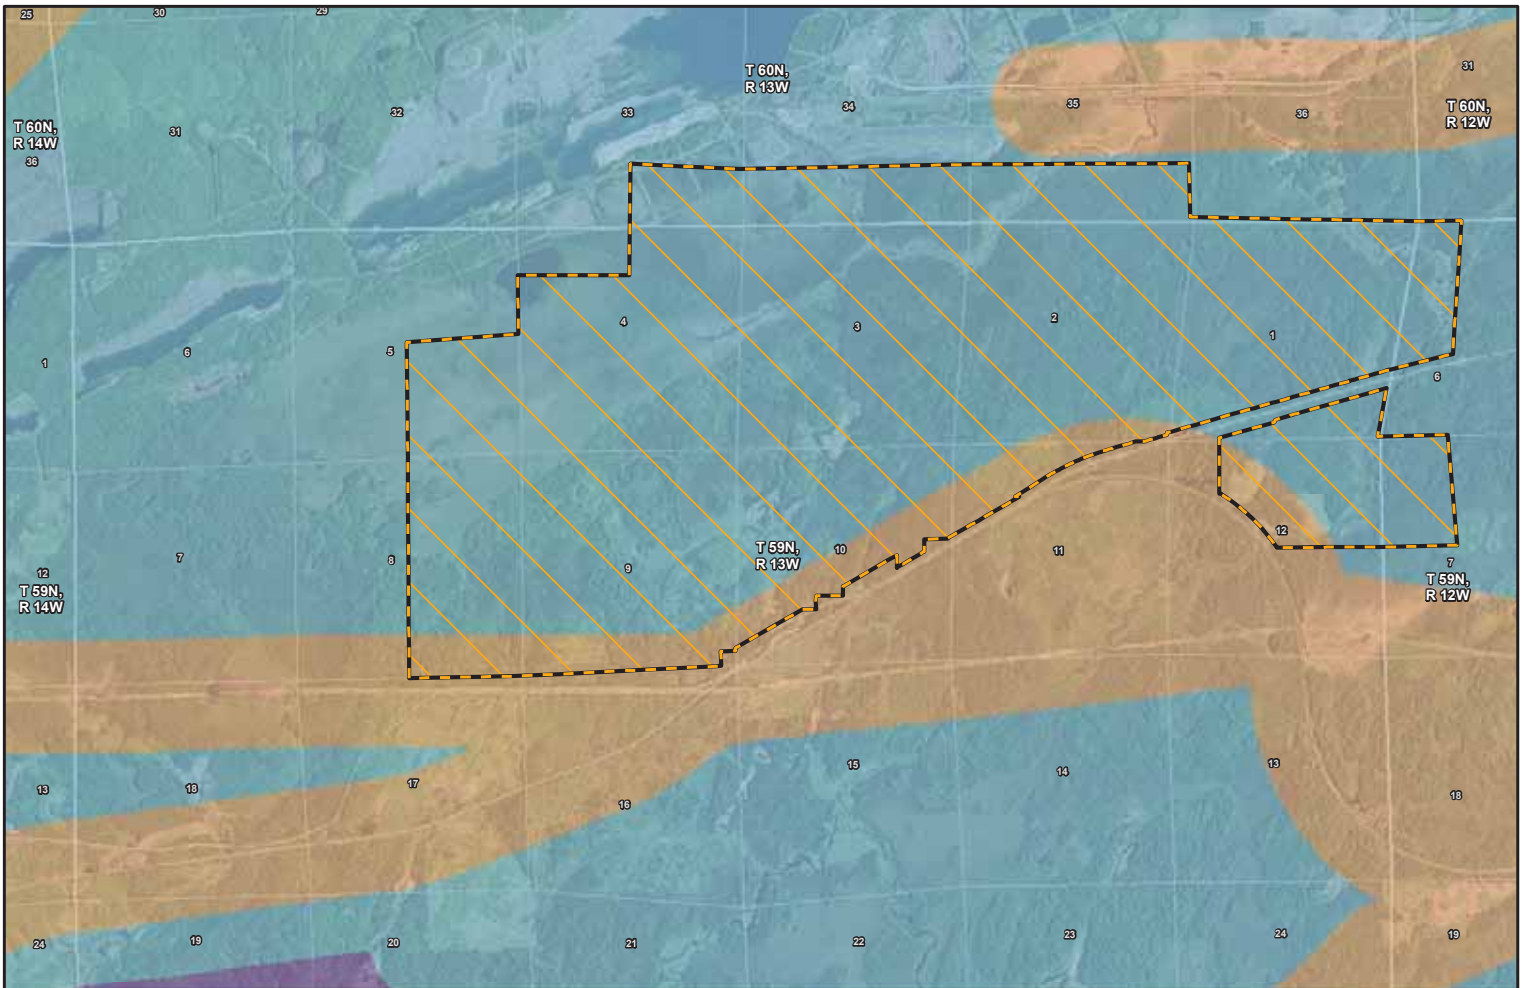

117 <sup>1</sup> Mud Lake (comprising 30.5 acres of the 6,495.4 acres in the federal lands) would not be managed by USFS, and therefore does  
 118 not have a SIO.

119 **5.3.11.3 Land Exchange Alternative B**

120 **5.3.11.3.1 Recreation**

121 Under the Land Exchange Alternative B, 4,752.6 acres of federal lands would be exchanged for  
 122 the 4,926.3-acre Tract 1. ROS classes for the federal lands portion of the Land Exchange  
 123 Alternative B are shown on Figure 5.3.11-7 (Tract 1 classes would remain unchanged from the  
 124 Land Exchange Proposed Action). Table 5.3.11-5 summarizes the ROS classes of these lands.

DRAFT

128 **Table 5.3.11-5 Recreation Opportunity Spectrum Class of Federal and Non-federal Lands**  
 129 **(Land Exchange Alternative B)**

| Parcel                  | Acres of ROS Class       |                              |                | Total   |
|-------------------------|--------------------------|------------------------------|----------------|---------|
|                         | Semi-Primitive Motorized | Semi-Primitive Non-Motorized | Roaded Natural |         |
| Lands Conveyed          |                          |                              |                |         |
| Alternative B           | 4,276.5                  | 0.0                          | 476.1          | 4,752.6 |
| Lands Acquired          |                          |                              |                |         |
| Tract 1 - Hay Lake      | 1,303.8                  | 2,162.2                      | 1,460.3        | 4,926.3 |
| Net Change              |                          |                              |                |         |
| Net Increase (Decrease) | (2,972.7)                | 2,162.2                      | 984.2          | 173.7   |

130 Source: Duffy and Ness, USFS, Pers. Comm., November 2011.

131 Similar to the Land Exchange Proposed Action, there is no public land access to and no  
 132 opportunity for recreational activity on the federal lands, and the smaller federal parcel would  
 133 remain inaccessible after completion of the Land Exchange Alternative B. By comparison, the  
 134 non-federal lands (Tract 1) would be accessible (to varying degrees), and therefore would be  
 135 capable of hosting recreational activities, as defined by their respective ROS classes. Tract 1 is  
 136 accessible and therefore would result in the greatest potential for public recreational use.

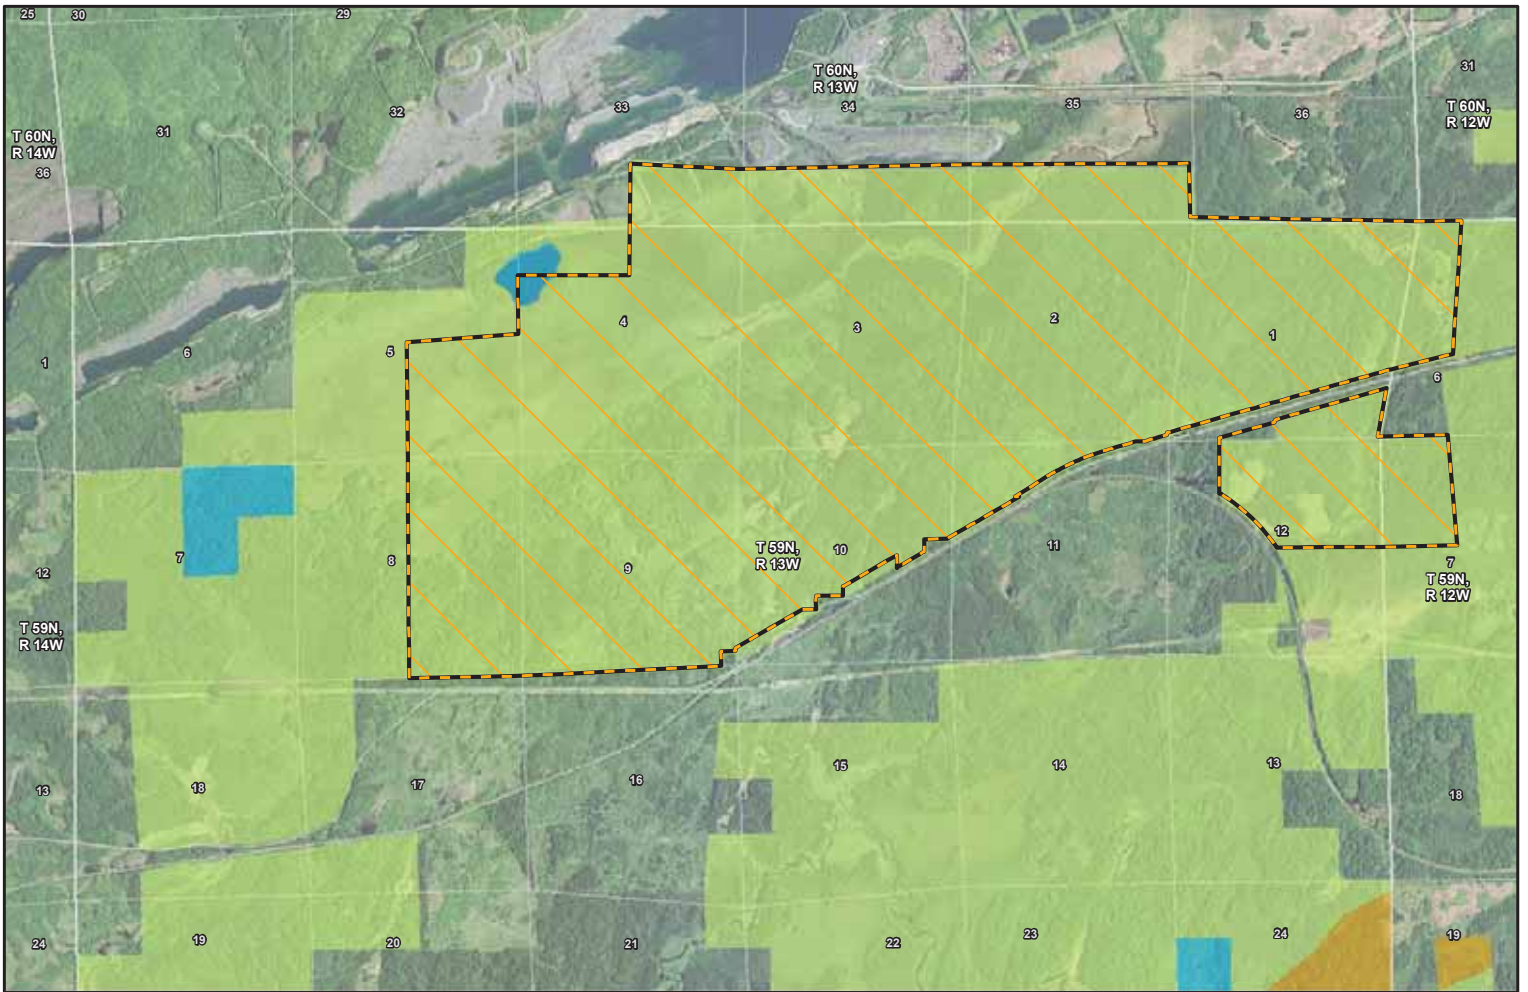

137 As Table 5.3.11-5 shows, the Land Exchange Alternative B would result in a net decrease to the  
 138 federal estate of 2,972.7 acres of land designated as Semi-Primitive Motorized, and an increase  
 139 to the federal estate of 2,162.2 acres of Semi-Primitive Non-Motorized land and 984.2 acres of  
 140 Roaded Natural land. Although there would be a decrease of Semi-Primitive Motorized land, the  
 141 Land Exchange Alternative B overall would affect less than one-quarter of one percent of the  
 142 total area of the Superior National Forest, and the reduction to the federal estate of this ROS  
 143 class would be exceeded by the increase to the federal estate in other ROS classes.

144 As with the Land Exchange Proposed Action, because the federal lands are not accessible to the  
 145 public, the Land Exchange Alternative B represents an addition to the amount of potential  
 146 publicly accessible land in the Superior National Forest. As a result, the Land Exchange  
 147 Alternative B would increase opportunities for hunting, fishing, and other recreational activities.  
 148 Overall, the effects of the Land Exchange Alternative B on recreation are similar to those of the  
 149 Land Exchange Proposed Action, but smaller in magnitude, due to the reduced amount of land  
 150 involved.

### 151 **5.3.11.3.2 Visual Resources**

152 SIO classifications for the smaller federal parcel are shown on Figure 5.3.11-8 (Tract 1  
 153 classifications would remain unchanged from the Land Exchange Proposed Action) and are  
 154 summarized in Table 5.3.11-6. As with the Land Exchange Proposed Action, the Land Exchange  
 155 Alternative B has a Low SIO, indicating the lands may be dominated by management activities;  
 156 however, Tract 1 would only be somewhat visible from public roads and would generally help to  
 157 preserve the scenic quality of the parcel. The NorthMet Project area would not be visible from  
 158 Tract 1.

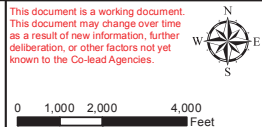

DRAFT

|                                                                                    |                                       |                                                                                              |
|------------------------------------------------------------------------------------|---------------------------------------|----------------------------------------------------------------------------------------------|
|  | Alternative B: Smaller Federal Parcel | <b>Scenic Integrity Objective</b>                                                            |
|  | Section Boundary                      |  High     |
|  | Section Label                         |  Moderate |
|                                                                                    |                                       |  Low      |
|                                                                                    |                                       |  N/A      |

**Scenic Integrity Objective**  
**Alternative B: Smaller Federal Parcel**  
 NorthMet Mining Project and Land Exchange PFEIS  
 Minnesota

DRAFT

162 The Land Exchange Alternative B would result in a net decrease to the federal estate of 1,153.2  
 163 acres of land with a Low SIO, in exchange for an increase to the federal estate of 20.4 acres of  
 164 land with a High SIO and 1,153.2 acres of land with a Moderate SIO. This change in the  
 165 composition of the visual character of the Superior National Forest, which affects less than one-  
 166 tenth of one percent of the total area of the Superior National Forest, would have generally  
 167 positive effects. The addition of land with Moderate and High SIOs (in lieu of land with a Low  
 168 SIO) could affect the types of forestry and management activities that can occur on those lands.  
 169 The USFS would acquire land with a wider diversity of SIOs and the Land Exchange Alternative  
 170 B would result in a net increase to the federal estate, although less than in the Land Exchange  
 171 Proposed Action.

172 **Table 5.3.11-6 Scenic Integrity Objectives of Federal and Non-federal Lands (Land**  
 173 **Exchange Alternative B)**

| Parcel                  | Acres of Scenic Integrity Objective Classification |          |                        |                        |
|-------------------------|----------------------------------------------------|----------|------------------------|------------------------|
|                         | High                                               | Moderate | Low                    | Total                  |
| Lands Conveyed          |                                                    |          |                        |                        |
| Alternative B           | 0                                                  | 0        | 4,743.7 <sup>(1)</sup> | 4,743.7 <sup>(1)</sup> |
| Lands Acquired          |                                                    |          |                        |                        |
| Tract 1 - Hay Lake      | 20.4                                               | 1,315.4  | 3,590.5                | 4,926.3                |
| Net Change              |                                                    |          |                        |                        |
| Net Increase (Decrease) | 20.4                                               | 1,315.4  | (1,153.2)              | 182.6                  |

174 Source: Duffy and Ness, USFS, Pers. Comm., November 2011.

175 <sup>1</sup> Mud Lake (comprising 8.9 acres of the 4,752.6 acres in the smaller federal parcel), would not be managed by USFS, and  
 176 therefore does not have a SIO.  
 177

### 178 5.3.11.4 Land Exchange No Action Alternative

#### 179 5.3.11.4.1 Recreation

180 Under the Land Exchange No Action Alternative, the federal and non-federal lands would  
 181 remain generally inaccessible to the public for recreation or other uses.

#### 182 5.3.11.4.2 Visual Resources

183 Under the Land Exchange No Action Alternative, the visual appearance of the federal and non-  
 184 federal lands would remain unchanged.

DRAFT

1 **5.3.12 Wilderness and Other Special Designation Areas**

2 This section describes the potential environmental consequences of the Land Exchange Proposed  
3 Action on wilderness and other special designation area resources that are on or near the federal  
4 and non-federal lands.

5 The Land Exchange Proposed Action would not result in a net increase or decrease in any  
6 wilderness areas. However, the Land Exchange Proposed Action would result in a net increase of  
7 306.9 acres of cRNAs to the federal estate through exchange of Tract 1. Land Exchange  
8 Alternative B would still include exchange of Tract 1; therefore, it would result in the same net  
9 changes to cRNA acreage as the Land Exchange Proposed Action.

10 The Land Exchange No Action Alternative would not affect wilderness or special-designation  
11 areas as the Land Exchange would not occur.

12 **5.3.12.1 Methodology and Evaluation Criteria**

13 An evaluation was conducted to determine the potential effect that the Land Exchange Proposed  
14 Action would have on the wilderness character of the area. Potential effects on noise, water  
15 resources, and recreation and visual resources were evaluated. The analysis of the wilderness  
16 character affected by the Land Exchange Proposed Action was guided by evaluation criteria that  
17 were developed by the USFS and other Co-lead Agencies.

18 Estimated ambient noise levels at each of the sensitive receptor sites adjacent to the federal lands  
19 were compared with modeled noise levels to determine effects. An appropriate noise propagation  
20 model was used to generate noise contours from the Mine Site and Plant Site. To determine  
21 effects on water resources, in addition to available information from field efforts already  
22 performed by PolyMet for the NorthMet Project Proposed Action, analysis of air photos and  
23 available GIS layers for federal and non-federal lands included data layers and other collected  
24 data such as NWI maps, soil maps/ecological land type maps, and FEMA floodplain maps.  
25 Scenic quality and integrity of lands being acquired and conveyed was determined based on  
26 desktop study and limited field observations where necessary. The Forest Plan uses a nationally  
27 recognized classification system, the ROS, to describe different recreation settings, opportunities,  
28 and experiences. Reviewing existing information and consultation with area land managers  
29 provided the information needed to understand the existing and potential recreation  
30 opportunities.

31 **5.3.12.2 Land Exchange Proposed Action**

32 The Land Exchange Proposed Action would result in a net increase of cRNAs to the federal  
33 estate. As indicated in Section 5.3.1, the USFS has determined that Tract 1 would have the  
34 following management area designations: General Forest and cRNA. Therefore, the Land  
35 Exchange Proposed Action would include the Pike Mountain and Loka Lake cRNAs (southwest  
36 corner and northeast corner of the tract, respectively). The addition of Tract 1 into the federally  
37 managed areas would extend the Pike Mountain cRNA by 135.7 acres of primarily hardwoods  
38 plant community, and would extend the Loka Lake cRNA by 171.2 acres of lowland black  
39 spruce and tamarack swamp. The remaining 4,619.3 acres would be allocated to General Forest.

40 Tracts 2, 3, 4, and 5 would not result in a net change to wilderness or other special designation  
41 areas.

42 **5.3.12.3 Land Exchange Alternative B**

43 The Land Exchange Alternative B would result in the same net increase of cRNAs to the federal  
44 estate as the Land Exchange Proposed Action. The Land Exchange Alternative B would not  
45 result in a net change to any wilderness area.

46 **5.3.12.4 Land Exchange No Action Alternative**

47 Under the Land Exchange No Action Alternative, the Superior National Forest would have an  
48 ongoing responsibility for managing the wilderness and other special designations on or near the  
49 federal lands in accordance with the Forest Plan. The Land Exchange No Action Alternative  
50 would not change the USFS's responsibility for managing these resources and would result in no  
51 further effects on existing wilderness areas or other special designated areas.

DRAFT

1 **5.3.13 Hazardous Materials**

2 The Land Exchange Proposed Action and the Land Exchange Alternative B would not include  
3 operations or activities that involve the use of hazardous materials on federal or non-federal  
4 lands beyond those activities specific to the NorthMet Project Proposed Action described in  
5 Section 5.2.13. AOCs associated with legacy contamination by hazardous materials from former  
6 activities and operations on these lands are discussed in Section 5.3.1.

DRAFT

-Page Intentionally Left Blank-

DRAFT

1 **5.3.14 Geotechnical Stability**

2 Geotechnical stability considerations for the proposed stockpiles that would be located on federal  
3 land subject to the Land Exchange Proposed Action or Land Exchange Alternative B within the  
4 NorthMet Project area are discussed in Section 5.2.14. There are no other existing or proposed  
5 large-scale waste material storage facilities on land subject to the Land Exchange Proposed  
6 Action or Land Exchange Alternative B.

DRAFT

DRAFT

## 1 **6.0 CUMULATIVE EFFECTS**

### 2 **6.1 INTRODUCTION**

3 Both NEPA and MEPA require an assessment of potential cumulative effects. The CEQ defines  
4 cumulative effects as:

5 ...the impact on the environment which results from the incremental impact of the action when  
6 added to other past, present, and reasonably foreseeable future actions regardless of what agency  
7 (federal or non-federal) or person undertakes such other action. Cumulative impacts can result  
8 from individually minor but collectively significant actions taking place over a period of time.  
9 (40 CFR § 1508.7)

10 The MEQB's regulations in *Minnesota Rules*, Chapter 4410.0200, subparts 11 and 11a, mirror  
11 the CEQ cumulative effects definition. In addition to the regulations, this analysis follows the  
12 guidance in the 1997 CEQ guidance presented in *Considering Cumulative Effects under the*  
13 *National Environmental Policy Act* and the USEPA's NEPA review guidance *Consideration of*  
14 *Cumulative Impacts in EPA Review of NEPA Documents* (CEQ 1997 and USEPA 1999,  
15 respectively.)

16 This section presents the resource-specific cumulative effects analysis of the NorthMet Project  
17 Proposed Action and Land Exchange Proposed Action that may result when combined with  
18 effects from other activities (e.g., projects and/or actions). Each resource has specific spatial  
19 (geographic) or temporal (time) boundaries, which are called Cumulative Effects Assessment  
20 Areas (CEAAs). The cumulative projects and/or actions applied to this analysis are those past,  
21 present, and reasonably foreseeable activities within the various resource-specific CEAAs that,  
22 when combined with the NorthMet Project Proposed Action and Land Exchange Proposed  
23 Action, may cause cumulative effects as measured by the evaluation criteria and defined by  
24 NEPA and MEPA. In addition to additive effects, cumulative effects may be further magnified  
25 by synergisms or cross-interactions in the environment.

26 This chapter is divided into two major subsections: Section 6.2 describes the cumulative effects  
27 of the NorthMet Project Proposed Action and Section 6.3 describes the cumulative effects of the  
28 Land Exchange Proposed Action. The analysis does not assess the cumulative effects of the  
29 Proposed Connected Actions (i.e., the NorthMet Proposed Action and Land Exchange Proposed  
30 Action), which are described in Chapter 7.

31 Two basic factors are used to quantify how a proposed project and/or action may cause  
32 cumulative effects. The first summarizes existing environmental conditions, which are the result  
33 of actions that have taken place in the past or are subject to present activities. It is not possible,  
34 however, to catalogue all past human actions to quantify how the natural environment has been  
35 affected by anthropogenic activities. Chapter 4 describes the baseline conditions for the  
36 NorthMet Project area and Land Exchange parcels, which may include contributions from past  
37 and present activities. Intensive land uses, such as towns, cities, roads, hunting, fishing and  
38 trapping, mines, forest practices, farming, and damming of rivers and creation of reservoirs have  
39 all had an influence on the natural environment of the region, which has resulted in present day  
40 conditions. In addition, natural trends in the environment would be affected into the future by

41 currently permitted and approved land uses and projects. The direct and indirect effects of the  
42 NorthMet Proposed Action and Land Exchange Proposed Action are discussed in Chapter 5.

43 The second factor in determining how the NorthMet Project Proposed Action would, in  
44 combination with other reasonably foreseeable activities, cumulatively affect resources in the  
45 future constitutes the *reasonably foreseeable future actions*. The method and set of assumptions  
46 for identifying which projects, actions, and activities that could contribute to cumulative effects  
47 in described below in Section 6.1.1.1. In addition to the identified cumulative projects, actions,  
48 and activities, the USFS identified six projects which are land exchanges and/or land acquisition  
49 projects that are reasonably foreseeable to be considered in the cumulative effects assessment for  
50 the Land Exchange Proposed Action (see Sections 6.1.2 and 6.3).

51 Throughout this section, we refer to *Past*, *Present*, and *Reasonably Foreseeable Future Actions*  
52 when describing potential cumulative effects. The past and present actions are described in detail  
53 in Chapter 4, Affected Environment.

## 54 **6.1.1 NorthMet Project Proposed Action**

### 55 **6.1.1.1 Cumulative Effects Analysis Approach**

56 Potential cumulative effects for the NorthMet Project Proposed Action have been assessed at the  
57 resource level. The spatial and temporal extents of the CEAs depend on several resource-  
58 specific factors. For example, given that noise effects decrease in direct proportion to the  
59 distance between the source and sensitive receptors, the geographic extent is necessarily limited.  
60 Conversely, air effects can extend many miles from the source and are conversely much broader.  
61 For the purposes of the cumulative effects assessment, the timing or scheduling of specific  
62 cumulative actions is also important to the context of the assessment given the overlapping and  
63 possibly synergistic effects they may have on some resources, such as sediment loading to  
64 waterbodies or dust and particle emissions to visual resources.

65 For all resources, future temporal boundaries are the expected service life of the mining  
66 activities, including closure and post-closure restoration. The spatial and temporal boundaries for  
67 each resource are defined within the respective resources' sections of this analysis.

68 Resource-specific spatial and temporal boundaries are used to identify past, present, and  
69 reasonably foreseeable future projects/actions that would likely affect the same environmental  
70 resources as the NorthMet Project Proposed Action. MEQB, CEQ, and USEPA guidance allow  
71 for a fairly broad interpretation of "reasonably foreseeable" to accommodate project-specific  
72 conditions, but indicate that actions that would be considered "speculative" should be excluded.  
73 For the purposes of this assessment, "reasonably foreseeable" actions are defined as those actions  
74 that are included in approved planning documents and have approved funding, are permitted, or  
75 have a currently active federal or state permit or site plan application under review. The  
76 discussion of potential cumulative effects assumes the successful implementation of the best  
77 management practices and mitigation measures discussed throughout this FEIS, as well as  
78 compliance with all applicable federal, state, and local regulations and permit requirements.

79 In addition to other cumulative effects that may be identified through the analysis, Section 6.2  
80 also addresses the following cumulative effects topics, identified in the Final SDD (MDNR  
81 2005):

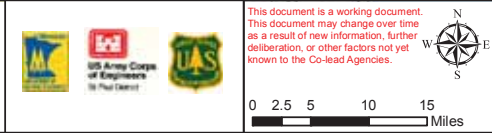

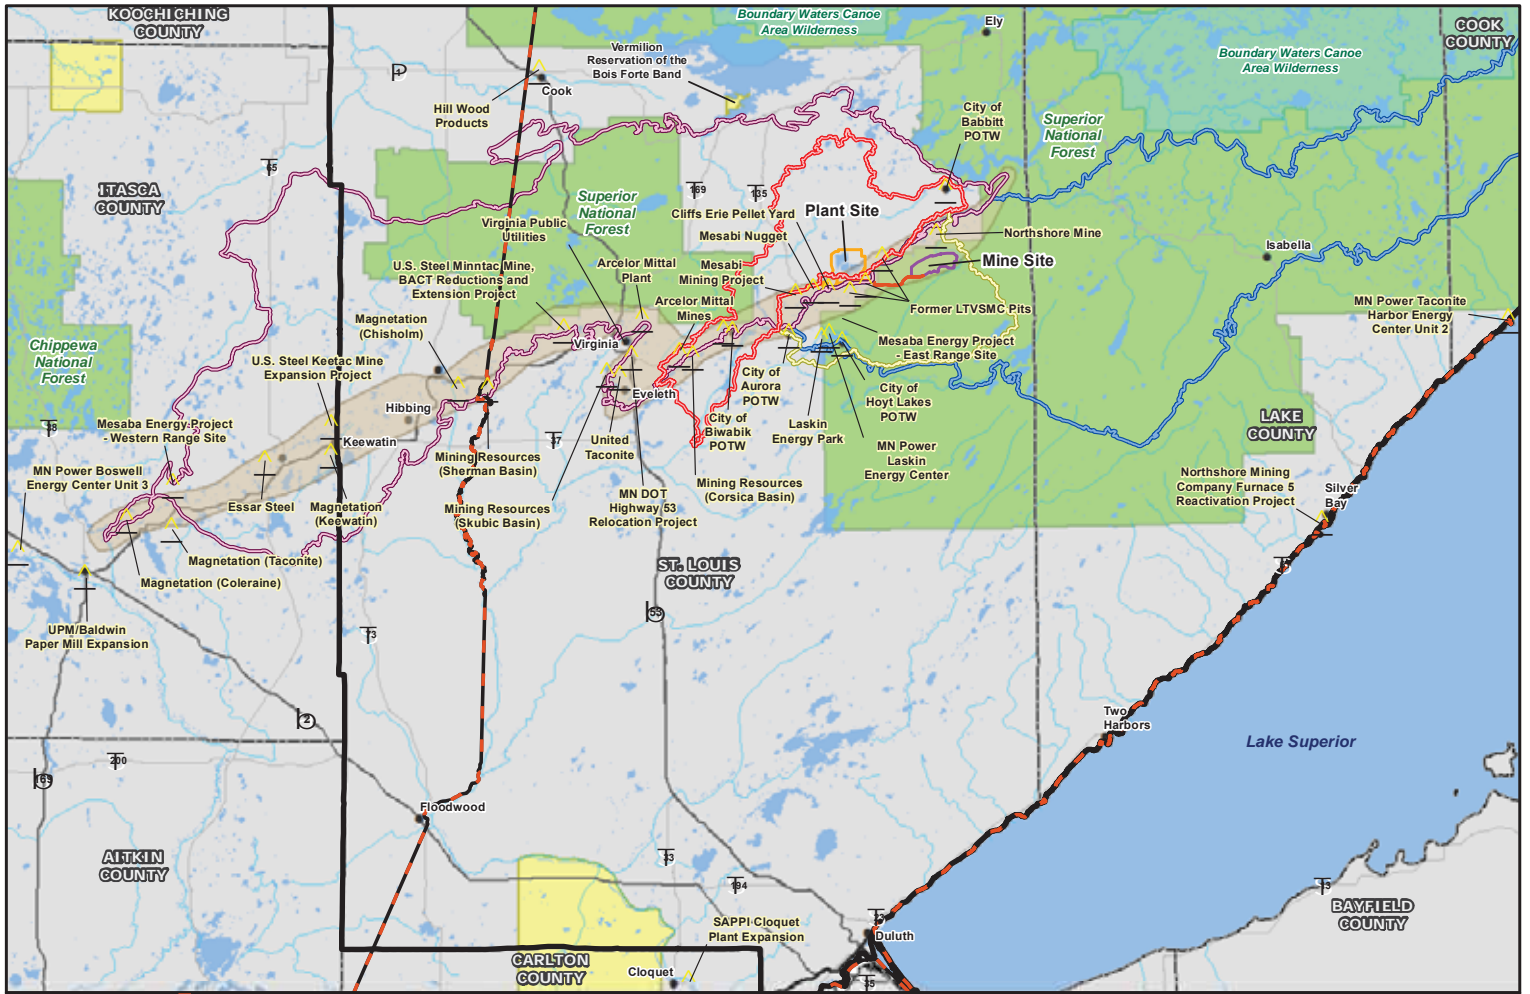

- 82 • Hoyt Lakes area projects and air concentrations in Class II areas,
- 83 • Class I areas PM<sub>10</sub> increment,
- 84 • ecosystem acidification resulting from deposition of air pollutants,
- 85 • mercury deposition and bioaccumulation in fish,
- 86 • visibility impairment,
- 87 • loss of threatened and endangered plant species,
- 88 • loss of wetlands,
- 89 • loss or fragmentation of wildlife habitat,
- 90 • streamflow and lake level changes,
- 91 • water quality changes,
- 92 • economic effects, and
- 93 • Social effects.

94 These topics are discussed under their respective resource sections in Section 6.2 below.

#### 95 **6.1.1.2 Past, Present, and Reasonably Foreseeable Actions and Projects**

96 For the purposes of this analysis, the NorthMet Project Proposed Action may contribute to  
97 cumulative effects when considered along with 44 other actions and projects in the region. These  
98 projects and/or actions are shown on Table 6.1-1 and Figure 6.1.1-1, and are further described in  
99 Section 6.1.1.2.1. Air Resources and Wilderness and other Special Designation Areas have  
100 unique extents of consideration and the specific actions considered are identified under those  
101 resource sections. Existing conditions that may be related to past or present actions on specific  
102 environmental resources are fully described in their respective sections in Chapter 4 and the  
103 direct and indirect impacts of the NorthMet Proposed Action are described in Chapter 5. Section  
104 6.1.1.2.1 provides a brief description of the cumulative actions considered in this assessment.  
105 Some actions unique to a particular resource are discussed under those resources.

111 <sup>1</sup> At closest point to NorthMet Project area.  
 112 <sup>2</sup> The State of Minnesota has issued permits for the West Range site. However, the United States Department of Energy has not  
 113 issued an ROD for this EIS. See below for more information. Given this, the East Range site is included as a reasonably  
 114 foreseeable project for this cumulative effects assessment.  
 115 <sup>3</sup> This project was included in the cumulative effects analysis in the SDEIS. While the applications are still active, the likelihood  
 116 of them occurring has diminished. Class II modeling for the Plant Site was already completed when the MPCA recommended  
 117 that the Mesabi Mining project not be included; therefore, the modeling results reported can be considered conservative.  
 118 <sup>4</sup> Class II modeling for the SDEIS included this facility as burning coal. Natural gas is now the primary fuel; therefore, the  
 119 modeling performed for the SDEIS was conservative.  
 120 <sup>5</sup> This project was included in the cumulative effects analysis in the SDEIS. While the applications are still active, the likelihood  
 121 of them occurring has diminished.

122 Table 6.1.1-2 summarizes the CEAA spatial areas that were utilized by each resource area for the  
 123 projects identified above.

124 **Table 6.1.1-2 Summary of the Spatial Areas Used for the Cumulative Effects Analysis of**  
 125 **the NorthMet Project Proposed Action**

| Resource Area                                                  | Spatial Area Assessed                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Land Use, Recreation and Visual Resources, Wilderness          | The portion of the Mesabi Iron Range encompassed by St. Louis County.                                                                                                                                                                                                         |
| Water Resources, Wetlands <sup>1</sup> , Aquatics <sup>2</sup> | Partridge River and Embarrass River watersheds.                                                                                                                                                                                                                               |
| Vegetation, Wildlife                                           | The portion of the Mesabi Iron Range located within the Nashwauk Uplands and Laurentian Uplands ecological subsections.                                                                                                                                                       |
| Air Quality                                                    | Areas with sources that generally are located within the Arrowhead region and outside the boundaries of the NorthMet Plant Site and Mine Site, the Mesabi Nugget Ambient Air Boundary, Cliffs Erie Pellet Yard, and the Northshore Mine.                                      |
| Noise and Vibration                                            | An approximate 0.5-mile radius of the Mine Site and Plant Site; no past, present, or reasonably foreseeable actions located within a 0.5-mile radius of the Mine Site and Plant Site that would interact in such a way as to have cumulative effects on identified receptors. |
| Hazardous Materials, Geotechnical Stability                    | The topic areas were not assessed for cumulative effects because they would not interact with any other past, present, or reasonably foreseeable actions in such a way as to cause cumulative effects.                                                                        |
| Cultural Resources                                             | The portion of the 1854 Ceded Territory that is within the Mesabi Iron Range.                                                                                                                                                                                                 |
| Socioeconomics                                                 | The Mesabi Iron Range within St. Louis, Lake, and Cook counties.                                                                                                                                                                                                              |

126 <sup>1</sup> A qualitative assessment for wetlands was also performed and the spatial area was the St. Louis River below the ordinary high  
 127 water mark from its confluence with the Embarrass River to Lake Superior.

128 <sup>2</sup> A qualitative assessment for aquatics was also performed and the spatial area was the St. Louis River, as the Partridge River  
 129 and Embarrass River are tributaries to the St. Louis River, which flows through the Fond du Lac Indian Reservation and  
 130 empties into Lake Superior near Duluth.

131 **6.1.1.2.1 Brief Description of Cumulative Actions Considered**

132 **ArcelorMittal Mines (Laurentian and East Reserve Deposits, Push-Back Project, and**  
 133 **Plant)**

134 ArcelorMittal operates two separate taconite deposits, the Laurentian and the East Reserve.  
 135 These deposits are approximately 2 miles apart between Gilbert and Biwabik, in St. Louis  
 136 County, Minnesota. Both are located approximately 18 miles from the NorthMet Project area.

137 The Laurentian Deposit has been operating since the early 1990s and is 2 miles southwest of the  
 138 East Reserve Deposit. East Reserve Pit #1 began operations in 2008. A second pit, East Reserve  
 139 Pit #2, has been permitted and stripping/site development has begun.

140 Ore from the East Reserve #1 Pit is being blended with, and intended to gradually replace, ore  
 141 from the Laurentian Deposit. It is used to make steel, primarily for the automobile industry and  
 142 the transportation sector.

143 ArcelorMittal plans to amend the Permit to Mine with a pushback project that would extend the  
 144 limits of East Pits 1 and 2, which are referred to as push-back areas, to the south, allowing for  
 145 economical mining/increased ore reserve. Specifically, there are two elements to the proposed  
 146 push-back project: extending the permitted mining area by 103 acres and extending the permitted  
 147 plant site by 11 acres to construct a new construction equipment pole area. The push-backs  
 148 would not result in additional mining roads, production rates, plant emission rates, or dewatering  
 149 rates.

150 The taconite facility is capable of producing up to approximately 3.2 million long tons of  
151 finished pellets per year. There are three main areas where emissions are released: the mine, the  
152 tailings basin, and the pellet plant. Emissions from the mine are fugitive emissions, which are  
153 primarily particulate matter, and are created from blasting, coarse ore loading and unloading,  
154 overburden loading and unloading, and haul truck traffic on unpaved roads. Emissions from the  
155 tailings basin are fugitive emissions, which are primarily particulate matter, and are created by  
156 tailings basin dike construction, truck traffic on unpaved roads, and wind erosion of exposed  
157 tailings beaches. Emissions from the pellet plant consist of point source emissions from crushing,  
158 concentrating, and agglomerating operations, which primarily create particulate matter  
159 emissions. The indurating furnace emits particulate matter, SO<sub>2</sub>, NO<sub>x</sub>, CO, and other pollutants  
160 such as HAPs. HAPs emissions tend to be metals and products of combustion. Fugitive  
161 emissions from the pellet plant are from pellet loadout and wind erosion of fine particles from  
162 the pellet storage piles and are particulate matter. The facility uses a variety of bag houses and  
163 wet scrubbers to control emissions from the point sources located in the pellet plant. Water and  
164 chemical dust suppressants are applied to haul roads and other fugitive sources to reduce  
165 particulate emissions when weather permits.

166 **City of Aurora Publicly Owned Treatment Works**

167 To support its POTW, the City of Aurora withdraws water from the St. James Pit, which is a  
168 former natural ore pit within the Embarrass River Watershed. The facility discharges treated  
169 wastewater into Silver Creek, which, in turn, drains into the St. Louis River.

170 **City of Babbitt Publicly Owned Treatment Works**

171 The City of Babbitt uses several wells, some of which are in the Dunka River Watershed, for its  
172 municipal water supply. The City POTW discharges treated wastewater effluent to the  
173 Embarrass River. Because some of the discharged water originates in the Dunka River  
174 Watershed and is transferred to the Embarrass River, the treatment work is assumed to increase  
175 the flow in the Embarrass River and decrease flow in the Dunka River.

176 **City of Biwabik Publicly Owned Treatment Works**

177 The City of Biwabik withdraws water from the flooded Canton Mine Pit for its municipal water  
178 supply and discharges treated wastewater to a tributary of Embarrass Lake.

179 **City of Hoyt Lakes Publicly Owned Treatment Works**

180 The City of Hoyt Lakes withdraws water from Colby Lake for municipal water supply and  
181 discharges treated wastewater to the Whitewater Reservoir. Most of this water returns to the  
182 Partridge River Watershed during droughts, when it is pumped from the Whitewater Reservoir to  
183 maintain water levels in Colby Lake or seeps into the Lower Partridge River through a dike.

184 **Cliffs Erie Pellet Yard**

185 Under Amendment 005 to Emission Permit No, 13700009, Cliffs Erie LLC would provide  
186 commercial taconite pellet shipping and storage for pellets produced on the Mesabi Iron Range  
187 utilizing the Cliffs Erie (formerly LTV Steel Mining Company) site in Hoyt Lakes. These  
188 facilities include a pellet yard at Hoyt Lakes, shipping docks at Taconite Harbor, and

189 interconnected railroads. Modifications to the existing facilities are required to accommodate  
190 commercial pellet shipping operations.

191 **Essar Steel Mine**

192 Essar is permitted and has begun constructing a new taconite mine and processing plant near  
193 Nashwauk, Minnesota, in Itasca County. The project would produce 6.5 million metric tonnes  
194 per year (mtpy) of high-flux pellets, or 7.0 million mtpy of low-flux taconite pellets. Essar  
195 estimates that, once operational, the modifications would operate at full capacity for up to 15  
196 years. The project is located approximately 55 miles southwest of the NorthMet Project area.  
197 Essar has stated that it intends to complete construction and begin operation in 2015.

198 **Hill Wood Products (Hill Wood Products and Major Modifications Amendment)**

199 Hill Wood Products is a sawmill and lumber-processing facility. The facility purchases birch log  
200 rough-cut wood to produce various wood products including wood pallets, wood biscuits, and  
201 flooring. The facility sources include:

- 202 • Two boilers and dryer combustion sources. The boilers and dryer burn wood waste. The  
203 dryer dries wood waste for processing in the hammermills for use as a fuel both on and off  
204 site. The dryer has an electrified filter bed and cyclone for emissions control. The boilers  
205 provide steam for a lumber kiln.
- 206 • Particulate emission sources such as debarking, skragging, sawing, trimming, molding,  
207 sanding, hammermills, and storage silos. Some units are vented internally without controls,  
208 some internally with controls, and some externally with controls.
- 209 • Miscellaneous sources such as a small extruder for surface coating, an emergency fire pump,  
210 and an emergency generator.

211 Non-permitted equipment was documented by MPCA staff during a site inspection in August  
212 2007, which led to the signing of a Stipulation Agreement on October 13, 2008. A major permit  
213 amendment was issued in 2010 to incorporate 17 emission units, 2 fugitive sources, and 1  
214 baghouse and to delete 21 removed emission units, 1 baghouse, and 1 stack vent from the permit.

215 **Laskin Energy Park**

216 The Laskin Energy Park is proposed 220-acre industrial park that is located in the Partridge  
217 River Watershed and south of the Minnesota Power Laskin Energy Center. It is located adjacent  
218 to Colby Lake and Whitewater Lake, near the City of Hoyt Lakes.

219 **LTV Steel Mining Company Former LTVSMC Pits**

220 LTVSMC mined and processed taconite from the 1950s to 2001, when it went bankrupt. Cliffs  
221 Erie LLC (a subsidiary of Cliffs Natural Resources, Inc. [both names for this company are used  
222 in this document, depending on the specific context of the citation]) acquired a port of the former  
223 LTVSMC lands and is currently managing legacy issues through voluntary actions (e.g., VIC  
224 agreements), NPDES/SDS permits, and a Consent Decree with the MPCA. Mesabi Nugget LLC  
225 (a joint venture of Steel Dynamics and Kobe Steel) and Mesabi Mining LLC, a subsidiary of  
226 Steel Dynamics, own the remainder of the former LTVSMC lands. The former LTVSMC  
227 processing plant and tailings facility now owned by Cliffs Erie is proposed for use by the

228 NorthMet Project Proposed Action. The former LTVSMC mine pits are now owned by Mesabi  
229 Nugget, Mesabi Mining, and Cliffs Erie and are located to the west, south, and east of the  
230 NorthMet Project area. Ownership and the current hydrologic status of each of these pits is  
231 described below.

### 232 ***Mesabi Nugget***

233 Pit 1: Because of Mesabi Nugget, this pit has seasonal (September to March) discharges of  
234 approximately 4,000 gpm (9.0 cfs) to Second Creek; no discharges occur from April to August.  
235 The proposed Mesabi Mining Project would result in the partial dewatering of this pit to a  
236 currently unspecified water at an unspecified rate.

### 237 ***Mesabi Mining***

- 238 • Pit 2WX: The pit is currently in the process of filling. Within a few years, this pit may  
239 overflow to an unnamed creek that discharges to the Partridge River just below Colby Lake.
- 240 • Pit 6: This pit currently releases water to Second Creek via the surficial aquifer. There is no  
241 surface water discharge.
- 242 • Pit 9S: This pit is currently stable (with likely groundwater discharge off-site and/or to Pit 6).
- 243 • Pit 9N: This pit is currently stable (with a likely groundwater connection to Pit 1).

### 244 ***Cliffs Erie***

- 245 • Pit 2/2E: This pit is stabilized with no direct discharge. There is likely groundwater flow  
246 from this pit to Pit 2W.
- 247 • Pit 2W: This pit recently reached the level at which an overflow discharge occurs to Second  
248 Creek at a current rate of approximately 4,000 gpm (8.9 cfs)
- 249 • Pit 3: This pit currently discharges to Wyman Creek at approximately 350 gpm (0.8 cfs).  
250 Cliffs Erie is currently considering the feasibility of pumping the overflow from this pit to Pit  
251 2W, which ultimately overflows to Second Creek, as part of its NPDES/SDS permit  
252 reissuance process.
- 253 • Pit 5SW: This pit overflows via “dispersed” discharge, at an estimated rate of less than 350  
254 gpm (0.8 cfs) to Wyman Creek. PolyMet has an option agreement to purchase this pit;  
255 however, Pit 5SW is not part of the NorthMet Project Proposed Action.
- 256 • Pit 5NW: This pit has an overflow discharge of approximately 700 gpm (1.5 cfs) to Spring  
257 Mine Creek, a tributary of the Embarrass River. PolyMet has an option agreement to  
258 purchase this pit; however, Pit 5NW is not part of the NorthMet Project Proposed Action.

### 259 ***Magnetation (Keewatin, Taconite, Chisolm, Coleraine)***

260 Magnetation is currently permitted and operating (or co-operating) scam mining operations near  
261 Keewatin, Taconite, and Chisholm. Scram mining is a mining process that produces natural iron  
262 ore, natural iron ore concentrates, or taconite ore from previously developed stockpiles, tailing  
263 basins, underground mine workings, or open pits and that involves no more than 80 acres of land  
264 not previously affected by mining, or more than 80 acres of land not previously affected by  
265 mining if the operator can demonstrate that impacts would be substantially the same as other

266 scam operations. “Land not previously affected by mining” means land upon which mine wastes  
267 have not been deposited and land from which materials have not been removed in connection  
268 with the production or extraction of metallic minerals (*Minnesota Statutes* 93.46, Subd.10).  
269 Magnetation has received a permit for a new operation near Coleraine. Magnetation has an EAW  
270 underway for dewatering the Canisteo pit in order to explore potential future scam mining.

### 271 **Minnesota Department of Transportation US Highway 53 Virginia to Eveleth Relocation**

272 This highway project is needed to allow United Taconite to continue its permitted mining  
273 operations near Eveleth, St. Louis County, Minnesota. United Taconite has authority to continue  
274 its mining operations, including an area that crosses the current location of Highway 53. The  
275 Minnesota Department of Transportation (MDOT) has proposed a new route (Preferred  
276 Alternative E-2), analyzed in a Draft EIS released in December 2014 (MDOT 2014). No other  
277 details are available at this time regarding the timing and exact scope of this road construction  
278 project. The proposed road construction is planned for 2017.

### 279 **Mesaba Energy Project – Western Iron Range Site**

280 Excelsior Energy has received permits to develop the Mesaba Energy Project, a natural gas  
281 fueled electric power-generating station. The project would be designed, constructed, and  
282 operated in two phases, each phase generally producing 600 megawatts. Excelsior’s preferred  
283 site is the Western Iron Range site near Taconite, Minnesota, about 55 miles from the NorthMet  
284 Project area. Pit 2/2E, Pit 2W, and Pit 3 of the LTVSMC mine (see above) could be drawn down  
285 as part of the Mesaba Energy Project. An FEIS was prepared in 2009 by the USDOE and MDC.

286 On March 12, 2010, the Minnesota Public Utilities Commission (PUC) granted Excelsior  
287 Energy’s Mesaba Energy Project a Large Electric Power Generating Plant Site Permit, a High  
288 Voltage Transmission Line Route Permit, and a Pipeline Route Permit (together, “the Site and  
289 Route Permits”), for construction of an Integrated Coal Gasification Combined Cycle electric  
290 power-generating station. On May 31, 2012, Excelsior Energy requested that the PUC confirm  
291 that the Site and Route Permits issued in 2010 were valid for a construction of a gas-fired plant at  
292 the same site, and that no additional environmental review was required. On September 19, 2012,  
293 the PUC issued an Order finding the Site and Route Permits valid and requiring additional filings  
294 prior to construction of the natural gas-fueled facility. At the time of this FEIS, the project has  
295 not yet been constructed.

### 296 **Mesabi Nugget (Formerly Mesabi Nugget Phase I)**

297 The Mesabi Nugget facility, located within approximately 2 miles of the NorthMet Project area,  
298 is currently producing iron nuggets from iron ore concentrate. The concentrate is mixed, dried,  
299 and fed into a rotary hearth furnace and reduced to a metallic iron and slag material. Water is  
300 appropriate from Pit 1 and/or Pit 2WX for contact and non-contact cooling and air pollution  
301 control equipment. Treated wastewater is discharged into Pit 1, which, in turn, is discharged on a  
302 seasonal basis (September through March) into Second Creek.

### 303 **Mesabi Mining Project (Formerly Mesabi Nugget Phase II)**

304 The Mesabi Mining Project area is located approximately 2 miles from the NorthMet Project  
305 area, and is currently under a Closure Plan. This facility would involve the reactivation of a  
306 taconite mine and construction of a taconite concentration facility near Hoyt Lakes. Under the

307 most recent proposal, Pits 2WX and 6 would be dewatered to access the iron ore and tailings  
308 would be disposed into Pit 1. Most of the concentrate generated at the Mesabi Mining Project  
309 facility would be used in the Mesabi Nugget facility, and the remainder would be shipped by rail  
310 to other facilities for processing. This project is currently on indefinite hold by the applicant, but  
311 was considered as reasonably foreseeable for this assessment.

312 **Mining Resources (Austin Powder Basin, Corsica Basin, Skubic Basin, and Sherman**  
313 **Basin)**

314 Mining Resources is a scam operation that received their original Permit to Mine in November  
315 2011. Mining Resources is currently operating in the Duncan, Niles, Douglas, Dunwoody  
316 Tailings Basin just south of Chisholm, Minnesota (Section 35, Township 58N, Range 20 West).  
317 Proposed scam projects to extend the mine life of this operation include expansion into the  
318 Sherman Tailings Basin located approximately 1 mile east of the current facility, as well as  
319 expansion in to further afield basins, called “backhauls,” which refers to the plan to load tailings  
320 into trucks returning from the Mesabi Nugget facility. Mesabi Nugget currently runs Mining  
321 Resources’ concentrate through the pelletization process. Backhaul basins included in the current  
322 permit amendment application are the Austin Powder Basin located near Biwabik, the Corsica  
323 Basin located near McKinley, and Skubic Basin located southwest of Virginia.

324 **Minnesota Power Boswell Energy Center Unit 3**

325 In 2006, Minnesota Power submitted an emission reduction proposal, the Boswell 3  
326 Environmental Improvement Plan, pursuant to *Minnesota Statutes* 216B.682 and 216B.6851.  
327 The proposal was designed to remove existing air pollution control equipment on Unit 3 of the  
328 Boswell station, and replace the equipment to control mercury, NO<sub>x</sub>, SO<sub>2</sub>, and particulate matter  
329 emissions. The project would result in considerable reductions in key pollutant emissions from  
330 the Boswell electric power generating station. Emissions of SO<sub>2</sub> would be reduced by 90 percent  
331 and NO<sub>x</sub> would be reduced by 81 percent from Unit 3. Emissions of mercury would be reduced  
332 by more than 90 percent from Unit 3.

333 In 2007, the MPCA issued a major permit amendment (003) to the facility’s total facility  
334 operating permit. This amendment allowed for a project to be conducted to comply with  
335 USEPA’s Regional Haze Rule, CAIR, Minnesota’s Mercury Reduction Act, and USEPA’s Clean  
336 Air Mercury Rule. The amendment authorized the installation of new air quality control  
337 equipment, including wet flue gas desulfurization, low NO<sub>x</sub> burners, selective catalytic  
338 reduction, baghouse filter, and a carbon injection system.

339 **Minnesota Power Laskin Energy Center**

340 The Minnesota Power Laskin Energy Center is currently a coal-fired power plant on Colby Lake  
341 between Aurora and Holt Lakes, about 5 miles from the NorthMet Project area. The facility was  
342 permitted in 2014 for conversion from coal to natural gas combustion. For the purposes of this  
343 cumulative effects analysis, it was assumed that the plant would be gas-fired. The project also  
344 included installation of low-NO<sub>x</sub> burners. The facility withdraws cooling water from Colby Lake  
345 and discharges it into the downstream portion of the lake. The plant produces more than 110  
346 megawatts of power. The project also includes retrofits similar to Minnesota Power Taconite  
347 Harbor Energy Center Unit 2 described below. Work on these retrofits began in 2006.

348 **Minnesota Power Taconite Harbor Energy Center Unit 2, Emission Control Modifications**

349 In 2009, Minnesota Power was permitted for implementing emission control modifications to  
350 Unit 2 of its Taconite Harbor Center in Schroeder, Cook County, Minnesota. This facility is  
351 located approximately 48 miles east of the NorthMet Project area. The company installed a  
352 custom-designed control system that injects sorbents into the combustion process to control SO<sub>2</sub>,  
353 NO<sub>x</sub>, and mercury. Minnesota Power anticipates the system would cut NO<sub>x</sub> emissions by more  
354 than 60 percent and SO<sub>2</sub> emissions by 65 percent.

355 The project also included similar retrofits at Minnesota Power's Laskin Energy Center in Hoyt  
356 Lakes. Work on these retrofits began in 2006.

357 **Northshore Mining Company: Furnace 5 Reactivation Project**

358 The Reserve Mining Company opened the facility in Babbitt, St. Louis County, Minnesota, in  
359 the 1950s and operated it until 1986, when the facility closed. Cyprus Minerals acquired and  
360 reopened the facility in 1989 and operated it until 1994, when Cliffs Natural Resources, Inc.  
361 acquired it. The Northshore Mining Company is a wholly-owned subsidiary of Cliffs Natural  
362 Resources, Inc.

363 In the early 2000s, the Northshore Mining Company reactivated Furnace 5, a pelletizing furnace  
364 at its taconite processing facility near Silver Bay on Lake Superior, Minnesota, about 39 miles to  
365 the southeast of the proposed NorthMet Mine Site and about 46 miles from the proposed  
366 NorthMet Plant Site.

367 The reactivated equipment included two crushing units and nine ore concentrator sections, as  
368 well as the construction of a concentrate handling system and an expansion of the facility's  
369 WWTP.

370 **Northshore Mine (Mine, Ultimate Pit Progression, Closure and BART Reductions)**

371 The Northshore Mine (also known as the Peter Mitchell Mine) is an open-pit taconite mine near  
372 Babbitt, St. Louis County, Minnesota, that opened in 1951, about 4 miles northwest and  
373 northeast from the NorthMet Plant Site and about 1 mile north of the NorthMet Mine Site. One  
374 of the mine areas currently discharges to the Partridge River. Northshore Mining Company has  
375 recognized at least another 60 years of minable reserves at current production rates. Conceptual  
376 post-closure plans for the Northshore Mine pit allow for the pit to flood due to groundwater  
377 inflow and runoff. Predicted ultimate outflow from the pit would be from the northeast end of the  
378 pit, to the Dunka River in the Rainy River Watershed. No water from mine dewatering would be  
379 anticipated to be flowing to the Partridge River post-closure (MDNR 2011s).

380 The mine is operated by Northshore Mining Company, Inc. the ore and processes it into pellets at  
381 Silver Bay, which ships it to steel producing blast furnaces throughout the country.

382 Northshore Mining Company is proposing a 108-acre progression of the Ultimate Pit Limit  
383 within its Permit to Mine at its Northshore Mine to access additional economic taconite ore,  
384 consistent with the company's long-term development plan for the mine. Environmental review  
385 is currently in progress for Northshore's proposed progression project and the DNR is the RGU  
386 for an EAW on the proposed project.

387

388 **Sappi Cloquet Plant Expansion**

389 Sappi Cloquet LLC is an existing pulp and paper mill that uses the Kraft process to make pulp  
390 from wood chips. The pulp is bleached and made into coated paper. Currently, the mill operates  
391 four boilers, including a chemical recovery boiler to provide heating and process steam and to  
392 generate electricity.

393 Other sources of air emissions, besides the boilers, include the sources in the chemical recovery  
394 system. The bleach plant sources include the chlorine dioxide plant and a bleach line. These  
395 sources are primarily sources of chlorine dioxide and chloroform emissions; the bleaching  
396 system is also a source of CO and VOC emissions. Some of the particulate emissions, besides the  
397 boilers and chemical recovery sources, include fugitive sources such as woodpiles and roadways.

398 Sappi controls odor-causing non-condensable gases by collecting them in three different  
399 systems: a Low-Volume/High Concentration system, a High-Volume/Low Concentration  
400 system, and a steam Stripper Off-Gas system. The non-condensable gases are currently burned in  
401 the Incinerator-Quencher scrubber, with Power Boiler #7 or #9 used as backup.

402 The latest permit amendment, 014, issued on March 13, 2012, authorizes Sappi to modify the  
403 pulp mill to manufacture chemical cellulose pulp, also known as dissolving pulp. The project  
404 emissions increases are quite small, but include a projected increase in ozone emissions, which is  
405 subject to PSD requirements at any increase greater than zero.

406 This project replaces a previously planned plant expansion (“Project Hercules”), which was  
407 authorized through permit amendment 011, issued on October 28, 2009. Most of the facility  
408 changes permitted through that permit action will be “unpermitted” through this permit action.

409 **St. Louis County Public Works Bridge Replacement**

410 St. Louis County Public Works will be conducting eight bridge replacements in the Partridge  
411 River and Embarrass River watersheds over the next 10 years. Bridge replacements generally  
412 directly impact 10,000 ft<sup>2</sup> of wetlands or less, so the maximum direct wetland impact from the  
413 bridge projects would be 1.8 acres.

414 **U.S. Steel Keetac Mine and Mine Expansion Project (Keewatin)**

415 U.S. Steel is permitted to restart an idled production line and expand contiguous sections at the  
416 Keetac Mine and taconite processing facility near Keewatin, Itasca County, Minnesota, about 45  
417 miles from the NorthMet Project area, on the boundary between St. Louis and Itasca counties.  
418 The project would increase iron pellet production from 6 million to 9.6 million tpy.

419 The project involved preparation of a joint State-Federal EIS; the State ROD was issued in  
420 December 2010. The expanded facility is scheduled to begin full operations between 2013 and  
421 2015. U.S. Steel has announced that this project is currently on indefinite hold. Media reports in  
422 September 2014 stated that U.S. Steel had cancelled these projects (Minneapolis/St. Paul  
423 Business Journal 2014). These projects, however, were included in the cumulative effects air  
424 quality assessment for the NorthMet Project Proposed Action SDEIS, so they have been included  
425 in this analysis, and until a final decision by the federal agency (USACE) is made, this project is  
426 considered reasonably foreseeable for the purposes of this assessment. This change would reduce  
427 overall air emissions in the cumulative effects analysis area for air resources. .

428 **U.S. Steel Minntac Mine, Best Available Control Technology Reductions (Mountain Iron)**  
429 **and Minntac Mine Extension Project**

430 The U.S. Steel Minntac Mine Project included three components for the cumulative effects  
431 analysis: the active mine, BACT reductions, and the proposed Minntac Mine Extension Project.

432 The BACT reductions project implemented technological modifications to reduce air emissions  
433 from the existing facility. In 2008, the MPCA issued a draft permit to U.S. Steel establishing  
434 BACT limits for VOCs, CO, and fluorides at the company's Minntac facility in Mountain Iron,  
435 Minnesota. The permit addresses potential effects on visibility from NO<sub>x</sub> emissions and  
436 establishes a procedure to set a BACT limit for NO<sub>x</sub>. The draft permits set interim NO<sub>x</sub> limits  
437 and requires the ongoing testing of control technologies for NO<sub>x</sub>, with a goal to reduce emissions  
438 more than 70 percent compared to the initial permit limit.

439 U.S. Steel is also proposing to extend its open pit facilities by 483 permitted acres at the Minntac  
440 Mine in Mountain Iron, St. Louis County, Minnesota. The project is expected to extend mine life  
441 and taconite production to 2031.

442 The Minntac Mine is a taconite mine and pelletizing operation about 25 miles from the NorthMet  
443 Project area. The Minntac plant consists of a series of crushers and screens, a concentrator, an  
444 agglomerator, and auxiliary facilities. Taconite produced from the extension would continue to  
445 be processed at the existing Minntac facility at the current levels of production.

446 MDNR issued a ROD on April 11, 2013, stating that the project would not cause significant  
447 environmental effects and that an EIS was not required (MDNR 2013f).

448 **United Taconite Mine**

449 This is a taconite mine near Eveleth, St. Louis County, Minnesota that began operations in 1965  
450 and has an annual capacity of approximately 5.2 million gross tons of taconite pellets. It is  
451 located about 27 miles west of the NorthMet Project area. The United Taconite mine has six  
452 permitted mine pit dewatering discharges, all of which discharge to the St. Louis River  
453 Basin. United Taconite make-up water comes from the St. Louis River.

454 At the mine site, crushed ore is unloaded in a covered building. The ore is then transferred by a  
455 covered conveyor to the fine crusher building where it is immediately crushed at the third stage  
456 crusher or sent to the coarse ore surge pile. The coarse ore surge pile is used to store ore between  
457 train shipments or during times when the crusher is down.

458 Ore is returned from the coarse ore surge pile and fed into one of the 5 third-stage crushers.  
459 Particulate emissions from the third-stage crusher are controlled by wet scrubbers. The oversize  
460 material is conveyed to 1 of 8 fourth-stage crushers. Each fourth-stage crusher has a dedicated  
461 wet scrubber to control particulate emissions. Undersize material is transferred to the fine ore  
462 storage building. Oversize material is recirculated to the fourth-stage crushers.

463 Five concentrator lines receive ore from the fine ore surge building. Particulate emissions from  
464 the transfer of fine ore to the concentrator lines are controlled using wet scrubbers. Here ore is  
465 ground and magnetic separators remove the magnetite ore from the tailings. Low-magnetic  
466 coarse tailing are transported by truck for use as construction material for the tailings basin  
467 sidewalls. Fine tailings are pumped in slurry form to the tailings basin. Processes performed in  
468 the concentrator are wet operations. Concentrate is piped as a slurry to the pelletizing plant. The  
469 slurry is dewatered with filters and additives are introduced. Green pellets are produced in

470 balling drums and conveyed to one of two travelling grate kilns. Grate feed, grate discharge, kiln  
471 induration, and kiln cooler emissions are controlled with wet scrubbers.

472 Fired pellets are conveyed to pellet storage silos. Pellets are then loaded into rail cars and  
473 transported from the facility. Particulate emissions from the pellets are controlled with wet  
474 scrubbers and dust suppressants. Intermediate products and byproducts, including but not limited  
475 to rocks, tailings, and concentrate, are also sold by the United Taconite.

#### 476 **United Taconite Mine Modifications**

477 The MPCA issued a major air permit amendment in 2002 for the installation and operation of the  
478 replacement pellet reclaim screening system. Furthermore, the MPCA issued a major permit  
479 amendment in 2010 for the installation of air pollution control equipment, implementation of an  
480 energy reduction project, and conversion of fuel type. The MPCA is currently working on a  
481 major amendment that would authorize the replacement of particulate controls and modification  
482 of scrubber solids wasting requirements.

#### 483 **United Taconite Green Production Project**

484 This project involves fuel changes and improvements to the concentrator and the Line 1 pellet  
485 plant to increase pellet production and was a PSD minor project. Because it was a PSD minor  
486 project, specific considerations for BACT/MACT were not required. However, the Line 1 pellet  
487 plant has an existing wet scrubber to control particulate and SO<sub>2</sub> emissions. Emission estimates  
488 are taken from the Technical Support Document for Permit No. 13700113-005 authorizing the  
489 project on August 19, 2010.

#### 490 **UPM/Blandin Paper Mill Expansion, Project Thunderhawk**

491 This project would include the installation of a complete new paper manufacturing line,  
492 efficiency improvements to a second paper manufacturing line, shutdown of another existing  
493 paper machine and related infrastructure, additional pulping capacity, a new water intake  
494 structure, energy infrastructure improvements, a new paper warehousing facility, and WWTF  
495 modifications. Paper production would increase by an estimated 314,000 tons per year. The  
496 MPCA issued a permit action that incorporated a major amendment application (for Project  
497 Thunderhawk) dated August 23, 2005, for a modification that will increase paper production.

#### 498 **Virginia Public Utilities**

499 The City of Virginia Department of Public Utilities provides steam and electricity to businesses  
500 and residents of the local Virginia area. The department has the potential to operate any  
501 combination of four boilers using coal and/or natural gas and/or wood as fuel. Boiler 7 (EU001)  
502 and Boiler 9 (EU003) can burn only coal, and Boiler 10 (EU004) is a natural gas fired boiler.  
503 Boiler 11 (EU006) is a wood-fired boiler to be used for district heating and electric generation.  
504 There is an additional boiler, Boiler 8, located at the facility but it is physically disconnected  
505 from the utility system. Pollution control equipment consists of wet scrubbers, baghouses, and/or  
506 electrostatic precipitators in combination with good combustion practices.

507

508

509 **Community Growth and Development**

510 Where community growth and development are assessed, they are based on historical and  
511 projected population and economic trends derived from state census data and regional land use  
512 plans as described in the appropriate resource sections.

513 **Forestry Practices on Public and Private Lands**

514 Where forestry practices are assessed, they are based on historical and projected trends derived  
515 from state databases and regional forestry plans as described in the appropriate resource sections.

516 **6.1.1.2.2 Speculative Actions**

517 Other projects in the early stages of development by mining companies are considered to be  
518 speculative by the Co-lead Agencies. While these projects have been identified to provide an  
519 indication of regional development interest, these actions have not been mapped or considered in  
520 the cumulative analysis.

521 **Twin Metals**

522 Twin Metals Minnesota Joint Venture (Duluth Metals Limited and Antofagasta PLC) has begun  
523 looking at the feasibility of creating an underground copper-nickel-PGE mine near Ely, Lake  
524 County, Minnesota. This venture is known as the Twin Metals Project. At this time, a permit  
525 application has not been submitted for activities that would require state and federal permits,  
526 including a DA permit pursuant to Section 404 of the CWA. This project would likely require  
527 preparation of a joint State-Federal EIS. Preliminary data collection and maps to support  
528 environmental review and permitting is underway by the company.

529 **Essar Steel**

530 The Essar Steel Nashwauk, Itasca County, Minnesota, facility was permitted in 2007 and is  
531 under construction, and a plant expansion of its taconite operations is permitted and under  
532 construction. The construction of a legacy scam processing facility is being considered. Scram  
533 operations produce natural iron ore or iron ore concentrates from previously developed  
534 stockpiles, basins, underground workings, or open pits. The legacy scam facility is exempt from  
535 state environmental review, but requires state permitting.

536 **Rio Tinto (Kennecott Exploration)**

537 Rio Tinto is currently performing exploration drilling of a non-ferrous (copper-nickel) deposit  
538 near Tamarack, Aitkin County, Minnesota, about 45 miles west of Duluth, St. Louis County,  
539 Minnesota. The project may require preparation of a joint State-Federal EIS. Preliminary data  
540 collection to support environmental review and permitting is currently underway by the company  
541 (Rio Tinto 2010).

542 **Teck**

543 Teck is considering operations to mine the Mesaba deposit near Babbitt, St. Louis County,  
544 Minnesota, approximately 3 miles east of the NorthMet Mine Site, for non-ferrous metals  
545 (copper-nickel). The current phase is exploration and drilling. The project may require a joint

546 State-Federal EIS. Preliminary data collection to support environmental review and permitting is  
547 underway.

#### 548 **North Star Blue Scope Steel**

549 North Star Blue Scope Steel is considering a direct reduced iron (DRI) plant to process iron ore  
550 concentrate purchased from others into DRI-grade pellets. A site for the plant has not been  
551 selected. The project may require preparation of a joint State-Federal EIS.

#### 552 **ArcelorMittal**

553 The ArcelorMittal facility is an operating iron taconite plant in Virginia, St. Louis County,  
554 Minnesota. The company is considering an expansion by initiating mining operations in a central  
555 pit, thereby connecting two existing pits. The project may require preparation of a joint State-  
556 Federal EIS and reissuance of NPDES permits for the mine and plant sites. The Town of  
557 McKinley is located between the two pits.

#### 558 **Cardero Resource Group (Two Projects)**

559 Cardero Resource Group has initiated exploration activities for non-ferrous deposits (titanium)  
560 for its Longnose and Titac properties. Although both properties are located near Aurora, St.  
561 Louis County, Minnesota, they are separated by approximately 25 miles. The two are considered  
562 separate mines and each project may require preparation of a joint State-Federal EIS.

#### 563 **Cooperative Mineral Resources**

564 Cooperative Mineral Resources is a subsidiary of Crow Wing Power located near Emily, Crow  
565 Wing County, Minnesota. The project is located 50 miles south and west of the Iron Range area  
566 and is proposed as a non-ferrous mine with an interest in manganese extraction from deposits  
567 200 to 400 ft bgs. The project proposer has conducted small-scale pilot testing of extraction  
568 technology at the site. Based on results of the pilot-testing, the company does not intend to  
569 proceed with the project at this time. If the project were to move ahead, it would require  
570 preparation of a State EIS, and may require preparation of a joint State-Federal EIS.

#### 571 **Encampment Minerals**

572 Encampment Minerals, Inc. is currently exploring the Serpentine copper-nickel deposit. This  
573 project would require a State EIS.

### 574 ***6.1.2 Land Exchange Proposed Action***

#### 575 **6.1.2.1 Cumulative Effects Analysis Approach and Baseline Conditions**

576 Potential cumulative effects for the Land Exchange Proposed Action have been assessed at the  
577 resource level. The spatial and temporal extents of the CEAs depend on several resource-  
578 specific factors. As discussed in the NorthMet Project Proposed Action cumulative effects  
579 introduction, some resources would not be directly affected by the action of a land exchange.  
580 These topics include noise, cultural/historic resources, geotechnical stability, wilderness and  
581 other special designation areas, and hazardous materials. The cumulative effects analysis for  
582 these topics, including the indirect effects of mining operations following any land exchange, are  
583 identified in their respective headings under Section 6.2, NorthMet Project Proposed Action.

584 The resource discussions in Chapter 4 provide the baseline conditions of the natural and human  
585 environment affected by past and present actions. Future actions—also called reasonably  
586 foreseeable projects—are those activities that could combine with the Land Exchange Proposed  
587 Action to potentially cause cumulative effects. The focus of this analysis is on those future  
588 activities when placed against baseline conditions that include the effects of past and present  
589 activities.

590 Land exchanges are property purchase and transfer transactions, whereas land acquisitions are  
591 only property purchases. The land exchange and property acquisition actions described in this  
592 section are designed to consolidate and enhance the functional boundaries of the Superior  
593 National Forest. The effects measure the net increase or decrease of each specific resource that  
594 would result from the Land Exchange Proposed Action and other cumulative actions in context  
595 of the entire Superior National Forest system.

596 In addition to the Land Exchange Proposed Action, two alternatives have been carried forward:  
597 Land Exchange Alternative B and the Land Exchange No Action Alternative. A description of  
598 these alternatives is presented in Chapter 3.

#### 599 **6.1.2.2 Cumulative Forest Service Land Actions**

600 Because past land exchange and land acquisition actions through 2011 have been incorporated  
601 into the existing Superior National Forest boundaries and the subsequent area and resource  
602 calculations, it is assumed that the aggregate effect of these past land exchange actions has been  
603 absorbed into and are represented in the current Superior National Forest baseline data. Based on  
604 this assumption, the Land Exchange Proposed Action and other current and foreseeable land  
605 exchange and land acquisition actions are evaluated as cumulative actions.

606 The USFS identified the following six current and reasonably foreseeable land exchange and  
607 land acquisition (Figure 6.1.2-1) actions that would be cumulative to the Land Exchange  
608 Proposed Action:

- 609 • Cook County Land Exchange;
- 610 • Crane Lake Land Exchange;
- 611 • Fall Lake Land Acquisition;
- 612 • Gunflint Land Acquisition;
- 613 • School Trust Land Exchange and Land Acquisition; and
- 614 • Wolf Island Phase 2 Land Acquisition.

615 A brief description of each of the current and reasonable foreseeable land exchange and land  
616 acquisition actions is presented below.

##### 617 **6.1.2.2.1 Cook County Land Exchange**

618 The USFS proposes to exchange up to 1,620 acres for 1,911 acres of Cook County lands within  
619 the BWCAW to assist in meeting the goals and objectives of the BWCAW elements of the  
620 Forest Plan. The federal lands consist of 41 parcels located throughout Cook County and would  
621 be conveyed to Cook County to allow for sustainable development. The lands the USFS would  
622 receive would consolidate National Forest System land within the BWCAW.

623 **6.1.2.2.2 Crane Lake Land Exchange**

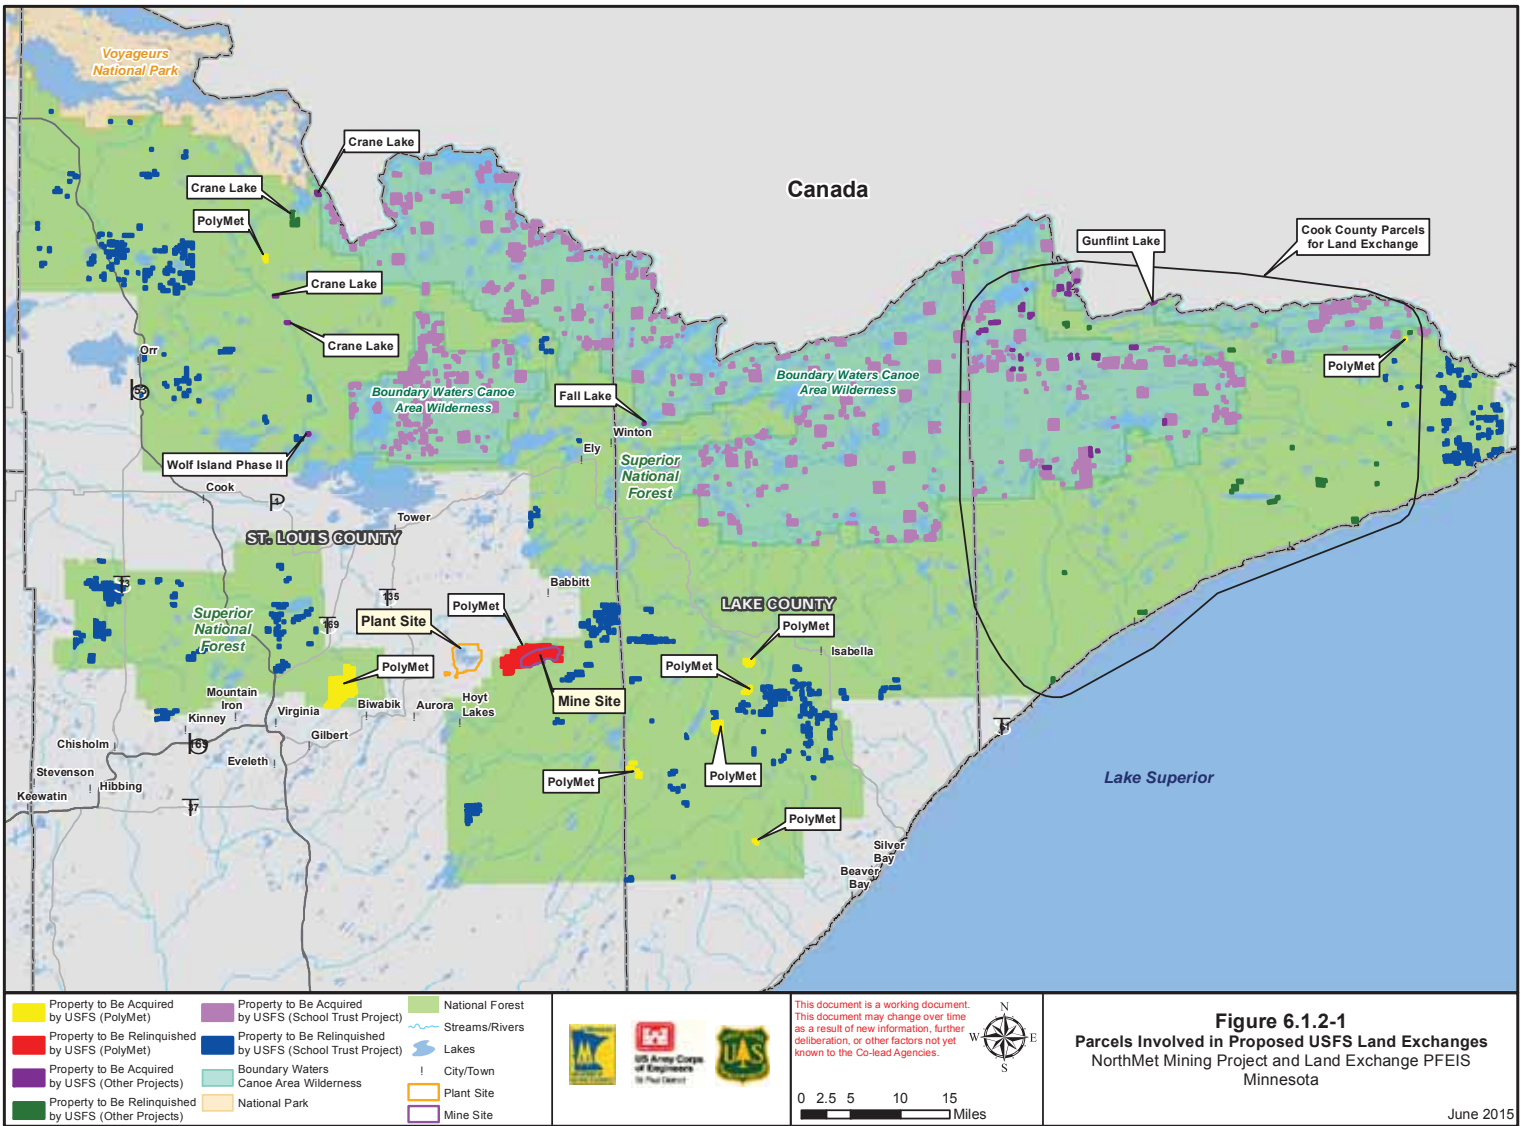

624 This land exchange proposal involves federal land located within and adjacent to the Town of  
625 Crane Lake for private land in the general vicinity of Crane Lake and the BWCAW. Under the  
626 land exchange, the USFS would acquire approximately 265 acres of non-federal land in  
627 exchange for up to approximately 352 acres of federal land. The federal lands to be conveyed are  
628 adjacent to the Town of Crane Lake in T67N, R17W, Sections 23 and 26. The non-federal lands  
629 proposed for exchange include three separate parcels in the general vicinity of Crane Lake and  
630 some distance south of the town.

631 The USFS's purpose is to acquire and consolidate land adjoining the BWCAW, the Vermillion  
632 River, and other existing National Forest System lands. The Town of Crane Lake's purpose is to  
633 acquire land that would better allow for sustainable municipal development and management of  
634 municipal facilities by the Town of Crane Lake.

DRAFT

DRAFT

DRAFT

638 **6.1.2.2.3 Fall Lake Land Acquisition**

639 The Trust for Public Land purchased two properties totaling approximately 27 acres between  
640 2009 and 2011 and is holding the title to these properties until the USFS has received funds to  
641 acquire these properties from the Trust for Public Land in order to consolidate them into the  
642 Superior National Forest. The request for funds to purchase these properties was included in the  
643 USFS's 2012 Land and Water Conservation Fund request with funding anticipated in 2014. The  
644 two properties include Duvall (11 acres of Fall Lake) and Laur (17 acres on Fall Lake).

645 The properties are located on the shores of Fall Lake, across from the Fall Lake boat  
646 landing/campground and within 0.5 mile of the Fall Lake entry to the BWCAW.

647 **6.1.2.2.4 Gunflint Land Acquisition**

648 The Conservation Fund purchased this 32-acre property in 2014 and is holding title until the  
649 USFS has received the funds to acquire the lands in order to consolidate them into the Superior  
650 National Forest. The request for funds to purchase these properties was included in the USFS's  
651 Land and Water Conservation Fund request with funding anticipated in 2015.

652 The property is located in Cook County along Gunflint and Little Gunflint Lakes at the US-  
653 Canadian border along the "Voyageurs Route." The acquisition would protect 5,465 ft of  
654 shoreline along Gunflint Lake and Little Gunflint Lake.

655 **6.1.2.2.5 School Trust Land Exchange and Land Acquisition**

656 The State of Minnesota and the USFS are working together on a mutually beneficial strategy to  
657 transfer ownership of approximately 86,000 acres of currently designated school trust lands,  
658 located within the BWCAW, to federal ownership as part of a combined purchase and land  
659 exchange. The USFS would exchange federal lands outside the BWCAW for one-third of the  
660 school trust parcels within the BWCAW. The USFS would purchase the remaining two-thirds of  
661 the school trust lands within the BWCAW.

662 **6.1.2.2.6 Wolf Island Phase 2 Land Acquisition (Domine Phase 2)**

663 The Trust for Public Land purchased this 27.54-acre property in 2007 and is holding title until  
664 Congress appropriates funds to purchase the land. This parcel represents the northern portion of  
665 Wolf Island in the northern arm of Lake Vermilion, 1 mile from the head of the Vermillion  
666 River. The USFS acquired the southern portion of Wolf Island in 2010. This purchase would  
667 consolidate the entire island under the USFS. Acquisition of the remainder of Wolf Island would  
668 result in public ownership of the entire 60-acre island and approximately 10,500 ft of lakeshore  
669 on Lake Vermilion. The island provides riparian habitat for sensitive species, including bald  
670 eagles and other resident and migratory birds such as osprey, loons, and blue herons.

DRAFT

1 **6.2 CUMULATIVE EFFECTS BY RESOURCE FOR THE NORTHMET**  
2 **PROJECT PROPOSED ACTION**

3 This section considers cumulative effects by resource area. Only the direct and indirect effects of  
4 the NorthMet Project Proposed Action described in Chapter 5 of the FEIS are considered to  
5 potentially cause cumulative effects for the purposes of this analysis. For each of the resources  
6 analyzed in this chapter, the specific methodologies used to approach the cumulative analysis, as  
7 well as the spatial and temporal boundaries that limit the analysis, are described.

8 **6.2.1 Land Use**

9 The NorthMet Project Proposed Action would affect approximately 6,498 acres of land near  
10 Hoyt Lakes and Babbitt, in St. Louis County, Minnesota. This area includes public lands in the  
11 Superior National Forest, as well as private lands within the municipal boundaries of Hoyt Lakes  
12 and Babbitt.

13 **6.2.1.1 Approach**

14 The cumulative actions were evaluated against existing land use plans and ordinances. These  
15 include the St. Louis County Comprehensive Land Use Plan, provisions of the 1854 Treaty with  
16 the Chippewa of Lake Superior as they may affect or be affected by land use, and local  
17 (municipal) land use plans and zoning ordinances.

18 **6.2.1.2 Cumulative Effects Assessment Area**

19 **6.2.1.2.1 Spatial**

20 The CEAA for land use includes effects associated with the NorthMet Project Proposed Action  
21 combined with other industrial (including mining) or public works projects located within the  
22 portion of the Mesabi Iron Range encompassed by St. Louis County (see Figure 6.1.1-1). While  
23 changes in land use patterns do not necessarily depend on such projects, historical census data  
24 indicate changes in population in St. Louis County have been historically linked to such projects,  
25 especially mines. As discussed in Section 4.2.10, the iron deposits associated with the Mesabi  
26 Iron Range have been mined on an industrial scale for more than 100 years.

27 Recreation and natural areas (such as the BWCAW, Voyageurs National Park, and Superior  
28 National Forest) are also important economic and land use resources; however, the spatial extent  
29 of these designated lands is largely fixed (i.e., they have designated federal boundaries). Changes  
30 in use of these resources are due to evolving socioeconomic preferences, such as preferred type  
31 and amount of recreational activity.

32 **6.2.1.2.2 Temporal**

33 This evaluation focuses on existing and reasonably foreseeable land use patterns within the  
34 CEAA. Because mining and public resource management have been historically the primary  
35 drivers defining regional development and land use within the CEAA for over 100 years,  
36 existing conditions are considered indicative and representative of historical mining and resource  
37 management activities.

### 38 **6.2.1.3 Contributing Past, Present, and Reasonably Foreseeable Actions**

39 As noted previously, it is not possible to identify all past activities that may contribute to a  
40 cumulative effect. Similarly, all present activities would continue to affect the environment. The  
41 impacts of these combined activities are described in Chapter 4, Affected Environment. While  
42 not a new project, the Northshore Mine is anticipated to close in 2070.

43 The foreseeable future actions included in this analysis are discussed in Section 6.1.1.2.  
44 Activities specifically associated with potential cumulative effects on land use include permitted  
45 mines and other projects in the portions of the Mesabi Iron Range in St. Louis County where  
46 future activities are likely to be different from current activities. These projects include:

- 47 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits),
- 48 • Mesabi Mining Project,
- 49 • Northshore Closure;
- 50 • U.S. Steel Keetac Mine (Keewatin), and
- 51 • U.S. Steel Minntac Mine, Extension Project.

### 52 **6.2.1.4 Cumulative Effects Assessment**

53 The cumulative actions described in Section 6.2.1.3 are largely existing, expanded, or  
54 reconfigured mines operating on private land. These activities total approximately 2,650 acres,  
55 including more than 2,000 acres at the Keetac mine alone (MDNR and USACE 2010). While  
56 much of this land has not previously been mined, all of the cumulative actions are found within  
57 the Mesabi Iron Range. Expanded mining in this area does not necessarily reflect a change in  
58 land use and is consistent with land use regulations (St. Louis County 2011).

59 Together, the five projects included in the cumulative assessment would generate new jobs  
60 (Section 6.2.10). As with the NorthMet Project Proposed Action, this could increase housing  
61 demand in the region although a majority of this increased demand could be absorbed by the  
62 substantial available housing stock in St. Louis County (see Section 5.2.10.2.4). Any new  
63 housing would need to be consistent with the St. Louis County Land Use Ordinance 27  
64 (Comprehensive Plan Land Use).

65 Post-closure, the Northshore Mine pit lake is estimated to be approximately 2,800 acres at an  
66 elevation of 1,500 ft amsl. Mitigation for changes to the watershed includes in-pit aquatic habitat  
67 development and upland enhancements. Public access to the reclaimed pit lake would be  
68 provided (Barr 2010e).

69 The sources for data regarding cumulative actions include MDNR and USACE 2007, USDOE  
70 and MDC 2007, and MDNR and USACE 2010.

## 6.2.2 Water Resources

The FSDD identified several resources with the potential to be cumulatively affected, including water resources, which would be subjected to a cumulative effects analysis using guidance from the CEQ (CEQ 1997). The FSDD identified hydrology and water quality as elements with the potential for cumulative effects. The analysis within this FEIS also identified the potential for cumulative effects on surface water hydrology and water quality. Neither the FSDD nor this FEIS identified potential cumulative effects on groundwater. The NorthMet Project Proposed Action would supplant the existing seepage from the existing LTVSMC Tailings Basin and extend the duration of these effects, but these effects are localized and already incorporated in the groundwater quality models the results of which are in Section 5.2.2. The existing LTVSMC Tailings Basin is not considered a part of the cumulative effects because the NorthMet Project Proposed Action would replace these effects; therefore, they cannot be considered in addition to the NorthMet Project Proposed Action. Although the NorthMet Project Proposed Action would affect groundwater levels, this effect would be very limited geographically and temporally (e.g., groundwater levels would begin to restore once pit dewatering ceases) and not subject to any off-site cumulative effects. The effects of mine pit dewatering are considered in terms of effects on surface water flows. Therefore, the scope of this cumulative effects assessment focuses on the effects of past, present, and reasonably foreseeable future activities on surface water hydrology and quality.

### 6.2.2.1 Cumulative Effects Assessment Areas

In accordance with the CEQ guidance, a cumulative effects assessment should define the spatial and temporal scope of its analysis. These are described below.

#### 6.2.2.1.1 Spatial

The FSDD identified the Partridge River and the Embarrass River as the geographic scope for the hydrology and water quality analyses. The analysis in this FEIS supports this study area. The St. Louis River was considered for inclusion in the cumulative effects assessment, but not included in the assessment of project-specific impacts for the reasons described below. The cumulative effects actions with the potential to affect flow within the Partridge River and Colby Lake include the Northshore Mine, Laskin Energy City of Hoyt Lakes, Mesabi Mining, and Mesabi Nugget. In the Embarrass River, the projects include ArcelorMittal Deposits (Laurentian and East Reserve Deposits), City of Aurora POTW, City of Babbitt POTW, and the City of Biwabik POTW.

As concluded in Section 5.2.2, the NorthMet Project Proposed Action, which includes augmentation to Embarrass River tributaries, is predicted to only result in minor changes to hydrology within the Partridge River and Embarrass River. Most of the actions considered in this cumulative effects analysis (see Table 6.1.1-1) with the potential to cumulatively affect hydrology within the Partridge River and Embarrass River exist and their hydrologic effects are already incorporated into the impact assessment water modeling for the NorthMet Project Proposed Action.

The water quality modeling for the NorthMet Project Proposed Action already takes into consideration low flow conditions, and even during low flows, it is not predicted to result in any

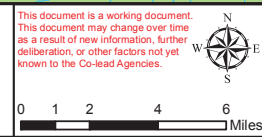

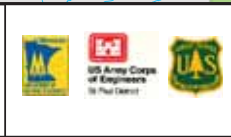

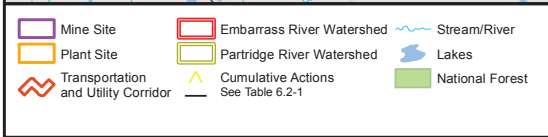

42 direct exceedances of water quality evaluation criteria, although achieving this would require  
43 long-term water treatment and WWTF and WWTP maintenance. Other reasonably foreseeable  
44 actions may also increase metal and other solute loadings downstream, but it is assumed that  
45 these other actions would also be required to meet federal and state water quality requirements,  
46 including nondegradation. Therefore, the potential for exceedances of water quality evaluation  
47 criteria as a result of cumulative effects from the NorthMet Project Proposed Action and other  
48 reasonably foreseeable actions is considered unlikely.

49 Although not expected to result in any direct exceedances of water quality evaluation criteria, the  
50 NorthMet Project Proposed Action, in combination with other reasonably foreseeable actions,  
51 would increase metal and other solute loadings to the Partridge River and Embarrass River, and  
52 further downstream in the St. Louis River. These loadings would, however, be diluted as the  
53 solutes are transported downstream (i.e., average annual flow in the St. Louis River at the  
54 confluence with the Embarrass River is approximately four times more than in the Partridge and  
55 Embarrass rivers alone). Further, the MPCA will review the NorthMet Project Proposed Action  
56 for consistency with the State's non-degradation requirements prior to any permitting, as it  
57 would also do at the time of permitting for any other reasonably foreseeable actions.

58 Finally, sulfate and mercury loadings, two key constituents of concern, are predicted to decrease  
59 overall as a result of the NorthMet Project Proposed Action. Although sulfate loadings are  
60 predicted to increase slightly in the Partridge River Watershed (less than 1 percent) as a result of  
61 the NorthMet Project Proposed Action, this is offset by a large decrease in the Embarrass River  
62 Watershed (greater than 40 percent at PM-13), resulting in a significant net decrease in overall  
63 sulfate loadings to the St. Louis River as a result of the NorthMet Project Proposed Action.  
64 Similarly, mercury loadings are predicted to increase slightly in the Embarrass River Watershed  
65 (1 percent) as a result of the NorthMet Project Proposed Action, but this is offset by a larger  
66 decrease (5 percent) in the Partridge River Watershed, resulting in a net decrease in overall  
67 mercury loadings to the St. Louis River as a result of the NorthMet Project Proposed Action.

68 Therefore, the NorthMet Project Proposed Action is not considered to have the potential for  
69 cumulative effects on hydrology and water quality in the St. Louis River. As a result, the CEAA  
70 for surface water is defined by the Partridge River and Embarrass River watersheds as shown on  
71 Figure 6.2.2-1.

DRAFT

74 **6.2.2.1.2 Temporal**

75 In terms of temporal scope, this assessment considered past and present and reasonably  
76 foreseeable effects on flow and water quality in the Partridge River and Embarrass River as  
77 reflected in existing baseline hydrologic and water quality conditions. Limited flow data are  
78 available back to the 1940s for the Embarrass River and 1970s for the Partridge River. Limited  
79 water quality data are available dating back to the 1970s. In addition to the NorthMet Project  
80 Proposed Action, this assessment considered the activities identified below.

81 **6.2.2.2 Contributing Past, Present, and Reasonably Foreseeable Actions**

82 It is not possible to identify all past activities that may contribute to a cumulative effect.  
83 Similarly, all present activities would continue to affect the environment. The impacts of these  
84 combined activities are described in Chapter 4, Affected Environment. Existing and potential  
85 future actions, in combination with the NorthMet Project Proposed Action, which could  
86 cumulatively affect surface water hydrology and quality within the Partridge River and  
87 Embarrass River watersheds, include the following:

- 88 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 89 • City of Aurora POTW;
- 90 • City of Babbitt POTW;
- 91 • City of Biwabik POTW;
- 92 • City of Hoyt Lakes POTW;
- 93 • LTVSMC Pits (Cliffs Erie Pits);
- 94 • Mesabi Mining Project;
- 95 • Mesabi Nugget Project;
- 96 • Minnesota Power Laskin Energy Center; and
- 97 • Northshore Mine and Closure.

98 **6.2.2.3 Cumulative Effects on Hydrology**

99 This section discusses cumulative effects on the hydrology of the Partridge River and the  
100 Embarrass River.

101 **6.2.2.3.1 Partridge River**

102 There are several mines (active, closed, and proposed), the City of Hoyt Lakes POTW, and  
103 Minnesota Power's Laskin Energy Center (a power plant) that have withdrawn or discharged  
104 water in the past and/or are currently withdrawing or discharging water that affects flows in the  
105 Partridge River (see Figure 4.2.2-10). Table 4.2.2-10 summarizes the NPDES/SDS discharges to  
106 and surface water withdrawals from the Partridge River and its tributaries. Most of these outfalls  
107 do not discharge continuously, and many, although still "active" in terms of permit status, have  
108 not discharged for many years (such as various mine pit dewatering discharges). The existing or  
109 predicted future hydrologic effects of these activities are briefly described below and  
110 summarized in Table 6.2.2-1. The average net hydrologic effect listed reflects the extent to

111 which the listed activity impacts natural average annual flow in the Partridge River. For example,  
 112 flooded pit overflows (without artificial management) are assumed to generally reflect natural  
 113 flow contributions.

114 **Table 6.2.2-1 Cumulative Effects on Partridge River and Colby Lake Hydrology by Activity**

| Activity                                         | Average Net Hydrologic Effect (cfs) | Location of Effects                               | Timing           | Magnitude             | Future Duration   |
|--------------------------------------------------|-------------------------------------|---------------------------------------------------|------------------|-----------------------|-------------------|
| Northshore Mine                                  | +2.6                                | Upper Partridge River and Colby Lake              | Intermittent     | Varies                | >50 years ongoing |
| Northshore Mine Closure                          | 0.0                                 | Upper Partridge River and Colby lake              | NA               | NA                    | Beginning in 2070 |
| City of Hoyt Lakes POTW                          | -0.1                                | Colby Lake                                        | Continuous       | Relatively consistent | Long-term ongoing |
| LTVSMC Pits                                      | +1.7                                | Wyman Creek, Upper Partridge River and Colby Lake | Varies           | Varies                | Long-term ongoing |
| NorthMet Project Proposed Action Mine Site WWTF  | +0.65                               | Upper Partridge River and Colby Lake              | Continuous       | Relatively consistent | Long-term         |
| Mesabi Nugget                                    | +5.6                                | Unknown                                           | October to March | Relatively consistent | Ongoing           |
| Mesabi Mining Project                            | Unknown                             | Second Creek and Lower Partridge River            | Unknown          | Unknown               | Unknown           |
| Mesabi Mining Site Existing Conditions           | 0.0                                 | Second Creek and Lower Partridge River            | NA               | NA                    | NA                |
| Minnesota Power Laskin Energy Center             | -4.2                                | Colby Lake                                        | Continuous       | Relatively consistent | Long-term ongoing |
| NorthMet Project Proposed Action Plant Site WWTP | ±0.1                                | Second Creek and Lower Partridge River            | Continuous       | Relatively consistent | Long-term         |

 116 2014e; MPCA 2014f.

- 117 • Northshore Mine – This is an open pit taconite mine. The mine consists of three mining  
 118 areas, only one of which (water appropriation permit Area 003) discharges to the Partridge  
 119 River Watershed. There are several permitted discharges from Area 003, but only two mine  
 120 pit discharges and a crusher discharge, with a collective maximum water appropriation-  
 121 permitted discharge to the Partridge River of 29 cfs, are active. Upper Partridge River flows  
 122 are currently influenced by the timing and magnitude of Northshore Mine discharges from  
 123 the Peter Mitchell Pit at SD-009, and would be influenced by the cessation of those  
 124 discharges in approximately mine year 55.

125 Available records show an average annual discharge to the Partridge River ranging from 6.8  
 126 to 15.1 cfs, with a highest reported monthly discharge of 34 cfs (Barr 2008f). Since 2004, the

127 average annual daily discharge from the Northshore Mine has been approximately 5.8 cfs,  
128 but this rate is quite variable, ranging from zero (mostly during the winter and summer  
129 droughts) to as high as approximately 20 cfs.

130 However, monthly Peter Mitchell Pit pumping records for the Northshore Mine provide a  
131 poor estimate of actual contributions to the Upper Partridge River because the Northshore  
132 Mine does not discharge directly to the Partridge River. The Northshore Mine's actual  
133 contributions to the Partridge River are uncertain due to the variability of the Peter Mitchell  
134 pit pumping, complex storage and release mechanisms (e.g., wetlands, ponds, losses in the  
135 Partridge River, and ice storage), evapotranspiration, and seepage from the West Pond (see  
136 Figure 4.2.2-9). To address these uncertainties, the Co-lead Agencies relied on available  
137 sulfate and flow data to derive a continuous flow of 2.6 cfs from the Northshore Mine to use  
138 as the basis for water quality impact predictions in the FEIS (MDNR et al. 2014c). This  
139 estimated flow is reasonable for purposes of water quality impact predictions, and it is also  
140 reasonable to estimate cumulative effects to flow.

- 141 • Northshore Mine Closure – Following closure in year 2070 of the Northshore Mine, its  
142 discharge to the Partridge River Watershed would cease as the pit is allowed to flood with  
143 water. After the pit lake is flooded, the pit would discharge towards the Dunka River into the  
144 Rainy River Watershed, effectively removing the pit from the Partridge River Watershed.  
145 Discharge from the Northshore Mine to the Partridge River is expected to end in  
146 approximately 2070 (PolyMet 2015m).
- 147 • City of Hoyt Lakes POTW – The City of Hoyt Lakes is authorized to withdraw up to 2.3 cfs,  
148 but currently withdraws approximately 0.6 cfs of water from Colby Lake for municipal  
149 potable use, and discharges approximately 0.5 cfs of treated wastewater from its POTW to  
150 Whitewater Reservoir. Most of this water is returned to the Partridge River Watershed either  
151 via pumping during droughts to maintain water levels in Colby Lake or via seepage through  
152 its northwest dike to the Lower Partridge River. For purposes of this cumulative effects  
153 analysis, a consumptive loss of 0.1 cfs is assumed from the Partridge River Watershed.
- 154 • Mesabi Nugget, Pit 1 – This existing plant processes taconite concentrate into nuggets. It is  
155 not an active mine site. Wastewater from the plant is routed through a chemical precipitation  
156 unit and discharged into the west end of the Area 1 Pit. Water from the east end of the Area 1  
157 Pit is then pumped to Outfall SD001 with ultimate discharge into Second Creek. This pit has  
158 seasonal (September to March) discharges to Second Creek that average approximately 5.6  
159 cfs; no discharges occur from April to August.
- 160 • Mesabi Mining Project – This is a proposed project involving reactivation of a taconite mine  
161 and construction of a new taconite concentration facility. The iron ore concentrate would be  
162 used as feedstock for the Mesabi Nugget facility, with the remaining balance shipped by rail  
163 for use in other facilities. The project underwent some NEPA and MEPA review from 2009  
164 to 2011, but that work is currently in suspension while the project is reevaluated/redesigned.  
165 The water management strategy for this facility is still in the process of development, so the  
166 hydrologic effects of this action are unknown.

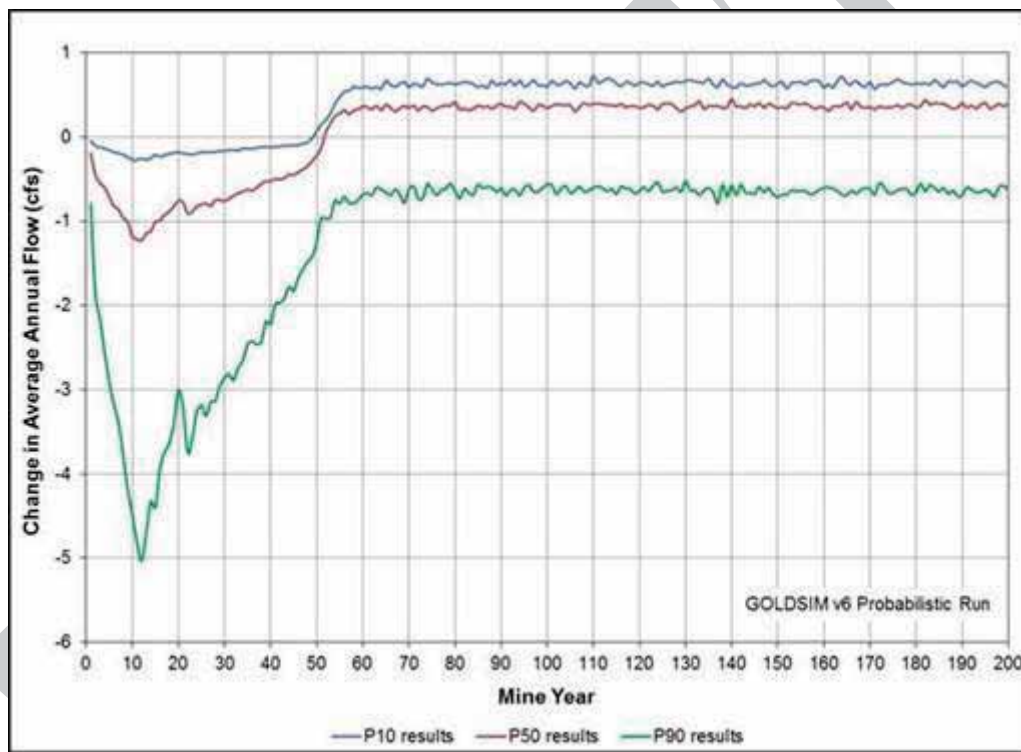

167

- 168 • Mesabi Mining Site Existing Conditions:
- 169 – Pit 2WX: The pit is currently in the process of filling. Within a few years, this pit may  
170 overflow to an unnamed creek that discharges to the Partridge River just below Colby  
171 Lake.
- 172 – Pit 6: This pit currently releases water to Second Creek via the surficial aquifer. There is  
173 no surface water discharge.
- 174 – Pit 9S: This pit is currently stable (with likely groundwater discharge off site and/or to Pit  
175 6).
- 176 – Pit 9N: This pit is currently stable (with groundwater discharge to Pit 1 and the surficial  
177 aquifer).
- 178 • LTVSMC Pits (Cliffs Erie Pits) – These pits would influence the flow of the Upper Partridge  
179 River downstream of Wyman Creek’s confluence with the Partridge River:
- 180 – Pit 2/2E: This pit is stabilized with no direct discharge. There is likely groundwater flow  
181 from this pit to Pit 2W.
- 182 – Pit 2W: There is no discharge from this pit.
- 183 – Pit 3: This pit currently discharges to Wyman Creek, a tributary to the Upper Partridge  
184 River, at approximately 0.9 cfs.
- 185 – Pit 5SW: This pit overflows to Wyman Creek via “dispersed” discharge, at an estimated  
186 rate of less than 0.8 cfs.
- 187 • Minnesota Power Laskin Energy Center – This is a coal-fired power plant that withdraws  
188 cooling water from Colby Lake. It discharges once-through, non-contact cooling water to the  
189 downstream portion of Colby Lake, but has a 4.2 cfs evaporative loss of water to the  
190 atmosphere. No changes to its current mode of operation are anticipated for the foreseeable  
191 future.
- 192 • NorthMet Project Proposed Action – The NorthMet Project Proposed Action would also  
193 influence future Partridge River flows through: 1) WWTF discharges starting in mine year  
194 52; 2) a watershed reduction; 3) pit inflows during operations and reclamation; and 4)  
195 groundwater flowpath contributions from stockpiles and pits during operations, reclamation,  
196 and closure. The WWTF would discharge continuously at rate of 0.65 cfs. Watershed area  
197 reductions resulting from the NorthMet Project Proposed Action for SW-001, SW-002,  
198 SW-003, SW-004, and SW-004a range from 0 to 2.1 percent during closure and long-term  
199 maintenance, which translates to a reduction of 0.39 cfs below current and future flows at  
200 SW-004a. Pit inflows would reduce Partridge River flows by less than 2 cfs. Changes to  
201 groundwater flows are considered negligible. There would be a decrease in flows during  
202 operations (about mine year 12) when the rate of pit inflows would be the greatest. There  
203 would be an increase in flows during closure for about a 3-year period when the WWTF  
204 would be discharging to the Partridge River.

205 The south discharge from the Tailings Basin into Second Creek would be managed within  
206  $\pm 20$  percent of flows, estimated to be 0.5 cfs, prior to the installation of the containment  
207 system. The expected flows from the WWTP that would augment these flows are predicted  
208 to range between 0.4 and 0.6 cfs.

209 **Upper Partridge River**

210 The P50 average annual modeled flows were assessed for the 200-year simulation in the  
211 Partridge River at SW-004a. The NorthMet Project Proposed Action decreases flows by no more  
212 than 4 percent and increase by no more than 2 percent (See Section 5.2.2.3.2). This equates to a  
213 range of about +0.50 to -0.25 cfs. Figure 6.2.2-2 shows P10, P50, and P90 cumulative flowrates  
214 to capture the uncertainty in the hydrology. The decrease in flows would occur during  
215 operations. Downstream of SW-004a and upstream of Colby Lake, contributions from existing  
216 LTVSMC pits total approximately 11 cfs.

217

218 **Figure 6.2.2-2 Change in Average Annual Stream Flow at SW-004a**

219 **Colby Lake**

220 Cumulative hydrologic effects on Colby Lake would be influenced by activities identified in the  
221 Upper Partridge River identified above and three additional activities: 1) NorthMet Project  
222 Proposed Action pumping from Colby Lake in mine years 1 to 20, at an average rate of 1.7 cfs,  
223 for Plant Site operational needs; 2) Laskin Energy Center pumping from Colby Lake, at a rate of  
224 4.2 cfs, to support its operations; and 3) City of Hoyt Lakes POTW pumping with a net effect of  
225 a 0.1 cfs decrease.

226 This recognized, Colby Lake water elevations are regulated and managed and this ultimately  
227 dictates flows from Colby Lake into the Lower Partridge River. Partridge River flows into Colby  
228 Lake during peak flow events are pumped to the Whitewater Reservoir, thereby mitigating  
229 potential increases in flows to the Lower Partridge River from this source. There is a minimum  
230 regulated water level threshold of 1,439 amsl on Colby Lake as required under MDNR Water  
231 Appropriation Permit 1949-0135. As this threshold is approached, water is diverted out of  
232 Whitewater Reservoir through set of gates to Colby Lake to increase water elevations in the lake  
233 and, with it, flow to the lower Partridge River. Due to Colby Lake's hydrologic relationship with  
234 the Whitewater Reservoir, as well as regulated management, no impacts to hydrology in Colby  
235 Lake are expected.

### 236 **Lower Partridge River**

237 Water would be discharged from SD-026 south of the Tailings Basin into Second Creek, a  
238 tributary to the Lower Partridge River. Flows from SD-026 would be augmented by the  
239 NorthMet Project Proposed Action to maintain flows that existed prior to the installation of the  
240 containment system. Due to this augmentation, discharges from SD-026 could deviate  $\pm 0.1$  cfs  
241 from the baseline. This impact would be added to Mesabi Nugget's 5.6 cfs seasonal discharge  
242 increase and an unknown impact from the proposed Mesabi Mining Project.

### 243 **6.2.2.3.2 Embarrass River**

244 In general, flows in the Embarrass River have been affected to a minor extent by municipal water  
245 withdrawals and wastewater discharges, and, since the mid-1950s, by mining (e.g., seepage from  
246 the existing LTVSMC Tailings Basin). Most of these discharges are relatively continuous,  
247 although there can be wide variations in their magnitudes, most of which are attributable to  
248 precipitation trends. Larger discharges tend to coincide with either snow melt or large storm  
249 events when flows in the Embarrass River are typically high, thereby reducing the magnitude of  
250 these discharges. On the other hand, there can be less discharge during drier periods when river  
251 flows are lower. Including the NorthMet Project Proposed Action, there are seven past, present,  
252 and reasonably foreseeable future activities that could affect the hydrology of the Embarrass  
253 River. The existing or predicted future hydrologic effects of these activities are briefly described  
254 below and summarized in Table 6.2.2-2. The average net hydrologic effect listed reflects the  
255 extent to which the particular activity impacts natural average annual flow in the Embarrass  
256 River. For example, flooded pit overflows (without artificial management) are assumed to  
257 generally reflect natural flow contributions.

258 **Table 6.2.2-2 Existing Cumulative Effects on Embarrass River Hydrology by Activity**

| <b>Activity</b>                                  | <b>Average Net Hydrologic Effect (cfs)</b> | <b>Location of Effects</b>      | <b>Discharge Timing</b> | <b>Magnitude</b>      | <b>Duration</b>                      |
|--------------------------------------------------|--------------------------------------------|---------------------------------|-------------------------|-----------------------|--------------------------------------|
| City of Babbitt POTW                             | +0.1                                       | Upper and Lower Embarrass River | Continuous              | Relatively consistent | Long-term ongoing                    |

259 Sources: PolyMet 2015i; MPCA2012i; MPCA 2012j; MPCA 2013g; MPCA 2013h; MPCA 2014c; MPCA 2014d.

260 • City of Babbitt POTW – The City of Babbitt uses several wells, some of which are in the  
 261 Dunka River Watershed, as its water supply source, and discharges 0.33 cfs of treated  
 262 wastewater effluent to the headwaters of the Embarrass River. Since some of this discharge is  
 263 Dunka River Watershed water, it is estimated that the City of Babbitt provides an annual  
 264 average net increase of 0.1 cfs to the Embarrass River.

265 • LTVSMC Pits (Cliffs Erie Pits) – Pit 5NW overflows to Spring Mine Creek, a tributary of  
 266 the Embarrass River. This pit has an overflow discharge of approximately 1.2 cfs, but its  
 267 flow varies with precipitation and has been measured as low as 0.23 cfs.

268 • NorthMet Project Proposed Action Plant Site – Tributaries extending north of the Tailings  
 269 Basin would be augmented to maintain existing flows within ±20 percent. The effect of the  
 270 NorthMet Project Proposed Action decreases with distance downstream, as can be seen at  
 271 PM-13, where the maximum change in flow is an approximate 3 percent decrease in the  
 272 annual average flow during operations, with a long-term closure decrease of less than 2  
 273 percent.

274 • ArcelorMittal Laurentian Deposit – This is a taconite mine that has been in operation since  
 275 approximately 1993. The mine has three permitted dewatering discharges to an unnamed  
 276 tributary of the Lower Embarrass River (immediately downstream of Esquagama Lake), but  
 277 only one is actively used (SD-003). This mine is expected to close sometime in the late  
 278 2010s, at which time pit dewatering would stop, and flow to the Embarrass River would be  
 279 reduced until the pit floods.

280 Pit dewatering discharges averaged approximately 5.1 cfs annually between 2012 and 2014  
 281 (MPCA 2010a; MPCA 2011f; MPCA 2012i). Discharges were reasonably constant over the  
 282 period, with most monthly values ranging between 4.5 and 6.0 cfs. Flows similar to these are  
 283 expected until the mine closes, at which time pit dewatering and discharge to the Embarrass

284 River would stop. This would result in a net reduction in flow to the Embarrass River of  
285 approximately 5.0 cfs until the pit floods.

286 • ArcelorMittal East Reserve Deposit – This is an open-pit taconite mine, which began  
287 operations (East Reserve #1) in 2008. The second pit (East Reserve #2) is permitted and is  
288 expected to begin operations about the same time the Laurentian Mine closes.

289 The first pit has a single permitted dewatering discharge (SD-005) to an unnamed tributary of  
290 the Lower Embarrass River (immediately downstream of Esquagama Lake). Pit dewatering  
291 discharges from East Reserve #1 averaged approximately 2.7 cfs from 2012 to 2014, but this  
292 discharge would likely gradually increase as the pit gets deeper. When discharging, the flow  
293 rate is constant, but currently there are several months of the year (primarily in winter) when  
294 no discharge occurs. At some yet-to-be-determined point, East Reserve #2 would be opened  
295 and pit dewatering would begin through a second permitted discharge (SD-006). The East  
296 Reserve Deposit (Pit 1 and Pit 2) would have a combined permitted discharge to the Lower  
297 Embarrass River of up to 9.3 cfs, though the actual discharge would likely vary seasonally,  
298 and as the mines are developed, at a rate somewhat lower than that. As with the Laurentian  
299 Mine, it is important to note that a substantial portion of the permitted discharge replaces  
300 natural runoff that is captured by the pit watershed.

301 • City of Aurora POTW – The City of Aurora withdraws approximately 0.32 cfs from the St.  
302 James Pit, a former natural ore pit within the Embarrass River Watershed, and discharges  
303 approximately 0.31 cfs of treated wastewater to Silver Creek, which drains to the St. Louis  
304 River. Therefore, this withdrawal represents a loss of water from the Embarrass River  
305 Watershed of 0.32 cfs.

306 • City of Biwabik POTW – The City of Biwabik withdraws approximately 0.25 cfs from the  
307 Canton Pit for municipal water supply and discharges treated wastewater to a tributary of  
308 Embarrass Lake at approximately the same rate. There is effectively no net loss of water  
309 associated with the City's water usage.

310 The net effect of these hydrologic changes would be an approximately 5.2 cfs increase in flow,  
311 plus about a 2.6 cfs (operations) to 1.6 cfs (closure) reduction as a result of the NorthMet Project  
312 Proposed Action, for a total increase in flow of between 7.8 and 3.6 cfs at the confluence with  
313 the St. Louis River, or about 7 percent of average annual flow (assuming an average annual flow  
314 of about 117 cfs for a 180.8 square mile watershed with an average annual flow of 0.65 cfs per  
315 square mile based on flow at the McKinley gage).

#### 316 **6.2.2.4 Cumulative Effects on Surface Water Quality**

317 This section discusses cumulative effects on water quality for the Partridge River and the  
318 Embarrass River.

##### 319 **6.2.2.4.1 Partridge River**

320 Water quality in the Partridge River has been affected by discharges from the Northshore Mine,  
321 discharges/overflows from several former LTVSMC pits, and two permitted discharges from  
322 Minnesota Power's Laskin Energy Center for decades. As mentioned in Section 5.2.2, the  
323 NorthMet Project Proposed Action does not propose any surface water discharges (other than  
324 flow augmentation to Second Creek) until the West Pit overflows and the WWTF begins

325 discharging around year 52. However, non-contact stormwater runoff, unrecoverable  
326 groundwater seepage from the five groundwater flowpaths (i.e., from the waste rock stockpiles,  
327 pits, Ore Surge Pile, WWTF, and Overburden Storage and Laydown Area), and the WWTF  
328 discharge would all serve as potential contaminant sources. Stormwater from undisturbed areas  
329 of the proposed Mine Site would be similar in chemistry to current runoff from the proposed  
330 Mine Site area. The WWTF discharge would be permitted under the NPDES permitting  
331 program.

332 The NorthMet Project Proposed Action is predicted to meet or not cause or contribute to an  
333 exceedance of all surface water quality evaluation criteria at all evaluation locations within the  
334 Partridge River watershed for the entire 200-year modeling period. Consequently, the additional  
335 potential cumulative environmental impacts resulting from the NorthMet Project Proposed  
336 Action would be minimal. The scope of cumulative impacts analysis is therefore focused on  
337 parameters with a potential to bioaccumulate in or adversely impact wild rice, an important  
338 cultural resource. As a result, the cumulative effects analysis focuses on sulfate (because of its  
339 relationship with mercury methylation and wild rice) and mercury (because it is the only  
340 parameter on the Partridge River 303(d) list). Mercury is only discussed from a water quality  
341 perspective; the potential cumulative effects of the NorthMet Project Proposed Action on the  
342 bioaccumulation of methylmercury in fish are discussed in Section 6.2.6.3.3.

#### 343 **Sulfate**

344 Sulfate is a concern along the Partridge River because of the presence of waters supporting the  
345 production of wild rice immediately downstream of the NorthMet Project area (including  
346 evaluation locations SW-005 and SW-006 immediately above Colby Lake and the portion of the  
347 river below Colby Lake). According to available surface water monitoring data, including sulfate  
348 sampling conducted as part of recent wild rice field surveys (Barr 2009b, 2011a, 2012a, and  
349 2013m), sulfate concentrations in the Upper Partridge River range from 0.5 to 21 mg/L, which  
350 are slightly elevated relative to baseline conditions, assumed to be similar to values in the South  
351 Branch of the Partridge River reported in the 1970s (average of 5.2 mg/L). Sampling in Colby  
352 Lake found a range of concentrations between 37 and 42 mg/L. Downstream of Colby Lake,  
353 sulfate concentrations increase. Pit 1 water is discharged October through March with a daily  
354 average flow of 7.4 cfs and an average sulfate concentration of 478 mg/L (MPCA 2015). Pit  
355 2WX, Pit 6, Pit 9, and Pit 9s are not currently discharging water. Average sulfate concentrations  
356 in the Partridge River in 2013 were 71.3 mg/L at station S005-752, which is just downstream of  
357 the confluence with Second Creek at the County Road 110 Bridge. The wild rice surveys found  
358 sulfate concentrations as high as 1,100 mg/L in Second Creek.

359 The baseline sulfate concentrations found in the Partridge River reflect the effects of discharges  
360 from existing activities within the watershed. Table 6.2.2-3 summarizes the relative sulfate load  
361 contributions from the various identified activities in the watershed. In terms of historic increases  
362 in Lower Partridge River sulfate concentration, three important existing loads of sulfate to the  
363 Lower Partridge River include the Mesabi Nugget operation, the previous SD-026 seep from the  
364 existing LTVSMC Tailings Basin, and the Mesabi Mining Pit 6 seepage, all entering Lower  
365 Partridge River via Second Creek.

366 **Table 6.2.2-3 Cumulative Sulfate Loadings to the Partridge River by Activity**

| Activity                                         | Average Discharge/Release Rate (cfs) | Representative Sulfate Concentration (mg/L) | Average Sulfate Load (kg/d) |

| NorthMet Project Proposed Action Plant Site WWTF | 0.65                                 | 9                                           | 14.3                        |

367 Sources: PolyMet 2015i; PolyMet 2015r; MPCA 2012m; MPCA 2013h; MPCA 2014d; MPCA 2012l; MPCA 2013k; MPCA  
 368 2014e; MPCA 2013j; MPCA 2014f; USDOE and MDC 2009, Table 5.3-4; MDNR et al. 2014c).

369 The NorthMet Project Proposed Action sulfate concentration is modeled to increase by 0.1 mg/L  
 370 but is not predicted to cause or contribute to an exceedance of the evaluation criterion. Therefore,  
 371 the NorthMet Project Proposed Action should not adversely affect downstream waters that  
 372 support the production of wild rice. The potential cumulative effect of sulfate on mercury  
 373 methylation in the Partridge River Watershed is discussed below.

374 **Mercury**

375 Based on sampling in studies done for PolyMet, it is estimated that current total mercury  
 376 concentrations average about 3.3 ng/L in the Upper Partridge River (Barr 2011a) and between  
 377 4.6 and 8.7 ng/L in Colby Lake.

378 Details of the effect of the NorthMet Project Proposed Action on mercury deposition impacts and  
 379 mercury concentrations are discussed in Section 5.2.7. Table 6.2.2-4 summarizes the relative  
 380 mercury contributions from the various identified activities in the watershed. Research has found  
 381 that taconite tailings are effective in sequestering mercury from seepage. Analog data from  
 382 natural lakes and mine pit lakes in northeastern Minnesota suggest that mercury concentrations  
 383 generally remain below the 1.3 ng/L standard, despite precipitation averaging approximately 13  
 384 ng/L mercury. Mercury in surface waters undergoes transformations when exposed to sunlight,  
 385 which can limit its concentration in lakes. For example, methylmercury degrades to soluble  
 386 oxidized mercury in sunlight, which in turn degrades to elemental mercury, which volatilizes  
 387 from lakes. Further, much of the mercury in lakes associates with particulate matter, which often  
 388 settles to the bottom.

389 The NorthMet Project Proposed Action is predicted to result in a net decrease in mercury  
 390 loadings to the Partridge River from 24.2 grams per year to 23.0 grams per year. This would  
 391 primarily be a result of a decrease in natural runoff (with a total mercury concentration of 3.6  
 392 ng/L) and a proportional increase in water discharged from the West Pit via the WWTF (with a  
 393 total mercury concentration of 1.3 ng/L). As discussed above, sulfate concentrations and  
 394 loadings from the NorthMet Project Proposed Action to the Partridge River are predicted to  
 395 remain about the same as existing conditions, so the NorthMet Project Proposed Action would  
 396 not be contributing additional sulfate that could promote mercury methylation. Therefore, the  
 397 NorthMet Project Proposed Action would not contribute to cumulative effects on mercury  
 398 loading in the Partridge River.

399 **Table 6.2.2-4 Cumulative Mercury Loadings to the Partridge River by Activity**

| <b>Activity</b>                                           | <b>Average Discharge/Release Rate (cfs)</b> | <b>Representative Mercury Concentration (ng/L)</b> | <b>Average Mercury Load (kg/d)</b>                              |
|-----------------------------------------------------------|---------------------------------------------|----------------------------------------------------|-----------------------------------------------------------------|
| Northshore Mine Operations                                | 2.6                                         | 0.7                                                | 4.5E-06                                                         |
| Northshore Mine in Closure                                | 0.0                                         | 0.0                                                | 0.0                                                             |
| City of Hoyt Lakes POTW                                   | 0.4                                         | 7.7                                                | 7.5E-06                                                         |
| Mesabi Nugget                                             | 5.6                                         | 0.6                                                | 8.2E-06                                                         |

403 **6.2.2.4.2 Embarrass River**

404 Section 5.2.2.3.3 contains a detailed discussion of modeled water quality changes in the  
 405 Embarrass River at PM-13. The NorthMet Project Proposed Action is predicted to meet or not  
 406 cause or contribute to an exceedance of all surface water quality evaluation criteria at all  
 407 evaluation locations within the Embarrass River watershed for the entire 500-year modeling  
 408 period. Consequently, the additional potential cumulative environmental effects resulting from  
 409 the NorthMet Project Proposed Action are expected to be less than significant.

410 The placement of the Embarrass River headwaters and Spring Mine Creek on the MPCA 2012  
 411 Impaired Waters list indicates that aquatic biota are already under stress in this system (MPCA

412 2012n). Although stressors have not been identified, the water quality change predicted under the  
413 NorthMet Project Proposed Action would have potential to add to these stressors. Therefore, this  
414 cumulative effects analysis focuses on sulfate (because of its relationship with mercury  
415 methylation and wild rice) and mercury (because it is the only parameter on the 303(d) list).  
416 Mercury is only discussed here from a water quality perspective; the potential cumulative effects  
417 of the NorthMet Project Proposed Action on the bioaccumulation of methylmercury in fish are  
418 discussed in Section 6.2.6.3.3.

419 **Sulfate**

420 Sulfate is a concern within the Embarrass River because of the presence of waters supporting the  
421 production of wild rice downstream of PM-13. Present sulfate concentrations in the Embarrass  
422 River downstream of the NorthMet Project area are elevated well above natural background  
423 levels and currently exceed the wild rice sulfate standard of 10 mg/L. Median sulfate  
424 concentration at PM-12, upstream of any historic mining activity, is about 7.2 mg/L compared to  
425 a median of about 39.4 mg/L at PM-13. This increase in sulfate concentrations is primarily  
426 attributable to the Pit 5NW overflow (average discharge at SD-033 of 1.2 cfs and sulfate  
427 concentration of 1,088 mg/L) and seepage from the existing LTVSMC Tailings Basin (average  
428 surface and groundwater seepage of 5.7 cfs and a range of mean sulfate concentrations from 109  
429 to 185 mg/L). The combined effects of the Tailings Basin containment system and stream  
430 augmentation would reduce the predicted P90 sulfate concentration (see Section 5.2.2.1.3) at  
431 PM-13 by about 50 percent relative to the CEC scenario model results.

432 Considering cumulative downstream effects, the Embarrass chain of seven lakes tend to  
433 attenuate the sulfate concentrations by dilution and biological uptake, with concentrations  
434 gradually declining in a downstream direction from 21.3 mg/L in Embarrass Lake to 17.1 mg/L  
435 at the outlet from Esquagama Lake.

436 The existing sulfate concentrations in the Embarrass River reflect the effects of discharges from  
437 existing activities within the watershed. Table 6.2.2-5 summarizes the relative sulfate load  
438 contributions from the various identified activities in the watershed.

439 **Table 6.2.2-5 Cumulative Sulfate Loadings to the Embarrass River by Activity**

440 Sources: MPCA 2012d; PolyMet 2014w; Clark, MPCA, Pers. Comm., April 29, 2013; MPCA 2012i; MPCA 2013g; MPCA  
 441 2014c; PolyMet 2015i; MPCA 2012j; MPCA 2013h; MPCA 2014d.

442 Note:

443 <sup>1</sup> Discharge is to the St. Louis River.

444 The NorthMet Project Proposed Action would reduce the sulfate load from the existing  
 445 LTVSMC Tailings Basin as a result of the containment of tailings seepage by the containment  
 446 system and subsequent treatment via the WWTP before discharge as part of the tributary stream  
 447 flow augmentation. This NorthMet Project Proposed Action would result in a greater than 40  
 448 percent overall reduction in sulfate loading at PM-13 and would have a positive effect on  
 449 reducing the sulfate concentration in the Embarrass River downstream of PM-13 (where wild  
 450 rice is present), the chain of lakes, and the Lower Embarrass River.

451 **Mercury**

452 The Embarrass River is not on the 303(d) list of impaired waters for mercury impairment;  
 453 however, several lakes downstream of the NorthMet Project Proposed Action along the  
 454 Embarrass River are listed for “mercury in fish tissue” impairment, including Sabin, Wynne,  
 455 Embarrass, and Esquagama lakes. These lakes are not covered by the statewide mercury TMDL,  
 456 but are impaired waters and in need of a TMDL pollution reduction study. These waters are not  
 457 included in Minnesota’s regional mercury TMDL because the mercury concentrations in fish are  
 458 too high to be returned to Minnesota’s mercury water quality standard through reductions in  
 459 mercury emissions from Minnesota sources alone. Based on limited sampling in studies done for  
 460 PolyMet, it is estimated that total mercury concentrations in the Embarrass River averaged  
 461 4.8 ng/L at monitoring station PM-12 and 4.0 ng/L at monitoring station PM-13 from 2004 to  
 462 2013. Methylmercury concentrations in the Embarrass River averaged 0.5 ng/L at PM-12 and 0.4  
 463 ng/L at PM-13 over the same period (see Section 4.2.2.1.4). The overall average total mercury  
 464 concentration at two discharge locations at the existing LTVSMC Tailings Basin (SD-026 and  
 465 SD-004) over a 5-year period was 1.0 ng/L, indicating relatively low mercury concentrations in  
 466 the seepage from this basin. All monitoring results were well below average concentrations in  
 467 precipitation (approximately 13 ng/L), suggesting that some mercury appears to be sequestered  
 468 in the existing LTVSMC tailings.

469 As discussed in Section 5.2.2.3.4, mercury would be released from the Tailings Basin via  
 470 seepage, discharge from the WWTP, and volatilization from the Tailings Basin pond. As with  
 471 the Mine Site, analog data and simple mass balance model estimation methods were used to  
 472 estimate future mercury concentrations. Table 6.2.2-6 summarizes the relative mercury  
 473 contributions from the various identified activities in the watershed. As discussed in Section  
 474 5.2.2.3.4 and above, research indicates that mining itself is not expected to appreciably affect  
 475 total mercury discharges; rather, the greater concern is the potential for sulfate  
 476 discharges/releases to promote mercury methylation.

477 **Table 6.2.2-6 Cumulative Mercury Loadings to the Embarrass River by Activity**

| Activity                                                     | Average Discharge/<br>Release Rate<br>(cfs) | Representative<br>Mercury Concentration<br>(ng/L) | Average Total Mercury Load<br>(kg/d)                            |
|--------------------------------------------------------------|---------------------------------------------|---------------------------------------------------|-----------------------------------------------------------------|

| City of Aurora POTW                                          | 0.3 <sup>(1)</sup>                          | NA                                                | NA                                                              |
| City of Biwabik<br>POTW                                      | 0.0                                         | 0.0                                               | 0.0                                                             |
| ArcelorMittal Mines<br>(Laurentian and East<br>Reserve Mine) | 9.3                                         | 1.6                                               | 3.6E-05                                                         |
| NorthMet Project<br>Proposed Action Plant<br>Site WWTP       | 5.4 (operations)<br>4.3 (closure)           | 1.0–1.3                                           | 1.3E-05 to 1.7E-05 (operations)<br>1.1E-05 to 1.4E-05 (closure) |

478 Sources: MPCA 2014b; PolyMet 2014w; PolyMet 2015i; MPCA2012i; MPCA 2013g; MPCA 2014c; MPCA 2012j; MPCA  
 479 2013h; MPCA 2014d.

480 Note:  
 481 <sup>1</sup> Discharge is to the St. Louis River.

482 The NorthMet Project Proposed Action is predicted to result in a net increase in mercury  
 483 loadings to the Embarrass River of up to 0.2 grams per year (from 22.3 grams per year to 22.5  
 484 grams per year), which represents about a 1 percent increase. This increase is primarily  
 485 attributable to the redirection of surface runoff diverted via the drainage swale constructed east  
 486 of the Tailings Dam East Dam directly to Mud Lake Creek at an assumed mercury concentration  
 487 of 3.5 ng/L (versus a seepage concentration of 1.0 ng/L). The Tailings Basin Containment  
 488 System, which collects seepage from the Tailings Basin, with an estimated mercury  
 489 concentration of 1.0 ng/L, routes it to the WWTP, which discharges with an assumed mercury  
 490 concentration of 1.3 ng/L, which is considered conservative in that the WWTP and the greensand  
 491 filter are expected to remove some mercury from effluent.

492 Overall, the NorthMet Project Proposed Action is predicted to result in a net decrease of  
 493 mercury-loadings of approximately 1.0 grams per year (i.e., a net decrease of 1.2 grams per year  
 494 in the Partridge River and a net increase of 0.2 grams per year in the Embarrass River), which is  
 495 too small to distinguish from natural background variability using available laboratory methods.  
 496 Therefore, the NorthMet Project Proposed Action would not contribute to cumulative effects on  
 497 mercury loading to the St. Louis River.

498

## 1 **6.2.3 Wetlands**

2 The cumulative effects analysis for wetlands included both a quantitative analysis as well as a  
3 qualitative analysis for determining cumulative effects to wetlands. An analysis was done to  
4 determine cumulative effects of direct impacts from all past, present, and reasonably foreseeable  
5 future projects to wetlands, lakes, and deepwater resources (i.e., mine pits) located in the  
6 Partridge River and Embarrass River watersheds (PolyMet 2015b). Three time periods were used  
7 in the effects analysis, including pre-settlement, existing, and the foreseeable future. In addition,  
8 a qualitative analysis was done 1) to assess the potential cumulative wetland indirect effects  
9 (Section 6.2.3.4.4) and 2) for cumulative wetland effects for the St. Louis River below the  
10 ordinary high water mark from its confluence with the Embarrass River to Lake Superior  
11 (Section 6.2.3.4.5). A qualitative assessment of the potential impacts of climate change on  
12 wetlands is discussed in Section 5.2.7.2.4 and 6.2.7.

### 13 **6.2.3.1 Approach**

14 An estimate of pre-settlement wetland, lake, and deepwater (i.e., mine pits) acreages within the  
15 Partridge River and Embarrass River watersheds was developed using the USFWS NWI maps  
16 and the original survey maps developed using data from the original General Land Office  
17 surveys (PolyMet 2015b).

18 Existing wetland, lake, and deepwater resources were estimated using wetland delineations  
19 completed in the area, NWI maps, USGS National Hydrograph Dataset (to estimate lacustrine  
20 waterbodies), and MDNR Mesabi Mining features in combination with 2010 LiDAR data and  
21 aerial photographs from 2003, 2008, 2009, and 2010 to estimate deepwater or mine pit  
22 waterbodies (PolyMet 2015b).

23 Federal, state, and local agencies were contacted to identify foreseeable future actions within the  
24 Partridge River and Embarrass River watersheds. Agency officials were asked to identify actual  
25 or potential development projects that may occur in these two watersheds during the life of the  
26 NorthMet Project Proposed Action. The projects and their proposed mitigation for this  
27 assessment are provided below (PolyMet 2015b):

- 28 • The NorthMet Project Proposed Action, located in the Embarrass and Partridge River  
29 watersheds, would directly affect 913.8 acres of wetlands located within the NorthMet  
30 Project area over the next 20 years (see Table 6.2.3-1). Approximately 321 acres of  
31 deepwater habitat is planned at the Mine Site at the conclusion of the NorthMet Project  
32 Proposed Action.
- 33 • The proposed Mesabi Mining Project, located in the Partridge River Watershed, has  
34 identified the potential for approximately 267 acres of direct wetland impact over the life of  
35 the project (see Table 6.2.3-1). Approximately 1,601 acres of deepwater habitat is planned at  
36 the conclusion of the project, resulting in an increase of 49 acres from existing 1,552 acres of  
37 deepwater habitat (see Table 6.2.3-1).
- 38 • The ArcelorMittal Deposit East Reserve Project, located in the Embarrass River Watershed,  
39 has identified the potential for 116.2 acres of direct wetland impact over the life of the  
40 project (see Table 6.2-3-1). Through 2014 there have been 67.1 acres of direct wetland  
41 impacts, which have been accounted for under present conditions. Therefore, potential future

42 wetland impacts of 49.1 acres would still be anticipated over the life of the project (see Table  
43 6.2.3-1). Approximately 275 acres of deepwater habitat is planned at the conclusion of the  
44 project, resulting in an increase of 275 acres from the existing zero acres of deepwater  
45 habitat.

46 • The ArcelorMittal Deposit Push Back Project, located in the Embarrass River Watershed, has  
47 identified the potential for approximately 23 acres of direct wetland impact over the life of  
48 the project (see Table 6.2.3-1). Approximately 107 acres of deepwater habitat may develop at  
49 the conclusion of the project, resulting in an increase of 107 acres from the existing zero  
50 acres of deepwater habitat.

51 • The Mining Resources Austin Powder Project, located in the Embarrass River Watershed,  
52 has identified the potential for 3.4 acres of direct wetland impact over the life of the project  
53 (see Table 6.2.3-1). No deepwater habitat is planned at the conclusion of the project.

54 • The Mining Resources Corsica Basin Project, located in the Embarrass River Watershed, has  
55 identified the potential for approximately 50 acres of direct wetland impact over the life of  
56 the project (see Table 6.2.3-1). No deepwater habitat is planned at the conclusion of the  
57 project.

58 • The Laskin Energy Park is located in the Partridge River Watershed and south of the  
59 Minnesota Power Laskin Energy Center (see Table 6.2.3-1). It is located adjacent to Colby  
60 and Whitewater Lakes, near the City of Hoyt Lakes. If every lot in the 220-acre industrial  
61 park was fully developed, the potential direct wetland impacts could range from zero to  
62 seven acres. The amount of wetland mitigation that may be conducted in the Partridge River  
63 Watershed is unknown at this time.

64 • St. Louis County Public Works are planning eight bridge replacements in the Partridge River  
65 and Embarrass River watersheds over the next 10 years. These bridge replacements generally  
66 directly impact 10,000 ft<sup>2</sup> of wetlands or less, so the maximum direct wetland impact from  
67 the bridge projects would be about 1.8 acres (see Table 6.2.3-1).

68 Table 6.2.3-1 below summarizes the direct wetland effects, proposed wetland mitigation, and the  
69 existing and future deepwater habitat, as well as the proposed net change for wetlands and  
70 deepwater habitat that would occur from the foreseeable future actions that were identified  
71 within the wetland CEAA. Tables 6.2.3-2 and 6.2.3-3 summarize the overall wetland and water  
72 resources found during the pre-settlement condition time period and that currently exist within  
73 the CEAA. Tables 6.2.3-4 and 6.2.3-5 summarize the overall wetland and water resources that  
74 would be expected future conditions within the CEAA when taking into account the projects that  
75 were assessed within the CEAA direct wetland effects and future deepwater habitat as presented  
76 in Table 6.2.3-1.

77 **Table 6.2.3-1 Future Conditions for Wetland and Deepwater Habitat Resources for the**  
 78 **Foreseeable Future Actions within the Partridge River and Embarrass River**  
 79 **Watersheds**

| Project Name                                             | Wetland Impact (acres) | Proposed Wetland Mitigation (acres) | Net Change in Wetlands (acres) | Existing Deepwater Habitat (acres) | Future Deepwater Habitat (acres) | Net Change in Deepwater (acres) |
|----------------------------------------------------------|------------------------|-------------------------------------|--------------------------------|------------------------------------|----------------------------------|---------------------------------|

80 Source: PolyMet 2015b.

81 Notes:

82 <sup>1</sup> The (-) represents a loss of water resources acres and the (+) represents a gain of water resources acres.

83 <sup>2</sup> These wetlands are exempt because the wetlands are located within the LT VSMC Permit to Mine Ultimate Tailings Basin Limit  
 84 boundary and are not regulated by state and federal wetland regulations (see Section 5.2.3).

85 To estimate the future projected wetland, lake, and deepwater resource effects from the  
 86 NorthMet Project Proposed Action, the Mesabi Mining Project, the Laskin Energy Park project,  
 87 and the St. Louis County bridge replacement, the maximum effect acreages were used to  
 88 calculate total acreages. The projected foreseeable future conditions were estimated by  
 89 calculating the net change in wetlands, lakes, and deepwater resources (see Table 6.2.3-1) and  
 90 then adding this future projected development of wetland, lake, and deepwater resources to the  
 91 existing resource totals (PolyMet 2015b).

## 92 **6.2.3.2 Cumulative Effects Assessment Area**

### 93 **6.2.3.2.1 Spatial**

94 The Partridge River and Embarrass River watersheds were used as the spatial boundary for  
95 wetland cumulative effects, as these are the only watersheds in which proposed direct and  
96 indirect wetland effects would occur. A qualitative analysis of cumulative wetland effects for the  
97 St. Louis River below the ordinary high water mark from its confluence with the Embarrass  
98 River to Lake Superior was also evaluated based on a qualitative estimate of flow changes in the  
99 river.

### 100 **6.2.3.2.2 Temporal**

101 The pre-settlement condition time period represents wetland, lake, and deepwater resources as  
102 they existed prior to mining and urban development in the late 1800s to early 1900s. The existing  
103 conditions time period represents those resources as they exist today, prior to the development of  
104 the NorthMet Project Proposed Action. The future conditions time period represents wetland,  
105 lake, and deepwater resources expected to be present following the conclusion and long-term  
106 closure of the NorthMet Project Proposed Action. It was assumed that the future conditions  
107 represent the time period after the conclusion of the future projects when the mine pits would  
108 have flooded with water (PolyMet 2015b).

### 109 **6.2.3.3 Cumulative Actions**

110 This assessment included physical cumulative effects on wetland, lake, and deepwater resources  
111 associated with the current and foreseeable mining actions listed below (PolyMet 2015b). The  
112 following reasonably foreseeable cumulative actions were included in the cumulative effects  
113 assessment for wetlands:

- 114 • ArcelorMittal East Reserve Project;
- 115 • ArcelorMittal Deposits Push Back;
- 116 • LTV Steel Mining Company Former LTVSMC Pits;
- 117 • Laskin Energy Park;
- 118 • Mesabi Mining Project;
- 119 • Mesabi Nugget;
- 120 • Mining Resources Austin Powder Basin Project;
- 121 • Mining Resources Corsica Basin Project;
- 122 • Minnesota Power Laskin Energy Center;
- 123 • Northshore Mine;
- 124 • Northshore Closure; and
- 125 • St. Louis County Public Works Bridge Replacements.

126 **6.2.3.4 Cumulative Effects Assessment**

127 **6.2.3.4.1 Pre-settlement Wetland and Water Resources**

128 A relationship (ratio) was developed between the NWI mapping and pre-settlement mapping of  
129 wetland, lake, and deepwater resources to serve as an adjustment factor. This factor converted  
130 the original survey data to the standards of the NWI data for estimating the pre-settlement  
131 wetland, lake, and deepwater resources within disturbed areas of each watershed.

132 **Partridge River Watershed**

133 Using the disturbance at the township level (0.2 percent in the entire township and 0.4 percent  
134 for the portion within the watershed), the ratio of NWI to pre-settlement wetlands, lakes, and  
135 deepwater resources was calculated to be 1.21 for the least-disturbed township in the Partridge  
136 River Watershed. This ratio indicates there were approximately 21 percent more wetlands, lakes,  
137 and deepwater resources identified on the NWI maps than on the pre-settlement maps for the  
138 Partridge River Watershed (PolyMet 2015b).

139 Disturbance in the townships located within the Partridge River Watershed ranged between 0.4  
140 and 52 percent, with approximately 15 percent of the entire Partridge River Watershed  
141 containing substantial human disturbance since settlement of the area. The disturbance types in  
142 the watershed consisted of: mining features such as stockpiles, mine pits, roads, and other  
143 infrastructure (82 percent of the disturbed areas); municipal/residential development (e.g., cities  
144 of Aurora and Hoyt Lakes) with some barren land and cultivated crops (13 percent of the  
145 disturbed areas); and roads and railroads (5 percent of the disturbed areas). Approximately 85  
146 percent of the Partridge River Watershed was deemed to be relatively undisturbed; therefore,  
147 NWI mapping was used in these areas to represent pre-settlement conditions for wetlands, lakes,  
148 and deepwater resources (PolyMet 2015b).

149 Based on the original survey maps, approximately 2,991 acres of wetland were mapped within  
150 the disturbed areas in the Partridge River Watershed. This wetland acreage was adjusted to 3,620  
151 acres using the 1.21 adjustment factor. After accounting for the disturbed areas, a total of 33,601  
152 acres of wetlands was identified in the 101,812-acre watershed, comprising 33 percent of the  
153 watershed (see Table 6.2.3-2).

154 Based on the original survey maps, 24 acres of lake were mapped within the disturbed areas in  
155 the Partridge River Watershed. This lake acreage was adjusted to 29 acres using the 1.21  
156 adjustment factor. After accounting for the disturbed areas, a total of 2,688 acres of lake was  
157 identified in the 101,812-acre watershed, comprising 3 percent of the watershed (see  
158 Table 6.2.3-2).

159 No deepwater resources were identified in the watershed for the pre-settlement conditions (see  
160 Table 6.2.3-2)

161

162 **Table 6.2.3-2 Pre-settlement Wetland and Water Resources by Watershed**

| Watershed       | Total Land Area (Acres) | Wetland Area |                | Lake Area |                | Deepwater Area |                |
|-----------------|-------------------------|--------------|----------------|-----------|----------------|----------------|----------------|
|                 |                         | Acres        | % of Watershed | Acres     | % of Watershed | Acres          | % of Watershed |
| Partridge River | 101,812                 | 33,601       | 33             | 2,688     | 3              | 0              | 0              |
| Embarrass River | 116,797                 | 34,650       | 30             | 3,121     | 3              | 0              | 0              |

163 Source: PolyMet 2015b.

164 **Embarrass River Watershed**

165 Using the disturbance at the township level (0.6 percent in the entire township and 0.7 percent  
 166 for the portion contained within the watershed), the ratio of NWI to original survey wetlands,  
 167 lakes, and deepwater resources was calculated to be 0.85 for the least-disturbed township in the  
 168 Embarrass River Watershed. Based on this analysis, the ratio of NWI to original survey  
 169 wetlands, lakes, and deepwater resources was calculated to be approximately 15 percent fewer  
 170 wetlands, lakes, and deepwater resources identified on the NWI maps than the original survey  
 171 maps for the Embarrass River Watershed (PolyMet 2015b).

172 Disturbance in the portions of townships located within the Embarrass River Watershed range  
 173 between 0.7 percent and 63 percent, with approximately 12 percent of the entire Embarrass River  
 174 Watershed containing substantial human disturbance since settlement of the area. The  
 175 disturbance types in the watershed consisted of: mining features including stockpiles, mine pits,  
 176 roads, and other infrastructure (61 percent of the disturbed areas); municipal/residential  
 177 development (e.g., cities of Babbitt, Biwabik, Gilbert, and McKinley) with some barren land and  
 178 cultivated crops (27 percent of the disturbed areas); and roads and railroads (12 percent of the  
 179 disturbed areas). Approximately 88 percent of the Embarrass River Watershed was deemed to be  
 180 relatively undisturbed; therefore, NWI mapping was used in these areas to represent pre-  
 181 settlement conditions for wetlands, lakes, and deepwater resources (PolyMet 2015b).

182 Based on the original survey maps, approximately 2,388 acres of wetland were mapped within  
 183 the disturbed areas of the Embarrass River Watershed. This wetland acreage was adjusted to  
 184 2,030 acres using the 0.85 adjustment factor. After accounting for the disturbed areas, a total of  
 185 34,650 acres of wetlands was identified in the 116,797-acre Embarrass River Watershed,  
 186 comprising approximately 30 percent of the watershed (see Table 6.2.3-2).

187 Based on the original survey maps, 224 acres of lake were mapped within the disturbed areas in  
 188 the Embarrass River Watershed. This lake acreage was adjusted to 190 acres using the 0.85  
 189 adjustment factor. After accounting for the disturbed areas, a total of 3,121 acres of lakes was  
 190 identified in the 116,797-acre watershed, comprising less than 3 percent of the watershed (see  
 191 Table 6.2.3-2).

192 No deepwater resources (i.e., mine pits) were identified in the watershed for the pre-settlement  
 193 conditions (see Table 6.2.3-2).

194 **6.2.3.4.2 Existing Wetland and Water Resources**

195 ***Partridge River Watershed***

196 A total of 31,318 acres of existing wetlands was identified in the 101,812-acre watershed,  
 197 comprising 31 percent of the land area (see Table 6.2.3-3). There has been a decrease of  
 198 approximately 2,283 acres of wetland; this represents a 7 percent reduction in wetland area  
 199 compared to pre-settlement conditions (PolyMet 2015b).

200 A total of 3,194 acres of lakes was identified in the 101,812-acre watershed, comprising 3  
 201 percent of the land area (see Table 6.2.3-3). There has been an increase of approximately 506  
 202 acres of lakes; this represents a 19 percent increase in lake area compared to pre-settlement  
 203 conditions (PolyMet 2015b).

204 A total of 3,146 acres of deepwater resources (i.e., mine pits) was identified in the 101,812-acre  
 205 watershed, comprising 3 percent of the land area (see Table 6.2.3-3). There has been an increase  
 206 of 3,146 acres of deepwater resources in the watershed compared to no deepwater resources  
 207 present under pre-settlement conditions (PolyMet 2015b).

208 The change in wetland, lake, and deepwater acreage has resulted primarily from mining projects,  
 209 development of municipalities, and construction of transportation infrastructure such as roads  
 210 and railroads.

211 **Table 6.2.3-3 Existing Wetland and Water Resources by Watershed**

| Watershed       | Total Land Area (Acres) | Wetland Area |                | Lake Area |                | Deepwater Area |                |
|-----------------|-------------------------|--------------|----------------|-----------|----------------|----------------|----------------|
|                 |                         | Acres        | % of Watershed | Acres     | % of Watershed | Acres          | % of Watershed |
| Partridge River | 101,812                 | 31,318       | 31             | 3,194     | 3              | 3,146          | 3              |
| Embarrass River | 116,797                 | 34,249       | 29             | 2,904     | 3              | 977            | 1              |

212 Source: PolyMet 2015b.

213 ***Embarrass River Watershed***

214 A total of 34,249 acres of existing wetlands was identified in the 116,797-acre watershed,  
 215 comprising 29 percent of the land area (see Table 6.2.3-3). There has been a decrease of  
 216 approximately 401 acres of wetlands; this represents a 1 percent reduction in wetland area  
 217 compared to pre-settlement conditions (PolyMet 2015b).

218 A total of 2,904 acres of lakes was identified in the 116,797-acre watershed, comprising 3  
 219 percent of the land area (see Table 6.2.3-3). There was a decrease of approximately 217 acres of  
 220 lakes in the watershed; this represents a 7 percent reduction in lake area compared to pre-  
 221 settlement conditions (PolyMet 2015b).

222 A total of 977 acres of deepwater resources (i.e., mine pits) was identified in the 116,797-acre  
 223 watershed, comprising less than 1 percent of the land area (see Table 6.2.3-3). There has been an  
 224 increase of 977 acres of deepwater resources in the watershed compared to no deepwater  
 225 resources present under pre-settlement conditions (PolyMet 2015b).

226 The change in wetland, lake, and deepwater acreage has resulted primarily from mining projects,  
 227 development of municipalities, and construction of transportation infrastructure such as roads  
 228 and railroads.

229 **6.2.3.4.3 Future Wetland and Water Resources**

230 ***Partridge River Watershed***

231 The NorthMet Project Proposed Action in combination with present and reasonably foreseeable  
 232 future projects would likely result in the following cumulative wetlands effects:

- 233 • Approximately 30,276 acres of wetlands are projected to be present in the 101,812-acre  
 234 watershed in the foreseeable future, comprising 30 percent of the land area (see Table  
 235 6.2.3-4). The change in wetlands, as a proportion of all wetlands within the study area, would  
 236 be a 10 percent reduction from pre-settlement conditions and a 3 percent reduction compared  
 237 to existing conditions (PolyMet 2015b).
- 238 • Approximately 3,194 acres of lakes are projected to be present in the 101,812-acre watershed  
 239 in the foreseeable future, comprising 3 percent of the land area (see Table 6.2.3-4). The  
 240 change in lakes, as a proportion of the total study area, would be a 19 percent increase from  
 241 pre-settlement conditions and there would be no changes compared to existing conditions  
 242 (PolyMet 2015b).
- 243 • Approximately 3,516 acres of deepwater resources are projected to be present in the 101,812-  
 244 acre watershed in the foreseeable future, comprising 3 percent of the land area (see Table  
 245 6.2.3-4). The change in deepwater resources, as a proportion of the total study area, would be  
 246 an introduction of 3,516 acres of new deepwater resources (compared to zero pre-settlement)  
 247 and a 12 percent increase compared to existing conditions (PolyMet 2015b).

248 Some of these projects would include mitigation of wetlands, lakes, and deepwater resources in  
 249 the Partridge River Watershed.

250 **Table 6.2.3-4 Future Wetland and Water Resources by Watershed under the NorthMet**  
 251 **Project Proposed Action**

| Watershed       | Total Land Area (Acres) | Wetland Area |                | Lake Area |                | Deepwater Area |                |
|-----------------|-------------------------|--------------|----------------|-----------|----------------|----------------|----------------|
|                 |                         | Acres        | % of Watershed | Acres     | % of Watershed | Acres          | % of Watershed |
| Partridge River | 101,812                 | 30,276       | 30             | 3,194     | 3              | 3,516          | 3              |
| Embarrass River | 116,797                 | 33,947       | 29             | 2,904     | 3              | 1,359          | 1              |

252 Source: PolyMet 2015b.

253 Under the NorthMet Project No Action Alternative, development of other projects (and  
 254 associated effects on and mitigation of wetlands, lakes, and deepwater resources in the Partridge  
 255 River Watershed) would still occur under the foreseeable future conditions.

256 Under the NorthMet Project No Action Alternative, approximately 31,044 acres of wetlands  
 257 have been projected to be present in the 101,812-acre watershed in the foreseeable future,  
 258 comprising 30 percent of the land area (see Table 6.2.3-5). The change in wetlands, as a

259 proportion of all wetlands within the study area, would be an 8 percent reduction from pre-  
 260 settlement conditions and a 1 percent reduction compared to existing conditions (PolyMet  
 261 2015b).

262 Similar to under the NorthMet Project Proposed Action, under the NorthMet Project No Action  
 263 Alternative, approximately 3,194 acres of lakes are projected to be present in the 101,812-acre  
 264 watershed in the foreseeable future, comprising 3 percent of the land area (see Table 6.2.3-5).  
 265 The change in lakes, as a proportion of the total study area, would be a 19 percent increase from  
 266 pre-settlement conditions and there would be no changes compared to existing conditions  
 267 (PolyMet 2015b).

268 Under the NorthMet Project No Action Alternative, approximately 3,195 acres of deepwater  
 269 resources are projected to be present in the 101,812-acre watershed in the foreseeable future,  
 270 comprising 3 percent of the land area (see Table 6.2.3-5). The change in deepwater resources, as  
 271 a proportion of the total study area, would be an introduction of 3,195 acres of new deepwater  
 272 resources (compared to zero pre-settlement) and a 2 percent increase compared to existing  
 273 conditions (PolyMet 2015b).

274 **Table 6.2.3-5 Future Wetland and Water Resources by Watershed under the NorthMet**  
 275 **Project No Action Alternative**

| Watershed       | Total Land Area (Acres) | Wetland Area |                | Lake Area |                | Deepwater Area |                |
|-----------------|-------------------------|--------------|----------------|-----------|----------------|----------------|----------------|
|                 |                         | Acres        | % of Watershed | Acres     | % of Watershed | Acres          | % of Watershed |
| Partridge River | 101,812                 | 31,044       | 30             | 3,194     | 3              | 3,195          | 3              |
| Embarrass River | 116,797                 | 34,122       | 29             | 2,904     | 3              | 1,359          | 1              |

276 Source: PolyMet 2015b.

277 **Embarrass River Watershed**

278 The NorthMet Proposed Project, in combination with present and reasonably foreseeable future  
 279 projects, would likely result in the following cumulative wetlands effects:

- 280 • Approximately 33,947 acres of wetlands are projected to be present in the 116,797-acre  
 281 watershed in the foreseeable future, comprising 29 percent of the land area (see Table  
 282 6.2.3-4). The change in wetlands, as a proportion of all wetlands within the study area, would  
 283 be a 2 percent reduction from pre-settlement conditions and a 1 percent reduction compared  
 284 to existing conditions (PolyMet 2015b).
- 285 • Approximately 2,904 acres of lakes are projected to be present in the 116,797-acre watershed  
 286 in the foreseeable future, comprising 3 percent of the land area (see Table 6.2.3-4). The  
 287 change in lakes, as a proportion of the total study area, would be a 7 percent reduction from  
 288 pre-settlement conditions and there would be no changes compared to existing conditions  
 289 (PolyMet 2015b).

290 • Approximately 1,359 acres of deepwater resources are projected to be present in the 116,797-  
291 acre watershed in the foreseeable future, comprising a 1 percent of the land area (see Table  
292 6.2.3-4). There would be an introduction of 1,359 acres of new deepwater resources  
293 (compared to zero pre-settlement) and there would be a 39 percent increase in deepwater  
294 resources compared to existing conditions (PolyMet 2015b).

295 Under the NorthMet Project No Action Alternative, development of other projects (and  
296 associated effects on and mitigation of wetlands, lakes, and deepwater resources in the Partridge  
297 River Watershed) would still occur under the foreseeable future conditions.

298 Under the NorthMet Project No Action Alternative, approximately 34,122 acres of wetlands  
299 have been projected to be present in the 116,797-acre watershed in the foreseeable future,  
300 comprising 29 percent of the land area (see Table 6.2.3-5). The change in wetlands, as a  
301 proportion of all wetlands within the study area, would be a 2 percent reduction from pre-  
302 settlement conditions and less than 1 percent reduction compared to existing conditions (PolyMet  
303 2015b).

304 Similar to under the NorthMet Project Proposed Action, under the NorthMet Project No Action  
305 Alternative, approximately 2,904 acres of lakes are projected to be present in the 116,797-acre  
306 watershed in the foreseeable future, comprising 3 percent of the land area (see Table 6.2.3-5).  
307 The change in lakes, as a proportion of the total study area, would be a 7 percent reduction from  
308 pre-settlement conditions and there would be no changes compared to existing conditions  
309 (PolyMet 2015b).

310 Similar to the NorthMet Project Proposed Action, under the NorthMet Project No Action  
311 Alternative, approximately 1,359 acres of deepwater resources are projected to be present in the  
312 116,797-acre watershed in the foreseeable future, comprising 1 percent of the land area (see  
313 Table 6.2.3-5). The change in deepwater resources, as a proportion of the total study area, would  
314 be an introduction of 1,359 acres of new deepwater resources (compared to zero pre-settlement)  
315 and there would be a 39 percent increase in deepwater resources compared to existing conditions  
316 (PolyMet 2015b).

#### 317 **6.2.3.4.4 Qualitative Assessment of Cumulative Potential Indirect Effects**

318 It is difficult to predict indirect wetland effects within the CEAA, as well as to know what the  
319 potential indirect wetland effects would be for the projects assessed other than the NorthMet  
320 Project Proposed Action. However, based on the amount of potential indirect wetland effects that  
321 could occur from the NorthMet Proposed Action, there could be 0.1 to 12.0 percent cumulatively  
322 lost, in addition to the direct wetland impacts assessed, within the Partridge and Embarrass River  
323 watersheds.

324 Based on the wetlands crossing analog zones analysis approach, the acreage of wetlands whose  
325 hydrology would have a high likelihood of being affected by drawdown at the Mine Site is 866.9  
326 acres. The wetlands categorized as high likelihood are dominated by one alder thicket (848  
327 acres) that has approximately 4 acres (less than 1 percent) within the 0-1,000 ft analog impact  
328 zone. The remainder of this wetland (more than 99 percent) is located more than 1,000 ft away  
329 from the edge of the mine pits and extends out to the edge of Area 1 (see Figure 5.2.3-6).  
330 Furthermore, based on this method, there would be 1,854.5 acres of wetlands within the 0-2,000  
331 ft zone and 2,147.6 acres within the 0-3,500 ft zone that could be affected by potential  
332 drawdown. Based on this approach, the total projected potential indirect effects from all six

333 factors that were assessed under this method could be up to 7,694.2 acres of wetlands potentially  
334 indirectly affected by the NorthMet Project Proposed Action. Therefore, the potential indirect  
335 cumulative effect from the NorthMet Project Proposed Action, in addition to the direct wetland  
336 impacts assessed, under this method would range between 1.3 to 12 percent.

337 Based on the method approach of wetlands within analog zones, the acreage of wetlands whose  
338 hydrology would have a high likelihood of being affected by drawdown at the Mine Site is 46.4  
339 acres. Furthermore, based on this method, there would be 348.4 acres of wetlands within the  
340 0-2,000 ft zone and 733.3 acres within the 0-3,500 ft zone that could be affected by potential  
341 drawdown. Based on this approach, the total projected potential indirect effects from all six  
342 factors that were assessed under this method could be up to 6,568.8 acres of wetlands potentially  
343 indirectly affected by the NorthMet Project Proposed Action. Therefore, the potential indirect  
344 cumulative effect from the NorthMet Project Proposed Action, in addition to the direct wetland  
345 impacts assessed, under this method would range between 0.1 to 10.2 percent.

346 **6.2.3.4.5 Qualitative Analysis of Cumulative Wetland Impacts for the St. Louis River**  
347 **below the Ordinary High Water Mark from Its Confluence with the Embarrass**  
348 **River to Lake Superior**

349 The XP-SWMM model developed for the Partridge River identified that the changes in average  
350 annual flow (and therefore stage) of the Partridge River would be within the naturally occurring  
351 annual variation for the Partridge River. Section 5.2.2 provides more details on the XP-SWMM  
352 model. Therefore, no potential indirect cumulative wetland effects are identified for the wetlands  
353 abutting the Partridge River.

354 The St. Louis River is located downstream of the Partridge River. Effects on flows (and, by  
355 extension, water surface elevations) generated by the NorthMet Project Proposed Action are  
356 anticipated to be less than those estimated for the Partridge River and within the natural variation  
357 of flow within the St. Louis River (e.g., less than 1 percent reduction in average annual flow as  
358 measured at the confluence of the Embarrass River with the St. Louis River). Therefore, no  
359 potential indirect cumulative wetland effects are identified for the wetlands within the St. Louis  
360 River below the ordinary high water mark, from its confluence with the Embarrass River to Lake  
361 Superior.

DRAFT

## 1 **6.2.4 Vegetation**

2 The cumulative effects analysis for vegetation focuses on potential losses of vegetative cover  
3 types, plant communities, MBS Sites of Biodiversity Significance, and ETSC plant species. As  
4 described below, the NorthMet Project Proposed Action would contribute to a loss of vegetative  
5 cover and ETSC plant species populations, which would combine with other past, present, and  
6 reasonably foreseeable future actions in the CEAA. Given the risk to the viability of ETSC  
7 species and their sensitivity to changes to their habitat from development projects, the analysis  
8 focuses on these species. Wildlife habitat is addressed in Section 6.2.5.

### 9 **6.2.4.1 Approach**

10 The GIS data presented in Sections 4.2.4 and 5.2.4 was compared to other actions within the  
11 CEAA, and the cumulative effects were assessed. Specifically, GIS data were obtained from the  
12 MDNR regarding the GAP, which is vegetation land cover types derived from satellite imagery,  
13 and listed ETSC plant species within the NHIS database.

14 GIS analysis was used to calculate effects on the resources described above. The effects were  
15 calculated for habitat types, classifications, and species where they physically overlap tailings  
16 piles, mine pits, tailings basins, roads, buildings, or other new infrastructure associated with the  
17 cumulative actions below.

18 NorthMet Project Proposed Action-related effects on the 10 state-listed ETSC plant species that  
19 may be present in the NorthMet Project area were identified and evaluated in Section 5.2.4.2. As  
20 discussed below, of these 10, three have a distribution that may be subject to cumulative effects.  
21 No federally listed ETSC plant species would be affected by the NorthMet Project Proposed  
22 Action (see Section 5.2.4.2). Because six of the ETSC species are also RFSS plants, the analysis  
23 below also applies to the known RFSS plants in the NorthMet Project area.

24 This section evaluates the potential cumulative effects of the NorthMet Project Proposed Action  
25 on these 10 ETSC plant species. Potential future effects were identified by analyzing Take  
26 Permits (issued by the USFWS or MDNR to authorize activities resulting in the loss of federally  
27 or state-listed species), as well as GIS information from the MDNR, to determine the extent of  
28 expected losses from recently permitted projects.

### 29 **6.2.4.2 Cumulative Effects Assessment Area**

30 The NorthMet Project Proposed Action's CEAA boundary for vegetation is described below,  
31 both spatially and temporally.

#### 32 **6.2.4.2.1 Spatial**

33 The CEAA for evaluation of cumulative effects on vegetation is defined geographically by the  
34 portion of the Mesabi Iron Range encompassed by the Nashwauk Uplands and Laurentian  
35 Uplands ecological subsections (see Figure 6.1.1-1). The ecological subsections are described in  
36 detail in Section 4.2.4.1. The area has been limited to the Mesabi Iron Range as it is a definable  
37 physiographic region encompassing the region's mining, which represents the largest and most  
38 influential land use within a reasonable distance from the NorthMet Project area.

39 **6.2.4.2.2 Temporal**

40 Overall habitat composition changes in the ecological subsections were evaluated as the temporal  
41 area of assessment, based on pre-settlement conditions (approximately 1890) through the present  
42 day (1990 to present). These timespans are indicative of past and relatively current trends in  
43 regional habitat changes relevant to the CEAA. An estimate of future trends would be based on  
44 estimated development/habitat loss, direct loss of species and individuals, and the regulatory  
45 requirements for protected species and habitats (i.e., approximately 40 years, which is consistent  
46 with the life of the NorthMet Project Proposed Action, including construction, operations, and  
47 closure).

48 **6.2.4.3 Contributing Past, Present, and Reasonably Foreseeable Actions**

49 As noted previously, it is not possible to identify all past activities that may contribute to a  
50 cumulative effect. Similarly, all present activities would continue to affect the environment. The  
51 impacts of these combined activities are described in Chapter 4, Affected Environment. This  
52 assessment includes physical cumulative effects on vegetation cover types and protected ETSC  
53 plant species associated with current and foreseeable mining actions listed below. The following  
54 reasonably foreseeable projects and/or actions, described further in Section 6.1.1.2, are included  
55 in the cumulative effects assessment for vegetation:

- 56 • ArcelorMittal Deposits (Laurentian and East Reserve deposits);
- 57 • ArcelorMittal Deposit Push Back;
- 58 • Cliffs Erie Pellet Yard;
- 59 • Community growth and development;
- 60 • Essar Steel;
- 61 • Forestry on public and private lands;
- 62 • Magnetation (Coleraine, Keewatin, Chisholm);
- 63 • Mining Resources (Sherman Basin);
- 64 • MDOT Highway 53 Relocation;
- 65 • St. Louis County Public Works Bridge Replacements;
- 66 • United Taconite Mine Expansions; and
- 67 • U.S. Steel Keetac Mine Expansion Project.

68 This analysis also looked at the six actions listed below:

- 69 • LTV Steel Mining Company (Former LTVSMC Pits);
- 70 • Mesabi Mining Project;
- 71 • Mesabi Nugget;
- 72 • Northshore Mine;
- 73 • Northshore Mine Ultimate Pit Progression Project; and

- 74 • U.S. Steel Minntac Mine.

75 Using best available information, the NHIS data and MDNR take permit data were reviewed and  
76 no vegetation records were available for these four actions. As a result, these actions are not  
77 considered in the cumulative effects analysis for vegetation.

## 78 **6.2.4.4 Cumulative Effects Assessment**

### 79 **6.2.4.4.1 Evaluation Criteria**

80 The cumulative effects assessment on vegetation is guided by evaluation criteria, which are  
81 outlined below:

- 82 • Direct effects on vegetative cover types, plant communities, MBS Sites of Biodiversity  
83 Significance, and rare species would occur through clearing, filling, and other construction  
84 activities. Direct effects would include the removal of vegetation in the construction,  
85 operation, maintenance, or closure of the NorthMet Project Proposed Action when an ETSC  
86 plant species is removed (i.e., taking of an individual plant or entire plant populations).
- 87 • An indirect effect occurs on vegetation when a change in conditions results in a change over  
88 time in cover type, plant community, or MBS Sites of Biodiversity Significance, or a rare  
89 species experiences a change in vegetative composition. Potential indirect effects on  
90 vegetation may include changes in hydrology, deposition of particulate matter (dust),  
91 changes in successional stage, alteration of microclimate (e.g., tree removal resulting in drier  
92 soil conditions, rise or fall in water table, loss of pollinators, or loss of fungal associates in  
93 the rooting zone), new or increased erosion and sedimentation, and invasion of non-native  
94 species.

### 95 **6.2.4.4.2 Existing Baseline Conditions and Past Losses**

96 As discussed in detail in Chapter 4, past changes in cover types show a mixed pattern of gains  
97 and losses from the 1890s to the 1990s (see Table 6.2.4-1). These trends are continuing today  
98 and would be expected to continue into the future. In the Laurentian Uplands subsection, few  
99 cover types discussed below have decreased. In the Nashwauk Uplands subsection, many of the  
100 cover types have experienced declines over this period, with the largest percentage decline to  
101 upland coniferous forests and upland conifer-deciduous mixed forests. Among the ETSC plant  
102 species that occur within the NorthMet Project area boundaries, ternate, or St. Lawrence,  
103 grapefern (*Botrychium rugulosum*) is most likely to occur in the upland coniferous type (see  
104 Table 6.2.4-2). Floating marsh marigold (*Caltha natans*) and least grapefern (*Botrychium*  
105 *simplex*) are most likely among these species to occur in the lowland deciduous type. Floating  
106 marsh marigold occupies edges of ponds, lakes, and streams in the lowland deciduous type, and  
107 least grapefern also occupies open wetlands, grasslands, and disturbed areas; consequently, a loss  
108 in lowland deciduous types is a less accurate reflection of trends in these species' habitats. While  
109 it appears the Laurentian Uplands subsection lost a large portion of shrublands, it is likely that  
110 habitat type was allowed to grow older, which explains the increases in upland coniferous and  
111 deciduous forests. The opposite is true for the Nashwauk Uplands subsection. Upland forest  
112 types were likely harvested in this subsection, which resulted in the increase of younger stands  
113 and shrubland habitat types.

114 **Table 6.2.4-1 Changes in Habitat Acreage between 1890 and 1990 by Ecological Subsection**

| Habitat Type                          | Percentage of Laurentian Uplands Gain/(Loss) | Percentage of Nashwauk Uplands Gain/(Loss) |
|---------------------------------------|----------------------------------------------|--------------------------------------------|
| Lowland coniferous forest             | 7                                            | (4)                                        |
| Lowland deciduous forest              | <1                                           | 2                                          |
| Upland coniferous forest              | 4                                            | (8)                                        |
| Upland deciduous forest               | 2                                            | (1)                                        |
| Upland conifer-deciduous mixed forest | <1                                           | (5)                                        |
| Shrubland                             | (15)                                         | 9                                          |
| Aquatic environments                  | 1                                            | <1                                         |

115 Source: MDNR 2006a.

116 Note:

117 <sup>1</sup> “na” indicates that insufficient data were available to determine percent coverage within the ecological subsections, although  
 118 these habitat types likely occurred at low levels.

119 This conclusion should be qualified by the understanding that the mapped habitat type does not  
 120 precisely match the habitat actually used by an ETSC or RFSS plant species. Because these plant  
 121 species occupy preferred habitats within larger mapped habitat types, the effect of habitat loss  
 122 may not directly correlate on a 1:1 basis to the effect on a plant species. Given this lack of  
 123 precision and uncertainty, the analysis assumed that large losses in mapped habitat types  
 124 represent a trend in losses of preferred habitat types for these ETSC or RFSS plant species.

125 **Table 6.2.4-2 Preferred Habitat for State-listed ETSC/RFSS Plant Species and Most Likely**  
 126 **Associated Habitat Types**

| Species                                                   | Preferred Plant Species Habitat                                                                                               | Corresponding Map Habitat Type                              |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| <i>Botrychium campestre</i>                               | Prairies, dunes, railroad sidings, fields                                                                                     | Disturbed; Cropland/ Grassland                              |
| <i>Botrychium pallidum</i> <sup>1</sup>                   | Open, disturbed habitats, log landings, roadsides, dunes, sandy gravel pits                                                   | Disturbed; Cropland/ Grassland                              |
| <i>Botrychium rugulosum</i> <sup>1</sup>                  | Generally open habitats, such as old log landings and edges of trails                                                         | Disturbed; Upland coniferous                                |
| <i>Botrychium simplex</i> <sup>1</sup>                    | Generally open habitats, such as old log landings, roadside ditch, trails, open fields, base of cliff, railroad rights of way | Disturbed; Cropland/Grassland; Lowland deciduous            |
| <i>Caltha natans</i> <sup>1</sup>                         | Shallow water of pools, ditches, sheltered lake margins, slow moving creeks, sloughs/oxbows, pools in shrub swamps            | Aquatic environments; Lowland coniferous; Lowland deciduous |
| <i>Eleocharis nitida</i> <sup>1</sup>                     | Mineral soil of wetlands, often with open canopy and disturbance, such as logging roads/ditches through wetlands              | Lowland coniferous; Disturbed                               |
| <i>Juncus stygius</i> var. <i>americanus</i> <sup>1</sup> | Shallow pools in non-forested peatlands, often in a sedge-dominated community                                                 | Lowland coniferous                                          |
| <i>Platanthera clavellata</i>                             | Coniferous swamps, fens                                                                                                       | Lowland coniferous                                          |
| <i>Ranunculus lapponicus</i>                              | Lowland conifer forests and peat bogs                                                                                         | Lowland coniferous                                          |
| <i>Torreyochloa pallida</i>                               | Pond/stream margins, lowland coniferous forest                                                                                | Aquatic environments; Lowland coniferous                    |

128 Note:

129 <sup>1</sup> These species are also RFSS plants as tracked by the USFS.

130 **6.2.4.4.3 Environmental Consequences of Reasonably Foreseeable Actions on ETSC and**  
 131 **RFSS Plant Species**

132 Future effects on ETSC and RFSS plant species were evaluated by comparing ETSC plant  
 133 species Take Permits from the MDNR to the reasonably foreseeable actions within the  
 134 cumulative spatial boundary. In addition, MDNR Lands and Minerals Division data provided  
 135 reasonably foreseeable action footprints for comparison. These were combined with best  
 136 available data that identified all known populations of ETSC plant species. Populations are  
 137 defined as a number of individuals of a species within proximity to each other and within a  
 138 defined habitat that can be self-sustaining under current conditions. MDNR NHIS populations  
 139 that match the ETSC Take Permits from the MDNR or are contained within them are presented  
 140 below for the cumulative discussion. These populations can contain from a few to thousands of  
 141 individual plants. Of the 10 ETSC plant species present in the NorthMet Project area, three  
 142 species would also be affected by other cumulative projects within the CEAA (see Table 6.2.4-  
 143 3). Cumulative effects on each of the state-listed ETSC species known to occur on the Mine Site  
 144 are discussed below. As discussed in Section 5.2.4.2, no federally listed ETSC plant species  
 145 would be affected by the NorthMet Project Proposed Action.

146 **Table 6.2.4-3 Potential Future Effects on ETSC or RFSS Plant Species Populations**  
 147 **Occurring from Reasonably Foreseeable Activities<sup>1,2</sup>**

| Species <sup>1</sup>                     | Other Projects Direct Effect (Populations) | Other Projects Indirect Effect (Populations) | NorthMet Project Proposed Action Total Effect (Populations) | Total Known Statewide Populations <sup>3</sup> | Percent of Known Statewide Populations Affected |
|------------------------------------------|--------------------------------------------|----------------------------------------------|-------------------------------------------------------------|------------------------------------------------|-------------------------------------------------|
| <i>Botrychium pallidum</i> <sup>4</sup>  | 4                                          | 0                                            | 1                                                           | 99                                             | 5                                               |
| <i>Botrychium rugulosum</i> <sup>4</sup> | 5                                          | 0                                            | 1                                                           | 72                                             | 8                                               |
| <i>Botrychium simplex</i>                | 3                                          | 0                                            | 3                                                           | 210                                            | 3                                               |

148 Notes:

149 <sup>1</sup> Species upon which no other actions besides the NorthMet Project Proposed Action are expected to have effects are discussed  
 150 in the “Proposed Action” section.

151 <sup>2</sup> Data included here were provided by the Division of Ecological Resources, MDNR, and were current as of August 5, 2014.  
 152 These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be  
 153 construed to mean that no significant features are present.

154 <sup>3</sup> Statewide population data provided by Lisa Joyal (MDNR) on March 26, 2013.

155 <sup>4</sup> These species are also RFSS plants as tracked by the USFS.

156 Pale moonwort (*Botrychium pallidum*) is widely distributed across five Canadian provinces and  
 157 eight U.S. states (Colorado, Maine, Michigan, Minnesota, Montana, South Dakota, Wisconsin,  
 158 and Wyoming). The NorthMet Project Proposed Action would directly affect one population.  
 159 The cumulative actions within the CEAA would directly affect four additional populations, while  
 160 no populations are expected to be indirectly affected. In total, approximately 5 percent of the  
 161 known populations in Minnesota would be directly affected by the NorthMet Project Proposed  
 162 Action and other present or reasonably foreseeable activities (see Table 6.2.4-3). Due to its small  
 163 size, the species is easily overlooked and additional populations may yet be located. *B. pallidum*  
 164 was listed as a state endangered species in 1996 when there were just six documented  
 165 occurrences in Minnesota. By 2009, the number had risen to 65 (MDNR 2011k). Its relatively  
 166 short lifespan (emergence to senescence within four weeks) may account for the few populations  
 167 documented to date. Given its preference for disturbed sites, the cumulative effects of the  
 168 NorthMet Project Proposed Action and other reasonably foreseeable activities are not expected  
 169 to jeopardize the presence of *B. pallidum* in Minnesota or in North America.

170 Ternate, or St. Lawrence, grapefern (*Botrychium rugulosum*) is widely distributed across three  
 171 Canadian provinces and six U.S. states (Connecticut, Michigan, Minnesota, New York, Vermont,  
 172 and Wisconsin). The NorthMet Project Proposed Action would directly affect one population of  
 173 the species (see Section 5.2.4.2). Other reasonably foreseeable activities would directly affect  
 174 five populations; no populations would be indirectly affected. In total, approximately 8 percent  
 175 of the known populations in Minnesota would be directly affected by the NorthMet Project  
 176 Proposed Action and other reasonably foreseeable activities (see Table 6.2.4-3). *B. rugulosum*  
 177 was listed as a state threatened species in Minnesota in 1996 (MDNR 2011k). This species’  
 178 tolerance for disturbance in early successional communities allows it to establish in areas  
 179 previously disturbed by human activity. Because of this habitat preference, and the early  
 180 successional habitats that develop around disturbed areas, the cumulative effects of the NorthMet  
 181 Project Proposed Action and other reasonably foreseeable activities are not expected to  
 182 jeopardize the presence of *B. rugulosum* in Minnesota or in North America.

183 Least grapefern (*Botrychium simplex*) is widely distributed across 34 U.S. states and 11  
184 Canadian provinces. The NorthMet Project Proposed Action would directly affect three  
185 populations of the species. Other reasonably foreseeable activities would directly affect three  
186 populations; no populations would be indirectly affected. In total, approximately 3 percent of the  
187 known populations in Minnesota would be directly affected. Given its tolerance for disturbance  
188 and that the species is considered “secure,” the cumulative effects of the NorthMet Project  
189 Proposed Action and other reasonably foreseeable activities are not expected to jeopardize the  
190 presence of *B. simplex* in Minnesota or in North America.

191 In addition to past, present, and reasonably foreseeable activities, other future changes in habitat  
192 types may affect ETSC plant populations. Forestry management generally has a greater influence  
193 on habitat acreage within the range of these ETSC plant species than does mining and other land  
194 development. It should be noted, however, that forestry management offers a greater range of  
195 options for ETSC plant species to co-exist with the practice, as it can mimic natural disturbances,  
196 whereas mining represents a complete land conversion that could affect long-term ETSC habitat  
197 availability. Between 2005 and 2014, the average annual forest acres within the Laurentian  
198 Uplands subsection that were harvested on state lands was approximately 1,034 acres (0.2  
199 percent of the subsection) (MDNR 2006b). Between 2010 and 2019, the average annual forest  
200 acres within the Nashwauk Uplands subsection that were or will be harvested on state lands was  
201 approximately 1,189 acres (0.1 percent of the subsection) (MDNR 2010b). On average, 1 percent  
202 of timber land in the Superior National Forest is harvested annually (Deckard, Pers. Comm.,  
203 April 26, 2012). Private timber harvest data are generally not available. The potential cumulative  
204 effects on the three state-listed ETSC species identified by this assessment are small relative to  
205 the extent of the populations and distribution within the Superior National Forest and within the  
206 state.

#### 207 **6.2.4.4.4 Effects from Acid (NO<sub>2</sub>/SO<sub>2</sub>) and Mercury Deposition**

208 Acid (sulfuric and nitric) and mercury deposition from air sources could also affect vegetation  
209 and ETSC species. The sources and analysis are described in Section 6.2.7.5. These depositions  
210 may have an adverse effect on the overall biodiversity of terrestrial ecosystems, including  
211 forested habitats, cover types, and plant communities. These pollutants may travel long distances  
212 and contribute to complex chemical and physical reactions within a variety of forested habitats,  
213 which could contribute to increased vulnerability of sensitive vegetation. Additionally, these  
214 pollutants can be carried by precipitation into nearby lakes and rivers, which sustain some  
215 vegetation and forested habitats. The lakes (and their associated watersheds) in the vicinity of the  
216 CEAA include Heikkila Lake, Colby Lake, Sabin Lake, Wynne Lake, and Whitewater Lake.

217 As described in Section 6.2.7.5, since the NorthMet Project Proposed Action would have  
218 relatively low emissions of SO<sub>2</sub> and NO<sub>2</sub> and potential deposition of sulfate would be below both  
219 the Minnesota standard threshold value and the federal Class I threshold values, in combination  
220 with the overall reduction in sulfate and nitrate-producing emissions cumulatively since 2008,  
221 the actions and projects would not likely cause a cumulative effect on the ecosystems.

222 The MPCA estimated that over 90 percent of the mercury deposition within Minnesota is a result  
223 of other states and countries (MPCA 2013e). However, as described in Section 5.2.7.2.5, the  
224 Plant Site would be expected to contribute essentially all of the NorthMet Project Proposed  
225 Action-related mercury air emissions of 4.6 lbs/year, as the Mine Site only contributes potential  
226 emissions of less than 1.0 lb/yr (Barr 2011g). Based on the results of the MMREM evaluation

227 summarized in cumulative effects Section 6.2.6.3.3, the potential additional mercury load that  
228 might be added to the Embarrass River and the Partridge River from air emissions is not  
229 expected to adversely affect these ecosystems when compared to the variability in background  
230 mercury concentrations. Similarly, the mercury deposition on terrestrial environments is not  
231 expected to adversely affect these ecosystems when compared to variability in background  
232 mercury concentrations. Additional information on the cumulative analysis of acid and mercury  
233 deposition associated with air emissions is summarized in Section 6.2.6.3.3 and 6.2.7.5.  
234

DRAFT

## 1 **6.2.5 Wildlife**

2 The cumulative effects analysis for wildlife focuses on potential losses of sensitive wildlife  
3 species (federally and state-listed species and Species of Special Concern, SGCN, RFSS, and  
4 other wildlife species), effects on wildlife habitat, and effects on wildlife travel corridors. The  
5 analysis reveals that, while some loss and fragmentation of wildlife habitat would occur as a  
6 result of the NorthMet Project Proposed Action and other cumulative projects in the CEAA,  
7 these actions would not further threaten special status wildlife species. See Section 6.2.4 for the  
8 discussion of potential cumulative effects from loss of vegetation cover types.

### 9 **6.2.5.1 Approach**

10 Cumulative effects on wildlife may include the loss and/or fragmentation of habitat and  
11 encroachments into critical wildlife travel corridors. Similar to the direct and indirect effects for  
12 the NorthMet Project Proposed Action, analysis was also conducted for cumulative effects on  
13 sensitive species such as federally or state-listed species, SGCN, and RFSS. These effects were  
14 assessed by evaluating the effects of the NorthMet Project Proposed Action with other past,  
15 present, and reasonably foreseeable future federal, state, and private actions.

16 Analysis of cumulative effects on wildlife was assessed both qualitatively and quantitatively  
17 using the following methods:

- 18 • MCWCS Action Plan, *Tomorrow's Habitat for the Wild & Rare* (MDNR 2006d);
- 19 • Marschner's Original Pre-settlement Vegetation Map of Minnesota as interpreted and  
20 analyzed by researchers, the Minnesota Forest Resources Council, and at the subsection level  
21 in the MCWCS approach by the MDNR (MFRC 2003a; MDNR 2006d); and
- 22 • Reports on mining, infrastructure, and forestry effects (e.g., Emmons & Olivier 2006; USFS  
23 2004b); state timber harvest reports (MDNR 2006b; MDNR 2010b).

24 The MCWCS is a central component of MDNR's strategy for managing wildlife populations in  
25 the state; use of the strategy is therefore appropriate as the basis for assessing cumulative effects  
26 on wildlife habitat loss and fragmentation.

### 27 **6.2.5.2 Cumulative Effects Assessment Boundary**

#### 28 **6.2.5.2.1 Spatial**

29 The spatial CEAA for wildlife includes the portions of the Mesabi Iron Range located within the  
30 Nashwauk Uplands and Laurentian Uplands ecological subsections (see Figure 6.1.1-1). The area  
31 has been limited to the Mesabi Iron Range, as it is a definable physiographic region  
32 encompassing the region's mining, which represents an influential land use in regards to wildlife  
33 and wildlife habitat.

#### 34 **6.2.5.2.2 Temporal**

35 Overall habitat composition changes in the ecological subsections were evaluated as the temporal  
36 area of assessment, based on pre-settlement conditions (approximately 1890) through the present  
37 day (1990 to present). These timespans are indicative of past and relatively current trends in  
38 regional habitat changes relevant to the CEAA. An estimate of future trends is based on

39 estimated development/habitat loss, direct loss of species and individuals, and the regulatory  
40 requirements for habitat and protected species (e.g., approximately 40 years, which is consistent  
41 with the life of the NorthMet Project Proposed Action, including construction, operations, and  
42 closure).

### 43 **6.2.5.3 Past, Present, and Reasonably Foreseeable Future Actions**

44 The following projects and actions, described in Section 6.1.1.2, have been included in the  
45 cumulative effects analysis due to their potential effects on wildlife across the Laurentian  
46 Uplands and Nashwauk Uplands ecological subsections:

- 47 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 48 • ArcelorMittal Deposit Push Back;
- 49 • Cliffs Erie Pellet Yard;
- 50 • Community growth and development (regional), including road construction and expansion  
51 projects;
- 52 • Essar Steel Mine;
- 53 • Forestry practices (regional);
- 54 • LTV Steel Mining Company Former LTVSMC Pits;
- 55 • Magnetation (Coleraine, Keewatin, and Chisholm);
- 56 • Mesabi Mining Project;
- 57 • Mesabi Nugget;
- 58 • Mining Resources (Sherman Basin);
- 59 • MDOT US Highway 53 Virginia to Eveleth Relocation;
- 60 • Northshore Mine and Northshore Ultimate Pit Progression Project;
- 61 • United Taconite Mine Expansions;
- 62 • U.S. Steel Mine Expansion Project (Keetac); and
- 63 • U.S. Steel Minntac Mine and Extension Project.

### 64 **6.2.5.4 Cumulative Effects Assessment**

#### 65 **6.2.5.4.1 Wildlife Habitat**

66 The study area for loss and fragmentation of habitat is the 810,000-acre Nashwauk Uplands and  
67 the 567,000-acre Laurentian Uplands ecological subsections. Forest composition changes from  
68 the pre-settlement period through current conditions are indicative of wildlife habitat trends. The  
69 MCWCS approach uses Marschner pre-settlement mapping as a baseline for describing changes  
70 taking place in vegetation types/ecosystems since the 1800s, using recent land cover data from  
71 the Minnesota GAP land cover data and reported by ecological subsection (MDNR 2006d). The  
72 effects on wildlife were evaluated by noting the change in amount of each Marschner habitat  
73 type in terms of the effect on wildlife species that use that habitat type.

74 Wildlife habitats that decreased in acreage from pre-settlement to current conditions present a  
75 higher risk of future SGCN population decreases and are in greater need of conservation in  
76 Minnesota.

77 The changes in habitat types in the Nashwauk Upland and Laurentian Upland subsections from  
78 pre-settlement through today are presented in Section 6.2.4.4, in Table 6.2.4-1. These data  
79 indicate an overall decrease in upland and lowland forest types in the Nashwauk Uplands  
80 ecological subsection during these periods. Forest types increased in the Laurentian Uplands.

81 In the majority of the region, forest communities have transitioned from predominately pine- and  
82 tamarack-dominated forests to aspen and other non-pine community-dominated forest species.  
83 Further, research indicates that current mature forest represents only about 4.4 percent of the old  
84 growth acreage that existed in the 1800s (Jaakko Poyry 1994). Forest composition has changed,  
85 and the MFRC (2003b) concluded that forest fragmentation has increased, with decreased patch  
86 sizes and more miles of forest edge.

87 Within the Laurentian Uplands and Nashwauk Uplands subsections, agricultural land use is  
88 minimal. Developed land including mined lands, non-mine related industrial use, commercial  
89 and residential use, cropland, and pasture total 11 percent of the Nashwauk Uplands and 1  
90 percent of the Laurentian Uplands. The balance is higher quality wildlife habitat, including  
91 forest, wetlands, and open water.

92 Some wildlife species in northeast Minnesota are sensitive to habitat changes and may be  
93 adversely affected by change. Disturbance (such as fire and forestry) produces a landscape  
94 pattern that contains less habitat for species needing large habitat patches, such as ovenbirds, and  
95 poorer quality habitat for species requiring older and more diverse forest vegetation, such as  
96 northern goshawks (MFRC 2003a). Some wildlife populations are more affected by timber  
97 harvest and forest composition than others, and species whose habitat range edges are affected  
98 by forest composition changes are more likely to be affected (Jaakko Poyry 1994).

99 An assessment of cumulative effects through 2014 from forestry, and for an unstated near-term  
100 period from mining and non-mining development, was completed for the 12.5 million-acre  
101 Arrowhead Region, which includes the Laurentian Uplands and Nashwauk Uplands ecological  
102 subsections (Emmons & Olivier 2006). Potential disturbances to wildlife habitat within the  
103 Laurentian Uplands ecological subsection were primarily due to timber harvest and mining, and  
104 habitat types most likely to be affected included upland and lowland coniferous forest, upland  
105 deciduous forest, and upland shrub/woodland. Within the Nashwauk Uplands ecological  
106 subsection, mining activities and urban development were more likely to affect wildlife habitat,  
107 with upland deciduous forests and upland shrub/woodland habitats most affected (Emmons &  
108 Olivier 2006).

109 A subsequent study for the Keetac Expansion Project (Barr 2009a) expanded on a previous  
110 wildlife corridor and habitat analysis and quantified the effects on habitat from reasonably  
111 foreseeable mining and urban/development projects along the Iron Range (Emmons & Olivier  
112 2006). The study differentiated between “high-impact” and “moderate-impact” features as  
113 related to mining and other urban/development. High-impact features create physically  
114 impenetrable barriers to wildlife including mining pits, in-pit activities, and operations plants and  
115 buildings. Moderate-impact features are areas that experience a change in topography,  
116 community structure, diversity, and function but would not be physically impenetrable for many

117 species, such as stockpiles, tailings basins, borrow areas, settling ponds, and haul roads.  
118 Moderate-impact areas may naturalize and revegetate over time (Barr 2009a).

#### 119 **6.2.5.4.2 Wildlife Travel Corridors**

120 Wildlife could be affected by the NorthMet Project Proposed Action and other actions through a  
121 cumulative disruption of their travel corridors. These actions could pose additional barriers to  
122 wildlife movement by increasing the number of isolated patches of suitable habitat, increasing  
123 mortality during transit, and physically blocking travel. This may lead to increased population  
124 and genetic isolation and decreased meta-population dynamics, which in turn could lead to  
125 decreases in overall population stability and persistence. See Section 5.2.5.2.3 for a discussion on  
126 studies regarding wildlife corridor mitigation options.

127 Two studies have examined the potential cumulative effects of mining operations on wildlife  
128 movement along the Iron Range, the conclusions of which form the base of cumulative effect  
129 analysis in this FEIS: Emmons & Olivier (2006) supplemented with additional findings from  
130 Barr (2009a).

131 As noted in Chapter 4, there are 13 major wildlife travel corridors connecting large roadless  
132 blocks along the Mesabi Iron Range (Emmons & Olivier 2006). These corridors range from less  
133 than 0.1 mile to over 3.2 miles wide, with a total combined length of 20.2 miles.

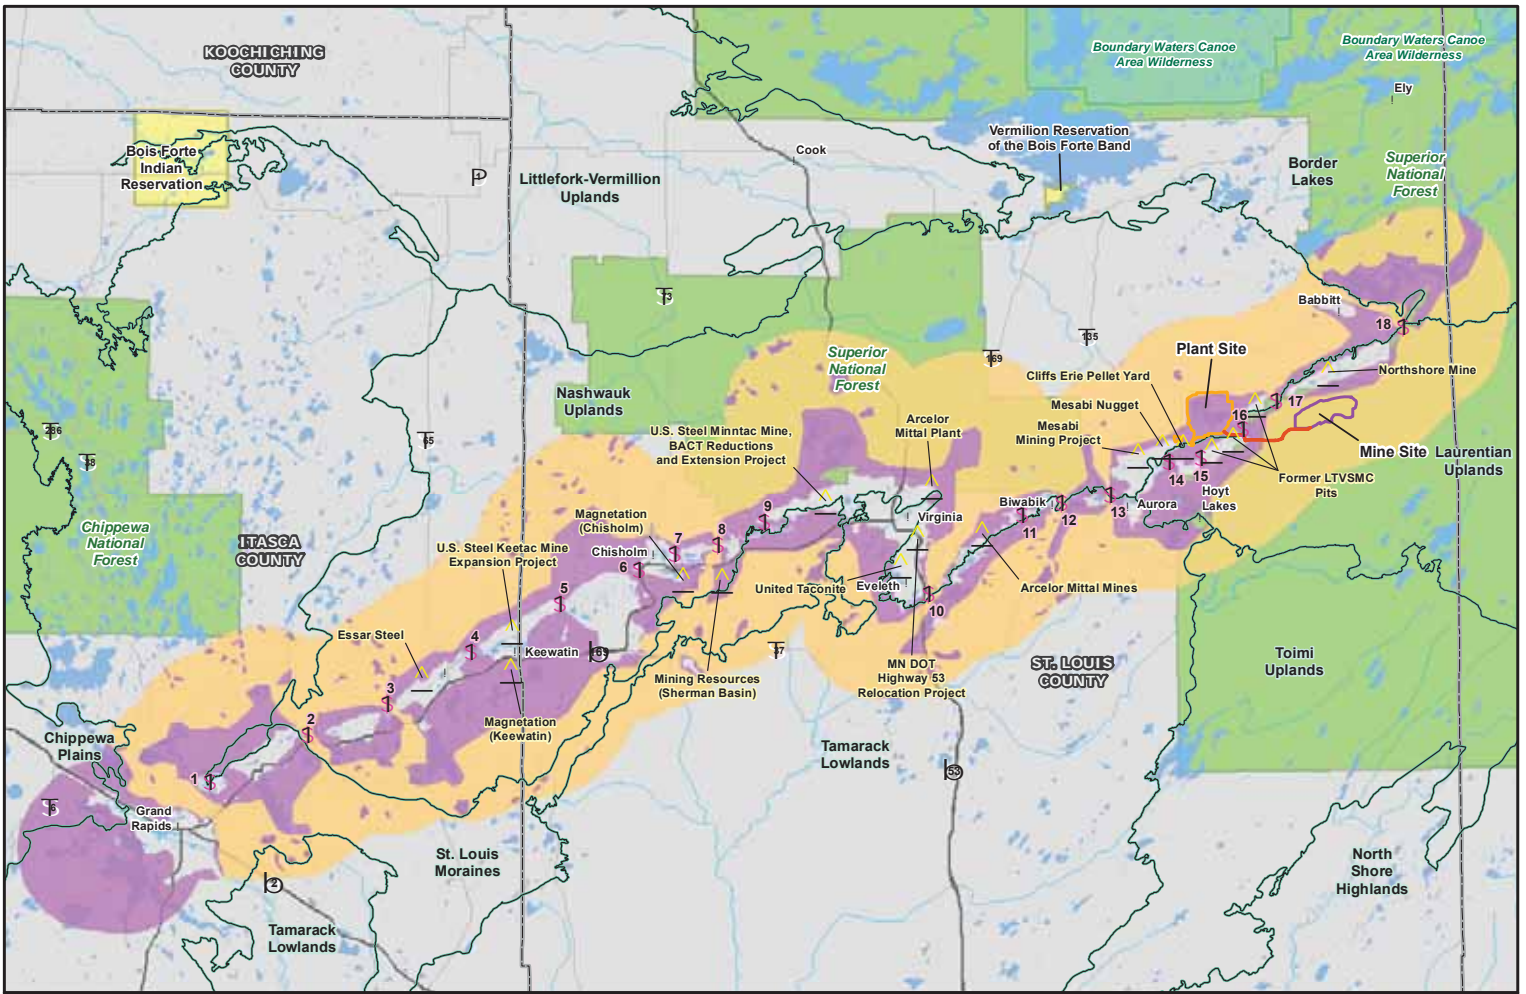

134 Barr Engineering (2009a) also analyzed wildlife corridors along the Mesabi Iron Range,  
135 identifying five additional corridors (for a total of 18) along the same extent and differentiating  
136 between mine features that precluded wildlife movement (high-impact features) and mine  
137 features that were still passable and would potentially revegetate over time (moderate-impact  
138 features) (see Figure 6.2.5-1).

139 Effects on these wildlife travel corridors were classified as: 1) direct loss of habitat inside the  
140 corridor, 2) fragmentation of habitat inside the corridor, 3) isolation of a corridor by the creation  
141 of a barrier inside or near its termini, and 4) direct loss or fragmentation of large habitat blocks  
142 outside the corridor, which are the presumed destinations of the animals using the corridors. This  
143 analysis included the following projects that could potentially represent barriers to wildlife  
144 travel:

- 145 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 146 • Essar Steel Mine;
- 147 • Magnetation (Chisholm);
- 148 • Mesabi Mining Project;
- 149 • Mesabi Nugget;
- 150 • Mining Resources (Sherman Basin);
- 151 • Northshore Mine;
- 152 • U.S. Steel Keetac Mine Expansion Project; and
- 153 • U.S. Steel Minntac Mine Extension Project.

DRAFT

161 Of the 13 large mammal wildlife crossing corridors identified by Emmons & Olivier, two are in  
 162 the vicinity of the Mine Site or Plant Site. The first is located approximately 1 mile southeast of  
 163 the existing Plant Site (see Figure 6.2.5-1). Though small, this corridor has been identified as  
 164 important (Emmons and Oliver 2006) and of moderate quality (Barr 2009a). The existing  
 165 LTVSMC Tailings Basin is located within the corridor, but does not obstruct the entire width of  
 166 it. The Tailings Basin provides poor habitat and is not likely to be heavily used by wildlife.  
 167 Because current use is already limited, increased activity at the Tailings Basin is not likely to  
 168 adversely affect wildlife movement through the corridor.

169 The second corridor is located approximately 0.5 mile northwest of the Mine Site. It has been  
 170 identified as important (Emmons and Oliver 2006) and contains high quality habitat (Barr  
 171 2009a). Operations at the Mine Site would indirectly affect the corridor by reducing its size and  
 172 acting as a source of noise and activity near the large habitat block southeast of the corridor.  
 173 Though the Transportation and Utility Corridor is outside the wildlife corridors identified by  
 174 Emmons & Olivier, it runs parallel and perpendicular to the corridors and would potentially  
 175 affect wildlife use.

176 The other reasonably foreseeable projects may also affect the 18 wildlife travel corridors mapped  
 177 by Emmons & Olivier and Barr (see Table 6.2.5-1 and Figure 6.2.5-1) (Emmons & Olivier 2006;  
 178 Barr 2009a). These effects may include blocking or encroachment into the mapped wildlife  
 179 corridors, which affects adjacent habitat that may make the corridor less valuable to wildlife, and  
 180 increasing traffic along new or existing roads through the corridor. The effects on these corridors  
 181 include complete loss (depending upon final extent of activities), habitat isolation, fragmentation,  
 182 and/or minimal effect.

183 **Table 6.2.5-1 Cumulative Effects on Wildlife Travel Corridors in the Mesabi Iron Range**

| Wildlife        |                                                                 |                                                                                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Travel Corridor | Project                                                         | Type of Effect                                                                                                                                                                                                                                                            |
| 1               | Urban Development,<br>Highway Traffic                           | Minimal habitat isolation; may restrict wildlife travel through corridor due to roads, railroads, and potential expansion of the City of Grand Rapids.                                                                                                                    |
| 2               | Highway Traffic                                                 | Habitat isolation; may restrict wildlife travel through corridor due to highway traffic (US 169), which may increase over time.                                                                                                                                           |
| 3               | Urban Development,<br>Essar Steel                               | Direct loss of travel corridor; wildlife travel through the western half of the corridor is currently restricted by historical mining effects, eastern half of corridor would be directly affected by the Essar Steel project, resulting in overall loss of the corridor. |
| 4               | Highway Traffic,<br>Essar Steel Mine,<br>U.S. Steel Keetac Mine | Habitat isolation; may restrict wildlife travel through the corridor due to the Keetac Expansion project, which would be south of the corridor, and the Essar Steel project, which would be west of the corridor.                                                         |
| 5               | U.S. Steel Keetac Mine                                          | Direct loss of travel corridor; wildlife travel through this corridor would be restricted by the U.S. Steel Keetac Mine and existing Hibbing Taconite, resulting in a direct loss of this low-quality corridor.                                                           |

| <b>Wildlife</b>        |                                                                       |                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|-----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Travel Corridor</b> | <b>Project</b>                                                        | <b>Type of Effect</b>                                                                                                                                                                                                                                                                                                                                                            |
| 6                      | Highway Traffic, Urban Development, U.S. Steel Keetac Mine            | Fragmentation and direct loss of travel corridor; wildlife travel through this corridor is restricted by Hibbing Taconite to the west of the corridor, highway traffic on State Highway 73, and fragmentation of travel corridor habitat may occur due to urban development of Chisholm (on the northern end of the corridor) and Hibbing (on the southern end of the corridor). |
| 7                      | Urban Development, Magnetation (Chisholm)                             | Habitat isolation; eastward expansion of Chisholm may restrict wildlife travel through this corridor. Scramming operations south of the corridor may further restrict travel.                                                                                                                                                                                                    |
| 8                      | Highway Traffic, U.S. Steel Minntac, Mining Resources (Sherman Basin) | Habitat isolation; may restrict wildlife travel through corridor due to highway traffic (US 169) south of the corridor, U.S. Steel Minntac may affect habitat to the northeast of the corridor, while Mining Resources' scrambling activities may affect habitat to the south of the corridor.                                                                                   |
| 9                      | U.S. Steel Minntac                                                    | Direct loss of travel corridor; the U.S. Steel Minntac mine pit expansion would eliminate eastern end of corridor.                                                                                                                                                                                                                                                               |
| 10                     | Urban Development                                                     | Minimal effect; wildlife travel through this corridor may be restricted by expansion of Eveleth or Gilbert and associated roads.                                                                                                                                                                                                                                                 |
| 11                     | ArcelorMittal Deposits                                                | Habitat isolation and direct loss; wildlife travel through this corridor may be restricted by ArcelorMittal's Project, which would prevent access between northern and southern blocks of the corridor.                                                                                                                                                                          |
| 12                     | Urban Development                                                     | Minimal effect; wildlife travel through this corridor may be restricted by expansion of the City of Biwabik.                                                                                                                                                                                                                                                                     |
| 13                     | Mesabi Nugget, Mesabi Mining Project, Urban Development               | Minimal effect; wildlife travel through this corridor may be restricted by westward expansion of the City of Aurora, and likely increase in traffic/noise due to the Mesabi Nugget Project.                                                                                                                                                                                      |
| 14                     | Mesabi Nugget and Mesabi Mining Projects                              | Minimal effect; wildlife travel through this corridor may be restricted by the Mesabi Nugget Project, which would reduce the corridor width, but not eliminate use.                                                                                                                                                                                                              |
| 15                     | Mesabi Nugget and Mesabi Mining Projects                              | Minimal effect; wildlife travel through this corridor may be restricted by the Mesabi Nugget Project, which would reduce the corridor width, but not eliminate use.                                                                                                                                                                                                              |
| 16                     | NorthMet Project Proposed Action                                      | Minimal effect; wildlife travel through this corridor may be restricted by noise and activities at the NorthMet Project Proposed Action Plant Site, which would be located northwest of the corridor.                                                                                                                                                                            |
| 17                     | NorthMet Project Proposed Action and Northshore Mine                  | Direct loss and fragmentation; the NorthMet Project Proposed Action would reduce habitat to southeast of the corridor. The NorthMet Project Proposed Action would not physically encroach into the corridor, but noise and activities at the NorthMet and Northshore mine operations could discourage use during mine operations.                                                |
| 18                     | Northshore Mine                                                       | Direct loss and fragmentation; possible expansion of Northshore mine eastward may block or fragment this corridor.                                                                                                                                                                                                                                                               |

#### 186 **6.2.5.4.3 Special Status Species**

187 In addition to habitat fragmentation and loss and effects on wildlife crossing corridors, wildlife  
188 species of concern in the Nashwauk Uplands and Laurentian Uplands ecological subsections are  
189 subject to other stressors that could result in cumulative effects. Traffic and activity related to  
190 mining projects, urban development, forestry, tourism, and road expansions all increase the risk  
191 for special status wildlife species and, as such, could result in cumulative effects. See Section  
192 5.2.5.2.3 for a discussion on studies regarding wildlife corridor mitigation options.

193 The Canada lynx is listed as a threatened species by the federal government, and is listed as a  
194 species of special concern in Minnesota. The NorthMet Project Proposed Action and other  
195 cumulative actions would result in additional habitat fragmentation, and may increase pressures  
196 from loss of habitat and disruptions in travel corridors for Canada lynx. Forest management  
197 would contribute the largest acreage effect for lynx, but this effect would be offset by the  
198 regeneration of forest stands over time. Additional human activity due to the NorthMet Project  
199 Proposed Action and other cumulative actions would likely result in additional vehicle and rail  
200 traffic and the potential for collisions with lynx.

201 The northern long-eared bat is proposed to be listed as a threatened species by the federal  
202 government, and is listed as a species of special concern in Minnesota. The NorthMet Project  
203 Proposed Action and other cumulative actions, including community growth and forest  
204 management, could affect northern long-eared bats through removal of summer roosting habitat  
205 and additional habitat fragmentation from timber harvests and road construction. The interim  
206 4(d) rule specifies that forest clearing activities may not occur within the summer maternity  
207 roosting season within one quarter mile of known occupied roost trees or a known occupied  
208 hibernacula.

209 The gray wolf has been re-listed as threatened by the federal government, but it was removed  
210 from the Minnesota ETSC species list in 2013. The wolf had rebounded sufficiently that the state  
211 held a limited hunting season in 2012 through 2014. A 2014 winter survey by the MDNR (Erb  
212 et. al 2014) estimated that 2,423 gray wolves were present in Minnesota, which, along with the  
213 2012-2014 hunts, indicates that populations have stabilized to the point that the wolf in  
214 Minnesota is viable. The NorthMet Project Proposed Action and other cumulative actions may  
215 increase pressures from loss of habitat and disruptions in travel corridors which may affect the  
216 total numbers of animals in the future.

#### 217 **6.2.5.4.4 Effects from Acid (NO<sub>2</sub>/SO<sub>2</sub>) and Mercury Deposition**

218 Acid depositions from sulfate (from SO<sub>2</sub> emissions) and nitrate (from NO<sub>2</sub> emissions) can have  
219 an adverse effect on terrestrial ecosystems, including forested wildlife habitat. These pollutants  
220 may travel long distances and contribute to complex chemical and physical reactions within a  
221 variety of habitats. These reactions could contribute to increased vulnerability of sensitive  
222 wildlife species and their habitats. Additionally, these pollutants can be carried by precipitation  
223 into nearby lakes and rivers, which wildlife species rely upon for food and water.

224 As described in Section 6.2.7.5, emissions from the NorthMet Project Proposed Action, in  
225 combination with other projects, would emit increased amounts of SO<sub>2</sub> and NO<sub>2</sub> emissions,  
226 resulting in a potential increase in acid deposition that may be too small to measure. However,  
227 the projects would not likely cause a cumulative effect on the ecosystems due to the NorthMet  
228 Project Proposed Action having relatively low emissions of SO<sub>2</sub> and NO<sub>2</sub> and potential

229 deposition of sulfate and nitrate that are below both the Minnesota standard threshold value and  
230 the federal Class I threshold values, in combination with the overall reduction in sulfate and  
231 nitrate-producing emissions cumulatively since 2008.

232 The MPCA estimated that over 90 percent of the mercury deposition within Minnesota is a result  
233 of other states and countries (MPCA 2013e). However, as described in Section 5.2.7.2.5, the  
234 Plant Site would be expected to contribute essentially all of the NorthMet Project Proposed  
235 Action-related mercury air emissions of 4.6 lbs/year, as the Mine Site only contributes potential  
236 emissions of less than 1.0 lb/yr (Barr 2011g). Based on the results of the MMREM evaluation  
237 summarized in cumulative effects Section 6.2.6.3.3, the potential additional mercury load that  
238 might be added to the Embarrass River and the Partridge River from air emissions is not  
239 expected to adversely affect these ecosystems when compared to the variability in background  
240 mercury concentrations. Similarly, the mercury deposition on terrestrial environments is not  
241 expected to adversely affect these ecosystems when compared to variability in background  
242 mercury concentrations. Additional information on the cumulative analysis of acid and mercury  
243 deposition associated with air emissions is summarized in Section 6.2.6.3.3 and 6.2.7.5.

244

DRAFT

## 1 **6.2.6 Aquatic Species**

2 The NorthMet Proposed Project Action could affect aquatic physical habitat and species via  
3 changes in flow and water quality in the Partridge River and Embarrass River. The analysis  
4 found the NorthMet Project Proposed Action would meet or not cause or contribute to  
5 exceedances of water quality evaluation criteria with the exception of aluminum (Section 5.2.2).  
6 For aluminum, ambient water quality already exceeds the Class 2B standard in both the Partridge  
7 River and Embarrass River, but would increase in several tributaries to the Embarrass River as a  
8 result of the NorthMet Project Proposed Action because of a decrease in Tailings Basin seepage  
9 with low aluminum concentrations and a proportional increase in natural runoff with higher  
10 aluminum concentrations (Section 5.2.2.3.2 and Section 5.2.2.3.3). Although all other solutes are  
11 predicted to meet Class 2B water quality standards, the aggregate of these solutes, primarily  
12 metals, has the potential to impact aquatic biota.

13 Although there is historic and current mining in the area, the water quality of these watersheds is  
14 generally good, with some exceptions. One exception involves portions of the Embarrass River  
15 that are included on the 303(d) list as impaired for “Fishes Bioassessment” (non-supportive of  
16 aquatic life and indicative of habitat stressors that limit aquatic life). Another exception relates to  
17 some lakes through which the Partridge River and Embarrass River flow that are on the 303(d)  
18 list of impaired waters for “mercury in fish tissue.” The MDH has issued fish consumption  
19 advisories for the “mercury in fish tissue” impaired waters to provide site-specific consumption  
20 guidance on the quantity and frequency of fish species consumed. The following sections  
21 provide a quantitative and semi-quantitative analysis of the potential cumulative effects of the  
22 NorthMet Project Proposed Action and other activities in the Partridge River and Embarrass  
23 River watersheds.

24 Both the Partridge River and Embarrass River are tributaries to the St. Louis River, which flows  
25 through the Fond du Lac Indian Reservation and empties into Lake Superior near Duluth. A  
26 qualitative assessment of the cumulative effects to aquatic resources in St. Louis River has been  
27 included.

28 The St. Louis River is not included within the spatial scale of the NorthMet Project’s cumulative  
29 effects analysis for these reasons:

- 30 • The NorthMet Project Proposed Action would not have any direct effects (i.e., habitat  
31 disturbance) on the St. Louis River, or even perennial waterbodies within the Partridge River  
32 and Embarrass River watersheds.
- 33 • The NorthMet Project Proposed Action would not pose any obstructions to fish movement  
34 between the St. Louis River and the Partridge River or Embarrass River.
- 35 • The NorthMet Project Proposed Action would result in about a 2 percent (about 6 cfs)  
36 reduction in average annual flow in the St. Louis River at the confluence with the Embarrass  
37 River during operations, and less than 1 percent reduction during closure. The NorthMet  
38 Project Proposed Action effects would be even less during low flows because of flow  
39 augmentation from Whitewater Reservoir once water levels in Colby Lake fall below 1,439  
40 ft, which equates to a flow of approximately 13 cfs).

- 41 • With the proposed design modifications and engineering controls, the water quality model  
42 predicted that the NorthMet Project Proposed Action would not cause any significant water  
43 quality impacts because: 1) exceedances of the P90 threshold did not occur, 2) the NorthMet  
44 Project Proposed Action concentrations were no higher than concentrations predicted for the  
45 Continuation of Existing Conditions (CEC) Scenario, or 3) the frequency of exceedances for  
46 NorthMet Project Proposed Action conditions was within an acceptable range or not  
47 attributable to NorthMet Project Proposed Action discharges or both.
- 48 • The NorthMet Project Proposed Action would result in a net decrease in overall mercury  
49 loadings (1.0 grams per year) with no detectable change in mercury concentrations to the St.  
50 Louis River.
- 51 • Therefore, the NorthMet Project Proposed Action would not have any direct effects on  
52 aquatic habitat in the St. Louis River and would not have any measureable indirect effects on  
53 fish or aquatic invertebrates as a result in changes in flow or water quality, and, therefore, it  
54 would not contribute any measureable cumulative effects to the St. Louis River.
- 55 • The NorthMet Proposed Project Action could affect aquatic physical habitat and species via  
56 changes in flow and water quality in the Partridge River and Embarrass River. The analysis  
57 found that changes in water chemistry would not exceed water quality evaluation criteria.

#### 58 **6.2.6.1 Temporal**

59 The evaluation focused on the potential cumulative effects of the NorthMet Project Proposed  
60 Action, in combination with other existing and reasonably foreseeable projects, on aquatic  
61 habitat. The NorthMet Project would have little direct effect on perennial streams and aquatic  
62 habitat within the vicinity of the NorthMet Project Proposed Action. Effects would likely be  
63 limited to changes in the seasonal hydrograph of the upper reaches of the Partridge and  
64 Embarrass Rivers, with no direct effect on aquatic habitat for other downstream areas within the  
65 CEAA.

#### 66 **6.2.6.2 Contributing Past, Present, and Reasonably Foreseeable Future Actions**

67 The assessment discusses potential cumulative effects on surface water habitats and aquatic  
68 species associated with the following current and future actions listed below in conjunction with  
69 the NorthMet Project Proposed Action:

- 70 • LTV Steel Mining Company Former LTVSMC Pits;  
71 • Mesabi Mining Project;  
72 • Mesabi Nugget Project;  
73 • Northshore Mine;  
74 • U.S. Steel Minntac; and  
75 • U.S. Steel Minntac Mine Extension Project.

76 These activities, along with the NorthMet Project area, are located within or adjacent to the  
77 CEAA. The aquatic habitats and species associated with the Embarrass River and Partridge River  
78 watersheds should be very similar in that they both contain headwaters (first-order streams which  
79 develop, downstream, into larger second- and third-order streams, as determined by the Strahler

80 Stream Order classification). Section 4.2.6 indicates that baseline studies performed within these  
81 watersheds exhibited species typical for this region and these species can be assumed to occur  
82 within the streams and rivers affected by the NorthMet Project Proposed Action.

### 83 **6.2.6.3 Cumulative Effects Assessment**

#### 84 **6.2.6.3.1 Water Quality Effects**

85 As described in Section 5.2. 2, with the proposed design modifications and engineering controls,  
86 the water quality model predicted that the NorthMet Project Proposed Action would not cause  
87 any significant water quality impacts because: 1) exceedances of the P90 threshold did not occur,  
88 2) the NorthMet Project Proposed Action concentrations were no higher than concentrations  
89 predicted for the Continuation of Existing Conditions (CEC) Scenario, or 3) the frequency of  
90 exceedances for NorthMet Project Proposed Action conditions was within an acceptable range or  
91 not attributable to NorthMet Project Proposed Action discharges or both.. Nevertheless, while  
92 the NorthMet Project Proposed Action would not cause or contribute to exceedances of water  
93 quality evaluation criteria, it could combine with other past, present and reasonably foreseeable  
94 future activities to create cumulative effects within the CEAA. The analysis below describes  
95 these combined effects to arrive at a finding that the NorthMet Proposed Action would not cause  
96 cumulative effects on aquatic resources within the CEAA. However, there is potential for  
97 cumulative effects on aquatic biota due to changes in water quality, especially in impaired waters  
98 for the Embarrass River, and in the Upper Partridge River from cessation of Northshore Mine  
99 dewatering post-closure.

100 The Class 2B standards were developed to be protective of aquatic life and to promote the  
101 “propagation and maintenance of a healthy community of cool or warm water sport or  
102 commercial fish and associated aquatic life, and their habitats” (*Minnesota Rules*, part  
103 7050.0222). The chronic standards are restrictive standards and reflect “the highest water  
104 concentration of a toxicant to which organisms can be exposed indefinitely without causing  
105 chronic toxicity” (*Minnesota Rules*, part 7050.0218, subpart 3, item I).

106 The NorthMet Project Proposed Action, in combination with other reasonably foreseeable  
107 projects, could increase solute concentrations for many constituents in the Partridge River and  
108 Embarrass River. This change in existing water quality and the interactions between effects from  
109 a number of projects in the area, natural conditions, and current and future hydrology could be  
110 addressed as part of the non-degradation analysis for the NorthMet Project Proposed Action in  
111 permitting. The NorthMet Project Proposed Action, in particular, but to some extent in  
112 combination with other existing and reasonably foreseeable projects, would shift maintenance of  
113 water quality in the Partridge River and Embarrass River from natural systems (i.e., essentially  
114 an ecosystem service) to mechanical systems (e.g., the NorthMet Project Proposed Action  
115 WWTF and WWTP). Given that with the proposed design modifications and engineering  
116 controls, the water quality model predicted that the NorthMet Project Proposed Action would not  
117 cause any significant water quality impacts, impacts due to changes in water quality from  
118 NorthMet Project Proposed Action, in combination with other reasonably foreseeable projects, to  
119 aquatic species are not anticipated.

120

121

122 **6.2.6.3.2 Physical Habitat Effects**

123 Hydrologic changes are often one of the major sources of effects on fish and macroinvertebrate  
124 habitat. While many aspects of the hydrologic regime can be important to the maintenance of  
125 fish and macroinvertebrate assemblages, reduction in baseflow (the portion of streamflow from  
126 groundwater) is particularly relevant because it represents a change or even a loss of habitat.

127 Section 5.2.6.2 concluded that the NorthMet Project Proposed Action would reduce flow  
128 upstream of Colby Lake and in the Embarrass River by very small amounts from the current  
129 baseline habitat conditions. Alterations due to multiple projects in the Second Creek Watershed  
130 within the Partridge River Watershed along with the planned flow augmentation of Second  
131 Creek due to the NorthMet Project Proposed Action may contribute to small cumulative effects  
132 on aquatic habitat if flows fluctuate by more than 20 percent, but fluctuations of this magnitude  
133 are not expected (see Section 6.2.2). Changes in average annual flow of less than 20 percent  
134 would fall into the range of annual natural variability in terms of precipitation and would have  
135 minimal impacts to ecosystem function and aquatic species within the Embarrass River  
136 Watershed.

137 After 2070, when Northshore Mine dewatering discharge is predicted to end, there may be  
138 effects on the headwater Partridge River instream habitat due to loss of flow. The NorthMet  
139 Project Proposed Action, however, would not be expected to contribute measurably to this  
140 cumulative effect, but instead would reduce the effect by discharging treated water in mine year  
141 52.

142

143 **6.2.6.3.3 Effects from Mercury**

144 **Estimated Mercury Deposition**

145 The NorthMet Project Proposed Action, along with other reasonably foreseeable projects have  
146 the potential for adverse effects from mercury deposition on nearby lakes, including the  
147 Heikkila, Colby, Sabin, Wynne, and Whitewater lakes, the Partridge River and Embarrass River  
148 watersheds, and the aquatic biota within these waterbodies.

149 The cumulative effects of mercury from the NorthMet Project Proposed Action and other  
150 cumulative actions on risks to fish consumption were analyzed using the MMREM. As described  
151 in Section 5.2.7.2.5, the MMREM assessed the potential changes in fish mercury concentrations  
152 in the following nearby lakes (Barr 2015f):

- 153 • Heikkila Lake;
- 154 • Colby Lake;
- 155 • Sabin Lake;
- 156 • Wynne Lake; and
- 157 • Whitewater Lake.

158 The five lakes are located within 12 km, about 7 miles, of the Plant Site. Heikkila Lake, Sabin  
159 Lake, and Wynne Lake are included in the Embarrass River watershed, while Colby Lake and  
160 Whitewater Lake are closest to the Plant Site and are part of the Partridge River watershed. The

161 closer a lake is to the Plant Site, the greater the potential for more effects from deposition related  
162 to Plant Site operations.

163 The MMREM method relies on empirical fish contamination data (Barr 2012b), combined with  
164 the principle of proportionality between mercury in fish and atmospheric deposition (MPCA  
165 2006a). As other cumulative analyses have identified that local impacts from mercury deposition  
166 are small and likely not measurable in terms of fish mercury concentration within 10 kilometers  
167 of a single project, it is expected that projects located further away would have fewer impacts.  
168 Consequently, it has been determined that the maximum extent of the quantitative cumulative  
169 impact assessments using the MMREM is about 25 kilometers (about 16 miles) from the specific  
170 project of interest (Barr 2015f). The analysis considered deposition from the NorthMet Project  
171 Proposed Action and the Mesabi Nugget emissions over existing risks. The Mesabi Nugget  
172 Large Scale Demonstration Plant was assessed because it is the only “reasonably foreseeable”  
173 project within 25 km of the NorthMet Project Proposed Action.

174 Because of uncertainty in speciation of emissions of the NorthMet Project Proposed Action, two  
175 speciation scenarios were used for assessing potential effects for the NorthMet Project (Barr  
176 2015f), while only one scenario was used to evaluate the Mesabi Nugget Large Scale  
177 Demonstration Plant emissions since there was no uncertainty in the speciation of the emissions  
178 from this action. The first scenario for the NorthMet Project Proposed Action represents a  
179 conservative overestimation of oxidized mercury (25 percent elemental mercury, 50 percent  
180 oxidized mercury, and 25 percent particle bound mercury), while the second scenario is a more  
181 conservative and more likely speciation for air emissions (80 percent elemental mercury, 10  
182 percent oxidized mercury, and 10 percent particle bound mercury) that is considered to provide a  
183 worst-case emissions scenario for the NorthMet Project Proposed Action. The scenario for the  
184 Mesabi Nugget Large Scale Demonstration plant evaluates 99.3 percent elemental mercury (see  
185 Section 5.2.7.2.5).

186 The current MPCA-estimated mercury atmospheric deposition rate is 12.5  $\mu\text{g}/\text{m}^2/\text{yr}$  for northeast  
187 Minnesota (MPCA 2007), which translates into about 250 pounds of mercury currently being  
188 deposited onto the St. Louis River Watershed (3,600 square miles) every year due to background  
189 deposition. The potential total annual deposition in the watershed from the NorthMet Project  
190 Proposed Action is estimated to be about 0.17 pounds per year (Barr 2012b), which is less than  
191 0.1 percent of the estimated 250 pounds per year of mercury already being deposited to the St.  
192 Louis River watershed due to background deposition.

193 The cumulative analysis assessment showed that projected increase in mercury concentrations  
194 from the two reasonably foreseeable cumulative sources in the fish for the five lakes ranges from  
195 0.3 to 1.8 percent (when considering both speciation scenarios), of which the increased  
196 percentage from the NorthMet Project Proposed Action alone ranges from 0.2 to 1.6 percent.  
197 Therefore, although the NorthMet Project Proposed Action would account for the majority of the  
198 increase, the total added mercury to the lakes is small compared to background conditions. The  
199 highest impact in fish concentration from the NorthMet Project Proposed Action alone was at  
200 Wynne Lake where the estimated incremental increase to fish tissue mercury concentration is  
201 0.016 ppm. This estimated incremental change in fish mercury concentration is small compared  
202 to the background fish tissue mercury concentrations in Wynne Lake range, which range from  
203 0.35 to 2.06 ppm. The increase to fish tissue mercury concentrations at the remaining four lakes  
204 was at or below 0.012 ppm (Barr 2013c) with the background fish tissue mercury concentrations  
205 in these lakes ranging from 0.12 ppm in Whitewater Lake to 2.06 ppm in Heikkila Lake (Barr

206 2015f). These potential increases would not be expected to have an appreciable effect on fish  
207 tissue mercury concentrations in the Embarrass River or Partridge River and would not have any  
208 effect on the current fish consumption advisories for the respective lakes.

### 209 **Hazard Quotient**

210 The Hazard Quotient is the ratio of the mercury concentration in fish to a health-based target of  
211 0.2 ppm; a Hazard Quotient greater than 1 exceeds the health-based target. To estimate the  
212 potential incremental Hazard Quotient, the incremental methylmercury exposure in mg/kg body  
213 weight per day and the reference dose are accounted for in the calculation. The incremental  
214 Hazard Quotient calculation in the MMREM Spreadsheet uses the following methodology:

- 215 • Incremental daily mercury consumed (mg) = estimated incremental increase in fish mercury  
216 due to the Project (mg/kg) x the amount of fish consumed (e.g. 0.142 kg for a subsistence  
217 fisher);
- 218 • Incremental methylmercury exposure (mg/kg body weight per day) = Incremental daily  
219 mercury consumed x 1.07945 / adult body weight (70 kg); and then
- 220 • Incremental Hazard Quotient = incremental methylmercury exposure (mg/kg body weight  
221 per day) / Reference Dose of 1.00E-04 mg methylmercury/kg body weight per day (i.e., the  
222 ratio of the incremental methylmercury exposure divided by the reference dose in the same  
223 units).

224 The maximum incremental cumulative Hazard Quotient from the two reasonably foreseeable  
225 cumulative projects over existing fish mercury concentrations is 0.08 for recreational anglers,  
226 0.61 for subsistence/tribal anglers, and 0.54 for subsistence fishers. This is only about a 0.3 to 1.8  
227 percent increase over the existing incremental risk levels, for recreational, subsistence/tribal and  
228 subsistence anglers. Of this, the NorthMet Project Proposed Action would contribute  
229 approximately 59 to 92 percent of the incremental cumulative Hazard Quotient. Note that the  
230 current fish tissue concentration in the five lakes results in Hazard Quotients that exceed 1,  
231 leading to the need for the fish consumption advisories currently in effect (see Table 6.2.6-1).

232

233 **Table 6.2.6-1** *Analysis of Existing Hazard Quotients of Cumulative Impacts from Mercury Deposition for Five Lakes*  
 234 *following Three Fish-Consumption Scenarios*

| Lake            | MDNR #   | Speciation Scenario | Recreational Angler <sup>1</sup> |                           | Subsistence/Tribal Angler <sup>2</sup> |                           | Subsistence Fisher <sup>3</sup> |                           |
|-----------------|----------|---------------------|----------------------------------|---------------------------|----------------------------------------|---------------------------|---------------------------------|---------------------------|
|                 |          |                     | Existing HQ                      | Incremental Cumulative HQ | Existing HQ                            | Incremental Cumulative HQ | Existing HQ                     | Incremental Cumulative HQ |
| Colby Lake      | 69024900 | Scenario 1          | 4.3                              | 0.05                      | 32                                     | 0.4                       | 28.4                            | 0.35                      |
|                 |          | Scenario 2          |                                  | 0.02                      |                                        | 0.1                       |                                 | 0.10                      |
| Heikkila Lake   | 69025300 | Scenario 1          | 3                                | 0.05                      | 22.3                                   | 0.4                       | 19.8                            | 0.35                      |
|                 |          | Scenario 2          |                                  | 0.01                      |                                        | 0.1                       |                                 | 0.09                      |

| Wynne Lake      | 69043402 | Scenario 1          | 6.2                              | 0.08                      | 46.2                                   | 0.6                       | 41                              | 0.54                      |
|                 |          | Scenario 2          |                                  | 0.02                      |                                        | 0.2                       |                                 | 0.15                      |

235 Source: Barr 2012b.

236 Notes:

237 <sup>1</sup> Consumption rate assumed to be 30 grams/ day.

238 <sup>2</sup> Consumption rate assumed to be 224 grams/ day and approximates the allowed take of fish by a Tribal member (~180 pounds per year of fish).

239 <sup>3</sup> Consumption rate assumed to be 199 grams/day.

240 **Water Mercury Mass Balance**

241 In addition to atmospheric mercury deposition, water discharges from the NorthMet Project area  
242 would affect the mercury load in the Embarrass and Partridge rivers (and ultimately on  
243 downstream portions of the St. Louis River). As discussed in Section 5.2.2.3.4, a water mass  
244 balance was performed to assess mercury load from NorthMet Project Proposed Action. The  
245 mass balance indicated that overall, the NorthMet Project Proposed Action is predicted to result  
246 in a net decrease in mercury loading to the St. Louis River watershed and is not likely to result in  
247 an appreciable change in the mercury concentration in fish in waterbodies of the St. Louis River  
248 watershed, including the Embarrass River or Partridge River, or in the St. Louis River itself (Barr  
249 2015f). Potential mercury increases from air deposition discussed above would not be expected  
250 to have any appreciable effect on inputs into the water quality mass loading calculations.

251 **Statewide Mercury TMDL and Mitigation Measures**

252 The MPCA Statewide Mercury TMDL is intended to provide the long-term framework to reduce  
253 mercury in fish within Minnesota lakes, including the five lakes targeted in this assessment. The  
254 MPCA and industries emitting mercury into the atmosphere are working to reduce Minnesota  
255 sources' contribution to fish contamination. Minnesota is relying on actions by other states and  
256 the USEPA to address deposition from long-range sources.

257 In the period of time between completion of the cumulative effects analysis background study for  
258 Minnesota Steel and the development of this FEIS, Minnesota stakeholders created an  
259 implementation plan for Minnesota's mercury TMDL (MPCA 2009). Within the implementation  
260 plan, there is a process for assessing new and expanding sources of mercury in Minnesota. It is  
261 important to assess sources so that while existing sources reduce emissions, new sources do not  
262 interfere or confound the state's progress in reducing mercury emissions overall. At the  
263 recommendation of the Minnesota stakeholders, MPCA has developed guidance for new and  
264 modified sources of mercury in Minnesota (MPCA 2013d). The guidance requires sources to:  
265 employ best controls to reduce mercury emissions and apply emissions limits to permit  
266 conditions. MPCA has conducted a review of the NorthMet Project Proposed Action mercury  
267 emissions and has determined that it would not impede the reduction goals (MPCA 2013c).  
268 Thus, no minimization and mitigation plan would be required for the NorthMet Project Proposed  
269 Action (see Section 5.2.7.2.5). Mercury mitigation measures are summarized in Section 5.2.2.3.5  
270 (water) and in Section 5.2.7.4 (air).

## 1 **6.2.7 Air Quality**

2 Several components of the NorthMet Project Proposed Action would combine with other past,  
3 present, and reasonably foreseeable proposed actions to cause cumulative effects on air quality.  
4 Of particular concern are the effects on Class I and Class II areas, especially with respect to acid  
5 deposition, particulates, and visibility impairment. Both direct and indirect effects of the  
6 NorthMet Project Proposed Action were used to calculate its effects in combination with those of  
7 other emission sources. Given the public's concern over air quality in the BWCAW and  
8 Voyageurs National Park, the analysis modeled how emissions from the NorthMet Project  
9 Proposed Action and other projects in the airshed would affect air quality and visibility in these  
10 areas.

### 11 **6.2.7.1 Approach**

12 Cumulative effects have been evaluated to assess the potential effects from other foreseeable  
13 projects that have been approved by regulatory agencies, but have not been implemented or  
14 accounted for in existing air quality conditions. The assessments of these projects, in  
15 combination with the NorthMet Project Proposed Action, were conducted to evaluate the overall  
16 effects on the NAAQS/MAAQS, the USEPA PSD Class I and Class II standards, and the  
17 USEPA Class I Visibility and Regional Haze criteria.

### 18 **6.2.7.2 Cumulative Effects Assessment Area**

#### 19 **6.2.7.2.1 Spatial**

20 The CEAA for air quality is defined as those areas that are beyond the boundaries of the Plant  
21 Site, Mine Site, the Mesabi Nugget Ambient Air Boundary, and the Northshore Mine (labeled as  
22 St. Louis County Tax Records) identified on Figure 6.2.7-1. The cumulative receptors on the  
23 figure (in blue) provide spatial projection of the closest receptors used in the modeling that are at  
24 or beyond the four boundary areas identified above.

#### 25 **6.2.7.2.2 Temporal**

26 Based on the approved model's limitations, this evaluation used a qualitative baseline of  
27 industrial growth within the Arrowhead Regional Airshed as indicative of the historical and more  
28 recent effects on air quality resulting in the current ambient conditions.

### 29 **6.2.7.3 Past, Present, and Reasonably Foreseeable Future Actions**

30 The air quality modeling used existing background to represent the cumulative effects from all  
31 past, present, and reasonably foreseeable future actions that affect air quality in the region.

### 32 **6.2.7.4 Cumulative Effects Assessment**

33 Air quality modeling analyses were conducted to assess cumulative effects on NAAQS,  
34 MAAQS, PSD Class II Increments, and Class I Increments using a similar modeling approach  
35 discussed in Section 5.2.7.2.1. However, relative to NAAQS, MAAQS, and PSD Class II  
36 Increments, the receptor locations were restricted to areas at and beyond the former LTVSMC  
37 ambient air boundary as defined in the Final SDD. However, the Class II modeling report for the

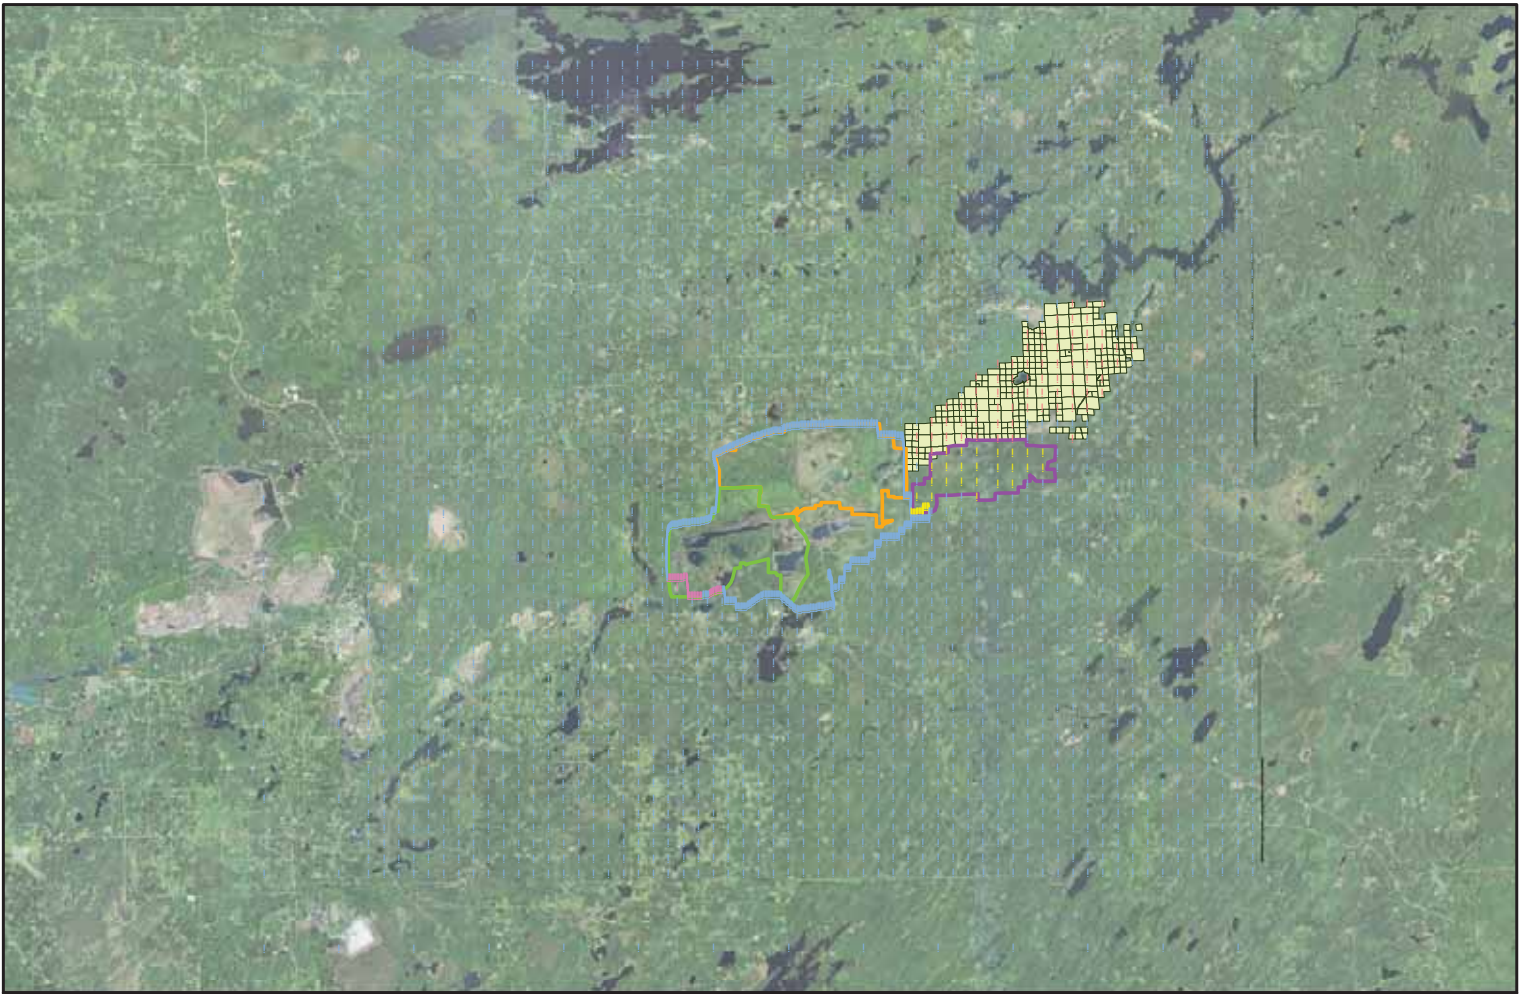

38 Plant Site included a more detailed and up-to-date assessment of combined effects at the Plant  
39 Site. For PSD Class I Increments, the cumulative analysis was conducted by adding the  
40 maximum effects from the NorthMet Project Proposed Action to the maximum effects from the  
41 cumulative analysis prepared for the Minnesota Steel EIS (MDNR and USACE 2007), in order  
42 to assess overall cumulative effects. The following sections describe the results of these  
43 assessments.

#### 44 **6.2.7.4.1 Cumulative Ambient Air Quality Effects (NAAQS/MAAQS)**

45 As stated earlier, an assessment of the Plant Site was conducted using the same modeling  
46 approach as presented in Section 5.2.7, except that receptor locations were limited to the Plant  
47 Site's boundary combined with the shared properties of the Mesabi Nugget and Cliffs Erie Pellet  
48 Yard (using the former LTVSMC processing plant boundary) as the ambient air boundary. It  
49 should be noted that the NorthMet Project Proposed Action emissions were evaluated on both  
50 Mesabi Nugget and Cliffs Erie property. Figure 6.2.7-1 shows the ambient air boundary for the  
51 former LTVSMC processing plant. The cumulative analysis included potential emissions for all  
52 NorthMet Project Proposed Action sources, nearby sources as defined in the Final SDD, and  
53 additional sources agreed upon with the MPCA, as identified above.

DRAFT

57 Table 6.2.7-1 summarizes the results of the cumulative NAAQS/MAAQS model analysis.  
58 Except for the cumulative 1-hour SO<sub>2</sub> and 1-hour NO<sub>2</sub> effects, all other maximum cumulative  
59 effects were below the respective NAAQS and MAAQS, ranging from 24 percent to 97 percent  
60 of their respective standards. In order to compare with the applicable standards, the following  
61 calculated maximum concentrations were defined, as defined in Section 5.2.7, by the “highest  
62 nth high” concentration (HnH) as follows:

- 63 • 24-hour PM<sub>10</sub> – H6H;
- 64 • 24-hour PM<sub>2.5</sub> and 1-hour NO<sub>2</sub> – H8H;
- 65 • 1-hour SO<sub>2</sub> – H4H;
- 66 • 3-hour and 24-hour SO<sub>2</sub> – H2H; and
- 67 • All annual – maximum.

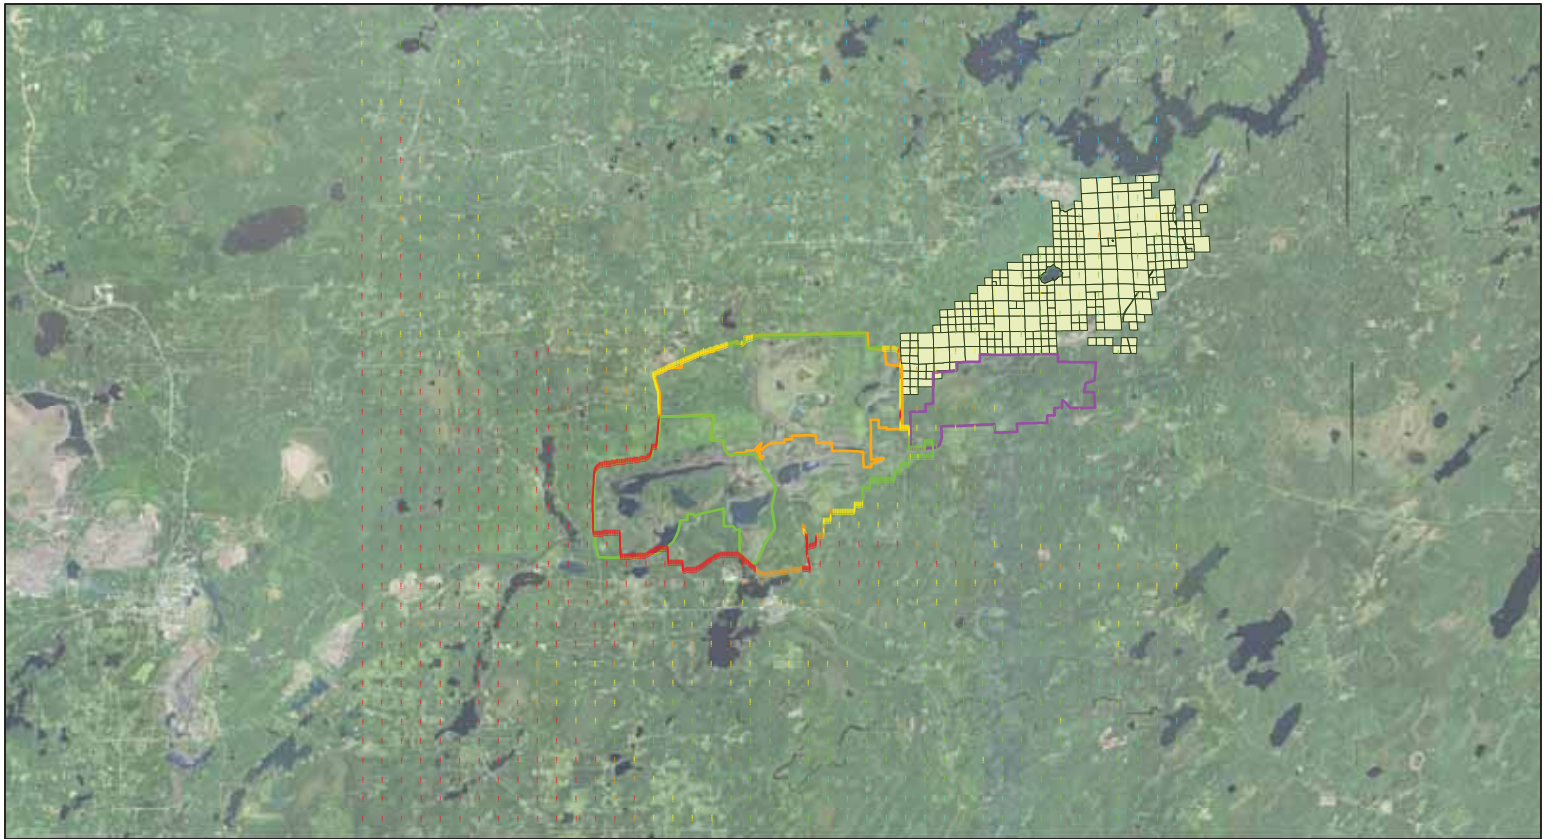

68 Ambient air background concentrations were added to modeled concentrations to determine  
69 compliance with NAAQS and MAAQS. Background concentrations represent the 2008 to 2010  
70 values from the Blaine-Anoka Airport Monitor (the nearest monitoring station available for  
71 model input), Rosemont Monitor, and Virginia Monitoring Stations for NO<sub>2</sub>, SO<sub>2</sub>, and  
72 PM<sub>10</sub>/PM<sub>2.5</sub>, respectively.

73 The maximum predicted ambient 1-hour NO<sub>2</sub> concentration was 292 µg/m<sup>3</sup>, which was predicted  
74 to occur to the southwest portion of the ambient air quality boundary, and exceeded the 1-hour  
75 NO<sub>2</sub> NAAQS (188 µg/m<sup>3</sup>). The Plant Site modeled contribution at the location of maximum  
76 effect was 0.002 µg/m<sup>3</sup>. Other receptors where concentrations were lower than the maximum but  
77 exceeded the 1-hour NO<sub>2</sub> NAAQS were predicted primarily on the western half of the receptor  
78 grid and were due to the nearby sources (see Figure 6.2.7-2). For all receptors that exceeded the  
79 1-hour NO<sub>2</sub> NAAQS, the contributions from the Plant Site sources were less than the 1-hour NO<sub>2</sub>  
80 Significance Threshold of 7.5 µg/m<sup>3</sup> and are considered to have no significant contribution to the  
81 predicted exceedances.

82 Similarly, the maximum 1-hour SO<sub>2</sub> ambient concentration was predicted at the southwestern  
83 border of the ambient boundary with a value of 893 µg/m<sup>3</sup> and exceeded the 1-hour SO<sub>2</sub> NAAQS  
84 of 196 µg/m<sup>3</sup> (see Figure 6.2.7-3). The Plant Site maximum modeled contribution to this  
85 maximum was 0.002 µg/m<sup>3</sup>, well below the 1-hour SO<sub>2</sub> SIL threshold of 7.8 µg/m<sup>3</sup>. For all  
86 receptors that exceeded the 1-hour SO<sub>2</sub> NAAQS, the contributions from the Plant Site sources  
87 were less than the 1-hour SO<sub>2</sub> Significance Threshold, thus having no cumulative effect on any  
88 predicted exceedances.

89 It should be noted that modeled NAAQS exceedances do not mean that the region is in non-  
90 attainment for these standards. NAAQS attainment is determined by measuring the actual  
91 concentration of pollutants in the air by monitoring. There is no monitoring data in the region  
92 that indicates that NAAQS standards are not being met. The NAAQS model results represent the  
93 maximum allowable emissions from NorthMet and all of the nearby sources, not the actual  
94 emission rates or actual pollutant concentrations, which are lower. In addition, the model results  
95 represent worst case meteorological conditions and background pollutant concentrations.  
96 Because the NorthMet Project Proposed Action is considered a synthetic minor PSD source and  
97 is not culpable for the modeled exceedances, per EPA guidance, permits can be issued for the  
98 project without addressing the modeled exceedances.

DRAFT

104 The MPCA is, however, taking actions to reduce emissions from taconite facilities with a goal to  
 105 evolve controls at these facilities. Specifically, the Long Term Strategy contained in Minnesota’s  
 106 Regional Haze State Implementation Plan to protect visibility in National Parks and Wilderness  
 107 Areas relies on demonstration of compliance with the 1-hour NO<sub>x</sub> and 1-hour SO<sub>2</sub> NAAQS at  
 108 the nearby taconite facilities. The MPCA has issued administrative orders to the existing taconite  
 109 facilities requiring modeling that demonstrates compliance with the NO<sub>2</sub> and SO<sub>2</sub> one-hour  
 110 standards, submittal of proposed emission limits that show they no longer contribute to modeled  
 111 noncompliance, and submittal of a description of any emission controls that would be needed. It  
 112 is likely that additional actions may be needed to reduce pollutants from other large emitters in  
 113 the region, including power plants, to address any modeled noncompliance.

114 **Table 6.2.7-1 Results of Cumulative Class II NAAQS Modeling**

| Pollutant         | Averaging Time | Maximum Modeled                    |                                 |                            | NAAQS/MAAQS (µg/m <sup>3</sup> ) |

|                   | Annual         | 6                                  | 18                              | 24                         | 100/100                          |

115 Note: Concentrations in **Bold** indicate exceedance with standard.

116 **6.2.7.4.2 Cumulative Class II Increment Effects**

117 Cumulative Class II Increment analysis was completed for PM<sub>10</sub>, NO<sub>x</sub>, and SO<sub>2</sub> for all increment  
 118 consuming NorthMet sources at both the Mine Site and Plant Site. The modeling included all  
 119 sources at maximum emission rates plus all nearby increment-consuming (and expanding)  
 120 emissions sources identified above. Increment consuming (or expanding) sources are all sources  
 121 with emission increases (or decreases) after the PSD Major Source baseline date for that  
 122 pollutant. The results of the increment analyses are shown in Table 6.2.7-2, along with a  
 123 comparison to the allowable Class II PSD increments.

124 The data in Table 6.2.7-2 summarize the PSD Class II Increment modeling results and  
 125 demonstrate that the NorthMet Project Proposed Action, in conjunction with all other  
 126 neighboring PSD sources, would satisfy all state and federal increment limits.

127 **Table 6.2.7-2 Results of Cumulative Class II PSD Increment Analysis**

| Pollutant        | Averaging Time | Cumulative Modeled Concentrations (µg/m3) | PSD Increment Limits (µg/m3) |
|------------------|----------------|-------------------------------------------|------------------------------|
| SO <sub>2</sub>  | 3-hour         | 11                                        | 512                          |
|                  | 24-hour        | 1.9                                       | 91                           |
|                  | Annual         | 0.2                                       | 20                           |
| PM <sub>10</sub> | 24-hour        | 18                                        | 30                           |
|                  | Annual         | 3                                         | 17                           |
| NO <sub>x</sub>  | Annual         | 0.9                                       | 25                           |

128 **6.2.7.4.3 Cumulative Class I Increment Effects**

129 Based upon the analysis presented in Section 5.2.7, the only modeling analysis with results  
 130 above the acceptable screening thresholds was the 24-Hour Class I SIL for PM<sub>10</sub> at BWCAW,  
 131 which triggers a cumulative modeling assessment. The PM<sub>10</sub> maximum modeled effect was  
 132 below the SIL at Voyagers National Park, but Voyagers National Park receptors were included at  
 133 the request of MPCA. The NorthMet Project Proposed Action is not a major source; however, a  
 134 cumulative assessment was prepared following the same methodology that is used for assessing  
 135 effects from major sources. A cumulative assessment requires modeling of all PSD increment  
 136 consuming and expanding facilities within 300 km of BWCAW. The cumulative emission  
 137 inventory, containing increment consuming and expanding sources, was obtained from MPCA.  
 138 No other major sources within the region have submitted permit applications since the inventory  
 139 was prepared. Recently permitted new sources, which have not begun operation or have recently  
 140 begun operation, are also included in the inventory, as are certain minor sources near the Class I  
 141 areas selected by MPCA.

142 The April 2006 FLM guidance suggests that area and mobile sources may be included in the  
 143 cumulative effect assessment. However, PM<sub>10</sub> emissions from these sources is small in the  
 144 region due to its rural nature; furthermore, total population in the nearby counties has decreased  
 145 since the minor source baseline trigger date. Therefore, no increase in area and mobile sources  
 146 emissions are expected to have occurred, and these emissions are not included in the increment  
 147 assessment.

148 Modeling was conducted to assess the 24-hour average PM<sub>10</sub> concentrations within the Class I  
 149 areas from the cumulative source inventory, and compared to effects from the NorthMet Project  
 150 Proposed Action alone. The maximum concentration from project emissions was added to the  
 151 maximum 24-hour PM<sub>10</sub> concentration from the comprehensive cumulative analysis. This is a  
 152 conservative approach, since the maximum modeled concentration due to the project sources is  
 153 not at the same location and time as the maximum from the comprehensive assessment. Table  
 154 6.2.7-3 summarizes the results of the analysis, showing that the cumulative Class I 24-hour PM<sub>10</sub>  
 155 is below the Class I PSD increment, indicating that the full increment has not been consumed.  
 156 Furthermore, sufficient increment remains in the area to allow for future growth.

157 **Table 6.2.7-3 Results of Cumulative Class I PSD PM<sub>10</sub> Increment Analysis**

| Class I Area            | Averaging Time | Maximum Modeled Air Concentration For NorthMet Modeled Emissions (µg/m <sup>3</sup> ) | Maximum Modeled Air Concentration For Cumulative Modeled Emissions (MPCA Inventory <sup>1</sup> ) (µg/m <sup>3</sup> ) | Total Cumulative Modeled Air Concentration (µg/m <sup>3</sup> ) <sup>2</sup> | PSD Increment Limit (µg/m <sup>3</sup> ) |
|-------------------------|----------------|---------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|------------------------------------------|
| BWCAW                   | 24-hour        | 0.33                                                                                  | 1.76                                                                                                                   | 2.09                                                                         | 8                                        |
| Voyageurs National Park | 24-hour        | 0.13                                                                                  | 0.22                                                                                                                   | 0.35                                                                         | 8                                        |

158 Notes:

159 <sup>1</sup> The MPCA inventory includes the NorthMet Project Proposed Action, but not the same emission data that were modeled for  
 160 the SDEIS.

161 <sup>2</sup> The value is conservative because the NorthMet Project Proposed Action is included in both the MPCA inventory and the  
 162 modeling done for the NorthMet Project Proposed Action alone for the SDEIS.

163 **6.2.7.5 Cumulative Effects of Acid Deposition on Ecosystems**

164 The potential for cumulative effects of acid deposition on ecosystems was evaluated in terms of  
 165 the potential increased acidification on the terrestrial and aquatic systems within a six county  
 166 area (Carlton, Itasca, St. Louis, Koochiching, Lake, and Cook counties) from 1980 to 2015, as  
 167 defined in the Final SDD (MDNR 2005). The pollutants of consideration included both wet and  
 168 dry deposition due to sulfate depositions from SO<sub>2</sub> emissions to the air and nitrate deposition  
 169 from NO<sub>2</sub> emissions to the air. Both of these pollutants can be exposed to long-range transport  
 170 and are subject to complex chemical and physical reactions prior to being washed out by  
 171 precipitation into lakes and rivers. MPCA has estimated that over 90 percent of the acid  
 172 deposition within Minnesota is a result of out-of-state emissions from long-range transport (State  
 173 of Minnesota 1985). Findings from other states and NAPAP (Mahoney et al. 1998) led the  
 174 USEPA to develop the federal Acid Deposition Control Program.

175 Based upon the most recent information available at the time this cumulative analysis was  
 176 conducted by PolyMet in January 2012, there are approximately 11 new projects for the six-  
 177 county area, including the NorthMet Project Proposed Action. Collectively, without accounting  
 178 for recent past reductions or expected future reductions, these sources could emit up to an  
 179 additional 6,635 tons per year NO<sub>x</sub> and 2,807 tons per year SO<sub>2</sub>, if all were constructed and  
 180 operated (Barr 2012o). This represents approximately a 12 percent and 7 percent increase,  
 181 respectively, in the estimated emissions for the two pollutants in the six county “zone of interest”  
 182 through 2009 (Carlton, Itasca, St. Louis, Koochiching, Lake, and Cook counties). However, due  
 183 to the projected decreases in emissions from the Minnesota Power Arrowhead Regional  
 184 Emission Abatement proposal in combination with various federal programs, including the  
 185 implementation of the taconite and electric utility Maximum Achievable Control Technologies  
 186 (MACTs), Best Achievable Retrofit Technology (BART) on Regional Haze Program and Clean  
 187 Fuels Regulations, the overall emissions would be reduced by 5,503 tpy and 3,292 tpy for NO<sub>2</sub>  
 188 and SO<sub>2</sub> respectively, since 2009 (Barr 2012o). In addition, supplemental decreases in emissions  
 189 from the two pollutants are expected to occur due to other reasonably foreseeable actions.

190 As such, the emissions from the NorthMet Project Proposed Action, in combination with other  
191 projects, would emit increased amounts of SO<sub>2</sub> and NO<sub>2</sub> emissions, resulting in a potential  
192 increase in acid deposition that may be too small to measure. However, due to the NorthMet  
193 Project Proposed Action having relatively low emissions of SO<sub>2</sub> and NO<sub>2</sub> and potential  
194 deposition of sulfate and nitrate are below both the Minnesota standard threshold value and the  
195 federal Class I threshold values, in combination with the overall reduction in sulfate and nitrate-  
196 producing emissions cumulatively since 2008, the projects would not likely cause a cumulative  
197 effect on the ecosystems.

#### 198 **6.2.7.6 Cumulative Visibility Effects**

199 A cumulative effects analysis assessing the potential visibility effects on Federal Class I areas  
200 was performed to provide information for the DEIS (Barr 2006h). Also, in addition to the  
201 quantitative assessment of cumulative PM<sub>10</sub> increment consumption in the BWCAW described  
202 in Section 6.2.7.4.3, a semi-quantitative assessment of potential cumulative PM<sub>10</sub> air  
203 concentrations and the potential effect on increment consumption in Minnesota Class I areas was  
204 also completed (Barr 2012o).

#### 205 **6.2.7.7 Cumulative Effects Analysis – Class I Visibility**

206 To help determine the potential effects on visibility impairment in the Class I areas in Minnesota  
207 from the NorthMet Project Proposed Action when combined with all other concurrent projects, a  
208 cumulative effects analysis for visibility was performed by PolyMet. The semi-quantitative  
209 analysis took into account the NorthMet Project Proposed Action along with other projects that  
210 were recently permitted or are currently in the permitting or environmental review process. The  
211 results of the analysis were described in a technical report – *Cumulative Impacts Analysis*  
212 *Minnesota Iron Range Industrial Development Projects; Assessment of Potential Visibility*  
213 *Impacts in Federal Class I Areas in Minnesota* (hereafter called the ‘2006 Visibility Class I  
214 Study’ [Barr 2006h]). An updated report was also submitted in 2012 (Barr 2012o). The 2006  
215 Visibility Class I Study addresses the effects of the NorthMet Project Proposed Action and all  
216 other past and “reasonably foreseeable” proposed projects consistent with the SDD. This analysis  
217 focused on a four-county project area (Itasca, St. Louis, Lake, and Cook counties).

218 The analysis presented here represents an update to the study previously prepared for the DEIS  
219 (Barr 2006h). The updated analysis includes a six-county project area (two additional counties  
220 added: Koochiching and Carlton), additional projects, and updated information on some projects  
221 included in the 2006 study (Barr 2012o). These updates were incorporated to make the analysis  
222 consistent with the work done in Minnesota to address the federal Regional Haze Rule since the  
223 2006 Visibility Class I Study was submitted to the state agencies.

#### 224 **6.2.7.8 Background on the Regional Haze Rule**

225 The USEPA published regulations in July 1999 intended to improve visibility in the nation’s  
226 Class I areas. On June 15, 2005, the USEPA issued final amendments to the July 1999 rule. This  
227 rule and amendments are referred to as the Regional Haze Rule. Minnesota has two Class I  
228 areas—the BWCAW and Voyageurs National Park. In addition, emissions from Minnesota  
229 contribute to visibility impairment to Michigan’s Isle Royale National Park Class I area. The rule  
230 requires that by year 2064, visibility in the Class I areas reflect no man-made impairment and  
231 also requires the installation of BART emission controls that reduce visibility impairment, for

232 certain industrial facilities emitting air pollutants. The MPCA submitted a SIP to the USEPA in  
233 2009, updated in 2012, that describes a 2018 visibility goal that makes reasonable progress  
234 towards the ultimate 2064 goal. Minnesota's Regional Haze SIP outlines the 2018 visibility goal  
235 and includes a target for 30 percent reduction in combined NO<sub>x</sub> and SO<sub>2</sub> emissions by 2018 from  
236 2002 levels from point sources in Northeast Minnesota that emit over 100 tons per year of either  
237 NO<sub>x</sub> and SO<sub>2</sub> (MPCA 2009a).

238 Minnesota has been included in the Cross-State Air Pollution Rule (CSAPR), as described in 40  
239 CFR 52.1240-1241. In 2011, the USEPA proposed that the emissions reductions in CSAPR  
240 achieved greater reasonable progress than source-specific BART determinations for power  
241 plants. As such, Minnesota has submitted a Regional Haze SIP Supplement (MPCA 2012g) to  
242 substitute CSAPR for BART for power plants. On June 12, 2012, the USEPA partially approved  
243 the SIP supplement. The partial approval allowed the substitution of CSAPR for BART of power  
244 plants; however, it failed to approve the BART emission limits for the taconite facilities. The  
245 partially approved plan also includes the identification of Class I areas, calculating baseline and  
246 natural visibility, establishing reasonable progress goals, adopting a long-term strategy for  
247 progress toward visibility goals, providing a monitoring strategy, and consulting with other states  
248 and FLMs prior to development of a regional haze plan. On August 21, 2012, the U.S. Circuit  
249 Court vacated the CSAPR. As such, unless the Supreme Court reverses the lower court decision,  
250 MPCA would be required to make source-by-source BART determinations for the power plants.  
251 On February 6, 2013, the USEPA issued a Federal Implementation Plan to set emissions  
252 standards for the six taconite facilities in Minnesota (and one in Michigan) that is designed to  
253 reduce NO<sub>x</sub> emissions by 22,000 tpy and SO<sub>2</sub> by 2,000 tpy.

#### 254 **6.2.7.8.1 Summary of the 2006 Visibility Class I Study Scope (Updated in 2011) –** 255 **Background**

##### 256 ***Regional Haze and Visibility Impairment***

257 The USEPA defines “regional haze” as visibility impairment caused by the cumulative air  
258 pollutant emissions from numerous sources over a wide geographic area (USEPA 2003). The  
259 primary pollutants that are contributing to regional haze in Minnesota's Class I areas are  
260 anthropogenic emissions of fine particulate matter (PM<sub>2.5</sub>). PM<sub>2.5</sub> includes ammonium sulfate,  
261 ammonium nitrate, and organic carbon matter (MPCA 2009a). Each of these components can be  
262 naturally occurring or can be the result of human activity. The natural levels of these species  
263 result in some level of visibility impairment in the absence of any human influences, and would  
264 vary with season, daily meteorology, and geography (USEPA 2003).

265 There are two categories of fine particulates: primary and secondary. Fine particulates, 2.5  
266 microns or less in diameter, that are placed directly into the atmosphere are called primary  
267 particulates. Secondary particulates are formed as a secondary pollutant by the chemical  
268 transformation of NO<sub>x</sub>, SO<sub>2</sub>, or VOC. Secondary particulates are the main contributor to regional  
269 haze. Both categories of fine particulates (primary and secondary) can be transported long  
270 distances.

271 Coarse particles between 2.5 and 10 microns in diameter do contribute to light extinction.  
272 However, these particles tend to settle out from the air more rapidly than fine particles and can  
273 be found relatively close to their emission sources (USEPA 2004, MPCA 2005), so emissions

274 from the NorthMet Project Proposed Action in this size range are not likely to impact Class I  
275 areas.

### 276 ***Measuring Visibility***

277 Visibility is characterized by the light extinction coefficient and haze index. Additional  
278 description on these two measures of visibility is provided below.

### 279 ***Light Extinction Coefficient***

280 The light extinction coefficient is the sum of the atmospheric concentration of each species of  
281 interest multiplied by a corresponding coefficient. The light extinction coefficient is referred to  
282 as  $b_{\text{ext}}$  and has units of  $10^{-6} \text{ m}^{-1}$  or  $(10^6 \text{ m})^{-1}$ , or as typically labeled, inverse megameters ( $\text{Mm}^{-1}$ ).  
283 Data from the Interagency Monitoring of Protected Visual Environments (IMPROVE) network  
284 is used to calculate light extinction coefficients for those Class I areas where monitoring is  
285 conducted.

### 286 ***Haze Index (Deciview)***

287 The haze index or deciview (dv) was developed to address the issue that light extinction  
288 coefficients are non-linear with respect to human perception of visual changes. The dv is derived  
289 from calculated light extinction, and is designed such that uniform changes in haze correspond  
290 approximately to uniform incremental changes in perception, across the entire range of  
291 conditions, from pristine to highly impaired (40 CFR Part 51.301).

### 292 ***Visibility Impairment “Cumulative Impact” Approach***

293 The scope of the updated cumulative effects on visibility for the NorthMet Project Proposed  
294 Action was completed in essentially four general steps:

- 295 • Assess the IMPROVE data for Voyageurs National Park and the BWCAW to provide the  
296 current status of particulate air concentrations and haze index including a trends analysis  
297 where there is sufficient data.  $\text{PM}_{10}$  concentrations are used to assess particulate  
298 concentration trends.
- 299 • Assess available information from the Regional Haze State SIP that identifies emission  
300 sources and/or emission source regions as significant contributors to ambient air  
301 concentrations in the Class I areas located in Minnesota.
- 302 • Evaluate local, statewide, and national  $\text{SO}_2$ ,  $\text{NO}_x$ , and  $\text{PM}_{10}$  emissions and trends using  
303 existing emission inventory data.
- 304 • Evaluate the cumulative effects from the proposed projects based on the potential increases  
305 in  $\text{SO}_2$ ,  $\text{NO}_x$ , and  $\text{PM}_{10}$  emissions and concurrent reductions from current and reasonably  
306 foreseeable projects and the expected decrease in state and national emissions.

### 307 ***Analysis Boundaries***

308 The following boundaries were identified to define the extent of the analysis for the visibility  
309 cumulative effects study:

- 310 • The timeframe for the trends analysis, both past and future.

- 311 • The timeframe for this analysis is 1990 to 2035.
- 312 • Other “reasonably foreseeable” actions to be assessed in addition to the NorthMet Project  
313 Proposed Action.
- 314 The following projects and actions are considered to be underway or “reasonably foreseeable”:
- 315 • Proposed Projects:
- 316 – Excelsior Energy, Mesaba Energy Project, Coal Gasification Power Plant;
- 317 – Essar Steel Minnesota LLC (formerly Minnesota Steel Industries),  
318 Mining/Taconite/DRI/Steel Plant;
- 319 – Essar Steel Minnesota LLC, Project Modifications;
- 320 – Mesabi Nugget, Large Scale Demonstration Plant;
- 321 – Mesabi Mining Project;
- 322 – Northshore Mining Company, Furnace 5 Reactivation Project;
- 323 – NorthMet Mining Project;
- 324 – Sappi Cloquet Plant Expansion;
- 325 – UPM/Blandin Paper Mill Expansion, Project Thunderhawk;
- 326 – U.S. Steel Keetac Expansion Project; and
- 327 – United Taconite Green Production Project.
- 328 • Emission Reduction Projects:
- 329 – Hill Wood Products major modification amendment;
- 330 – Minnesota Power Taconite Harbor Energy Center Unit 2, Emission Control  
331 Modifications;
- 332 – Minnesota Power Laskin Energy Center Unit 2, NOx Reductions;
- 333 – Minnesota Power Boswell Energy Center Unit 3;
- 334 – Northshore Mining Company: BART Reductions;
- 335 – U.S. Steel Minntac BACT Reductions; and
- 336 – United Taconite BART Reductions.
- 337 • Regulatory and other actions:
- 338 – Implementation of the CSAPR (40 CFR parts 52.1240-1241); and
- 339 – Implementation of the Regional Haze Rule and BART Rule.
- 340 • On-road mobile source programs:
- 341 – Fuel blending standards; and
- 342 – Tier II/Low-sulfur gasoline.

- 343 • Non-road mobile source programs:
- 344 – Control of emissions from unregulated non-road engines;
- 345 – Locomotive/marine engine reductions;
- 346 – Non-road diesel rule; and
- 347 – Updates and additions to the NAAQS for SO<sub>2</sub>, NO<sub>2</sub>, PM/PM<sub>2.5</sub>, and ozone, including 1-
- 348 hour NO<sub>2</sub> and SO<sub>2</sub> standards.

349 ***Geographic Area that May be Affected (“Zone of Impact”)***

350 The “zone of impact” is defined as the area of concern to be evaluated for potential cumulative  
351 effects due to the above-listed actions. Based on the scope defined in the SDD for the NorthMet  
352 Project Proposed Action, the selected zone of impact is defined as Voyageurs National Park and  
353 the BWCAW. Voyageurs National Park is primarily located in St. Louis County, while the  
354 BWCAW encompasses parts of St. Louis, Lake, and Cook counties.

355 ***Assessment of Existing Conditions***

356 An assessment of the baseline visibility conditions for Minnesota’s Class I areas is based on  
357 monitoring data from the IMPROVE program. Monitor sites from both the BWCAW (monitor  
358 ID: BOWA1) and Voyageurs National Park (monitor ID: VOYA2) were included in the analysis.  
359 The IMPROVE website (<http://vista.cira.colostate.edu/improve/Default/htm>) along with the  
360 Visibility Information Exchange Web System (VIEWS) ([http://vista.cira.colostate.edu/  
361 views/Web/Data/DataWizard.aspx](http://vista.cira.colostate.edu/views/Web/Data/DataWizard.aspx)), provide ambient air concentrations for particulate speciated  
362 by chemical and relative humidity data. Although another site collected data at Voyagers  
363 National Park (VOYA1), it was not used in the trend analysis due to a lack of continuous  
364 measurements and change in monitoring location, a comparison with VOYA2 was made. The  
365 VIEWS website provides the total light extinction coefficient from aerosol measurements and  
366 relative humidity.

367 The data for the BOWA1 location indicates a downward trend for haze index (visibility  
368 improvement) from 1992 to 2009 for the 20 percent best days, 20 percent worst days, and the  
369 median days. The data for VOYA2, representing a shorter time period from 2000 to 2009,  
370 showed a lesser visibility improvement trend in the haze index for the 20 percent best days, 20  
371 percent worst days, and median days (-14 percent, +1 percent, -9 percent, respectively) in the  
372 rolling 5-year average data, primarily due to 2009 levels. It should be noted that the comparison  
373 of the average HI median concentration dvs between VOYA1 (1988-1993) and VOYA2 (2000-  
374 2009) showed a 17 percent decrease in dvs between the two sites.

375 Natural, local, state, national, and international emission sources contribute to visibility  
376 impairment in Minnesota’s Class I areas. Minnesota’s Regional Haze SIP recognizes that  
377 international pollution is a contributor to visibility impairment in Minnesota’s Class I areas.

378 The Regional Haze SIP includes a modeling analysis of the potential contributions to light  
379 extinction for ammonium sulfate and ammonium nitrate on the 20 percent worst days by  
380 Minnesota and surrounding states for the projection year 2018 for BWCAW and Voyageurs  
381 National Park. The analysis indicates that Minnesota is the single largest contributor to visibility  
382 impairment at approximately 30 percent. The remaining 70 percent of the estimated contribution

383 is from surrounding states such as Iowa, Illinois, and Wisconsin, as well as other distant areas.  
 384 Northeast Minnesota sources make up approximately 50 percent of the contribution of visibility  
 385 impairment coming from Minnesota (MPCA 2009a) or about 15 percent of the total from all  
 386 sources.

### 387 6.2.7.9 Summary of Emission Trends

388 Table 6.2.7-4 shows the estimated potential emissions of SO<sub>2</sub>, NO<sub>x</sub>, and PM<sub>10</sub> from each of the  
 389 proposed projects included in this analysis. Concurrent emission reductions are provided for  
 390 comparison to the emissions estimated for the proposed projects. Proposed projects were  
 391 included only if they were not operating for most of 2009. This cutoff date was chosen since the  
 392 monitoring and emission inventory data used to assess the past or existing conditions includes  
 393 information up to 2009. Any sources not operating during most of 2009 were not included in the  
 394 analysis of the existing conditions and therefore need to be considered in the assessment of  
 395 future cumulative effects.

396 Emissions of both NO<sub>x</sub> and SO<sub>2</sub> have been reduced in northeast Minnesota by reductions from  
 397 power generation facilities. However, both power generation facilities and the mining facilities  
 398 contribute to visibility impairment in the area. As discussed in the *Background on Regional Haze*  
 399 section above, the MPCA currently has a Regional Haze SIP goal to reduce combined NO<sub>x</sub> and  
 400 SO<sub>2</sub> emissions from northeast Minnesota from 2002 levels by 30 percent by 2018. Current  
 401 MPCA estimates indicate that emission reductions at power generation facilities and additional  
 402 reasonably foreseeable projects in northeast Minnesota are not enough to meet the current  
 403 Regional Haze SIP goal; however, they are on track to meeting the reduction goal. Therefore,  
 404 additional mitigation or reductions may be necessary.

405 Even though there is a net increase in PM<sub>10</sub> for all the proposed projects combined, direct PM<sub>10</sub>  
 406 emissions are not considered to be a concern for visibility impairment in the BWCAW or  
 407 Voyageurs National Park as described in Minnesota's Regional Haze SIP (MPCA 2009a).

- 420 <sup>5</sup> Project modifications preliminary emission estimates Barr Engineering, emission estimate from EI Spreadsheet submitted to
- 421 MPCA on 4/5/2011.
- 422 <sup>6</sup> Northshore Mining's Furnace 5 Project: reactivating two crushing lines, nine concentrating lines, one pellet furnace (Furnace
- 423 5); new sources emissions only (MPCA permit #07500003-003). Although construction for the project was completed prior to
- 424 the January 1, 2009 cut-off date for this analysis, due to plant turnaround and current demand, the furnace has not yet operated
- 425 at a capacity reflecting the expected increase and is therefore included in this evaluation.
- 426 <sup>7</sup> PolyMet Mining's Proposed Facility: crushing/grinding of ore, reagent and materials handling, flotation, hydrometallurgical
- 427 processing, mobile emissions. Emission estimates from Barr 2012r (RS57).
- 428 <sup>8</sup> Net Emission Increase from Blandin Project Thunderhawk MPCA permit #06100001-009. No change in emissions for -010 or
- 429 -011. Note that this project was not built.
- 430 <sup>9</sup> U.S. Steel Keetac Mine, and Keetac (Keewatin) mine expansion and restart of taconite processing line – preliminary emission
- 431 calculations, Barr Engineering. Submitted to MPCA in May 2011 permit application. NO<sub>x</sub> emission increase is from the
- 432 baseline actual emissions used to determine PSD applicability. Although there would be a small increase in actual emissions,
- 433 there would be a decrease in the allowable emissions.

- 434 <sup>10</sup> Minnesota Power completed installation of the Low NO<sub>x</sub> burner system project in Spring 2010. Although actual 2009  
435 emissions already show reductions in excess of the anticipated reductions from 2002 levels, additional reductions are expected  
436 to result from the use of the low NO<sub>x</sub> burners in 2010 and future years. A reduction of zero is used in this analysis because the  
437 actual future restrictions are unknown.
- 438 <sup>11</sup> Emission estimates provided by the MPCA from the “Northeast Minnesota Plan Emission Tracking Spreadsheet” 1-20-2011.  
439 Reductions are the estimated reduction from 2002 emissions minus any reduction in actual emissions that has occurred  
440 between 2002 and 2009.
- 441 <sup>12</sup> Net emission change estimates from final EAW dated 5/1/2009. Plant expansion, new paper machine, new boiler.
- 442 <sup>13</sup> United Taconite Green Production Project – Involves fuel changes and improvements to concentrator and the Line 1 pellet  
443 plant to increase pellet production and was a PSD minor project. Because it was a PSD minor project, specific considerations  
444 for BACT/MACT were not required. However, the Line 1 pellet plant has an existing wet scrubber to control particulate and  
445 SO<sub>2</sub> emission, Emissions estimates are taken from the Technical Support Document of Permit Number 13700113-005  
446 authorizing the project on August 19, 2010.
- 447 <sup>14</sup> Net emissions increase from TSD of Air Emission Permit No. 13700030-003.
- 448 <sup>15</sup> Reductions calculated based on data in “US Steel Minntac Line 7 Low NO<sub>x</sub> Main Burner Final Testing Report”, May 13, 2011  
449 of 3,990 ton per year goal for NO<sub>x</sub> emissions and the 2009 actual emissions provided in the MPCA “Northeast Minnesota Plan  
450 Emissions Tracking Spreadsheet” 1-20-2011.
- 451 <sup>16</sup> PM<sub>10</sub> emissions estimates include stationary and fugitive emissions for all sources at a facility.
- 452 <sup>17</sup> The MPCA RH SIP is still being reviewed by the USEPA for approval including the recommended BART determinations for  
453 affected facilities. Actual BART requirements are pending discussions with the MPCA and have not yet been implemented.
- 454 <sup>18</sup> Abbreviations: tpy = tons per year  
455 BACT = Best Available Control Technology  
456 MACT = Maximum Achievable Control Technology  
457 SO<sub>2</sub> = sulfur dioxide  
458 PM<sub>10</sub> = particulate matter less than 10 micrometers in size  
459 NO<sub>x</sub> = nitrogen oxides  
460 NA = not applicable

#### 461 6.2.7.9.1 Summary of Visibility Cumulative Effects Analysis

462 The following items outline the results and environmental consequences of the 2011 Visibility  
463 Class I Study and newly released IMPROVE data:

- 464 1. **Class I Area Visibility Gradually Improving or Showing No Trend.** Between 1992 and  
465 2010, visibility in the BWCAW on the 20 percent worst days showed a downward trend in  
466 haze index (improvement in visibility), based on a rolling 5-year average. The trend since  
467 2000 is also of interest because this reflects the timeframe of the regional haze requirements.  
468 This trend was assessed based on latest IMPROVE data through 2010. The annual 20 percent  
469 best and 20 percent worst haze index values for the BWCAW shows an improved visibility  
470 trend from 2005 to 2010. The 5-year averages from 2006 to 2010 are also lower than the  
471 baseline averages from 2000 to 2004. The National Park Service has concluded that through  
472 2005, there was not a trend either improving or declining for Voyageurs National Park.  
473 Based on the latest IMPROVE data, there is no clear trend for Voyageurs National Park.  
474 Although visibility on the 20 percent worst days is improved from 2005 to 2010 (6-year  
475 period) for Voyageurs National Park, the 2006 to 2010 rolling 5-year average for the 20  
476 percent worst days is higher than the baseline average (indicating greater visibility  
477 impairment for this timeframe). However, for the 20 percent best days, the 2006 to 2010  
478 5-year rolling average shows improvement.
- 479 2. **Sulfate and Nitrate Particles Are Largest Contributor to Visibility Impairment.**  
480 Ammonium sulfate, ammonium nitrate, and organic carbon matter particulates are the largest  
481 contributors to visibility impairment in both Class I areas. The ammonium sulfate and nitrate  
482 are due to emissions of SO<sub>2</sub> and NO<sub>x</sub>, respectively. Each of these components can be  
483 naturally occurring or the result of human activity.

- 484 3. **Overall Emissions Decreases in Pollutants that are Precursors to Sulfate and Nitrate**  
485 **Particulates.** When the emissions from the proposed projects in northeast Minnesota are  
486 viewed together with the concurrent emission reduction projects of SO<sub>2</sub> and NO<sub>x</sub> from power  
487 generation facilities in northeast Minnesota, there is a net decrease in emissions of both  
488 pollutants in the six-county area of northeast Minnesota. As noted in the Environmental  
489 Consequences section above, current MPCA estimates indicate that emission reductions at  
490 power generation facilities and additional “reasonably foreseeable” projects in northeast  
491 Minnesota are not enough to meet the current Regional Haze SIP goal. Therefore, additional  
492 mitigation or reductions may be necessary to reach the 2018 goal.
- 493 4. **15 Percent of 2018 Visibility Impairment Projected to be Due to Northeast Minnesota**  
494 **Emissions, 15 Percent Due to Minnesota Emissions from Other Areas (In-State, but**  
495 **Outside Northeast Minnesota), and 70 Percent of Visibility Impairment Due to Out-of-**  
496 **State Emissions.** Predictive modeling done in support of the Minnesota Regional Haze SIP  
497 shows that Minnesota sources are expected to contribute approximately 30 percent of the  
498 visibility impairment at Minnesota’s Class I areas and approximately 14 percent of the  
499 visibility impairment at Isle Royale (MPCA 2009a). Of the visibility impairment in the  
500 Minnesota Class I Areas, Northeast Minnesota sources contribute about half of the total from  
501 Minnesota sources or 15 percent overall. The remainder is likely due to sources in other  
502 states and Canada. Emissions from Minnesota are the single largest contributor to regional  
503 haze at its own Class I areas; however, most of the visibility impairment in these areas is due  
504 to out-of-state emissions.
- 505 5. **Net Effect from Proposed Projects.** The net effect from the proposed projects, the  
506 voluntary reductions of power generation facilities, and the foreseeable regulatory actions  
507 shown in Table 6.2.7-2 would likely reduce emissions of SO<sub>2</sub> and NO<sub>x</sub> in Minnesota.  
508 However, as addressed above, the MPCA has developed Regional Haze SIP goals to reduce  
509 combined NO<sub>x</sub> and SO<sub>2</sub> from 2002 levels. The reduction is 20 percent by 2012 and 30  
510 percent by 2018. Based on current projections including the NorthMet Project Proposed  
511 Action, the reductions addressed in this section are not projected to be enough to meet the  
512 2018 goal. The reductions would be enough to meet the 2012 goal.

513 In the event that additional emission reduction measures are required by the MPCA to meet  
514 Regional Haze SIP goals, emissions from the NorthMet Project Proposed Action may be  
515 included for reduction consideration through the MPCA’s Regional Haze Rule and permitting  
516 programs.

#### 517 **6.2.7.10 Climate Change**

518 As noted in Section 5.2.7, and in this cumulative effects assessment, the construction and  
519 operation of the NorthMet Proposed Action would emit gases known to contribute to global  
520 climate change. For an in-depth discussion of global climate change, please refer to the Keetac  
521 Project EIS published in 2010 (MDNR and USACE 2010). That EIS’s cumulative effects  
522 assessment provided an exhaustive discussion of the state of scientific knowledge and policy  
523 framework regarding global climate change and has been incorporated by reference to this EIS as  
524 background information provided by the CEQ regulations (40 CFR 1502.21.).

525 The Keetac EIS found the following:

- 526 • global GHG emissions increased by about 19.6 percent between 1990 and 2004;
- 527 • U.S. GHG emissions increased by about 17 percent between 1990 and 2007; and
- 528 • Minnesota GHG emissions (for all economic sectors) increased by about 16.2 percent
- 529 between 1990 and 2006.

530 It should be noted that for the global figure, a portion of the increase in GHG emissions can be  
531 attributed to deforestation and biomass decay. Nevertheless, these numbers show a definite  
532 increasing trend in anthropogenic sources of GHGs, which the IPCC has determined is  
533 contributing to an increase in global temperatures (MDNR and USACE 2010).

534 As noted in Section 5.2.7, the NorthMet Proposed Action would directly produce approximately  
535 196,342 mtpy of GHG. Table 6.2.7-5 shows the amount of GHG that the NorthMet Proposed  
536 Action would produce in comparison to global, national, and Minnesota GHG emissions. It  
537 shows that the NorthMet Proposed Action's direct GHG emissions would be several orders of  
538 magnitude lower than total global, national, and even statewide GHG emissions.

539 **Table 6.2.7-5 Greenhouse Gas Emissions**

|                  | <b>Total GHG Emissions<br/>(million mtpy)</b> | <b>Proposed Action GHG Emissions as a<br/>Proportion of Total</b> |
|------------------|-----------------------------------------------|-------------------------------------------------------------------|
| <b>Global</b>    | 49,000                                        | 0.00038%                                                          |
| <b>National</b>  | 7,282                                         | 0.0026%                                                           |
| <b>Minnesota</b> | 159.4                                         | 0.12%                                                             |
| <b>NorthMet</b>  | 0.1963                                        |                                                                   |

540 Source: Barr 2012I.

541 Given the minor GHG contribution of the NorthMet Proposed Action to global GHG emissions,  
542 it is impossible to predict how much the NorthMet Proposed Action would factor into climate  
543 change, as noted in the Keetac EIS on Page 5-35. In general, increased GHG emissions from the  
544 NorthMet Project Proposed Action contribute to a cumulative adverse effect on the earth's  
545 climate. Based on the science available, there is the potential that climate change could have a  
546 significant effect on terrestrial and aquatic systems and economies worldwide. However,  
547 determining the significance of any single project is beyond the capabilities of current science.

#### 548 **6.2.7.11 Potential Cumulative Inhalation Risk Assessment**

549 A cumulative risk assessment was conducted to assess the estimated potential cumulative  
550 inhalation risk to a potential resident receptor which included background, non-Project air  
551 emissions. Potential projects considered for inclusion in the cumulative risk analysis were those  
552 within about 10 kilometers (about 6 miles) of the NorthMet Project Proposed Action and  
553 included the Mesabi Mining Project for particulate metals and NO<sub>2</sub> and the Minnesota Power  
554 Laskin Plant for NO<sub>x</sub>.

555 A summary of the maximum estimated potential cumulative inhalation risk to a potential resident  
556 receptor from background exposure (calculated by the MPCA from ambient air monitoring data),  
557 non-NorthMet Project Proposed Action air emissions (Mesabi Mining Project and the existing  
558 Minnesota Power Laskin Plant), and NorthMet Project Proposed Action air emissions (the  
559 incremental risk estimated from the Mine Site and the Plant Site) are summarized in

560 Table 6.2.7-6. The estimated cumulative risk is compared to the incremental risk guideline  
 561 values for a single facility or project, since there are no guideline values for cumulative risk, and  
 562 is intended to provide a broad context for reviewing the results.

563 The potential incremental risk from the NorthMet Mine Site and Plant Site together contribute  
 564 about 57 percent of the estimated potential cumulative acute risk. Total cumulative inhalation  
 565 acute risk does not exceed the incremental acute risk guideline value of one. Potential  
 566 incremental risk from the NorthMet Mine Site and Plant Site accounts for only 7 percent of the  
 567 estimated potential total cumulative chronic noncancer risk. Potential cumulative noncancer  
 568 chronic risks do not exceed the incremental chronic noncancer guideline value of one and are  
 569 predominately from risks based on monitored background air concentrations. Potential  
 570 incremental risk from the NorthMet Mine Site and Plant Site accounts for only 9 percent of the  
 571 estimated potential total cumulative cancer risk (4E-05). Cancer risk from monitored background  
 572 air concentrations (3E-05) is greater than the incremental cancer risk guideline value of 1E-05,  
 573 thus cumulative risk is also above this value.

574 **Table 6.2.7-6 Summary of Cumulative Inhalation Risks**

| <b>Estimated Potential Inhalation Risk<sup>1</sup></b> | <b>Cancer</b> | <b>Noncancer<br/>Chronic</b> | <b>Noncancer<br/>Acute</b> |
|--------------------------------------------------------|---------------|------------------------------|----------------------------|
| <b>Background<sup>2</sup></b>                          |               |                              |                            |
| <b>Ambient Air (calculated by MPCA)</b>                | 3E-05         | 1                            | 0.4                        |
| <b>Laskin Energy Center</b>                            | NA            | NA                           | 0.01                       |
| <b>Total Background</b>                                | 3E-05         | 1                            | 0.4                        |
| <b>Incremental<sup>3</sup></b>                         |               |                              |                            |
| <b>Mine Site and Plant Site</b>                        | 3E-06         | 0.1                          | 0.6                        |
| <b>Mesabi Mining Project</b>                           | NA            | 0.1                          | 0.03                       |
| <b>Total Incremental</b>                               | 3E-06         | 0.2                          | 0.6                        |
| <b>Cumulative<sup>4</sup></b>                          |               |                              |                            |
| <b>Total Cumulative Inhalation Risk</b>                | 4E-05         | 1                            | 1                          |
| <b>Report Calculated Values as<br/>Percentages</b>     | 9             | 7                            | 57                         |

575 Source: Supplemental Air Emission Risk Analysis – Plant Site (Barr 2013j).

576 Notes:

577 <sup>1</sup> The maximum potential cumulative risk represents the highest risk from the four receptors evaluated in the supplemental  
 578 analysis for the Plant Site (Barr 2013j).

579 <sup>2</sup> Background risks were calculated by the MPCA based on MPCA 2008-2010 monitoring data from Virginia, Ely and Cloquet.

580 <sup>3</sup> As per USEPA (2005) HHRAP guidance, all reported risk values are rounded to one significant digit. Totals, however, are  
 581 calculated from unrounded values (i.e., two or more significant figures) and may differ from the value obtained by adding the  
 582 rounded values shown in the table.

583 <sup>4</sup> LSDP = Large-Scale Demonstration Plant (Mesabi Nugget).  
 584

1     **6.2.8     *Noise and Vibration***

2     As described in Section 5.2.8, there would be a long-term increase in the levels and duration of  
3     noise above ambient levels throughout the construction, operation, and reclamation period in the  
4     vicinity (approximately half-mile radius) of the Mine Site (approximately 11,456 acres affected)  
5     and Plant Site (approximately 568 acres affected). The total noise modeling results presented in  
6     Table 5.2.8-7 include sources from the Mine Site and Plant Site (NorthMet Project Proposed  
7     Action) plus baseline noise levels in the region, which includes existing noise sources from past  
8     and present actions near the NorthMet Project area such as Northshore Mine and Mesabi Nugget  
9     Plant (formerly Mesabi Nugget Phase I).

10    There are no other past, present, or reasonably foreseeable actions within the half-mile radius of  
11    the Mine Site and Plant Site that would interact in such a way as to have a cumulative effect on  
12    the receptors identified in Sections 4.2.8 and 5.2.8. Therefore, adverse cumulative noise and  
13    vibration effects are not expected on nearby sensitive receptors (residences/dwelling places,  
14    recreational sites, cultural sites) due to the distance of the NorthMet Project Proposed Action  
15    from the closest reasonable foreseeable action, Mesabi Mining Project (formerly Mesabi Nugget  
16    Phase II) (approximately 2 miles west of the Plant Site and 10 miles west of the Mine Site).  
17    Other reasonable foreseeable projects in the region are 25 to 55 miles away from the NorthMet  
18    Project Proposed Action and, as such, would have no cumulative effect on nearest receptors (see  
19    Figure 6.1.1-1 and Table 6.1.1-1). As indicated above, other past and present actions are already  
20    accounted for in the baseline or ambient levels. Actual noise and vibration source terms from  
21    future projects such as the Mesabi Mining Project were not publicly available, and contour maps  
22    for such future projects were not provided. It should be noted that even if noise and vibration  
23    source terms for the Mesabi Mining Project were available, such contour maps would not be  
24    expected to overlap with the NorthMet Project noise and vibration contours due to the distance  
25    between both projects (i.e., considering the rapid decay of sound with increased distance  
26    [6 decibel decrease per doubling of distance] and attenuation from individual mine pit walls [i.e.,  
27    as the pits become deeper] and dense foliage [Superior National Forest]).

DRAFT

## 1 **6.2.9 Cultural Resources**

2 The cumulative effects analysis for cultural resources focuses on past, present, and reasonably  
3 foreseeable future effects on historic properties and 1854 Treaty resources. This section provides  
4 a qualitative analysis of cumulative effects on historic properties eligible for listing on the  
5 NRHP, as well as 1854 Treaty resources. The approach to the analysis of cumulative effects on  
6 historic properties and 1854 Treaty resources has been informed through discussions and  
7 consultation between the Co-lead Agencies and the Bands.

### 8 **6.2.9.1 Approach**

9 Cumulative effects on cultural resources were assessed by evaluating the effects of the NorthMet  
10 Project Proposed Action in conjunction with other past, present, and reasonably foreseeable  
11 future federal, state, and private actions within the CEAA for cultural resources. The cumulative  
12 effects on cultural resources are described below in Section 6.2.9.2. The baseline conditions of  
13 cultural resources, as directly and indirectly affected by past actions, are described in Section  
14 4.2.9, and direct and indirect effects from the NorthMet Project Proposed Action are described in  
15 Section 5.2.9.

16 Assessment of effects on cultural resources is done specific to the cultural resources identified  
17 within the CEAA. Although cultural resources surveys have been conducted within the Project  
18 area, no cultural resource surveys for the entire CEAA have been completed (cultural resource  
19 surveys are conducted on a project-by-project basis reflective of an individual project area. For  
20 cumulative effects analysis areas, generally the areas are too large and expansive to warrant a  
21 Section 106 equivalent cultural resources field survey. In such cases, therefore, a cumulative  
22 effects analysis is performed using a qualitative analysis of the cumulative effects analysis area  
23 for comparison purposes.). Section 4.2.9 provides background information on existing conditions  
24 as a result of field surveys and investigations within the APE of the NorthMet Project Proposed  
25 Action; however, there is no similar level of data specific to the entire CEAA to allow an impact  
26 assessment comparable to the one found in Section 5.2.9. Instead, data on cultural resources  
27 located within the CEAA that were previously recorded at the SHPO and the USFS were  
28 gathered and compiled in Section 6.2.9.4.1. These data, along with the data presented in Section  
29 4.2.9, were used to determine what cultural resource types are typically found within the CEAA.  
30 In turn the cumulative effects on cultural resources were analyzed qualitatively according to the  
31 cultural resource types typically found within the CEAA.

32 Cultural resources may be destroyed by erosion, construction, excavation, data collection, and  
33 looting; through the removal of artifacts from their surrounding contexts, moving the material  
34 such that it loses context; or through the removal or redeposition of artifacts and their  
35 surrounding context to another location. Cultural properties—including camps, structures,  
36 hunting and fishing sites, graves, and areas of particular religious or traditional importance—lose  
37 their integrity, and thus their potential eligibility for the NRHP, when they become degraded as a  
38 result of natural or human disturbance processes, or when the groups, such as the Ojibwe Bands,  
39 who value these places, can no longer access them, thus losing their cultural connection to the  
40 site or place over time.

41 The determination of effects for cultural resources is based on a resource's eligibility for  
42 inclusion on the NRHP. It should be noted that the NRHP status of some cultural resources

43 within the CEAA remain undetermined, and surveys would be required to determine if these  
44 resources would be eligible for inclusion in the NRHP. Effects on cultural resources listed in the  
45 NRHP, considered to be eligible for listing in the NRHP, or identified but unevaluated would be  
46 avoided or mitigated to the degree practicable as required by Section 106 of the NHPA of 1966  
47 during implementation of federal undertakings. For all cultural resources listed in the NRHP,  
48 considered to be eligible for listing in the NRHP, or unevaluated, avoidance would continue to  
49 be the preferred mitigation strategy. For any historic properties unavoidably and adversely  
50 affected by a proposed project, mitigation measures would be developed as part of a Treatment  
51 Plan for that project.

52 In determining how the Bands have traditionally conducted their usufructuary rights on or near  
53 the NorthMet Project area, interviews of individual Band members of Bois Forte, Fond du Lac,  
54 and Grand Portage were conducted. Only the results of interviews with Bois Forte were made  
55 available. There is little specific information concerning the use of natural resources by the  
56 Bands in the NorthMet Project area. This likely reflects limited subsistence gathering in the  
57 NorthMet Project area due to general inaccessibility. This lack of data also precludes the  
58 quantitative analysis of how Band members would be affected socioeconomically by effects on  
59 1854 Treaty resources, as discussed in Section 5.2.10. The primary source of data for assessing  
60 effects from the NorthMet Project Proposed Action on 1854 Treaty resources is from the analysis  
61 of the environment discussed in detail in Section 4.2.9 of this EIS.

## 62 **6.2.9.2 Cumulative Effects Assessment Area**

63 The NorthMet Project Proposed Action's CEAA for cultural resources is described below, both  
64 spatially and temporally.

### 65 **6.2.9.2.1 Spatial**

66 The CEAA for cultural resources is defined as the area of the Mesabi Iron Range that is within  
67 the 1854 Ceded Territory (see Figures 6.1.1-1 and 1.1-1). The area has been limited to the  
68 Mesabi Iron Range as it is a definable region encompassing the region's mining, which  
69 represents the largest and most influential land use within a reasonable distance from the  
70 NorthMet Project area. Additionally, the area is further limited to the 1854 Ceded Territory as it  
71 is an area of cultural importance to the Bands.

72 At various times during consultation for the NorthMet Project Proposed Action, the Bands have  
73 proposed using an expanded area for analysis of cumulative effects on cultural resources and  
74 natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the  
75 CEAA. The Co-lead Agencies believe that the use of the 1854 Ceded Territory as the CEAA for  
76 cultural resources would actually diminish the significance of any cumulative effect. By  
77 evaluating the effects of the NorthMet Project Proposed Action along with other past, present,  
78 and reasonably foreseeable future projects in the context of a much larger area with a much  
79 larger number of resources similar to those affected by the NorthMet Project Proposed Action,  
80 the effect of the NorthMet Project Proposed Action on those resources is diminished. The  
81 cumulative effects analysis focuses on the specific resources, or types of resources, affected by  
82 the NorthMet Project Proposed Action within an area that is geographically meaningful  
83 considering the resource and project under review. For these reasons, the Co-lead Agencies  
84 believe that the CEAA used in this section is appropriate for this analysis.

#### 85 **6.2.9.2.2 Temporal**

86 This evaluation includes a qualitative discussion of land use and public resource management  
87 developments within the 1854 Ceded Territory since the development and use of timber/mineral  
88 resources began as a result of European settlement in the area, from roughly the 1850s on.

#### 89 **6.2.9.3 Cumulative Actions**

90 This assessment includes direct and indirect cumulative effects on cultural resources associated  
91 with current and foreseeable actions listed below. The following reasonably foreseeable projects,  
92 described in Section 6.1.1.2, are included in the cumulative effects assessment for cultural  
93 resources:

- 94 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 95 • ArcelorMittal Mines Push-Back Project;
- 96 • Community growth and development;
- 97 • Forestry practices (regional);
- 98 • LTV Steel Mining Company Former LTVSMC Pits;
- 99 • Mesaba Energy Project – West Range Site;
- 100 • Mesabi Mining Project;
- 101 • Mesabi Nugget;
- 102 • Mining Resources (Austin Powder Basin, Corsica Basin, Skubic Basin, and Sherman Basin);
- 103 • Minnesota Department of Transportation Highway 53 Relocation;
- 104 • Northshore Mine;
- 105 • Northshore Mine Ultimate Pit Progression Project;
- 106 • U.S. Steel Minntac Mine and Processing; and
- 107 • U.S. Steel Minntac Mine Extension Project.

#### 108 **6.2.9.4 Cumulative Effects Assessment**

109 The NorthMet Project Proposed Action would result in both direct and indirect effects on historic  
110 properties and culturally important resources. Some of the historic properties affected by the  
111 NorthMet Project Proposed Action are part of a thematically related group of properties  
112 associated with Ojibwe land use patterns, while others could be thematically grouped by their  
113 relation to historic mining and development in Northern Minnesota. Cumulative effects on  
114 natural resources of cultural significance to the Bands are addressed in more detail in the specific  
115 natural resources sections and are only summarized in this section.

116 Cumulative effects on historic properties may be both direct and indirect and result in the  
117 physical loss of properties or changes to location, setting, design, materials, craftsmanship,  
118 feeling, or associations. Similar to the analysis of the direct and indirect effects of the NorthMet  
119 Project Proposed Action, analysis was conducted for the cumulative effects on historic properties  
120 and natural resources of significance to the Bands. Cumulative effects were assessed by

121 evaluating the effects of the NorthMet Project Proposed Action with other past, present, and  
122 reasonably foreseeable future federal, state, tribal, and private actions.

#### 123 **6.2.9.4.1 Cultural Resources Previously Recorded within the CEAA**

124 There have not been comprehensive cultural resource surveys of the defined CEAA. However,  
125 data on cultural resources located within the CEAA that were previously recorded at the SHPO  
126 and the USFS were gathered and compiled below. These data, along with the data presented in  
127 Section 4.2.9, were used to determine what cultural resource types are typically found within the  
128 CEAA. In turn, the cumulative effects on cultural resources were analyzed qualitatively  
129 according to the cultural resource types typically found within the CEAA. Also considered was  
130 the nature of some of the properties affected (i.e., thematic groups of properties), and the  
131 geographically extensive nature of some specific properties affected.

#### 132 **Archaeological Resources**

133 Two archaeological sites have been previously recorded outside the NorthMet Project Proposed  
134 Action APE, but within the CEAA.

135 Site 21SL0457, the Jackson Site, consists of a sparse pre-contact-period lithic scatter identified  
136 on the surface of a ridgetop just west of US Highway 53 between Eveleth and Midway,  
137 Minnesota. The lithic material identified at the site appeared to be some form of taconite.  
138 Subsurface investigation of the site was not carried out as part of the 1995 site documentation.  
139 The site has not been evaluated for inclusion in the NRHP.

140 Site 21SL1128, the Staff Family Farmstead Site, consists of a cellar depression, two outbuilding  
141 foundations, a milk house, an isolated concrete pad, a root cellar, a stone-bordered depression, a  
142 well house depression, a surface dump, and an artifact scatter. The early 20<sup>th</sup> century farmstead is  
143 located within a general upland in Nichols Township, Minnesota. The site was recommended to  
144 be potentially eligible for listing in the NRHP per the *Historic Context Study of Minnesota*  
145 *Farmsteads, 1820-1960* for its association with the agricultural development of the Cutover  
146 Region of Minnesota and under Criterion D for its potential to yield important information  
147 regarding the agricultural development of St. Louis County.

#### 148 **Architectural Resources**

149 Research indicates that 174 architectural properties and two historic districts have been  
150 previously inventoried outside the NorthMet Project Proposed Action APE, but within the  
151 CEAA.

152 The NRHP-Eligible Mountain Iron Mining Landscape Historic District comprises 10 properties  
153 and sites representing a system of open-pit natural ore mines, rail corridors, and other features  
154 associated with the early development of the Mesabi iron range between 1892 and 1909. The  
155 Mountain Iron Mining Landscape Historic District is located within the incorporated limits of the  
156 City of Mountain Iron.

157 The NRHP-Listed Virginia Commercial Historic District consists of 103 buildings, three vacant  
158 lots, and a clock tower. The district is located adjacent to Chestnut Street between 1<sup>st</sup> Avenue and  
159 6<sup>th</sup> Avenue in the City of Virginia and reflects the city's main historical industries—mining and  
160 logging.

161 The majority of the architectural properties previously inventoried within the CEAA consists of  
162 residential structures, commercial and industrial buildings, mining-related developments,  
163 government facilities, and infrastructure-related improvements such as bridges and railroads. Of  
164 the 174 architectural properties previously identified within the CEAA, 31 are listed or eligible  
165 for listing in the NRHP. An additional 57 architectural properties, which have not been evaluated  
166 for listing in the NRHP or have been designated not eligible for listing in the NRHP, have been  
167 deemed locally significant.

#### 168 **6.2.9.4.2 Past Actions**

169 The Ojibwe called the hills *Missabe*, the “sleeping giant”—land that lay undisturbed for  
170 millennia until the demand for iron drew prospectors to the area in the 1800s. On the Mesabi  
171 Range, stretching 100 miles from Grand Rapids to Babbitt, soft ore lay close to the surface,  
172 where it could be scooped from open pit mines. Prospectors came to Lake Vermilion in the  
173 1860s to search for gold (Lamppa 2004). It was the discovery of iron ore on the Vermilion  
174 Range, however, that led vast tracts of land to be purchased (Risjord 2005). Explorations in 1890  
175 by the Merritt brothers of Duluth—known as the “Seven Iron Men”—laid the groundwork for  
176 their Mountain Iron Mine, which marked the opening of the great Mesabi Range. Their second  
177 mine, opened at Biwabik in 1891, secured the Mesabi Range’s future legacy in rich hematite ore.  
178 The Merritt brothers’ railroad, the Duluth, Mesabi & Northern, carried its first carload of ore in  
179 1892 to ore docks in Superior, Wisconsin, across the bay from Duluth, itself a major shipping  
180 port (Minnesota Historical Society 2008). A decade later, the Mesabi Range boasted over 100  
181 open pit mines. From 1900 to 1980, the Mesabi Range contributed about 60 percent of the  
182 country’s total iron ore output. Production peaked in the 1940s, when about 600,000,000 tons  
183 were shipped to serve the nation’s needs during World War II. Production remained high in the  
184 1950s, and then began to decline. It had taken less than 100 years for industrial demand to  
185 deplete the supply of high-grade ore (Risjord 2005).

186 In addition to the mining industry, thick forests of pine, fir, spruce, cedar, birch, and aspen  
187 covered much of what is now the Mesabi Range when the first Europeans arrived in Northern  
188 Minnesota. In the early 1860s, sawmills in Duluth, Superior City (modern-day Superior), and  
189 Beaver Bay found a growing market for timber, shipping lumber to other towns on the Lake and  
190 beyond. By 1870, there were 207 saw mills in Minnesota. In 1877, a law allowing sale of timber  
191 off state lands further opened the state for logging. The logging boom had tapered off by the  
192 early 1900s (Risjord 2005).

193 Both the mining and logging industries would forever change the relatively pristine environment  
194 that existed at the time of contact between Native Americans and Europeans in the mid-1600s.  
195 The historic effects of these industries, prior to the development of historic preservation  
196 legislation in the 1960s (i.e., prior to NHPA), occurred with little analysis of cultural resource  
197 effects. Areas logged (such as past forestry practices), mined (such as the LTVSMC), roaded  
198 (such as past road construction and expansion projects), or otherwise subjected to extensive  
199 ground disturbance (such as past community growth and development) resulted in undocumented  
200 and unregulated effects on cultural resources. Cultural properties tend to degrade over time due  
201 to natural forces; however, many survive for hundreds or thousands of years. Modern human  
202 activity tends to exacerbate the damage and as a consequence cultural resources are being  
203 damaged and disappearing at an increasing rate. Many of the recorded cultural resources in the  
204 CEAA exhibit effects as a result from modern use of the land. Cultural resources are likely to

205 have sustained damage from previous mining, logging, road construction, recreation, wildfires  
206 and erosion resulting from these activities. Although difficult to quantify, the paucity of artifacts  
207 at some sites may be due to removal by artifact collectors.

208 Many specific use areas exist, or have existed, along the *Mesabe Widjiu*. Throughout the length  
209 of the Mesabi Iron Range, which includes a large portion of the *Mesabe Widjiu*, the setting and  
210 associated use areas have been affected by alterations to the landscape brought about by mining,  
211 community growth, road construction, and logging. Use of the *Mesabe Widjiu* and surrounding  
212 areas has changed as past development mines expanded and consumed areas once used by the  
213 Ojibwe. The setting of the *Mesabe Widjiu* and the association of the use areas and trails with the  
214 *Mesabe Widjiu* contribute to its significance.

215 An interconnected system of trails along the *Mesabe Widjiu* exists, as discussed in Section 4.2.9.  
216 Some of the trails are documented in the GLO surveys and some have no specific information  
217 available, but are shown on historic maps. Past mining operations have directly affected this trail  
218 system and are visible along parts of these trails. Past mining operations, therefore, have affected  
219 the setting that was otherwise largely unchanged at the time of contact between Native  
220 Americans and Europeans in the mid-1600s.

221 The specifics of cumulative effects on historic properties of traditional religious and cultural  
222 significance to the Ojibwe Bands are relatively unknown throughout the CEAA. However,  
223 historic documentation and oral history, as demonstrated through the Band member interviews  
224 conducted for the NorthMet Project Proposed Action, document Ojibwe occupation and use of  
225 the area throughout the CEAA. The Bands have ancestral ties to the CEAA and the Trygg Maps  
226 document a trail system and occupation sites at the time of the United States GLO surveys in the  
227 mid- to late 1800s. Landscapes such as the *Mesabe Widjiu* are part of Ojibwe oral history and  
228 traditional practices. From the signing of treaties in the 19<sup>th</sup> century to the expansion of mining  
229 operations today, mining activities in the Mesabi Iron Range likely have had substantial  
230 cumulative effect on historic properties of traditional religious and cultural significance to the  
231 Ojibwe Bands; however, the details concerning these effects are not well understood.

232 To address cumulative effects related to historic properties associated with taconite mining, the  
233 period that is most relevant to cumulative effects runs from 1957 (Initiation of Erie activities  
234 within the CEAA) to the present day. The concentrator building, railroads, and the majority of  
235 contributing structures were built in present form between 1957 and 1958. These structures and  
236 transportation features continued to be used in the industrial taconite process through 2001, when  
237 LTV idled activities at the Mine Site. The properties remained relatively unaltered throughout  
238 this period of use; however, there were regular periodic upgrades, maintenance, and engineering  
239 system improvements. Given the dynamic and evolving nature of mining landscapes, certain  
240 features were created, utilized, and subsequently abandoned throughout the 50-odd years of  
241 taconite mining. Mine Area No. 2, for example, was opened in 1957, but eventually merged with  
242 Mine Area No. 3 sometime after 1970. Concurrent with this evolving landscape is the movement  
243 of transportation infrastructure such as railroads and access roads, which typically have a  
244 dynamic and shifting use-life. The Erie/LTVSMC Tailings Basin is another mining feature that  
245 evolved extensively from 1957 through 2001. The spatial massing, height, and footprint of this  
246 particular feature changed regularly while mining was occurring, and its current form is vastly  
247 different than that during the period of significance for Erie. Following LTVSMC's bankruptcy  
248 in 2001 and idling of the mine site, the vast majority of the structures were deactivated, and the  
249 system railroads were not used. Cliffs Erie continued to provide site security, but maintenance

250 activities were not known to have occurred. PolyMet acquired options to the Plant Site through  
251 Cliffs Erie in 2005/2006. Outside of general maintenance to the Administration Building,  
252 PolyMet has not initiated any notable maintenance or rehabilitation projects in the APE. The  
253 pelletizer building was demolished in 2007, though it is the only structure from Erie's period of  
254 significance that has been removed.

#### 255 **6.2.9.4.3 Current and Future Actions**

256 Known or newly identified cultural resources, as part of current and future projects, are evaluated  
257 for their eligibility for listing on the NRHP based on their integrity at the time of documentation  
258 and evaluation. The combination of the implementation of an Unanticipated Discovery Plan  
259 (minimizing effects on unknown cultural resources that may be inadvertently encountered), as  
260 well as associated mitigation measures, and/or a Treatment Plan would mitigate cumulative  
261 effects on cultural resources. As discussed in Sections 4.2.9 and 5.2.9, identified cultural  
262 resources would be evaluated and avoided or minimized to the degree practicable as required by  
263 Section 106 of the NHPA during implementation of the NorthMet Project Proposed Action.  
264 Although continued current development could affect cultural resources, considerations such as  
265 these conducted through the NEPA and NHPA processes would help to mitigate many of the  
266 effects caused by currently proposed projects. However, cumulative effects on cultural resources  
267 could include reasonably foreseeable incremental effects in the form of unauthorized artifact  
268 collection and inadvertent disturbance in the CEAA caused by increased human activity.

269 Potential current and future effects from projects, such as the ArcelorMittal Mines, Essar Steel  
270 Project, Mesabi Nugget and Mesabi Mining Project, Northshore Mine, and U.S. Steel Minntac  
271 Project, would largely be grouped by similar types of direct and indirect impacts. Generally,  
272 these types of large mining and energy projects are going to have similar direct and indirect  
273 effects, although how they affect the significance of that property (i.e., the reason for their  
274 potential eligibility in the NRHP) could be different. It is important to note that, while the  
275 Mesaba Energy projects are outside of the CEAA, they are located immediately adjacent to it.  
276 Because many historic properties of traditional religious and cultural significance are not as  
277 readily documented for the cultural resources practitioner and the physical boundaries of  
278 properties, such as *Mesabe Widjiu*, for example, generally consist of a subjective boundary-based  
279 social, cultural, or traditional perceptions or perspectives of the property, these projects were  
280 included within the CEAA for analysis purposes. Larger categories of current and future regional  
281 projects, such as forestry practices, road construction and expansion projects, and community  
282 growth and development would not generally be expected to have unmitigated adverse impacts  
283 to historic properties due to the requirements of Section 106 of the NHPA for federal  
284 undertakings and various other local and state historic preservation requirements. There could be  
285 effects to historic properties, however, due to projects occurring on private lands where no local,  
286 state, or federal permits are required.

287 Landscape properties can be exposed to a number of potential direct and indirect effects. Not all  
288 effects to a landscape property, such as *Mesabe Widjiu*, would result in an adverse effect. For  
289 instance, larger landscape properties may allow for changes in landscape to a non-contributing  
290 portion of the property or minor changes to the landscape or setting. Factors to consider would  
291 include the scale of the landscape, the prominence of the affected elements, the magnitude of the  
292 proposed project, and the permanency of the change.

293 For large-scale natural landscapes, such as the *Mesabe Widjiu*, the relationship of landscape  
294 characteristics and integrity is complex, as discussed in Section 4.2.9 and 5.2.9. As is the case in  
295 Northern Minnesota, the compatibility of the *Mesabe Widjiu* and historic and modern mining  
296 presents change, an inescapable part of any landscape. In the case of the *Mesabe Widjiu*, direct  
297 impacts can come from new construction or incompatible land uses, such as modern logging,  
298 mining, growth or development of commercial or residential areas, transportation construction,  
299 or other activities that reshape the land or disturb significant aspects of the landscape.

300 For the *Mesabe Widjiu*, setting is an essential component of its use by Band members. Once  
301 pristine in nature, peacefulness and solitude contribute to its cultural significance as a traditional  
302 and sacred location. Indirect effects outside the *Mesabe Widjiu's* boundaries can constitute  
303 intrusions when such changes introduce incompatible visible, audible, or atmospheric elements.  
304 Ultimately, such effects could result in an interruption in the continuity of its historic integrity or  
305 use. More directly, changes in land ownership or segregation of the landscape or a specific use  
306 area could result in inaccessibility for Band members to experience the property for the very  
307 factors that made it eligible.

308 In the case of Native American trails, anticipated direct and indirect effects would come in the  
309 form of continuing segmentation and disassociation of once-related sites and resources. In  
310 particular, changes to the trail system due to expanded mining operations, would also have  
311 residual effects on this and potentially other cultural resources. Visual effects on these trails  
312 would also continue indefinitely and are considered to be cumulative, as well. There would also  
313 be continued cumulative visual intrusions (shape of the landscape) and noise effects on this type  
314 of cultural resource, as the NorthMet Project Proposed Action and other current and future  
315 projects are visible along the trails.

316 Direct and indirect effects on the Spring Mine Lake Sugarbush and other more finite historic  
317 properties of traditional religious and cultural significance would be similar to those described  
318 above for the *Mesabe Widjiu* and Native American trails. In addition to those mentioned above,  
319 effects could result from increases in human access leading to subsequent disturbance (e.g.,  
320 looting, vandalism, and trampling) of historic properties and features. These effects could result  
321 from the establishment of corridors or facilities in otherwise intact and inaccessible areas, or  
322 increased human access. Additionally, historic properties with natural resources components,  
323 such as the Spring Mine Lake Sugarbush, could be exposed to other indirect effects such as those  
324 related to water, air, and invasive species.

325 Additionally, within the CEAA, there are significant historic mining properties that have both  
326 archaeological and structural components. Reuse of the Erie Mining Company Concentrator  
327 Building and Railroad as part of the NorthMet Project Proposed Action are examples of known  
328 mining properties that exist and would be affected within the CEAA. A mining landscape still  
329 being worked may retain integrity if modern extraction methods and character are similar to  
330 those practiced historically, important physical elements remain, and comparable properties are  
331 less intact. Continued use of a property also may destroy it, such as modern mining, which  
332 obliterates all traces of earlier mining activity. Continued mining on the Mesabi Iron Range has  
333 and would continue to eliminate, or alter, the landscape or structures resulting from prior mining  
334 activity, which may qualify for the NRHP. This is a cumulative effect of mining on historic  
335 mining properties that is inherent in the mining industry itself.

336 The NorthMet Project Proposed Action has essentially provided a temporary reprieve in  
337 demolition and site reclamation activities required by *Minnesota Rule* 6132.3200, which calls,  
338 among other remediation activities, for the removal of mining equipment, facilities, railroad  
339 tracks and ties (not required by common carriers), and structures. This administrative rule is  
340 applicable to the other Erie infrastructure, and is cited here for review purposes:

341 *Minnesota Rules*, part 6132.3200 CLOSURE AND POSTCLOSURE MAINTENANCE,  
342 Subpart 2, E(4). Within three years after closure begins, or within a longer period if  
343 approved by the commissioner, the following shall be accomplished:

344 (b) permittee-owned power plants and associated facilities except public utilities,  
345 transmission lines, pipelines, docks and associated facilities, and railroads except  
346 common carrier transportation facilities shall be removed or provisions made for  
347 continued subsequent use; and

348 (c) all other equipment, facilities, and structures shall be removed and foundations razed  
349 and covered with a minimum of two feet of surface overburden.

350 PolyMet would be required to implement a closure and remediation plan for the Mine Site in the  
351 event of permitting. Specific language regarding the removal of structures and features is  
352 available in Section 3.2.2.3.12. Given the requirements for closure pursuant to *Minnesota Rule*  
353 6132.3200, it is reasonable to assume that all buildings and structures not approved for potential  
354 future use within the APE of the NorthMet Project Proposed Action that are considered to be  
355 contributing to the overall Erie Mining Landscape Historic District would be demolished and  
356 reclaimed after the 20-year mining period.

#### 357 **6.2.9.4.4 1854 Treaty Resources**

358 Given the broad range of resources under the term “1854 Treaty resources,” the reader should  
359 reference the appropriate natural resource sections for detail regarding cumulative effects on  
360 specific natural resources of concern.

361 As discussed in Section 5.2.9.2.2, the NorthMet Project Proposed Action could have effects on  
362 1854 Treaty resources, that is, those plant and animal species that are traditionally or culturally  
363 important to the Bands. Band members’ use of the NorthMet Project area, and the entire CEAA,  
364 is not well-defined through research, and did not emerge through interviews. Construction and  
365 operation of the NorthMet Project Proposed Action and other past, present, and reasonably  
366 foreseeable future projects are not likely to reduce overall availability of 1854 Treaty resources  
367 that are typically part of subsistence activities in the 1854 Ceded Territory. However, noise and  
368 other consequences of operations could affect migration or other animal species behavior.

369 Additionally, the NorthMet Project Proposed Action could affect the availability of 1854 Treaty  
370 resources for some Band members through increased bioaccumulation of mercury in fish tissue,  
371 including species associated with subsistence. Effects on the environment, including those from  
372 increased mercury, are all expected to meet the standards and regulations set forth by the  
373 appropriate state or federal agency or program. These laws are intended to protect important  
374 natural and cultural resources and include but are not limited to the ESA, the CWA, and the  
375 CAA. Effects on 1854 Treaty resources are difficult to quantify when the effects are within  
376 environmental standards yet above current baseline conditions. As such, cultural effects on the  
377 Bands would be difficult to quantify in regards to such incremental increases below standards or  
378 effects on species where appropriate mitigation is used.

DRAFT

## 1 **6.2.10 Socioeconomics**

2 Socioeconomics includes demographic characteristics of population, employment, income,  
3 market composition, public finance, housing, public services, and the economic characteristics of  
4 subsistence activities. The cultural aspects of subsistence, specifically for Native American  
5 populations, are discussed in the Cultural Resources section of Chapter 5. Individual subsistence  
6 products (e.g., wild rice, game animals, etc.) are discussed in appropriate resource-specific  
7 sections.

8 The assessment found that, while the NorthMet Project Proposed Action and other past, present,  
9 and reasonably foreseeable future actions would generate economic activity within the CEAA,  
10 the combined actions would not cause cumulative socioeconomic effects.

### 11 **6.2.10.1 Approach**

12 As discussed in Chapter 5, many of the socioeconomic effects of the NorthMet Project Proposed  
13 Action—such as increased population, housing demand, and effects on public facilities and  
14 services—are functions of the jobs and revenue that the NorthMet Project Proposed Action  
15 would create, as modeled using IMPLAN. Conclusions in this analysis were drawn using readily  
16 available data for the cumulative actions under consideration and IMPLAN estimations for the  
17 NorthMet Project Proposed Action.

18 Evaluation of socioeconomic cumulative effects is based largely on the number of new full-time  
19 (or full-time equivalent) jobs created by operation of the cumulative actions. While specific  
20 factors may vary, other socioeconomic effects (earnings, value added, demand for housing and  
21 community services, etc.) are presumed to vary proportionally with employment changes.

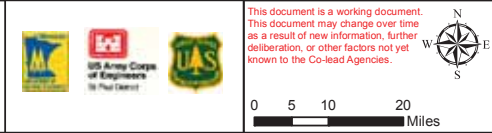

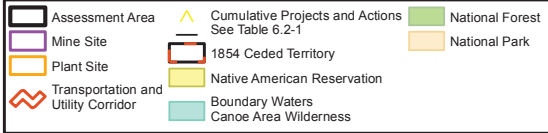

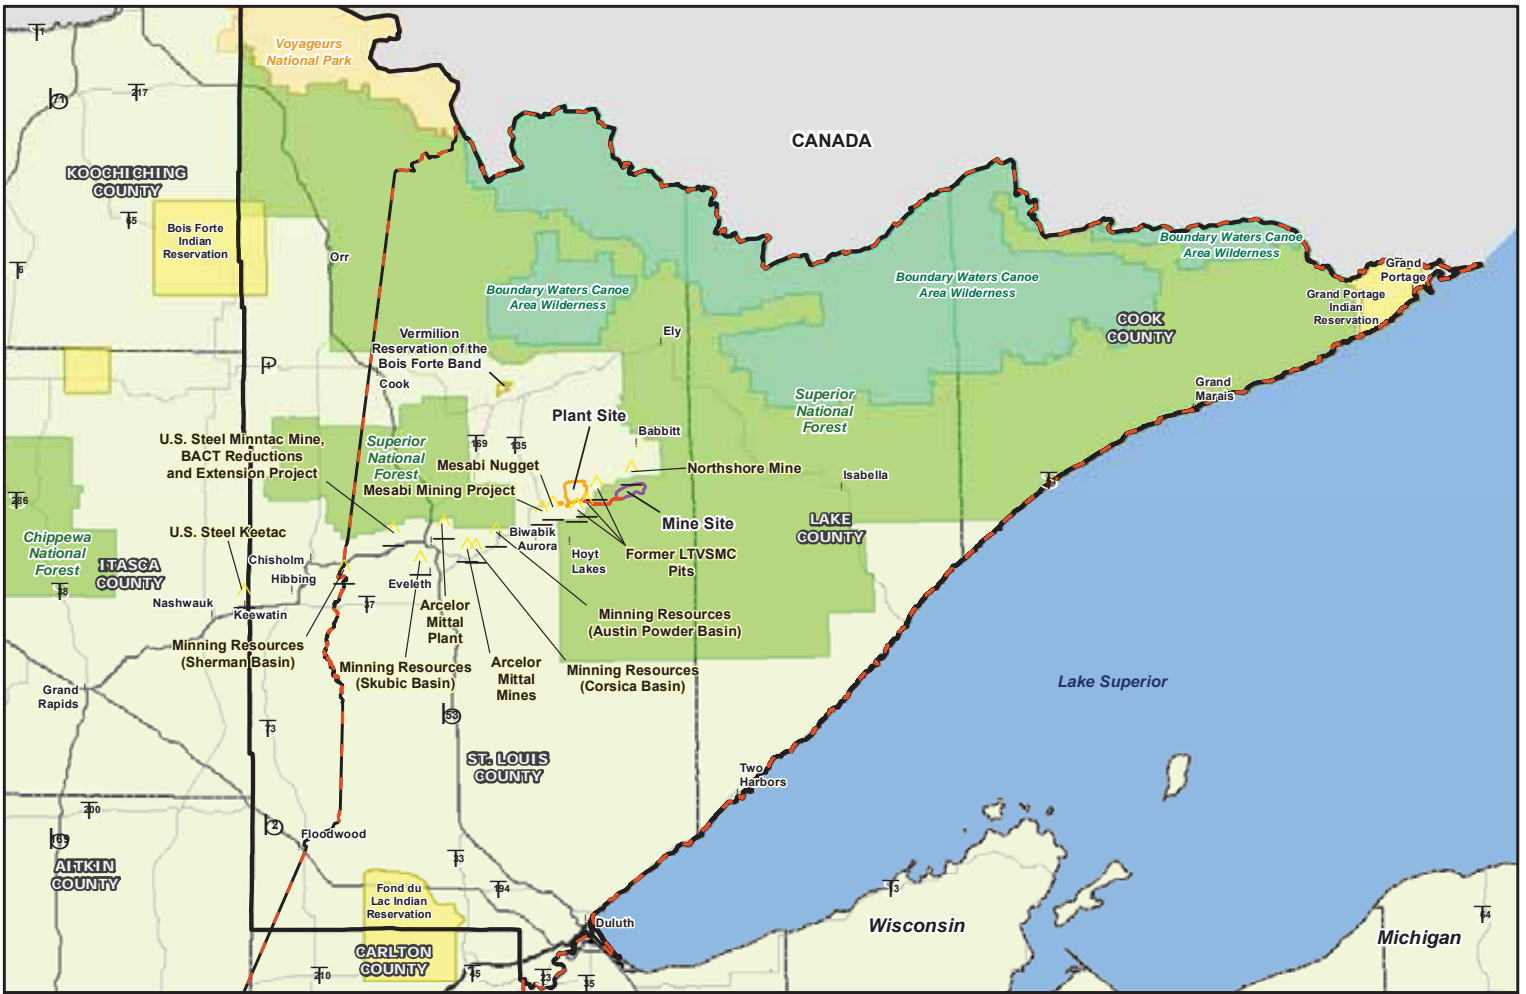

### 22 **6.2.10.2 Cumulative Effects Assessment Area**

#### 23 **6.2.10.2.1 Spatial**

24 The CEAA for socioeconomics includes effects associated with the NorthMet Project Proposed  
25 Action, combined with other industrial (including mining) projects located within the portion of  
26 the Mesabi Iron Range encompassed by St. Louis, Lake, and Cook counties (see Figure  
27 6.2.10-1). As with the NorthMet Project Proposed Action (see Section 5.2.10), iron, taconite, and  
28 precious metal mining in the Mesabi Iron Range have helped to define the region's  
29 socioeconomic conditions for decades. While mining activity has decreased greatly from its peak  
30 in the middle of the 20<sup>th</sup> century, it remains an important economic factor.

31 Tourism and other economic activity associated with the region's high-quality recreation and  
32 natural areas (such as BWCAW) are also important economic and land use drivers. These  
33 economic contributions are based largely on socioeconomic preferences (e.g., retirees choosing  
34 to live in the region to be close to recreational resources), rather than definable projects or  
35 activities. The CEAA for socioeconomics includes many of the largest and most important  
36 recreational and tourist resources in northeastern Minnesota.

 Minnesota  
 June 2015

DRAFT

40 **6.2.10.2.2 Temporal**

41 This evaluation focused on the existing and anticipated future use of the CEAA. Because mining  
42 and public resource management (including recreation and natural resource tourism) have been  
43 the primary drivers defining regional socioeconomic development within the CEAA for over 100  
44 years, existing conditions are considered indicative and representative of historical mining and  
45 resource management activities.

46 **6.2.10.3 Past, Present, and Reasonably Foreseeable Future Actions**

47 For the purposes of this assessment, cumulative actions are those current and permitted mine  
48 projects located in the portion of the Mesabi Iron Range within St. Louis, Lake, and Cook  
49 counties. The socioeconomic effects of the region's recreation and tourism resources are  
50 discussed in Section 5.2.10, and no specific cumulative actions or activities related to these  
51 resources have been identified. These projects, described in Section 6.1.1.2, are listed below.

- 52 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 53 • ArcelorMittal Deposit Push-Back;
- 54 • LTV Steel Mining Company Former LTVSMC Pits;
- 55 • Mesabi Mining Project;
- 56 • Mesabi Nugget;
- 57 • Mining Resources, (Austin Powder Basin, Corsica Basin, Skubic Basin, and Sherman Basin;
- 58 • Northshore Mine;
- 59 • Northshore Mine Ultimate Pit Progression Project;
- 60 • U.S. Steel Keetac Mine (Keewatin);
- 61 • U.S. Steel Minntac Mine;
- 62 • U.S. Steel Minntac Extension Project; and
- 63 • United Taconite Mine expansions.

64 The locations of these actions relative to the NorthMet Project Proposed Action are shown on  
65 Figure 6.2.10-1.

66 **6.2.10.4 Cumulative Effects Assessment**

67 Table 6.2.10-1 summarizes the anticipated cumulative effects of the NorthMet Project Proposed  
68 Action and cumulative actions. Existing studies, approved NEPA documents, and other  
69 information about the cumulative actions did not include detailed economic modeling—such as  
70 the IMPLAN model conducted for the Proposed Action. As shown in Table 6.2.10-1, these  
71 existing documents do estimate direct employment from some of the cumulative actions, but  
72 there are no substantive data or estimates of output and value added (as defined in Section  
73 5.2.10.1). As a result, much of the analysis in this section is largely qualitative in nature.

74

75 **Table 6.2.10-1 Summary of Socioeconomic Cumulative Effects**

| Project                                                    | Temporal Scale         | New Direct Employment |              |
|------------------------------------------------------------|------------------------|-----------------------|--------------|
|                                                            |                        | Construction          | Operation    |
| NorthMet Project Proposed Action <sup>1</sup>              | Future                 | 764                   | 360          |
| ArcelorMittal Mines (Laurentian and East Reserve Deposits) | Present                | 0                     | 0            |
| ArcelorMittal Deposit Push Back                            | Reasonably Foreseeable | Undetermined          | Undetermined |
| Mesabi Nugget                                              | Present                | Undetermined          | Undetermined |
| Mesabi Mining Project <sup>3</sup>                         | Reasonably Foreseeable | 250                   | 220          |
| Mining Resources, Austin Powder Basin                      | Reasonably Foreseeable | Undetermined          | Undetermined |
| Mining Resources, Corsica Basin                            | Reasonably Foreseeable | Undetermined          | Undetermined |
| Mining Resources, Skubic Basin                             | Reasonably Foreseeable | Undetermined          | Undetermined |
| Mining Resources, Sherman Basin                            | Reasonably Foreseeable | Undetermined          | Undetermined |
| Northshore Mine                                            | Present                | 0                     | 0            |
| Northshore Mine Ultimate Pit Progression Project           | Reasonably Foreseeable | Undetermined          | Undetermined |
| U.S. Steel Keetac Mine (Keewatin) <sup>4</sup>             | Present                | 500                   | 170          |
| U.S. Steel Minntac Mine <sup>2</sup>                       | Present,               | Undetermined          | 0            |
| U.S. Steel Minntac Mine, Extension Project <sup>2</sup>    | Reasonably Foreseeable | Undetermined          | 0            |
| United Taconite Mine expansions                            | Reasonably Foreseeable | Undetermined          | Undetermined |
| <b>Total, Cumulative Projects Only</b>                     |                        | <b>750</b>            | <b>390</b>   |

- 76 Notes:  
 77 <sup>1</sup> Operations employment reflects typical year of operations.  
 78 <sup>2</sup> U.S. Steel announced in March that it will temporarily idle these operations due to low iron ore prices (Coyle 2015). Analysis  
 79 assumes they are in full operation.  
 80 <sup>3</sup> Indicates the maximum typical construction employment.  
 81 <sup>4</sup> Reflects peak of 4-year construction period.

82 Construction of the above-mentioned projects would generate approximately 750 new jobs  
 83 directly in the CEAA (in addition to jobs associated with projects whose employment needs are  
 84 undetermined), one percent of the total existing study area employment. Given the timing of  
 85 these projects, the effects are likely to be experienced across different geographies over time.

86 The operational phases of the cumulative actions would generate approximately 390 new jobs in  
 87 the CEAA (in addition to jobs associated with projects whose employment needs are  
 88 undetermined), less than one percent of the area's total current employment. Including indirect  
 89 and induced employment, this figure could triple (based on multipliers associated with the  
 90 NorthMet Project Proposed Action), resulting in approximately 1,170 total new jobs. Added to  
 91 the NorthMet Project Proposed Action, cumulative effects on employment could surpass 1,934  
 92 total new jobs in the three-county study area.

93 Earnings and value added from the cumulative actions would likely be generated at a similar rate  
 94 (per new employee) to the NorthMet Project Proposed Action. Therefore, it is estimated that the  
 95 economic contribution of the cumulative actions, together, would likely match (and could  
 96 exceed) that of the NorthMet Project Proposed Action.

97 Demand for housing and public services due to the cumulative actions would also likely match  
98 that of the NorthMet Project Proposed Action, although these demands would likely occur in  
99 cities and towns not evaluated in Section 5.2.10, such as Mountain Iron, Chisholm, and cities in  
100 other counties to the west, which would be in commuting distance to the cumulative actions, but  
101 that are not within commuting distance of the NorthMet Project Proposed Action. As of 2011,  
102 there were approximately 700 vacant, non-seasonal housing units in Itasca County (as well as  
103 6,900 seasonal units, some of which could conceivably be converted or marketed for full-year  
104 use).

105 As with the NorthMet Project Proposed Action, some portion of these new employees are likely  
106 to already be residents of the CEAA, while some indirect and induced jobs may be filled by  
107 spouses or children of cumulative project employees. By comparison, St. Louis and Itasca  
108 counties have approximately 245,000 residents and 130,000 housing units (vacant and occupied)  
109 (US Census Bureau 2010b). Increases in population and housing demand to the cumulative  
110 actions would likely represent less than one percent of these figures. Such increases would not  
111 likely strain overall service capacity in the region due to existing capacity (see Section 5.2.10),  
112 but could create localized pressures on housing markets or public service agencies.

113 The cumulative actions would all occur in areas already affected by mining and many are, in  
114 fact, expansions of previous mining projects. These projects are largely on private land already  
115 zoned or otherwise designated for such activities. While EJ effects could occur on properly  
116 zoned land, there is no evidence that these cumulative actions would generate EJ effects  
117 associated with economic factors.

118 Increases of mercury in waterbodies from the NorthMet Project Proposed Action are discussed in  
119 Section 5.2.2.3.4, and cumulative increases are discussed in Section 6.2.2.4 and Section  
120 6.2.6.3.3. Cumulative increases in mercury concentrations and the resultant increased mercury  
121 concentrations in fish tissue could constitute an EJ impact for Band members and other  
122 subsistence consumers of fish. However, the AERA assessed health effects for recreational and  
123 tribal fishermen and their families consuming fish that could potentially contain elevated  
124 bioaccumulated levels of methylmercury. A potential small change in fish mercury concentration  
125 was estimated based on modelled emissions and deposition. The potential change in  
126 methylmercury concentration is not statistically measureable given variability in background  
127 concentrations and current laboratory analytical methods (Barr 2013j). Therefore, there is no  
128 expected change in fish mercury concentrations, and no subsequent change in human health risks  
129 related to fish consumption (see Section 5.2.7.2.5). Also, this information is summarized in  
130 Section 7.3.4.4.3 of the FEIS.

DRAFT

## 1 **6.2.11 Recreation and Visual Resources**

2 The NorthMet Project Proposed Action (including the Mine Site, Transportation and Utility  
3 Corridor, and Plant Site), occupies 7,650.1 acres of land near Hoyt Lakes and Babbitt, in St.  
4 Louis County, Minnesota. This includes public lands in the Superior National Forest, as well as  
5 private lands within the municipal boundaries of Hoyt Lakes and Babbitt.

### 6 **6.2.11.1 Approach**

7 The cumulative actions are evaluated to determine whether they would directly affect  
8 recreational lands or activities, or whether they would cause direct or indirect changes in  
9 recreational patterns or views on a regional scale.

### 10 **6.2.11.2 Cumulative Effects Assessment Area**

#### 11 **6.2.11.2.1 Spatial**

12 The CEAA for recreation and visual resources includes the portion of the Mesabi Iron Range  
13 within St. Louis County (see Figure 6.1.1-1). The Mesabi Iron Range encompasses the region's  
14 mining activity, which has the greatest potential to affect recreational resources and activities.

15 This analysis also recognizes the Arrowhead Region's substantial existing high-quality  
16 recreational resources, such as BWCAW, Voyageurs National Park, and Superior National  
17 Forest. Changes in recreational activity associated with these sources are typically associated  
18 with socioeconomic preferences (e.g., increased population and/or changes in recreational  
19 preferences and patterns).

#### 20 **6.2.11.2.2 Temporal**

21 This evaluation focused on existing and anticipated future activities that would affect recreation  
22 and visual resources within the CEAA. Existing conditions are considered indicative and  
23 representative of historical mining and resource management activities. Some additional  
24 qualitative consideration has been given to the pre-historic viewshed conditions documented by  
25 regional tribes in their cultural and religious teachings.

### 26 **6.2.11.3 Contributing Past, Present, and Reasonably Foreseeable Actions**

27 As noted previously, it is not possible to identify all past activities that may contribute to a  
28 cumulative effect. Similarly, all present activities would continue to affect the environment. The  
29 impacts of these combined activities are described in Chapter 4, Affected Environment.  
30 Activities included with the NorthMet Project Proposed Action for the assessment of cumulative  
31 effects are shown on Figure 6.1.1-1 and described in Section 6.1. Activities specifically  
32 associated with potential cumulative effects on recreation include permitted mines and other  
33 projects in portions of the Mesabi Iron Range in St. Louis County where future activities would  
34 likely be different from current activities. These projects include:

- 35 • ArcelorMittal Deposits (Laurentian and East Reserve Deposits);
- 36 • ArcelorMittal Deposit Push-Back;
- 37 • Mesabi Mining Project;

- 38 • Northshore Mine Ultimate Pit Progression Project;
- 39 • U.S. Steel Keetac Mine; and
- 40 • U.S. Steel Minntac Mine, Extension Project.

#### 41 **6.2.11.4 Cumulative Effects Assessment**

42 The cumulative actions described in Section 6.2.11.3 are largely existing, expanded, or  
43 reconfigured mines on private land, totaling approximately 2,650 acres. Sources for the data  
44 regarding cumulative actions include MDNR and USACE 2007, USDOE and MDC 2007, and  
45 MDNR and USACE 2010.

##### 46 **6.2.11.4.1 Recreation**

47 None of the cumulative actions would directly affect recreational lands such as local or state  
48 parks. The public's enjoyment of recreational activities in the region—such as hunting, fishing,  
49 boating, hiking, and winter sports—is tied in part to visual resources, as well as to factors such as  
50 the availability and quality of fish and other aquatic species, vegetation, and wildlife (particularly  
51 game species), noise, air quality, water quality, and wetlands. Direct and indirect effects on these  
52 resources are presented in their respective sections in Chapter 5.

53 The cumulative actions would all occur on or in close proximity to existing or previously mined  
54 land. Excluding effects related to noise, fisheries, air quality, and other effects described  
55 elsewhere in Chapters 5 and 6, and given the proximity of active and past mining and industrial  
56 activity to high-quality recreational activity in the Arrowhead Region (such as the BWCAW),  
57 there is no evidence that the activities associated with the NorthMet Project Proposed Action, in  
58 and of themselves, would directly affect the public's overall ability to hunt, fish, and conduct  
59 other recreational activities, or affect their overall recreational experience in the Arrowhead  
60 Region as a whole.

##### 61 **6.2.11.4.2 Visual Resources**

62 Changes in visual conditions associated with the cumulative actions are expected to be  
63 comparable to those described for the NorthMet Project Proposed Action in Section 5.2.11.2.1.  
64 Whereas portions of the NorthMet Project Proposed Action would occur on previously unmined  
65 land, the mining-related cumulative actions would occur in areas where mine pits and processing  
66 facilities are already part of the visual landscape. After reclamation, the Northshore Mine  
67 Ultimate Pit Progression Project would introduce new visual elements to the mining area  
68 including: the construction of islands for bird habitat, areas for fish spawning, public access to  
69 the lake (post-closure) and flooding organic debris to aid in the initiation of biological  
70 productivity (MDNR 2014f).

## 1 **6.2.12 Wilderness and Other Special Designation Areas**

### 2 **6.2.12.1 Approach**

3 The Mine Site, Plant Site, and surrounding federal lands are not located within or adjacent to any  
4 wilderness areas, nor are there any special designation areas within or adjacent to the NorthMet  
5 Project area. For the purposes of analysis, the study area is an approximate 25-mile radius from  
6 the NorthMet Project area, as described below (see Figure 4.2.12-1).

7 For the purposes of this analysis, the term “wilderness” is defined by the Wilderness Act of 1964  
8 (Public Law 88-577) (16 USC §1131–1136). Other special-designated areas (listed below) are  
9 identified by Presidential Designation, Congressional Designation, or Administrative  
10 Designation, and define lands that are considered to have remarkable ecological, paleontological,  
11 historic, scenic, recreational, geologic, or fish and wildlife value. They include wilderness areas,  
12 wilderness study areas, research natural areas, national scenic or historic trails, wild or scenic  
13 rivers, unique biological areas, national natural landmarks, national historic landmarks, and  
14 national monuments, among others. They fall under the management jurisdiction of the federal  
15 land management agencies, including the MDNR, USFS, National Park Service, and USFWS.

- 16 • Designated Wilderness Areas within the study area:
  - 17 – BWCAW – 25 miles north of the NorthMet Project area.
- 18 • National Park System Units near the study area:
  - 19 – Voyageurs National Park – 50 miles northwest of the NorthMet Project area.
- 20 • State Parks within the study area:
  - 21 – Soudan Underground Mine State Park – 18 miles west of the NorthMet Project area;
  - 22 – Lake Vermilion State Park – 16 miles northeast of the NorthMet Project area;
  - 23 – Bear Head Lake State Park – 11 miles northeast of the NorthMet Project area; and
  - 24 – Iron Range Off-Highway Vehicle State Park – 17 miles northeast of the NorthMet Project
  - 25 area.
- 26 • Established and Candidate Research Natural Areas (cRNAs) within the study area:
  - 27 – The Big Lake-Seven Beavers Area – 12 miles east of the NorthMet Project area;
  - 28 – Keeley Creek Natural Area – 25 miles northeast of the NorthMet Project area; and
  - 29 – Dragon Lake – 25 miles east of the NorthMet Project area.
- 30 • Unique Biological Areas (UBAs) within the study area:
  - 31 – Little Isabella River – 25 miles east of the NorthMet Project area; and
  - 32 – Harris Lake National Natural Landmark – 20 miles northeast of the NorthMet Project
  - 33 area.
- 34 • National Historic Landmarks within the study area:
  - 35 – Soudan Iron Mine – 18 miles northwest of the NorthMet Project area.

- 36 • Scenic Byways within the study area:
- 37 – Superior National Forest Scenic Byway – a portion of the trail is 9 miles southwest of the
- 38 NorthMet Project area.
- 39 • Designated Recreation Trails within the study area:
- 40 – Taconite State Trail – a portion of the trail is 15 to 17 miles north of the NorthMet Project
- 41 area.

42 The cumulative actions have been evaluated against Class I air modeling to determine potential

43 visual effects of haze from the NorthMet Project Proposed Action.

#### 44 **6.2.12.2 Cumulative Effects Assessment Area**

##### 45 **6.2.12.2.1 Spatial**

46 The CEAA for Wilderness and Other Special Designation Areas includes effects associated with

47 the Proposed Action and combined with other industrial (including mining) or public works

48 projects located within the portion of the Mesabi Iron Range encompassed by St. Louis County

49 (see Figure 6.1.1-1). While no direct effects on wilderness character are anticipated, there may be

50 measurable indirect cumulative air effects associated with the NorthMet Project Proposed

51 Action. The CEAA for assessment of potential air effects on designated wilderness and other

52 designated areas is the boundary of measurable air effects identified in Chapter 5.

##### 53 **6.2.12.2.2 Temporal**

54 This evaluation includes a brief discussion of documented air quality degradation in the

55 designated areas since the establishment of these wilderness or other designated areas.

#### 56 **6.2.12.3 Contributing Past, Present, and Reasonably Foreseeable Actions**

57 As noted previously, it is not possible to identify all past activities that may contribute to a

58 cumulative effect. Similarly, all present activities would continue to affect the environment. The

59 impacts of these combined activities are described in Chapter 4, Affected Environment.

60 Activities included with the NorthMet Project Proposed Action for the assessment of cumulative

61 effects are shown on Figure 6.1.1-1 and described in Section 6.1.1. Activities specifically

62 associated with potential cumulative effects on wilderness and other special designated areas

63 include permitted mines and other projects in the portions of the Mesabi Iron Range in St. Louis

64 County where future activities would likely be different from current activities. These projects

65 include:

- 66 • Mesabi Mining Project;
- 67 • Mesabi Nugget;
- 68 • LTV Steel Mining Company Former LTVSMC Pits;
- 69 • Minnesota Power Laskin Energy Center;
- 70 • Minnesota Power Taconite Harbor Energy Center Unit 2, Emission control modifications;
- 71 • Northshore Mine;

- 72 • Northshore Mining Company Furnace 5 Reactivation Project;  
73 • Northshore Mine Ultimate Pit Progression Project;  
74 • U.S. Steel Minntac; and  
75 • U.S. Steel Minntac Mine Extension Project.

76 **6.2.12.4 Cumulative Effects Assessment**

77 The cumulative actions described in Section 6.2.12.3 are largely existing, expanded, or  
78 reconfigured mines on private land.

79 Based on the detailed visibility analysis presented in the Air Quality Section (6.2.7), even though  
80 there would be a net increase in PM<sub>10</sub> from the cumulative actions, these emissions would not  
81 impair visibility in the BWCAW or Voyageurs National Park as described in Minnesota's  
82 Regional Haze SIP (MPCA 2009a).

DRAFT

DRAFT

1 **6.2.13 Hazardous Materials**

2 As described in Chapters 4 and 5, hazardous materials are a site-specific issue; however, there  
3 could be a small likelihood of cumulative effects associated with increased traffic carrying  
4 hazardous materials.

DRAFT

5

-Page Intentionally Left Blank-

6

DRAFT

1 **6.2.14 Geotechnical Stability**

2 This topic relates to the waste material storage facilities (Tailings Basin, waste rock stockpiles,  
3 and Hydrometallurgical Residue Facility). The stability of these facilities is guided by local  
4 geology and design (operation and maintenance) and would not interact with other similar  
5 facilities outside of the NorthMet Project area. Given the discrete nature of these facilities, it has  
6 been concluded that no cumulative geotechnical effects would occur as a result of the NorthMet  
7 Project Proposed Action.

10

DRAFT

1 **6.3 CUMULATIVE EFFECTS BY RESOURCE FOR THE LAND**  
2 **EXCHANGE PROPOSED ACTION**

3 **6.3.1 Land Use**

4 The cumulative effects analysis for land use for the Land Exchange Proposed Action focused on  
5 potential changes in the land area and boundary length of the Superior National Forest; changes  
6 in land fragmentation (i.e., size of patches of federal and non-federal properties) that would  
7 occur that could affect USFS management of the forest; changes in the extent or types of  
8 designated land uses, as defined by management area designations, where known; and changes in  
9 the potential for additional lands open to public use.

10 **6.3.1.1 Approach**

11 This section compared the types of data presented in Sections 4.3.1 and 5.3.1, for each of the  
12 projects within the CEAA Land Exchange Proposed Action boundary. Projects within the CEAA  
13 Land Exchange Proposed Action boundary were evaluated based on the most current available  
14 Superior National Forest land ownership GIS data, as well as the other datasets used in the land  
15 use discussions in Sections 4.3.1 and 5.3.1.

16 **6.3.1.2 Cumulative Assessment Boundary**

17 The CEAA Land Exchange boundary for land use is described below, both spatially and  
18 temporally.

19 **6.3.1.2.1 Spatial**

20 The CEAA for Land Exchange effects on land use was the entire Superior National Forest.

21 **6.3.1.2.2 Temporal**

22 This evaluation focused on the existing and anticipated future use of the CEAA for the life of the  
23 NorthMet Project Proposed Action (approximately 40 years). This includes the approximate  
24 15-year life of the Superior National Forest Plan, which would extend through approximately  
25 2019. Because Superior National Forest was established in 1909, existing conditions are  
26 considered indicative and representative of historical resource management activities.

27 **6.3.1.3 Cumulative Assessment**

28 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
29 increase or decrease of land ownership, boundary managed, fragmentation, and management  
30 areas. Effects were evaluated by comparing GIS shapefiles of the Superior National Forest  
31 before any exchanges or acquisitions to GIS shapefiles of the Superior National Forest after all  
32 cumulative actions and the NorthMet Project Proposed Action alternatives occur.

33 The cumulative actions would result in a net increase in lands within the Superior National  
34 Forest. All of the lands that would be acquired are within the 1854 Ceded Territory and would  
35 thus replace the Mine Site lands with an equal or greater number of acres available for traditional  
36 land use by the Bands. Table 6.3.1-1 shows the management area designations that would result  
37 from the cumulative actions.

38 **Table 6.3.1-1 Potential Increase/Decrease of Management Area Allocations Occurring from the Cumulative Actions**

| Management Area <sup>1,2</sup>                 | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                                      | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                                      | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                                      |

| Fragmentation (linear miles per acre)                  | 0.005                             | 0.004                                                                                          | (0.001)                 | 0.005                                                                                        | 0.0                     | 0.004                                                                                               | (0.001)                 |

49 The cumulative effects of the Land Exchange Proposed Action, Land Exchange Alternative B,  
 50 and the Land Exchange No Action Alternative would all result in an increase to the federal estate  
 51 by adding acreage to the 2,171,603.9 acres of USFS-managed land within the Superior National  
 52 Forest. Furthermore, the cumulative actions would all result in net reduction of the perimeter  
 53 around the USFS-managed portions of the Superior National Forest. Two of the three cumulative  
 54 actions would slightly alter the existing ratio of fragmentation in the Superior National Forest of  
 55 approximately 0.005 linear mile of boundary per acre of USFS-managed Superior National  
 56 Forest land (see Table 6.3.1-2).

57 The Land Exchange and the cumulative projects would also include the following net land use  
 58 effects:

- 59 • consolidation of federal ownership of land within Superior National Forest, specifically of  
 60 land abutting Fall Lake, Gunflint Lake, and Little Gunflint Lake; land on Wolf Island; and  
 61 86,000 acres of currently designated school trust lands, resulting in decreased fragmentation  
 62 and easier access by Forest Service managers;
- 63 • reduced mineral, forestry, residential, and commercial development potential within Superior  
 64 National Forest and decreased conflict related to split surface and subsurface ownership;
- 65 • increased opportunities for public recreational use of stream and lake shorelines and semi-  
 66 primitive non-motorized activities in the Superior National Forest;
- 67 • decreased opportunities for public recreational use of scenic landscapes and semi-primitive  
 68 motorized activities in the Superior National Forest;
- 69 • contribution to local land use and economic goals such as growth and development of the  
 70 Town of Crane Lake and School Trust Land revenue; and

- 71 • minimal net effect on land available for tribal use under the 1854 Treaty.
- 72 Land Exchange Alternative B would have similar effects, but to a lesser degree. Under the Land
- 73 Exchange No Action Alternative, none of the effects described above would occur.

DRAFT

1 **6.3.2 Water Resources**

2 **6.3.2.1 Surface Water**

3 The cumulative effects analysis for water resources for the Land Exchange Proposed Action  
4 focused on the potential increases or decreases of water resources, including lakes, streams, and  
5 wild rice beds.

6 **6.3.2.2 Approach**

7 The cumulative projects were evaluated against water resources including the acreages and miles  
8 of shoreline for lakes, miles of public streams, and wild rice beds. This section evaluated the  
9 cumulative effects on water resources similar to those resources included in Section 5.3.2.

10 This section compared the types of data presented in Sections 4.3.2 and 5.3.2, but for each of the  
11 projects within the CEAA Land Exchange Proposed Action boundary. The GIS data obtained for  
12 the sections mentioned above were compared to projects within the CEAA Land Exchange  
13 Proposed Action boundary, and effects were determined based on this proximity. Specifically,  
14 NWI GIS data was used to determine the analysis.

15 **6.3.2.3 Cumulative Effects Assessment Area**

16 The project's CEAA Land Exchange Proposed Action boundary for water resources is described  
17 below, both spatially and temporally.

18 **6.3.2.3.1 Spatial**

19 The spatial boundary includes the Superior National Forest. The net increase or decrease of  
20 waterways that result from the Land Exchange Proposed Action and other cumulative actions  
21 have been examined in the context of the entire forest in Section 6.1.2.

22 **6.3.2.3.2 Temporal**

23 The temporal boundary includes the present through 2024 (the end of the second decade of the  
24 Forest Plan).

25 **6.3.2.4 Cumulative Effects Assessment**

26 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
27 increase or decrease of water resources (acres/miles of shoreline for lakes, acreages of wild rice  
28 beds, and miles of streams). Effects were evaluated by comparing GIS shapefiles of the Superior  
29 National Forest before any exchanges or acquisitions to the Superior National Forest after all  
30 cumulative actions and alternatives occur.

31 Table 6.3.2-1 summarizes the amount and type of water resources in each of the cumulative  
32 actions.

33

34

35 **Table 6.3.2-1 Potential Increase/Decrease of Water Resources Occurring from Cumulative**  
 36 **Actions**

| Water Resource Types                   | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                         |
|----------------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|
|                                        |                                   | Acres                                                                                          | Net Increase (Decrease) | Acres                                                                                        | Net Increase (Decrease) | Acres                                                                                               | Net Increase (Decrease) |
| Public Water Lakes, Acres              | 73,307.8                          | 80,562.9                                                                                       | 7,255.10                | 8,0574                                                                                       | 7,266.20                | 80,456.7                                                                                            | 7,148.90                |
| Public Water Lakes, Miles of Shoreline | 5,232.2                           | 5,627.1                                                                                        | 394.90                  | 5,627.3                                                                                      | 395.10                  | 5,624.8                                                                                             | 392.60                  |
| Public Water Streams, Miles            | 2,196.0                           | 2,243.5                                                                                        | 47.50                   | 2,242.4                                                                                      | 46.40                   | 2,236.5                                                                                             | 40.50                   |
| Wild Rice Beds, Acres                  | 10,452.4                          | 11,093.3                                                                                       | 640.90 <sup>1</sup>     | 11,093.3                                                                                     | 640.90 <sup>1</sup>     | 10,964.8                                                                                            | 512.40                  |

37 Notes:  
 38 Totals may not match overall Land Exchange area acreages due to rounding and/or due to inconsistencies in GIS data layers.  
 39 <sup>1</sup> Excludes area of wild rice stands in Pike River. Presence of wild rice in the Pike River, which runs through Little Rice Lake,  
 40 was noted in Barr’s surveys (2011a; 2012a; 2013i), but the area of rice was not calculated. The net increase in wild rice due to  
 41 the Land Exchange Proposed Action is approximately 125 acres.

42 The Land Exchange Proposed Action, Land Exchange Alternative B, and Land Exchange No  
 43 Action Alternative cumulative effects would all result in an increase to water resource areas,  
 44 including wild rice within the Superior National Forest.

1 **6.3.3 Wetlands**

2 The cumulative effects analysis for wetlands for the Land Exchange Proposed Action focused on  
3 the potential increases or decreases of wetland acres and wetland types.

4 **6.3.3.1 Approach**

5 The cumulative projects were evaluated against wetland acres and wetland types. This section  
6 evaluated effects on wetland resources similar to Chapter 5.

7 This section compared the types of data presented in Sections 4.3.3 and 5.3.3, but for each of the  
8 projects within the CEAA Land Exchange Proposed Action boundary (see Section 6.1.2 and  
9 Figure 6.1.2-1). The GIS data obtained for the sections mentioned above were compared to  
10 projects within the CEAA Land Exchange Proposed Action boundary and effects were  
11 determined based on this proximity. Specifically, NWI GIS data was used to determine the  
12 analysis. Floodplain data for the CEAA Land Exchange Proposed Action boundary was not  
13 available for all areas; therefore, an analysis was not performed.

14 **6.3.3.2 Cumulative Effects Assessment Area**

15 The project's CEAA Land Exchange Proposed Action boundary for wetlands is described below,  
16 both spatially and temporally.

17 **6.3.3.2.1 Spatial**

18 The spatial boundary included the Superior National Forest. The net increase or decrease of  
19 wetland resources that result from the Land Exchange Proposed Action and other cumulative  
20 actions has been examined in context of the entire forest.

21 **6.3.3.2.2 Temporal**

22 The temporal boundary included the present through 2024 (the end of the second decade of the  
23 Forest Plan).

24 **6.3.3.3 Cumulative Effects Assessment**

25 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
26 increase or decrease of wetland resources (acres of wetlands and acres of wetland types). Effects  
27 were evaluated by comparing GIS shapefiles of the Superior National Forest before any  
28 exchanges or acquisitions to the Superior National Forest after all cumulative actions and the  
29 NorthMet Project Proposed Action alternatives occur.

30 Table 6.3.3-1 summarizes the amount and type of wetland resources in each of the Cumulative  
31 Actions.

32

33 **Table 6.3.3-1 Potential Increase/Decrease of Wetland Resources Occurring from**  
 34 **Cumulative Actions**

35 The cumulative effects of the Land Exchange Proposed Action, Land Exchange Alternative B,  
 36 and Land Exchange No Action Alternative would result in an increase to wetland resource areas  
 37 as well as wetland types.

## 1 **6.3.4 Vegetation**

2 The cumulative effects analysis for vegetation for the Land Exchange Proposed Action focused  
3 on potential increases or decreases of land cover types, landscape ecosystems, MBS Sites of  
4 Biodiversity Significance, and ETSC plant species. Other comparisons that cannot be fully made  
5 include MIH types, age classes, mature patches, RFSS plants, and invasive non-native species.

### 6 **6.3.4.1 Approach**

7 This section compared the types of data presented in Sections 4.3.4 and 5.3.4, but for each of the  
8 projects within the CEAA Land Exchange Proposed Action boundary. The GIS data obtained for  
9 the sections mentioned above were compared to projects within the CEAA Land Exchange  
10 Proposed Action boundary, and effects were determined based on this proximity. Specifically,  
11 GIS data were obtained from the MDNR regarding GAP land cover types and listed ETSC plant  
12 species within the NHIS database. Data were obtained from the USFS MIH types, forest stand  
13 age classes, landscape ecosystems, RFSS plants, and invasive non-native species.

### 14 **6.3.4.2 Cumulative Effects Assessment Area**

15 The CEAA Land Exchange Proposed Action boundary for vegetation is described below, both  
16 spatially and temporally.

#### 17 **6.3.4.2.1 Spatial**

18 The spatial boundary includes the Superior National Forest. The net increase or decrease of  
19 vegetation categories mentioned below that result from the Land Exchange Proposed Action and  
20 other cumulative actions has been examined in context of the entire forest. For state-listed ETSC  
21 plant species and RFSS species, federal and non-federal lands proposed for exchange are also  
22 analyzed in ecological context of the subsection.

#### 23 **6.3.4.2.2 Temporal**

24 The temporal boundary includes the present through 2024 (the end of the second decade of the  
25 Forest Plan). The Forest Plan establishes management objectives for the landscape ecosystems  
26 (Forest Plan pages 2-61 through 2-78) primarily for composition (forest type) and age class  
27 distribution. All of these may be subject to change in a future plan revision (post-2019), but the  
28 second decade would incorporate this timeframe.

### 29 **6.3.4.3 Cumulative Effects Assessment**

30 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
31 increase or decrease of vegetation cover types, MIH types, age classes, mature patches,  
32 landscape ecosystems, ETSC plant species, RFSS plants, and invasive non-native species. For all  
33 analyses, effects were evaluated by comparing GIS shapefiles of the Superior National Forest  
34 before any exchanges or acquisitions to the Superior National Forest after all cumulative actions  
35 and the NorthMet Project Proposed Action alternatives occur.

36 **6.3.4.3.1 Effect of Cumulative Actions on Gap Analysis Program Land Cover Types**  
 37 Effects were based on a net increase or decrease basis of GAP land cover type acres after all  
 38 cumulative actions and the Land Exchange Proposed Action alternatives occur (see Section  
 39 6.1.2.2 for details on the Land Exchange actions) (see Table 6.3.4-1).

40 **Table 6.3.4-1 Potential Increase/Decrease of GAP Land Cover Types Occurring from**  
 41 **Cumulative Actions**

| Cover Types                           | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                 |                    |                 |
|---------------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|-----------------|--------------------|-----------------|
|                                       | Acres                             | Acres                                                                                          | Acres                                                                                        | Acres                                                                                               |                 |                    |                 |

42 Notes:  
 43 <sup>1</sup> Totals may not match overall project area acreages due to rounding and/or due to inconsistencies in GIS data layers.

44 Under all cumulative Land Exchange scenarios (i.e., Land Exchange Proposed Action and all  
 45 other exchanges and acquisitions, Land Exchange Alternative B and all other exchanges and  
 46 acquisitions, and Land Exchange No Action Alternative with all other exchanges and  
 47 acquisitions), there would be a decrease in disturbed areas and cropland/grassland cover types on  
 48 the Superior National Forest. There would be an increase to the Superior National Forest of  
 49 aquatic environments, lowland coniferous forest, lowland deciduous forest, shrubland, upland  
 50 conifer-deciduous mixed forest, upland coniferous forest, and upland deciduous forest.

51 Generally, the effects of the Land Exchange Alternative B would be less pronounced than those  
 52 of the Land Exchange Proposed Action since less land would be exchanged, but all other  
 53 exchanges and acquisitions would continue.

54 **6.3.4.3.2 Effect of Cumulative Actions on Landscape Ecosystems**

55 Effects were based on a net increase or decrease basis of landscape ecosystem acres (see Table  
 56 6.3.4-2).

57 **Table 6.3.4-2 Potential Increase/Decrease of Landscape Ecosystems Occurring from**  
 58 **Cumulative Actions**

| Landscape Ecosystem          | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |
|------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|

59 Notes:  
 60 <sup>1</sup> Totals may not match overall project area acreages due to rounding and/or due to inconsistencies in GIS data layers.

61 Under all cumulative Land Exchange scenarios (i.e., Land Exchange Proposed Action and all  
 62 other exchanges and acquisitions, Land Exchange Alternative B and all other exchanges and  
 63 acquisitions, and Land Exchange No Action Alternative with all other exchanges and  
 64 acquisitions), there would be a decrease in dry-mesic red and white pine, lowland hardwood,  
 65 mesic birch-aspen-spruce-fir, mesic red and white pine, and sugar maple landscape ecosystems  
 66 on the Superior National Forest. There would be an increase to the Superior National Forest of  
 67 the jack pine-black spruce and lowland conifer landscape ecosystems.

68 **6.3.4.3.3 Effect of Cumulative Actions on Minnesota Biological Survey Sites of**  
 69 **Biodiversity Significance**

70 Effects were based on a net increase or decrease basis of landscape ecosystem acres (see Table  
 71 6.3.4-3).

72 **Table 6.3.4-3 Potential Increase/Decrease of MBS Sites of Biodiversity Significance**  
 73 **Occurring from Cumulative Actions**

|                                    |                                   | Net Increase (Decrease)                                                                        | Net Increase (Decrease)                                                                      | Net Increase (Decrease)                                                                             |          |           |          |
| High Biodiversity Significance     | 127,903.3                         | 145,448.3                                                                                      | 17,544.9                                                                                     | 146,846.8                                                                                           | 18,943.4 | 151,106.3 | 23,203.0 |
| Moderate Biodiversity Significance | 111,250.4                         | 146,528.4                                                                                      | 35,278.0                                                                                     | 145,771.5                                                                                           | 34,521.1 | 145,771.5 | 34,521.1 |
| <b>Total</b>                       | 239,153.7                         | 291,976.6                                                                                      | 52,822.9                                                                                     | 292,618.3                                                                                           | 53,464.6 | 296,877.8 | 57,724.1 |

74 There would be an increase in MBS Sites of “High” and “Moderate” Biodiversity Significance  
 75 on the Superior National Forest under all cumulative Land Exchange scenarios (i.e., Land  
 76 Exchange Proposed Action and all other exchanges and acquisitions, Land Exchange Alternative  
 77 B and all other exchanges and acquisitions, and Land Exchange No Action Alternative with all  
 78 other exchanges and acquisitions). There would be greater increases in the “Moderate” sites than  
 79 “High” sites under all scenarios.

80 **6.3.4.3.4 Effect of Cumulative Actions on Management Indicator Habitat Types**

81 Generally, the non-federal lands do not have any MIH types identified on them, as it is a federal  
 82 designation. Additionally, not all federal lands have been fully mapped for MIH types. As a  
 83 result, an MIH comparison cannot be made for the Superior National Forest before and after all  
 84 exchanges and acquisitions. Additionally, age classes and mature patches cannot be fully  
 85 analyzed since they are a subset of the MIH data.

86 **6.3.4.3.5 Effect of Cumulative Actions on Endangered, Threatened, and Special Concern**  
 87 **Plant Species**

88 Effects on ETSC plant species were evaluated by comparing the MDNR NHIS database for the  
 89 Superior National Forest before and after all exchanges or acquisitions would occur. Effects were  
 90 based on a net increase or decrease basis of number of species to federal land holdings. No  
 91 federally listed ETSC plant species would be affected by the Land Exchange Proposed Action.  
 92 The Land Exchange Proposed Action and all exchanges and acquisitions would not result in the  
 93 decrease or absence to the Superior National Forest of any of the 10 ETSC plant species listed  
 94 for the NorthMet Project Proposed Action or 4 ETSC plant species listed for the Land Exchange  
 95 Proposed Action.

96 Land Exchange Alternative B, and all exchanges and acquisitions, would not result in a decrease  
 97 or absence to the Superior National Forest of any of the 10 ETSC plant species listed for the  
 98 NorthMet Project Proposed Action or 4 ETSC plant species listed for the Land Exchange  
 99 Proposed Action.

100 The Land Exchange No Action Alternative, and all exchanges and acquisitions, would not result  
101 in a decrease or absence to the Superior National Forest of any of the 10 ETSC plant species  
102 listed for the NorthMet Project Proposed Action or 4 ETSC plant species listed for the Land  
103 Exchange Proposed Action.

#### 104 **6.3.4.3.6 Effect of Cumulative Actions on Regional Foresters Sensitive Species Plants**

105 Effects on RFSS plants were evaluated by comparing the federal RFSS GIS layer on the Superior  
106 National Forest before and after all exchanges and acquisitions. Effects were based on a net  
107 increase or decrease basis of species to the federal estate. Based on the GIS layer alone, there  
108 would be no change to RFSS plants on the Superior National Forest due to all exchanges and  
109 acquisitions. However, RFSS plants have not been identified on all federal and non-federal lands,  
110 and so a true comparison cannot be made.

#### 111 **6.3.4.3.7 Effect of Cumulative Actions on Invasive Non-native Species**

112 Effects on the federal estate regarding invasive non-native plant species were evaluated by  
113 comparing the federal invasive non-native species GIS layer on the Superior National Forest  
114 before and after all exchanges and acquisitions. Based on the GIS layer alone, there would be no  
115 change to invasive non-native plant species on the Superior National Forest due to all exchanges  
116 and acquisitions. However, invasive non-native species have not been identified on all federal  
117 and non-federal lands, and so a true comparison cannot be made.

118

DRAFT

1 **6.3.5 Wildlife**

2 The cumulative effects analysis for wildlife for the Land Exchange Proposed Action focuses on  
3 potential increases or decreases of habitat availability and occurrences of ETSC wildlife species.

4 **6.3.5.1 Approach**

5 This section evaluated effects on species similar to Chapter 5, but for the CEAA Land Exchange  
6 Proposed Action boundary. Land cover type GIS data from the MDNR, discussed in Section  
7 6.3.4, determined available habitat for wildlife species. Federally and state-listed wildlife species  
8 were identified in the NHIS database. Data obtained from the USFS identified miles of roads and  
9 trails available for use by Canada lynx.

10 **6.3.5.2 Cumulative Effects Assessment Area**

11 The CEAA Land Exchange Proposed Action boundary for wildlife is described below, both  
12 spatially and temporally.

13 **6.3.5.2.1 Spatial**

14 The FEIS analyzed effects on the Canada lynx, gray wolf, and northern long-eared bat occurring  
15 within the federal and non-federal lands proposed for exchange.

16 State-listed species were analyzed on the federal and non-federal lands proposed for exchange.

17 **6.3.5.2.2 Temporal**

18 The temporal boundary includes the present through 2019.

19 **6.3.5.3 Cumulative Effects Assessment**

20 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
21 increase or decrease of habitat types, of road and snow trail miles (for Canada lynx), and of  
22 ETSC and RFSS wildlife species occurrences.

23 **6.3.5.3.1 Environmental Consequences of Reasonably Foreseeable Actions on Wildlife**  
24 **Habitat**

25 Effects on key habitat type were evaluated by comparing GIS shapefiles of the Superior National  
26 Forest before any exchanges or acquisitions to GIS shapefiles of the Superior National Forest  
27 after all cumulative actions and the Land Exchange Proposed Action alternatives occur (see  
28 Section 6.1.2.2 for details on the Land Exchange actions). Effects were based on a net increase or  
29 decrease of habitat acres types to the federal estate (see Table 6.3.5-1).

30

31 **Table 6.3.5-1 Potential Increase/Decrease of Key Habitat Types Occurring from**

| <b>Total<sup>1</sup></b>                                                        | <b>2,171,325.9</b>                         | <b>2,217,396.6</b>                                                                                         | <b>46,070.7</b>               | <b>2,216,893.1</b>                                                                                       | <b>45,567.1</b>               | <b>2,216,526.4</b>                                                                                              | <b>45,200.5</b>               |

33 Notes:

34 <sup>1</sup> Totals may not match overall project area acreages due to rounding and/or due to inconsistencies in GIS data layers.

35 The cumulative effect of the Land Exchange Proposed Action, plus other exchanges and  
 36 acquisitions, would result in an increase of wildlife habitat on the federal estate. While mature  
 37 forest, grassland/ shrubland, and aquatic habitats would increase, there would be a decrease in  
 38 habitat acres for disturbed areas. The cumulative effect of Land Exchange Alternative B plus  
 39 other exchanges and acquisitions would result in a smaller but similar increase or decrease in  
 40 wildlife habitat. The Land Exchange No Action Alternative, plus other exchanges and  
 41 acquisitions, would result in an increase of wildlife habitat on the federal estate. Mature forest  
 42 and aquatic habitats would increase, but there would be a decrease in acres for disturbed and  
 43 grassland/shrubland habitats.

44 **6.3.5.3.2 Environmental Consequences of Reasonably Foreseeable Actions on Special**  
 45 **Status Wildlife Species**

46 Effects on special status wildlife species were evaluated by comparing GIS shapefiles of the  
 47 Superior National Forest before any exchanges or acquisitions to the Superior National Forest  
 48 after all cumulative actions and the Land Exchange Proposed Action alternatives occur. Effects  
 49 on special status wildlife species were evaluated by comparing the MDNR NHIS database for the  
 50 Superior National Forest before and after all exchanges or acquisitions would occur. Effects were  
 51 based on a net increase or decrease basis of species to the federal estate.

52 Based upon the MDNR NHIS database information, there would be a net decrease of special  
53 status wildlife species to the federal estate due to all three actions (Land Exchange Proposed  
54 Action, Land Exchange Alternative B, and Land Exchange No Action Alternative), plus other  
55 exchanges and acquisitions. According to available information, a species of special concern, the  
56 red-shouldered hawk (*Buteo lineatus*), would decrease due to one of the exchanges and  
57 acquisitions. Special status species studies that inform the NHIS database have not been  
58 completed for all federal and non-federal lands; therefore, a true comparison cannot be made.

59 There are 17 terrestrial wildlife species on the Superior National Forest RFSS list. These species  
60 are not legally protected and species studies have not been completed. Similar to the special  
61 status species studies mentioned above, a true comparison of the increase or decrease of RFSS  
62 species occurrences cannot be made.

### 63 **6.3.5.3.3 Environmental Consequences of Reasonably Foreseeable Actions on the** 64 **Federally Listed Species**

#### 65 **Canada Lynx**

66 The Superior National Forest, where the Land Exchange Proposed Action included in the CEAA  
67 is located, includes lynx habitat and habitat for lynx prey species. As discussed in Section  
68 5.3.5.2.1, lynx habitat includes a wide variety of upland and lowland habitats and forest  
69 types/ages, shrubland, and grasslands, but excludes aquatic environments. Denning habitat is  
70 typically found in mature forest and is generally more dependent on forest age classes, with trees  
71 older than saplings and with a dbh greater than 5 inches. Snowshoe hare are the primary prey  
72 species for the Canada lynx, and hare habitat includes all types and age classes of forest and  
73 shrubland, but not aquatic environments, disturbed areas, or grassland/croplands. Unsuitable  
74 habitat includes aquatic environments and disturbed areas.

75 The effects on lynx habitat were evaluated by comparing GIS shapefiles of the Superior National  
76 Forest before any exchanges or acquisitions to the Superior National Forest after all cumulative  
77 actions and the Land Exchange Proposed Action alternatives occur. Effects were based on a net  
78 increase or decrease of habitat acres to the federal estate (see Table 6.3.5-2).

79 **Table 6.3.5-2 Potential Increase/Decrease of Suitable Habitat Types for Canada Lynx and**  
 80 **Prey Species Occurring from Cumulative Actions**

| Suitable Habitat for Lynx and Prey Species    | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                         |
|-----------------------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|
|                                               | Acres                             | Acres                                                                                          | Net Increase (Decrease) | Acres                                                                                        | Net Increase (Decrease) | Acres                                                                                               | Net Increase (Decrease) |

| Suitable Snowshoe Hare Forage Habitat (acres) | 2,068,526.8                       | 2,110,365.0                                                                                    | 41,838.2                | 2,109,795.9                                                                                  | 41,269.1                | 2,109,650.4                                                                                         | 41,123.6                |
| Unsuitable Lynx Habitat (acres)               | 94,159.4                          | 98,825.8                                                                                       | 4,666.4                 | 98,887.0                                                                                     | 4,727.6                 | 98,689.1                                                                                            | 4,529.7                 |

81 All three actions (Land Exchange Proposed Action, Land Exchange Alternative B, and Land  
 82 Exchange No Action Alternative) plus other exchanges and acquisitions would result in some  
 83 increases in general suitable lynx habitat, snowshoe hare forage habitat, and unsuitable habitat.  
 84 Under all three actions plus other exchanges and acquisitions, there would be a decrease in lynx  
 85 denning habitat, using mature MIH forest types as a predictor.

86 Lynx utilize snow pack trails and roads as travel corridors. The effects on lynx travel corridors  
 87 were evaluated by comparing GIS shapefiles of the Superior National Forest before any  
 88 exchanges or acquisitions to GIS shapefiles of the Superior National Forest after all cumulative  
 89 actions and the Land Exchange Proposed Action alternatives occur. Effects were based on a net  
 90 increase or decrease of miles of snow pack trails and established roads to the federal estate (see  
 91 Table 6.3.5-3).

92 **Table 6.3.5-3 Potential Increase/Decrease of Lynx Travel Corridors on the Federal Estate**  
 93 **Occurring from Cumulative Actions**

| Travel Corridor Type         | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                         |
|------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|
|                              | Miles                             | Miles                                                                                          | Net Increase (Decrease) | Miles                                                                                        | Net Increase (Decrease) | Miles                                                                                               | Net Increase (Decrease) |
| Established Snow Pack Trails | 1,818.7                           | 1,803.5                                                                                        | (15.2)                  | 1,803.0                                                                                      | (15.7)                  | 1,803.0                                                                                             | (15.7)                  |
| Established Roads            | 3,167.3                           | 2,968.2                                                                                        | (199.1)                 | 2,968.3                                                                                      | (199.0)                 | 2,972.1                                                                                             | (195.2)                 |

94 All three actions (Land Exchange Proposed Action, Land Exchange Alternative B, and Land  
 95 Exchange No Action Alternative), plus other exchanges and acquisitions, would result in a  
 96 decrease in established road and established snow pack trails available for lynx use.

97 **Gray Wolf**

98 The Superior National Forest, where the Land Exchange Proposed Action included in the CEAA  
 99 is located, includes gray wolf habitat and habitat for wolf prey species. As discussed in Section  
 100 5.3.5.2.1, wolf cover habitat includes a wide variety of upland and lowland habitats and forest  
 101 types of immature to mature age classes. Forage habitat is typically found in young forest types.  
 102 Unsuitable habitat includes aquatic environments and disturbed areas.

103 The effects on wolf habitat were evaluated by comparing GIS shapefiles of the Superior National  
 104 Forest before any exchanges or acquisitions to the Superior National Forest after all cumulative  
 105 actions and the Land Exchange Proposed Action alternatives occur. MIH types and age classes  
 106 are not fully mapped on non-federal lands, and so a true comparison is impossible to make.  
 107 Effects were based on a net increase or decrease of habitat acres to the federal estate (see Table  
 108 6.3.5-4).

109 **Table 6.3.5-4 Potential Increase/Decrease of Gray Wolf Habitat on the Federal Estate**  
 110 **Occurring from Cumulative Actions**

| Suitable<br>Habitat for<br>Gray Wolf | Existing<br>Superior<br>National<br>Forest | Superior National<br>Forest – Land<br>Exchange Proposed<br>Action Plus other<br>Exchanges and<br>Acquisitions | Superior National<br>Forest – Land<br>Exchange Alternative B<br>Plus other Exchanges<br>and Acquisitions | Superior National Forest –<br>Land Exchange No Action<br>Alternative but other<br>Exchanges and Acquisitions |
|--------------------------------------|--------------------------------------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
|                                      | Acres                                      | Acres<br>Net<br>Increase<br>(Decrease)                                                                        | Acres<br>Net<br>Increase<br>(Decrease)                                                                   | Acres<br>Net Increase<br>(Decrease)                                                                          |
| Forage Habitat<br>(acres)            | 66,681.1                                   | 64,312.5<br>(2,368.6)                                                                                         | 64,307.0<br>(2,374.1)                                                                                    | 64,539.2<br>(2,141.9)                                                                                        |
| Cover Habitat<br>(acres)             | 1,107,492.2                                | 900,697.2<br>(206,795.0)                                                                                      | 901,181.6<br>(206,310.6)                                                                                 | 905,493.3<br>(201,998.9)                                                                                     |

111 All three actions (Land Exchange Proposed Action, Land Exchange Alternative B, and Land  
 112 Exchange No Action Alternative), plus other exchanges and acquisitions, would result in a  
 113 decrease in forage and cover habitat available for gray wolves.

114 **Northern Long-Eared Bat**

115 The Superior National Forest, where the Land Exchange Proposed Action included in the CEAA  
 116 is located, includes northern long-eared bat habitat. As discussed in Section 5.3.5.2.1, northern  
 117 long-eared bat summer roosting habitat includes mature forest types. Forage habitat is typically  
 118 found in mature forest understories or openings in such habitat types.

119 The effects on northern long-eared bat habitat were evaluated by comparing GIS shapefiles of  
 120 the Superior National Forest before any exchanges or acquisitions to the Superior National  
 121 Forest after all cumulative actions and the Land Exchange Proposed Action alternatives occur.  
 122 MIH types and age classes are not fully mapped on non-federal lands, and so a true comparison

123 is impossible to make. Effects were based on a net increase or decrease of habitat acres to the  
 124 federal estate (see Table 6.3.5-5).

125 **Table 6.3.5-5 Potential Increase/Decrease of Northern Long-Eared Bat Habitat on the**  
 126 **Federal Estate Occurring from Cumulative Actions**

| Suitable Habitat for Northern Long-Eared Bat | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                         |
|----------------------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|
|                                              | Acres                             | Acres                                                                                          | Net Increase (Decrease) | Acres                                                                                        | Net Increase (Decrease) | Acres                                                                                               | Net Increase (Decrease) |
| Forage and Roosting Habitat (acres)          | 748,762.1                         | 552,245.4                                                                                      | (196,516.6)             | 552,586.1                                                                                    | (196,175.9)             | 555,677.1                                                                                           | (193,085.0)             |

127 All three actions (Land Exchange Proposed Action, Land Exchange Alternative B, and Land  
 128 Exchange No Action Alternative), plus other exchanges and acquisitions, would result in a  
 129 decrease in forage and summer roosting habitat available for northern long-eared bats.

130  
 131  
 132

### 1 **6.3.6 Aquatic Species**

2 The cumulative effects analysis for aquatic species for the Land Exchange Proposed Action  
3 focused on the potential increases or decreases of surface water area and available shoreline, as  
4 these parameters are the limiting factors that determine the available aquatic species habitat.

#### 5 **6.3.6.1 Approach**

6 The cumulative effects of the Land Exchange Proposed Action, in combination with other  
7 existing and reasonably foreseeable projects were evaluated against stream shoreline frontage,  
8 lake surface area, and lake shoreline frontage. This section evaluated effects on aquatic species  
9 available habitat similar to Chapter 5.

10 This section compared the types of data presented in Sections 4.3.6 and 5.3.6, but for each of the  
11 projects within the CEAA Land Exchange Proposed Action boundary. The GIS data obtained for  
12 the sections mentioned above were compared to projects within the CEAA Land Exchange  
13 boundary, and effects were determined based on this proximity. Specifically, DNR 24K Lakes  
14 and DNR 24K Streams GIS data were used to determine the analysis; however, a shoreline  
15 frontage index was not analyzed, as in Section 5.3.6, due to limited data availability.

16 The surface water features analyzed were assumed to correlate to available aquatic species  
17 habitat.

#### 18 **6.3.6.2 Cumulative Effects Assessment Area**

19 The CEAA Land Exchange Proposed Action boundary for aquatic species habitat is described  
20 below, both spatially and temporally.

##### 21 **6.3.6.2.1 Spatial**

22 The spatial boundary included the Superior National Forest. The net increase or decrease of  
23 surface water features or SGCN species that result from the Land Exchange Proposed Action and  
24 other cumulative actions has been examined in context of the entire Superior National Forest.

##### 25 **6.3.6.2.2 Temporal**

26 The temporal boundary included the present through 2024 (the end of the second decade of the  
27 Forest Land and Resource Management Plan).

#### 28 **6.3.6.3 Cumulative Effects Assessment**

29 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
30 increase or decrease of surface water features and federal/state sensitive aquatic species (SGCN,  
31 ETSC, and RFSS species). Effects were evaluated by comparing GIS shapefiles of the Superior  
32 National Forest before any exchanges or acquisitions to GIS shapefiles of the Superior National  
33 Forest after all cumulative actions and the NorthMet Project Proposed Action alternatives occur.

34 **6.3.6.3.1 Effect of Cumulative Actions on Net Increase/Decrease of Surface Water**  
35 **Features**

36 Table 6.3.6-1 summarizes the surface water area and shoreline linear distance in each of the  
37 cumulative actions. For this qualitative assessment, it is assumed that the surface water features  
38 provide aquatic species habitat; however, the quality of that habitat could not be assessed or  
39 compared.

40 The effects of the cumulative actions for each scenario summarized below indicate there would  
41 be an increase in the lake area and lake shoreline distances, and a decrease in the riverine  
42 shoreline distances.

43 **6.3.6.3.2 Environmental Effects of Cumulative Actions on Special Status Aquatic Species**

44 Effects on special status aquatic species (federal and state ETSC, SGCN, and RFSS) were  
45 evaluated by comparing maps (derived from GIS data) of the existing Superior National Forest to  
46 the Forest if all cumulative actions and the alternatives to the Land Exchange were to occur. GIS  
47 analysis determined that no known special status aquatic species are located within the lands that  
48 would be relinquished or acquired by the Superior National Forest. However, it is likely that  
49 special status aquatic species habitat does exist on some of these lands, but the limited available  
50 data does not allow for an accurate comparison.

### 1 **6.3.10 Socioeconomics**

2 The cumulative effects analysis for socioeconomics for the Land Exchange Proposed Action  
3 focused on changes to revenue streams, timber harvesting, employment related to forestry and  
4 timber activities, recreation, and amount of accessible 1854 Ceded Territory area and resources.

#### 5 **6.3.10.1 Approach**

6 Criteria for evaluating the socioeconomic cumulative effects of the Land Exchange Proposed  
7 Action include:

- 8 • changes in revenue streams (taxes, payment in lieu of taxes) and assessed market value  
9 associated with transfers of land from non-federal to federal ownership;
- 10 • changes in the amount and value of land available for timber harvest and employment related  
11 to forestry and timber activities;
- 12 • changes in visitation, recreational tourism spending to the Superior National Forest; and
- 13 • changes in the amount of accessible 1854 Ceded Territory land and the availability of treaty  
14 resources (e.g., wild rice, fish, and game).

#### 15 **6.3.10.2 Cumulative Effects Assessment Area**

16 The CEAA Land Exchange Proposed Action boundary for socioeconomics is described below,  
17 both spatially and temporally.

##### 18 **6.3.10.2.1 Spatial**

19 The CEAA for socioeconomic effects of the Land Exchange Proposed Action is the portions of  
20 Superior National Forest in St. Louis, Lake, and Cook counties.

##### 21 **6.3.10.2.2 Temporal**

22 This evaluation focuses on the existing and anticipated future use of the CEAA for the life of the  
23 NorthMet Project Proposed Action (approximately 20 years). This includes the approximate 15-  
24 year life of the Forest Plan, which would extend through approximately 2019. Because Superior  
25 National Forest was established in 1909, existing conditions are considered indicative and  
26 representative of historical resource management activities.

#### 27 **6.3.10.3 Cumulative Effects Assessment**

28 The net socioeconomic effects of the Crane Lake Land Exchange would be a marginal increase  
29 in recreational activity (and thus regional tourism revenue) in the Superior National Forest, and  
30 increased economic benefit to the Town of Crane Lake due to additional development (consistent  
31 with existing plans).

32 The net socioeconomic effects of the Cook County Land Exchange would include increased  
33 revenue to Cook County through management activities (timber and development) on newly  
34 acquired parcels and reduced cost of federal management of the Superior National Forest and  
35 BWCAW.

36 The net socioeconomic effects of the School Trust Land Exchange and Land Acquisition would  
37 be a decrease in logging or mining activity (and thus timber and mineral revenue) in the Superior  
38 National Forest, and increased School Trust Land revenue due to additional development  
39 (consistent with existing plans).

40 The Fall Lake land acquisition and the Gunflint land acquisition would open additional areas of  
41 land to potential public use (as well as exercise of usufructuary rights under the 1854 Treaty) in  
42 an area that already experiences recreational activity (see Section 6.2.11). Any increases in  
43 economic activity associated with these expansions would be minimal. The Wolf Island Phase 2  
44 land acquisition would also open additional areas of land to potential public and tribal use and  
45 would consolidate Forest Service ownership of Wolf Island and its documented historical  
46 resources. Any increases in economic activity associated with this acquisition would be minimal.

47 In summary, the Land Exchange Proposed Action and cumulative actions would consolidate  
48 federal ownership within the Superior National Forest, thus reducing costs associated with  
49 management activities. At the same time, the Land Exchange Proposed Action and cumulative  
50 actions would provide more land to federal and county governments that could generate  
51 economic activity (for those entities and for the region as a whole) through timber, development,  
52 or increased recreational use. Increased activity could result in increased employment related to  
53 timber, development, and/or recreation.

54 Net change in public land available under the 1854 Treaty would increase due to the NorthMet  
55 Proposed Action and Land Exchange Proposed Action; although the federal lands proposed for  
56 exchange would no longer be available. The Land Exchange Proposed Action would transfer  
57 6,650.2 acres of USFS administered land to PolyMet for the NorthMet Project Proposed Action  
58 mine and acquire up to 6,722.5 acres of private land for administration by the USFS. The  
59 proposed land exchange is a discrete action for the sole purpose of resolving the instant conflict  
60 between surface and subsurface rights and would not spur additional conversion of land from  
61 private to public ownership.

62 There is no evidence that the land exchanges in question would create EJ effects.

63 Land Exchange Alternative B would have similar effects, although to a lesser degree.

64 Under the Land Exchange No Action Alternative, none of the effects described above would  
65 occur.

1 **6.3.11 Recreation and Visual Resources**

2 The cumulative effects analysis for recreation and visual resources for the Land Exchange  
3 Proposed Action focused on potential increases or decreases in recreation opportunities between  
4 recreation opportunity spectrum classes and in scenic integrity objective designated lands.

5 **6.3.11.1 Approach**

6 This section compared the types of data presented in Sections 4.3.11 and 5.3.11, for each of the  
7 projects within the CEAA Land Exchange Proposed Action boundary. Effects were determined  
8 based on GIS data for these projects, including USFS mapping of ROS classes and SIO  
9 designated lands.

10 ROS classes (see Section 4.2.11.1.1) were defined for the Superior National Forest by the USFS  
11 (1982). Likely ROS classes for the non-federal lands were identified by the USFS through the  
12 SDEIS process, and are generally the same as the existing mapped ROS classes on surrounding  
13 adjacent federal lands. GIS analysis was employed to determine the net change in acreage by  
14 ROS class.

15 SIOs (see Section 4.2.11.1.2) were defined for Superior National Forest by the USFS (1995). As  
16 with the ROS classes, likely SIO designations for the non-federal lands were identified through  
17 the SDEIS process and generally match the existing mapped SIO designations on surrounding  
18 adjacent federal lands. GIS analysis was employed to determine the net change in acreage by  
19 SIO.

20 **6.3.11.2 Cumulative Effects Assessment Area**

21 The CEAA Land Exchange Proposed Action boundary for recreation and visual resources is  
22 described below, both spatially and temporally.

23 **6.3.11.2.1 Spatial**

24 The spatial boundary for recreational resources included the Superior National Forest. The  
25 spatial boundary for visual resources included the Superior National Forest, including the  
26 viewshed of the federal tract. The net gain or loss of recreation and visual resources from the  
27 exchange and other foreseeable activities was examined in context of the entire forest.

28 **6.3.11.2.2 Temporal**

29 This evaluation focuses on the existing and anticipated future use of the CEAA for the life of the  
30 NorthMet Project Proposed Action (approximately 20 years). This includes the approximate 15-  
31 year life of the Forest Plan, which would extend through approximately 2019. Because Superior  
32 National Forest was established in 1909, existing conditions are considered indicative and  
33 representative of historical resource management activities.

34 **6.3.11.3 Cumulative Effects Assessment**

35 The cumulative assessment for the Land Exchange Proposed Action portion focused on the net  
36 increase or decrease of ROS classes and SIO-designated lands. For all analyses, effects were  
37 evaluated by comparing GIS shapefiles of the Superior National Forest before any exchanges or

38 acquisitions to GIS shapefiles of the Superior National Forest after all cumulative actions and the  
39 NorthMet Project Proposed Action alternatives occur.

40 Table 6.3.11-1 summarizes the net increase or decrease of recreation opportunity spectrum  
41 classifications in each of the cumulative actions.

42 **Table 6.3.11-1 Potential Increase/Decrease of Recreation Opportunity Spectrum**  
43 **Classifications Occurring from Cumulative Actions**

| Recreation Opportunity Spectrum | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions |                         | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |                         |
|---------------------------------|-----------------------------------|------------------------------------------------------------------------------------------------|-------------------------|----------------------------------------------------------------------------------------------|-------------------------|-----------------------------------------------------------------------------------------------------|-------------------------|
|                                 | Acres                             | Acres                                                                                          | Net Increase (Decrease) | Acres                                                                                        | Net Increase (Decrease) | Acres                                                                                               | Net Increase (Decrease) |
| Primitive                       | 481,022.1                         | 481,862.4                                                                                      | 840.3                   | 481,862.4                                                                                    | 840.3                   | 481,862.4                                                                                           | 840.3                   |
| Primitive                       | 481,022.1                         | 523,201.5                                                                                      | 42,179.4                | 523,201.5                                                                                    | 42,179.4                | 523,201.5                                                                                           | 42,179.4                |
| Roaded Natural                  | 314,667.2                         | 307,664.1                                                                                      | (7,003.1)               | 308,129.9                                                                                    | (6,537.3)               | 307,099.1                                                                                           | (7,568.1)               |
| Rural                           | 9,838.0                           | 9,448.1                                                                                        | (389.9)                 | 9,448.1                                                                                      | (389.9)                 | 9,448.1                                                                                             | (389.9)                 |
| Semi-Primitive Motorized        | 954,020.3                         | 933,211.6                                                                                      | (20,808.7)              | 932,391.0                                                                                    | (21,629.3)              | 935,194.1                                                                                           | (18,826.2)              |
| Semi-Primitive Non-motorized    | 411,717.2                         | 443,837.0                                                                                      | 32,119.8                | 443,688.2                                                                                    | 31,971.0                | 441,549.2                                                                                           | 29,832.0                |
| Urban                           | 93.2                              | 93.0                                                                                           | (0.2)                   | 93.0                                                                                         | (0.2)                   | 93.0                                                                                                | (0.2)                   |
| <b>Total<sup>1</sup></b>        | 2,171,357.9                       | 2,217,455.3                                                                                    | 46,097.4                | 2,216,951.7                                                                                  | 45,593.8                | 2,216,585.1                                                                                         | 45,227.2                |

44 Notes:

45 <sup>1</sup> Totals may not match overall project area acreages due to rounding and/or due to inconsistencies in GIS data layers.

46 The cumulative actions from the Land Exchange Proposed Action would result in an increase to  
47 Primitive and Semi-primitive Non-motorized classes, and a decrease in Roaded Natural, Rural,  
48 Semi-primitive Motorized, and Urban classes. The Land Exchange Alternative B would result in  
49 an increase to Primitive and Semi-primitive Non-motorized classes while there would be a  
50 decrease in Roaded Natural, Rural, Semi-primitive Motorized, and Urban classes. The Land  
51 Exchange No Action Alternative would result in a decrease to Roaded Natural, Rural, Semi-  
52 primitive Motorized, and Urban classes, but an increase to Primitive and Semi-primitive Non-  
53 motorized classes.

54 The Cook County Land Exchange action would help consolidate federal ownership of land  
55 within BWCAW, but would not change recreational opportunities within BWCAW. The Fall  
56 Lake land acquisition action would result in federal acquisition of tracts with recreational value  
57 along Fall Lake. The properties are located on the shores of Fall Lake, across from the Fall Lake  
58 boat landing/campground and within 0.5 mile of the Fall Lake entry to the BWCAW. The  
59 Gunflint Land acquisition action would result in federal acquisition of tracts with recreational  
60 value along Gunflint and Little Gunflint Lakes at the US-Canadian border along the “Voyageurs  
61 Route”. The School Trust Land Exchange and Land acquisition action would help consolidate  
62 federal ownership of land within BWCAW and would not change recreational opportunities  
63 within the BWCAW, but would decrease opportunities for public recreational use of scenic  
64 landscapes and Semi-primitive Motorized activities in the Superior National Forest. The Wolf

65 Island Phase 2 land acquisition action would result in federal acquisition of the northern portion  
 66 of Wolf Island, and consolidation of federal ownership of the entire island. The island has  
 67 documented historical resources, and is close to the BWCAW (TPL 2012).

68 In summary, the cumulative actions would increase the amount of public land available and  
 69 accessible for recreational activity; however, some specific recreational opportunities, such as  
 70 recreational use of scenic landscapes and Semi-primitive Motorized activities in the Superior  
 71 National Forest, would be diminished.

72 Table 6.3.11-2 summarizes the net increase or decrease of SIO classifications in each of the  
 73 cumulative actions.

74 **Table 6.3.11-2 Potential Increase/Decrease of Scenic Integrity Objectives Classifications**  
 75 **Occurring from Cumulative Actions**

| SIO Classifications | Existing Superior National Forest | Superior National Forest – Land Exchange Proposed Action Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange Alternative B Plus other Exchanges and Acquisitions | Superior National Forest – Land Exchange No Action Alternative but other Exchanges and Acquisitions |
|---------------------|-----------------------------------|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
|                     | Acres                             | Acres                                                                                          | Acres                                                                                        | Acres                                                                                               |
|                     |                                   | Net Increase (Decrease)                                                                        | Net Increase (Decrease)                                                                      | Net Increase (Decrease)                                                                             |
| High                | 344,508.1                         | 341,220.9 (3,287.2)                                                                            | 341,018.8 (3,489.3)                                                                          | 341,000.7 (3,507.4)                                                                                 |
| Moderate            | 798,922.5                         | 778,350.5 (20,572.0)                                                                           | 778,022.2 (20,900.3)                                                                         | 776,732.9 (22,189.6)                                                                                |

76 The cumulative actions from the Land Exchange Proposed Action, Land Exchange Alternative  
 77 B, and Land Exchange No Action Alternative would result in a net decrease to the federal estate  
 78 of acres of land with a High, Moderate, Low, and Unclassified SIO.

1 **7.0 COMPARISON OF ALTERNATIVES AND OTHER**  
2 **CONSIDERATIONS**

3 **7.1 INTRODUCTION**

4 This chapter compares the alternatives and their environmental consequences for the NorthMet  
5 Project Proposed Action and Land Exchange Proposed Action. It also addresses irretrievable and  
6 irreversible effects, short-term uses versus long-term productivity of the environment,  
7 unavoidable adverse effects, impacts on human health, and consideration of how the Land  
8 Exchange Proposed Action and alternatives meet the public interest. This chapter concludes with  
9 a statement on the federal Co-lead Agencies' preferred alternatives.

10 **7.2 COMPARISON OF ALTERNATIVES**

11 Alternatives to the NorthMet Project Proposed Action and Land Exchange Proposed Action were  
12 screened and analyzed relatively independently of each other because of the different nature of  
13 the actions. This section consolidates the connected actions, and summarizes the detailed  
14 analysis presented in the respective sections in Chapter 5 and 6. A description of the connected  
15 alternatives is provided below, followed by a comparison of the environmental consequences.

16 **7.2.1 Proposed Connected Actions**

17 The Proposed Connected Actions would involve both the NorthMet Project Proposed Action and  
18 Land Exchange Proposed Action as presented and described in Sections 3.2.2 and 3.3.2,  
19 respectively.

20 The NorthMet Project Proposed Action would involve three major components: a new copper-  
21 nickel-PGE Mine Site, a refurbished Plant Site at the former LTVSMC processing plant, and an  
22 existing Transportation and Utility Corridor that would connect the Mine Site and Plant Site. The  
23 NorthMet Project Proposed Action would comprise three phases. The first phase would last for  
24 approximately 18 months and would include site preparation, refurbishment of some existing  
25 buildings, and construction of new facilities and infrastructure. The second phase, which would  
26 last approximately 20 years, would include operation of the mine and processing facilities;  
27 blasting, hauling, and processing of the ore to be shipped; stockpiling of waste rock; and  
28 progressive reclamation (at the same time as mining). The third phase would occur after mining  
29 and would include infrastructure removal and final land reclamation, and post-closure  
30 maintenance.

31 The water quality objective of closure is to provide mechanical or non-mechanical treatment for  
32 as long as necessary to meet regulatory standards at applicable groundwater and surface water  
33 compliance points. Water quality modeling performed in support of this FEIS indicates that  
34 water treatment systems would be needed at the Mine Site and Plant Site indefinitely. The water  
35 models constructed to assess the potential effects from the NorthMet Project Proposed Action  
36 were not designed to predict the duration of treatment nor do they capture all the factors that  
37 influence the duration of treatment (e.g., potential future regulatory and technological changes).  
38 Therefore, the models cannot be used to predict when treatment would end. Actual treatment

39 requirements would be assessed on a recurring basis throughout operations and closure based on  
40 results of ongoing discharges, performance, and water resource monitoring, ensuring continuous  
41 protection of ground and surface water quality and compliance with applicable water quality  
42 standards. This reassessment process would rely on measured monitoring results (evaluated  
43 through modeling) rather than the results of the predictive modeling included in this FEIS.  
44 Regardless of the precise duration of effects or water treatment at either the Mine Site or Plant  
45 Site, there are measures available to address impacts to natural resources. PolyMet would be held  
46 accountable for maintenance and monitoring required under the permit and would not be  
47 released until all conditions have been met. PolyMet would be required to provide financial  
48 assurance to MDNR (managed independently) for closure and maintenance costs as a  
49 contingency if PolyMet or the operating company at that time were unable to fulfill the  
50 obligations under the Permit to Mine.

51 The configuration of the NorthMet Project Proposed Action is shown in Figure 3.2-1 in Section  
52 3.2.1. The development of the Mine Site is shown in Figures 3.2-4 through 3.2-9 in Section  
53 3.2.2.1. The Transportation and Utility Corridor is shown in Figure 3.2-20 in Section 3.2.2.2, and  
54 development of the Plant Site is shown in Figure 3.2-23 and Figure 3.2-29 in Section 3.2.2.3.

55 The Land Exchange Proposed Action would involve exchange of a single 6,650.2-acre (GLO)  
56 tract of federal land (encompassing the activities proposed at the Mine Site) with up to 6,722.5  
57 acres (GLO) of privately owned, non-federal lands located within five different tracts throughout  
58 the proclamation boundary of the Superior National Forest within St. Louis, Lake, and Cook  
59 counties of northeastern Minnesota. The location of the federal and non-federal lands is shown in  
60 Figure 3.3-1 in Section 3.3.2.

### 61 **7.2.2 Proposed Connected Actions Alternative B**

62 Proposed Connected Actions Alternative B would involve the NorthMet Project Proposed Action  
63 as described in Section 3.2.2 and summarized above in Section 7.2.1, and the Land Exchange  
64 Alternative B as described in Section 3.3.3.2.

65 Compared to the Land Exchange Proposed Action, the Land Exchange Alternative B would  
66 involve conveying fewer acres of federal lands, approximately 4,887.3 acres (GLO), for fewer  
67 acres of non-federal land, approximately 4,651.5 acres (GLO) from a single tract (Tract 1). The  
68 configuration of the smaller federal parcel is shown in Figure 3.3-2 in Section 3.3.3.2.

### 69 **7.2.3 No Action Alternative**

70 Under the No Action Alternative there would be no NorthMet Project Proposed Action or Land  
71 Exchange Proposed Action. Refer to Section 3.2.3.2 and Section 3.3.3.1 for a discussion on the  
72 No Action alternative for the respective connected actions.

73 At the Mine Site, PolyMet would be required under exploration approvals to reclaim surface  
74 disturbance associated with exploratory and development drilling activities. Other existing  
75 surface uses would be allowed to continue consistent with the Superior National Forest Plan. No  
76 further upgrades or new segments would be constructed along the existing power transmission  
77 line, railroad, and Dunka Road, which would continue to be used by their private owners. At the  
78 former LTVSMC processing plant and Tailings Basin, the land owner, Cliffs Erie, would be  
79 required to complete closure and reclamation activities as required under existing state permits,  
80 plans, and the Consent Decree.

81 The federal government would not convey federal lands to PolyMet and the USFS would  
82 continue managing these lands as has been done in the past. Furthermore, the federal government  
83 would not acquire the five tracts of non-federal lands and the lands would remain as private  
84 lands.

#### 85 **7.2.4 Comparison of Effects**

86 A summarized comparison of the environmental consequences of the alternatives—as described  
87 in Sections 7.2.1, 7.2.2, and 7.2.3—is provided in Table 7.2.4-1. Refer to the respective sections  
88 in Chapter 4 for discussion on the affected environment and to Chapter 5 for more detail on the  
89 environmental consequences.

90 In comparison to the Proposed Connected Actions (see Section 7.2.1), the Proposed Connected  
91 Actions Alternative B (see Section 7.2.2) would have the same effects from the NorthMet Project  
92 Proposed Action, but would convey fewer lands through the Land Exchange, resulting in smaller  
93 net increases/decreases in environmental resources. The No Action Alternative would not  
94 directly affect the existing environment and management of these lands would continue in  
95 accordance with their current permits. Compared to the Proposed Connected Actions and  
96 Proposed Connected Actions Alternative B, the No Action Alternative would likely result in  
97 active but different comprehensive management of water from the existing LTVSMC Tailings  
98 Basin. There would be no other measurable effect on other resources compared to their existing  
99 conditions.

104  
105

106 **7.3 OTHER CONSIDERATIONS**

107 In addition to disclosure of direct, indirect, and cumulative effects, NEPA requires that federal  
108 agencies identify whether, and to what extent, the proposed action would cause irreversible or  
109 irretrievable commitments of resources and considers the short-term use of the environment  
110 versus maintenance and enhancement of long-term productivity (40 CFR 1502.16). Each of these  
111 considerations is explained and disclosed below and the resultant unavoidable adverse effects are  
112 described in Table 7.2.4-1.

113 A number of comments were received during the SDEIS public comment period requesting that  
114 human health impacts of the NorthMet Project Proposed Action be considered in the FEIS.  
115 While human health is considered in establishing the evaluation criteria used in the resource-  
116 specific analysis in Chapter 5, a summary of the potential impacts on human health is provided  
117 below.

118 In addition, a summary of how the Land Exchange Proposed Action addresses the public interest  
119 review and factors that the USFS will consider in the ROD is provided below.

120 **7.3.1 Irreversible or Irretrievable Commitment of Resources**

121 Irreversible commitments of resources are those that involve permanent loss because the affected  
122 resource cannot be returned to its previous condition (e.g., mined ore or wetlands that would be  
123 permanently converted to rock stockpile). Irretrievable commitments of resources are more  
124 temporary in nature because the environment can be returned to its previous state through  
125 reclamation and restoration activities (e.g., wetlands that would be restored or former facilities  
126 that would be removed and the land recontoured and replanted per the reclamation plan).

127 The construction and operation of the NorthMet Project Proposed Action would result in the  
128 irreversible loss of approximately 225 million tons of base and precious metal ore. Mining  
129 activities would remove 913.8 acres of wetlands that would be permanently lost. Off-site wetland  
130 compensatory mitigation would be eventually replaced by the restoration of 1,602.7 acres of  
131 wetlands.

132 Other resources could also be irreversibly lost by the NorthMet Project Proposed Action. For  
133 example, changes in the viewshed from the expansion of the existing LTVSMC Tailings Basin  
134 would permanently alter visual resources. While cultural resources may be adversely affected,  
135 irreversible commitments would be minimized through avoidance. There would be both  
136 irreversible and irretrievable loss of federally managed wildlife habitat under the NorthMet  
137 Project Proposed Action and Land Exchange Proposed Action. Some species, such as white-  
138 tailed deer, may not avoid the area throughout the mine life, although some habitat would be  
139 disturbed. Others, such as the Canada lynx, may seek other, better habitat elsewhere. Air quality  
140 effects, primarily from fugitive dust, would occur during the mine life, but air quality would  
141 return to pre-mining conditions after closure and rehabilitation and restoration of disturbed areas.  
142 Water quality would be affected as discussed in Section 5.2.2. These would be considered  
143 irretrievable commitments due to their temporary nature.

144 The federal lands may contain natural resources culturally important to tribal entities, including  
145 access to the land itself, which would be irreversibly lost following the Land Exchange Proposed  
146 Action and conversion of the land from public to private ownership.

147 **7.3.2 *Short-Term Uses versus Long-Term Productivity of the***  
148 ***Environment***

149 NEPA requires that agencies disclose how the short-term use of land or a resource may affect its  
150 long-term productivity. For example, the NorthMet Project Proposed Action and Land Exchange  
151 Proposed Action would utilize existing federal resources (i.e., at the Mine Site), which would no  
152 longer be available for other purposes, such as timber harvesting or wildlife habitat. The long-  
153 term loss of the productivity of the land for these purposes would constitute a foregone  
154 opportunity.

155 The construction and operation of the NorthMet Project Proposed Action would cause short-term  
156 effects on air, noise, and visual resources during the 20-year life of the mine. Additionally, there  
157 may be potential short-term effects on wetlands from time delays between the loss of existing  
158 wetland resources (at the NorthMet Project area) and the development of new, viable wetlands  
159 with similar functions (at the off-site wetland mitigation areas). During construction and  
160 operation of the mine, air pollutant concentrations would be higher throughout the study area  
161 than they are currently, but below applicable air quality standards. Once mining and reclamation  
162 are completed, the pollutant concentrations would return to pre-mining levels. The noise levels in  
163 the area, while below standards, would increase during operation of the mine. However, post-  
164 closure, the noise levels would return to pre-mining levels. The visual effects from the NorthMet  
165 Project Proposed Action would be most noticeable during year 11, when the Category 2/3  
166 Stockpile and Category 4 Stockpile would be at their maximum heights (after which time they  
167 would be placed into the East Pit as backfill), and year 12, when the Category 1 Stockpile would  
168 reach its maximum height. Additionally, there would be short-term effects on visual resources  
169 from fugitive dust and night-lighting during operations. Long-term visual effects would be  
170 landform changes as a result of mining activities.

171 The Land Exchange Proposed Action would result in the permanent loss of the federal lands for  
172 mining purposes, which would be offset by the long-term increased productivity of the non-  
173 federal lands as they would be managed under the Forest Plan. As a result of the Land Exchange  
174 Proposed Action, there would be no effects as a result of short-term use of aquatic species,  
175 cultural resources, vegetation, wildlife, water resources, air resources, wetlands, or recreational  
176 and visual resources.

177 The NorthMet Project Proposed Action and Land Exchange Proposed Action would remove  
178 6,650.2 acres (GLO) at the Mine Site from Forest Service administration and management under  
179 the Forest Plan. Currently, the federal lands, which include the Mine Site, are managed under the  
180 Forest Plan as General Forest – Longer Rotation (6,140.1 acres) and as General Forest (355.3  
181 acres). If the land were exchanged, the long-term productivity of the federal lands at the Mine  
182 Site would be lost to timber production and other forest uses for the short-term use as a mine.  
183 This would represent an unquantified opportunity cost in which the lands and resources could not  
184 be used for forest purposes. The Proposed Connected Actions Alternative B would result in  
185 4,397.3 acres lost under General Forest – Longer Rotation management and 355.3 acres under  
186 the General Forest management category. These losses would be replaced by the acquisition,  
187 through the Land Exchange Proposed Action, of land for Forest purposes.

### 188 **7.3.3 Unavoidable Adverse Effects**

189 Regardless of the inclusion of all reasonable mitigation, some effects may not be avoided. For  
190 example, the NorthMet Project Proposed Action would utilize technologies to mitigate effects on  
191 water quality, which have been demonstrated through modeling to meet applicable water quality  
192 evaluation criteria (with two exceptions, refer to Section 5.2.2). However, effects on water  
193 quality would remain after all reasonable mitigation measures have been applied.

194 After the implementation of mitigation measures that have been built into the design, the  
195 NorthMet Project Proposed Action would have unavoidable adverse effects on wetlands,  
196 vegetation, wildlife, air quality, noise and vibration, visual resources, cultural resources, water  
197 resources, and aquatic species. Unavoidable direct effects on surface features such as wetlands,  
198 vegetation, and wildlife resources would be offset by gains through off-site mitigation (wetlands)  
199 and through lands acquired through the Land Exchange Proposed Action. Unavoidable noise and  
200 vibration, air, and water emissions from the NorthMet Project Proposed Action would affect the  
201 existing conditions, but would not trigger new exceedances of relevant water quality evaluation  
202 criteria (with two exceptions, refer to Section 5.2.2) and would result in comparatively small  
203 increases to existing levels. The residual practical effects of the Land Exchange Proposed Action  
204 would be the loss of federal land, which would be used for the NorthMet Project Proposed  
205 Action, and the gain of non-federal lands.

### 206 **7.3.4 Human Health Considerations**

#### 207 **7.3.4.1 Introduction**

208 This section summarizes relevant health issues and potential impacts for the NorthMet Project  
209 Proposed Action and identifies where specific health information can be found in the FEIS.

210 Public comments on the SDEIS identified several concerns based on potential interactions  
211 between the NorthMet Project Proposed Action and resources/receptors in the area. Public  
212 concerns identified potential health impacts as a result of the following:

- 213 • Exposure to air contaminants, particularly airborne fibers;
- 214 • Exposure to contaminants in drinking water, surface water, and food sources (e.g., wild rice,  
215 and fish);
- 216 • Increased risk of traffic accidents involving chemicals;
- 217 • Increased exposure to noise and vibration; and
- 218 • Strain on emergency response services.

#### 219 **7.3.4.2 Baseline Community Health**

220 A baseline assessment of community health can be found at the County Health Rankings website  
221 ([www.countyhealthrankings.org](http://www.countyhealthrankings.org)). The health rankings are based on a composite indices of health  
222 outcomes (e.g., premature death, diabetes prevalence) and health determinants (circumstances  
223 that can affect the future health of a population, such as lifestyle behaviors, health policies, and  
224 environmental quality).

225 Minnesota's population health status is good relative to other states in the nation (sixth out of 50;  
226 higher rankings indicate poorer health outcomes ([www.americashealthrankings.org/MN](http://www.americashealthrankings.org/MN)). Within  
227 Minnesota, health in Cook County is above the state average as it ranks 28<sup>th</sup> out of 87 counties  
228 for health measures (County Health Rankings 2014). Health in Lake and St. Louis counties are  
229 poor relative to other counties in Minnesota at 82 and 75 out of 87, respectively. The FEIS did  
230 not analyze how or whether these counties' community health rankings would be affected by the  
231 NorthMet Project Proposed Action.

### 232 7.3.4.3 Human Health Impacts

233 The following sections describe how human health could be affected by exposure to airborne and  
234 waterborne chemicals from the NorthMet Project Proposed Action. This information is drawn  
235 from the relevant resource sections in Chapter 5 of the FEIS.

#### 236 7.3.4.3.1 Exposure to Chemicals in Air Emissions

237 Industrial emissions to air have the potential to affect human health in several ways by the  
238 hazardous chemicals and dust irritants they may contain. State and federal ambient air quality  
239 standards have been established to protect human health and the FEIS analysis was conducted  
240 using these standards as threshold criteria to determine the magnitude and level of significance of  
241 the potential air quality impacts of the NorthMet Project Proposed Action. Section 5.2.7.2.3  
242 analyzes human health risks from Mine Site and Plant Site air emissions. The quantitative  
243 analysis evaluated 11 chemicals to determine the lifetime cancer and non-cancer health risks of  
244 the NorthMet Project Proposed Action. The assessment found that Mine Site and Plant Site  
245 emissions would not exceed MDH lifetime cancer and non-cancer guidance levels.

246 An AERA addressing the emissions from site operations of the NorthMet Project Proposed  
247 Action was conducted and is summarized in Section 5.2.7.2.3 of the FEIS. Separate AERAs  
248 were conducted for the Mine Site and Plant Site due to the distance (approximately 6 miles)  
249 between Mine Site and Plant Site sources.

250 The AERA included an evaluation of the most sensitive health endpoint for each chemical, e.g.,  
251 neurological morbidity from manganese, reproductive toxicity of methylmercury, and the  
252 carcinogenic potential of diesel, nickel, and arsenic. The FEIS concludes that there would be no  
253 lead emissions as a result of the NorthMet Project Proposed Action (Section 5.2.7.1.3).  
254 Toxicological information for arsenic, cobalt, diesel, nickel, manganese, mercury, and  
255 methylmercury (plus additional chemicals) was obtained from the MPCA Risk Assessment  
256 Screening Spreadsheet (RASS) and is found as an appendix to the AERA. The AERA includes  
257 an analysis of the potential health effects of those chemicals (MPCA 2013b).

258 Controls were incorporated to reduce airborne mercury emissions. The MPCA reviewed the  
259 NorthMet Proposed Action and determined that it would not impede State mercury reduction  
260 goals (MPCA 2013b). At the levels estimated in the FEIS, airborne mercury emissions resulting  
261 from the NorthMet Project Proposed Action were found to not be a health concern.

262 In summary, the FEIS conclude that the NorthMet Project Proposed Action, as designed and with  
263 the addition of mitigation measures, would meet all NAAQS (Section 5.2.7).

264 **7.3.4.3.2 Exposure to Airborne Fibers**

265 The NorthMet Project Proposed Action would mine ore from the Duluth Complex, which may  
266 contain amphibole mineral fibers. The potential air emissions of amphibole mineral fibers were  
267 analyzed in Section 5.2.7.5 of the FEIS. The vast majority of potential emissions of MN-fibers  
268 for the NorthMet Project Proposed Action would occur from the ore-crushing operations at the  
269 Plant Site, with minor potential emissions from the Tailings Basin and the Mine Site (Barr  
270 2007o). Fine-particulate matter emission controls were incorporated to minimize any release of  
271 fiber emissions.

272 Overall, amphibole mineral fibers were found to represent a relatively small percent of the  
273 mineral fibers associated with the processing of NorthMet Deposit ore (Flotation Pilot Testing in  
274 July and August 2005), approximately 9 percent of the fibers identified from all collected  
275 samples of ore, tailings, and process water. Chrysotile mineral fibers were not found in samples  
276 of ore, tailings, or process water collected from the flotation pilot-testing. However, PolyMet's  
277 petrographic observations indicate that chrysotile minerals are about 2 percent of the minerals  
278 associated with the waste rock from the NorthMet Project Proposed Action.

279 The University of Minnesota conducted a research effort, known as the Minnesota Taconite  
280 Workers Health Study (University of Minnesota 2014), funded by the State of Minnesota, to  
281 better understand taconite worker health issues, including an epidemiological investigation into  
282 causes of excess rates of disease, including mesothelioma, among taconite workers. The Study  
283 did not rule out amphibole mineral fibers as a potential source of health risk or as playing some  
284 role in the incidence of disease among taconite workers. Mine workers' health is regulated by the  
285 U.S. Department of Labor, Mine Safety and Health Administration. Exposure limits for airborne  
286 contaminants, including amphibole mineral fibers, is found in 30 CFR, Ch. 1, Subc. K, Part 56, §  
287 56.5001

288 The MDH considers the role of non-asbestiform amphibole fibers in the induction of health  
289 effects to be uncertain at this time. MDH concludes that amphibole mineral fibers have the  
290 potential for an undetermined toxicity and potency.

291 **7.3.4.4 Health Impacts from Chemicals in Water**

292 Human health impacts could occur by ingestion of water borne chemicals either directly through  
293 drinking water or through food sources. In addition, sulfates in wild rice stands could reduce  
294 productivity which may affect its availability as a subsistence food source.

295 **7.3.4.4.1 Drinking Water**

296 Potential arsenic and lead releases to groundwater and surface water are evaluated in Section  
297 5.2.2.1.1 and 5.2.2.1.2, respectively. GoldSim model output indicates that the dominating  
298 chemical controls on arsenic concentrations in Colby Lake (a drinking water source) are natural  
299 surface runoff, natural groundwater baseflow, and contaminant sources contributing directly to  
300 Colby Lake, all of which are not related to the NorthMet Project Proposed Action.

301 For conditions where the arsenic standard would be exceeded in Colby Lake, the NorthMet  
302 Project Proposed Action would not cause higher concentrations compared to what would occur  
303 for the CEC scenario. It is therefore concluded that the NorthMet Project Proposed Action would  
304 not cause arsenic exceedances in Colby Lake above and beyond what would occur without the  
305 NorthMet Project Proposed Action.

306 Examination of GoldSim results show that when lead concentrations at PM-11 are predicted to  
307 exceed associated hardness-based evaluation criteria, the flow at PM-11 is dominated by WWTP  
308 discharges. In GoldSim, the WWTP effluent lead concentration is assumed to be 3 µg/L.

309 When effluent lead concentration is decreased to 2 µg/L the predicted frequency of lead  
310 exceedance at PM-11 (when the CEC scenario does not exceed) was reduced to 1.3 percent,  
311 which is substantially less than the 5 percent screening threshold. Given that pilot testing shows  
312 that 2 µg/L lead concentration is achievable in the WWTP effluent, it is likely that actual lead  
313 concentrations at PM-11 would have acceptably low frequencies of exceedances.

314 Based on the analysis, the FEIS found that no discharges of water or seepage from the NorthMet  
315 Project Proposed Action would affect off-site domestic water wells or public sources in the area.

316 Amphibole mineral fibers may be found in water that has come in contact with ore at the Mine  
317 Site. There is no applicable water quality standard specific to non-asbestiform amphibole mineral  
318 fibers. The USEPA has developed drinking water standards for asbestos for drinking water  
319 utilities (USEPA 2015). This standard, called an MCL, is 7 million fibers per liter. The USEPA  
320 has provided proven methods of water treatment to meet the MCL, including  
321 coagulation/filtration, direct and diatomite filtration, and corrosion control.

322 Water in contact with waste rock, ore, and pit walls would be treated at the WWTF during  
323 operations utilizing a greensand filter. No discharge would occur off site during operations.  
324 During post-closure, a greensand filter, pre-filters, and a RO system would be used to treat water  
325 to meet water quality standards prior to discharge. This treated water would be discharged into  
326 the Partridge River, which flows into Colby Lake, the only lake in the area used for drinking  
327 water. It is the source of drinking water for the City of Hoyt Lakes. Currently, the City utilizes  
328 sand filters, coagulation, and settling and has been in compliance with the USEPA asbestos  
329 standards. When the RO treatment system would be constructed at the Mine Site, it would  
330 operate in the same fashion as the City's treatment system. As such, the discharge from the Mine  
331 Site would be expected to be in compliance with the federal standard prior to it being treated  
332 again by the City of Hoyt Lakes.

#### 333 **7.3.4.4.2 Fish**

334 The AERA assessed the health effects for recreational and tribal fishermen and their families  
335 consuming fish which may contain elevated bioaccumulated levels of methylmercury. It  
336 estimated a potential small change in fish mercury concentration based on modelled emissions  
337 and deposition. The FEIS concludes that this potential change in methylmercury concentration is  
338 not statistically measurable given the variability in background concentrations and the current  
339 laboratory analytical methods. Given that finding, no potential change in human health risks  
340 related to the fish consumption pathway is expected (Sections 5.2.2.3.4, 5.2.6.2.1, and  
341 5.2.6.2.2). Section 6.2.6 of the FEIS contains an assessment of cumulative effects to aquatic  
342 resources. It found that the NorthMet Project Proposed Action, in combination with other  
343 reasonably foreseeable projects, could increase solute concentrations for many constituents in the  
344 Partridge River and Embarrass River, although not above water quality evaluation criteria. This  
345 change in existing water quality and the interactions between effects from a number of projects  
346 in the area, natural conditions, and current and future hydrology could be addressed as part of the  
347 non-degradation analysis for the NorthMet Project Proposed Action in permitting. The NorthMet  
348 Project Proposed Action, in particular, but to some extent in combination with other existing and

349 reasonably foreseeable projects, would shift treatment of water discharged into the Partridge  
350 River and Embarrass River from natural systems (i.e., essentially an ecosystem service) to  
351 mechanical systems (e.g., the NorthMet Project Proposed Action WWTF and WWTP). Given  
352 that the solute concentrations for constituents in the Partridge River and Embarrass River are not  
353 expected to increase above water quality evaluation criteria, cumulative impacts to aquatic  
354 species due to changes in water quality from the NorthMet Project Proposed Action, in  
355 combination with other reasonably foreseeable projects, are not anticipated.

#### 356 **7.3.4.4.3 Wild Rice**

357 Waters downstream from the NorthMet Project area are used as a source of wild rice by  
358 the Ojibwe people who continue to harvest it in traditional ways. Research indicates that  
359 increased sulfate levels in wild rice habitat can adversely affect its growth and productivity  
360 during certain times of its lifecycle. It is possible that Tribal member health could be indirectly  
361 affected if their diet would need to increasingly rely on less-healthy replacement foods if wild  
362 rice production were to decrease as a result of the NorthMet Project Proposed Action.

363 In order to protect this food source, the State has issued regulations that place limits on the  
364 allowable level of sulfate in waters used for production of wild rice (*Minnesota Rules*, part  
365 7052.0100). Section 5.2.2.2.2 of the FEIS analyzes any sulfate released from the NorthMet Plant  
366 Site and Mine Site that could affect the production of wild rice downstream from both the Mine  
367 Site and Tailings Basin. The analysis concludes that in the Partridge River the NorthMet Project  
368 Proposed Action would not cause or contribute to exceedances of the sulfate evaluation criteria  
369 of 10 mg/L applicable at the MPCA staff recommended wild rice production waters near SW-  
370 005. In the Embarrass River, the NorthMet Project Proposed Action would decrease sulfate  
371 concentrations. In neither case would wild rice productivity be adversely affected or reduce its  
372 availability as a subsistence food source.

#### 373 **7.3.4.5 Health Impacts from Traffic Accidents Involving Chemicals**

374 Section 5.2.13 discusses risks involved in the transportation, storage and use of regulated  
375 hazardous materials used in mining and ore processing. These materials are regulated by state  
376 and federal rules, which limit the potential risks of off-site effects, especially if large quantities  
377 were transported to and from the NorthMet Project area. The hazardous materials analysis also  
378 included a risk assessment of large scale events which could affect populations along the  
379 transportation routes. This analysis found that given overall design and operational commitments  
380 of the NorthMet Project Proposed Action, there would not be any significant adverse effects  
381 from the proposed transportation of hazardous wastes.

#### 382 **7.3.4.6 Health Impacts from Noise and Vibration**

383 Impacts of noise and ground vibration from the NorthMet Project Proposed Action are discussed  
384 in Section 5.2.8. While health effects were not explicitly discussed, modelling shows that the  
385 NorthMet Project Proposed Action would meet State of Minnesota noise and vibration limits and  
386 would not, therefore, result in health concerns.

#### 387 **7.3.4.7 Health Impacts from Strain on Emergency Response Services**

388 Section 5.2.10.2 of the FEIS discusses changes in the local area's work force (local versus  
389 population influx), and demands on available services, including the medical infrastructure. A

390 sudden increase in population can place strain on local health resources including emergency  
391 management services, primary care, and acute health care services. Similarly, a large-scale  
392 emergency event can put a strain on emergency resources. The FEIS found that the NorthMet  
393 Project Proposed Action would result in minimal population and employment changes. Hence, it  
394 is not expected that the NorthMet Project Proposed Action would place a strain on existing  
395 emergency and health care services in the area.

396 As a requirement of the permit to mine, the operator of the NorthMet Mining Project would be  
397 required to prepare an Emergency Response Plan, which would require them to coordinate their  
398 emergency response planning with local agencies, as described in Section 5.2.13.2.4.

### 399 **7.3.5 Land Exchange Public Interest Consideration**

400 In accordance with CEQ regulations (40 CFR 1502.14), the ROD from the USFS will contain the  
401 rationale for the selected alternative and how the public interest is served under 36 CFR  
402 254.3(b). As stated in Section 1.4.3 of this FEIS, factors that must be considered include the  
403 opportunity to: achieve better management of federal lands and resources to meet the needs of  
404 state and local residents and their economies and secure important objectives, including but not  
405 limited to protection of fish and wildlife habitats, cultural resources, watersheds, and wilderness  
406 and aesthetic values; enhancement of recreation opportunities and public access; consolidation of  
407 lands and/or interests in lands, such as mineral and timber interests, for more logical and efficient  
408 management and development; consolidation of split estates; expansion of communities;  
409 accommodation of existing or planned land use authorizations; promotion of multiple-use values;  
410 implementations of applicable Forest Land and Resource Management Plans; and fulfillment of  
411 public needs (see 36 CFR 254.3(b) and 254.4(c)(4)). The ROD will also incorporate the finding  
412 of these factors and how the factors relate to how the public interest would be served by the Land  
413 Exchange Proposed Action, Land Exchange Alternative B, and the Land Exchange No Action  
414 Alternative. Table 7.3.5-1 below presents a comparison of how the alternatives address these  
415 factors.

416 Table 7.3.5-1 Public Interest Factors That Must be Considered for the Land Exchange Proposed Action

| Factors                                                                                                                                    |                                           | EIS Section Citation        | Land Exchange Proposed Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Land Exchange Alternative B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Land Exchange No Action Alternative                                                                                                                                                                                                                                                                                                                                                                      |

## 420 **7.4 AGENCY-PREFERRED ALTERNATIVE**

421 CEQ regulations (40 CFR 1502.14) states that based on the information and analysis presented in  
422 the affected environment and environmental consequences sections of an EIS, the EIS should  
423 present the environmental impacts of the proposal and the alternatives in comparative form to  
424 provide a clear basis for choice among the alternative options by the decision makers and the  
425 public. The regulations further state under 1502.14(e) that federal agencies shall identify the  
426 agency's preferred alternative or alternatives, if one or more exists, in the draft statement and  
427 identify such alternative in the final statement unless another law prohibits the expression of such  
428 a preference; however, the regulations do not require a rationale for the choice. No similar  
429 requirement to identify a preferred alternative exists for the MDNR under state law.

430 For the USFS, the Agency-Preferred Alternative is the Land Exchange Proposed Action  
431 described in Section 3.3.2. Potential effects specifically relating to the Land Exchange Proposed  
432 Action are identified in Sections 5.3 and 6.3. Table 7.3.5-1 summarizes potential effects relating  
433 to public interest factors considered for the Land Exchange Proposed Action and its alternatives.

434 For the USACE, Appendix B of 33 CFR 325 supersedes the CEQ requirement to identify an  
435 agency-preferred alternative. These procedures state that, "*the Corps is neither an opponent nor*  
436 *a proponent of the applicant's proposal; therefore the applicant's final proposal will be*  
437 *identified as the "applicant's preferred alternative" in the Final EIS".* The information in the  
438 FEIS will be used by USACE to determine whether the applicant's proposal is in compliance  
439 with the requirements of Section 404 of the CWA and in the overall public interest.

## 440 **7.5 LEAST ENVIRONMENTALLY DAMAGING PRACTICABLE** 441 **ALTERNATIVE**

442 The CWA Section 404(b)(1) Guidelines require that the USACE determine whether a project is  
443 water dependent. "Water dependent" means that the project requires access or proximity to, or  
444 siting within, a special aquatic site to fulfill its basic purpose. If a project is determined not to be  
445 water dependent, the regulations presume that: 1) an alternative site that does not involve special  
446 aquatic sites (in this case, wetlands) is available, and 2) practicable alternatives are available that  
447 would result in less environmental loss, unless clearly demonstrated otherwise by the applicant  
448 (40 CFR 230.10[a][3]). The regulations further require that the USACE alternatives analysis  
449 identifies the least environmentally damaging practicable alternative (LEDPA). Under the  
450 Section 404(b)(1) Guidelines, the USACE may not permit discharges of dredged or fill material  
451 into waters of the United States if there is a practicable alternative to the proposed discharge that  
452 would have less adverse impact on the aquatic ecosystem, so long as the alternative does not  
453 have other significant adverse environmental consequences (40 CFR 230.10(a)).  
454 "Environmental" in this context is defined by the USACE as non-aquatic natural resources. The  
455 term "practicable" is defined in 40 CFR 230.3(q) as "available and capable of being done after  
456 taking into consideration cost, existing technology, and logistics in light of the overall project  
457 purposes."

458 The regulations also require that the USACE consider a full range of public interest factors and  
459 conduct an alternative analysis in order to identify the least environmentally damaging  
460 practicable alternative. NEPA provides a broad-based approach to impact balancing. However,  
461 NEPA does not contain substantive requirements that compel agencies to choose a particular

462 alternative as is required by Section 404(b)(1) of the CWA. Compliance with NEPA  
463 requirements may not necessarily translate to compliance with Section 404(b)(1) Guidelines  
464 during the Section 404 permit process. For NEPA actions where the USACE is a permitting  
465 agency, the analysis of alternatives required for NEPA EISs will, in most cases, provide the  
466 necessary information for the evaluation of alternatives under the CWA Section 404(b)(1)  
467 Guidelines (40 CFR 230.10(a)(4)). The NEPA alternative analysis would be evaluated by the  
468 USACE to determine if it is considered the LEDPA in order to proceed with authorization under  
469 the CWA. The alternatives screening process should therefore be designed to provide sufficient  
470 information regarding impacts to the aquatic ecosystem, purpose and need, and proposed impacts  
471 to the natural environment. The FEIS should contain sufficient information to identify and  
472 substantiate the LEDPA but is it not required to identify a LEDPA; however, the final  
473 determination on the LEDPA will be made within the ROD, which serves as the USACE's  
474 decision document and the basis for the DA permit decision. The LEDPA is the only alternative  
475 that is allowable pursuant to the CWA Section 404(b)(1) Guidelines. The applicant must clearly  
476 demonstrate that the preferred alternative in the FEIS is the LEDPA and that the other  
477 alternatives are not practicable for reasons of logistics, technology, cost, or other elements of  
478 project viability. Failing this, other alternatives may be considered "practicable" for the Section  
479 404 alternatives analysis.

480 Under Subpart B of the Section 404(b)(1) Guidelines, the USACE's evaluation of the NorthMet  
481 Project Proposed Action is required to address the following four tests that the NorthMet Project  
482 Proposed Action must meet in order to receive a Section 404 permit:

- 483 • 40 CFR 230.10(a): Whether there is a practicable alternative to the proposed discharge that  
484 would have less adverse impact on the aquatic ecosystem, so long as that alternative would  
485 not result in other significant adverse environmental consequences. The alternative identified  
486 by this test is referred to as the LEDPA.
- 487 • 40 CFR 230.10(b): Whether the discharge would violate any applicable state water quality  
488 standards, Section 307 of the CWA, the ESA, or federal laws concerning marine sanctuaries.
- 489 • 40 CFR 230.10(c): Whether the discharge would cause or contribute to significant  
490 degradation of waters of the United States.
- 491 • 40 CFR 230.10(d): Whether appropriate and practicable steps have been taken that would  
492 minimize potential adverse impacts of the discharge on the aquatic ecosystem.

493 The ROD will include the Section 404(b)(1) analysis and the public interest review, and would  
494 determine the LEDPA. Furthermore, the ROD cannot be finalized until 30 days after release of  
495 an FEIS. Any comments received [on the FEIS] during the 30-day period may be considered in  
496 the ROD. The ROD will recommend issuance, issuance with conditions, or denial of the  
497 NorthMet Project Proposed Action.

498 In order to determine the LEDPA for the NorthMet Project Proposed Action, the identified  
499 project alternatives would be evaluated pursuant to the four tests identified above. Alternatives  
500 that do not meet the objectives of the project sponsor will not be further evaluated. Those  
501 alternatives that satisfy the criteria of 40 CFR 230.10(a)-(d) and meet the objectives of the  
502 project sponsor would be further investigated for selection of the LEDPA. In order to determine  
503 which alternative is the LEDPA, each alternative would be evaluated for its potential impact to  
504 air quality, biological resources, floodplains, geology and soils, hazardous material and wastes,

505 infrastructure, land use, noise, prime farmland, water resources, and wetlands. In evaluating  
506 those resources, best professional judgment will be necessary in order to determine the degree of  
507 potential adverse effect resultant from evaluated alternatives. Similarly, in determining which  
508 alternative is the LEDPA, best professional judgment will be necessary because some  
509 alternatives may impose greater environmental harm to some resources over others. As such, a  
510 qualitative approach to selecting the LEDPA is the most effective.

## 1 **8.0 MAJOR DIFFERENCES OF OPINION**

### 2 **8.1 SUMMARY**

3 This chapter discloses major differences of opinion Tribal Cooperating Agencies identified with  
4 the analysis that was presented in the SDEIS and updated for the FEIS. This information is  
5 provided to ensure that EIS reviewers are aware that major differences of opinion (MDOs) exist  
6 between the Co-lead Agencies and the Bands, GLIFWC, and 1854 Treaty Authority regarding  
7 the effects of the NorthMet Project Proposed Action and Land Exchange Proposed Action on the  
8 environment. The Co-lead Agencies' rationale for the analysis as presented in the FEIS,  
9 including references to where relevant concepts are discussed in the document, is also provided.

10 The USEPA is also a Cooperating Agency. Although the USEPA provided comments, the  
11 USEPA did not identify MDOs during preparation of the SDEIS.

### 12 **8.2 INTRODUCTION**

13 In developing the NorthMet Mining Project and Land Exchange EIS, the Co-lead Agencies  
14 invited the Bois Forte, Grand Portage, and Fond du Lac Bands to be Cooperating Agencies in  
15 preparation of the EIS. Other Tribal entities participating in the EIS process include the 1854  
16 Treaty Authority and GLIFWC. In addition, THPOs and staff from the 1854 Ceded Territory  
17 Bands have been, and continue to be, involved in Section 106 consultation with the USACE and  
18 USFS regarding potential effects on historic properties in the NorthMet Project area as directed  
19 in 36 CFR 800.

20 The EIS process anticipated comment and input from the Tribal Cooperating Agencies in the  
21 development of the FEIS. The Communications and Coordination Plan commits the Co-lead  
22 Agencies to actively seek input from the Bands on how potential effects of the NorthMet Project  
23 Proposed Action and Land Exchange Proposed Action on natural and cultural resources would  
24 affect the Bands' traditional cultural practices, and to identify and disclose where differences  
25 exist between the parties.

26 Consistent with the Communications and Coordination Plan commitment, the Co-lead Agencies  
27 engaged the Tribal Cooperating Agencies throughout development of the EIS and took into  
28 consideration their comments on the DEIS and SDEIS, and other concerns brought forth through  
29 their participation in a series of post-DEIS technical teams, along with other information-sharing  
30 and disclosure venues. These include:

- 31 • **Impact Assessment Planning (IAP).** The Co-lead Agencies convened a series of  
32 workgroups from September 2010 through July 2011 to identify the evaluations necessary to  
33 determine effects on the environment of the Agencies' Draft Alternative for the NorthMet  
34 Project Proposed Action. Impact areas assessed in the IAP process included air, wetlands,  
35 geotechnical stability, and water resources in four areas (surface water, groundwater,  
36 geochemistry, and impact criteria). Each workgroup was charged to update the analyses from  
37 the DEIS required for the analysis of the Agencies' Draft Alternative in terms of: 1) impact  
38 analysis requirements, 2) modeling assumptions, and 3) work plan requirements. Tribal  
39 Agencies and USEPA involvement varied across teams as a function of relevant expertise

40 and subject matter, including instances where these agencies did not participate. Each  
41 workgroup adopted a Final IAP Summary Memo to capture these requirements, but also  
42 identified key issues, decision points, and areas of disagreement with the Tribal Cooperating  
43 Agencies where applicable. See IAP Final Summary Memos (MDNR et al. 2011).

44 • **Tribal Issue Review Meetings.** After the DEIS and prior to the release of the SDEIS,  
45 meetings were held approximately every other month between the Co-lead Agencies and  
46 Tribal Cooperating Agencies to discuss the potential effects of the proposed NorthMet  
47 Project Proposed Action and Land Exchange Proposed Action on tribal interests. These  
48 sessions included the Co-lead Agencies' feedback on how these same comments and  
49 concerns have been taken into consideration in the development of the SDEIS. Participants  
50 typically included staff from the Co-lead Agencies, Tribal Cooperating Agencies, and the  
51 USEPA. Twelve meetings were held from June 2011 through March 2013, and included  
52 numerous opportunities for the Tribal Cooperating Agencies to engage the Co-lead Agencies  
53 on issues of concern and disagreement.

54 • **Monthly Cooperating Agency Meetings.** Meetings were held once a month between the  
55 DEIS and SDEIS publications to provide the opportunity for the Co-lead Agencies to brief  
56 the Tribal Cooperating Agencies on the status of concerns from the Tribal Issue Review  
57 Meetings or otherwise articulated by the Bands. These sessions were facilitated by the  
58 USACE using a general agenda, where participants typically included staff from the Co-lead  
59 Agencies, Tribal Cooperating Agencies, and USEPA. High-level outcomes typically  
60 addressed coordination and information needs or gaps identified by the Cooperating  
61 Agencies.

62 These were the primary venues where Tribal Cooperating Agencies were provided opportunities  
63 to express their points of view on the potential effects of the NorthMet Project Proposed Action  
64 and Land Exchange Proposed Action on the environment, including points of disagreement with  
65 the Co-lead Agencies, prior to the release and review of the SDEIS. Other opportunities took the  
66 form of ongoing coordination for information development and availability, and ad hoc technical  
67 meetings.

68 Following the publication of the SDEIS, the Cooperating Agencies were invited to participate at  
69 the three public meetings held during the SDEIS public comment period. The Tribal Cooperating  
70 Agencies hosted a Tribal Cooperating Agency informational booth at each of the meetings,  
71 which were open to the public.

72 Regular Cooperating Agency meetings were reestablished prior to the SDEIS comment period  
73 (December 2013), through development of the Preliminary FEIS (May 2015). These meetings  
74 were facilitated by the USFS to provide a continuing opportunity for the Co-lead Agencies to  
75 brief the Tribal Cooperating Agencies and USEPA on the status of the project, and for the  
76 Cooperating Agencies to identify specific topics for more detailed discussion at separate  
77 technical meetings. Several technical meetings were conducted in order for the Co-lead Agencies  
78 to fully understand and consider the specific Cooperating Agency comments received on the  
79 SDEIS, as well as for the Co-lead Agencies to update the Cooperating Agencies on how the  
80 comments would be addressed for the FEIS.

81 The Communications and Coordination Plan also included provisions for the Co-lead Agencies  
82 to identify and disclose in the SDEIS differences of opinion with the Cooperating Agencies. The  
83 Communications and Coordination Plan notes for the MDNR, in its capacity as RGU, that

84 *Minnesota Rules* part 4410.2300, item H, states: “The EIS shall identify and briefly discuss any  
85 major differences of opinion concerning significant impacts of the proposed project on the  
86 environment.” For the USACE and USFS, in their capacity as federal Co-lead Agencies, 40 CFR  
87 § 1502.9 and 1503.4 note they are obligated to work with the Cooperating Agencies to obtain  
88 their comments and “shall make every effort to disclose and discuss at appropriate points in the  
89 draft statement all major points of view on the environmental impacts of the alternatives  
90 including the proposed action.” The Co-lead Agencies believe these information disclosure  
91 requirements were satisfied by providing the Tribal Cooperating Agencies MDOs in this chapter  
92 of the SDEIS and in the FEIS.

### 93 **8.3 MAJOR DIFFERENCES OF OPINION**

94 The Co-lead Agencies distributed a Preliminary Supplemental Draft Environmental Impact  
95 Statement (PSDEIS) and requested review by the Cooperating Agencies (both Tribal and  
96 USEPA) and the MPCA. Reviewers assessed the document for accuracy and identified gaps in  
97 technical information or general logic that could substantially affect the reader’s understanding  
98 of the subject material. Comments were generated from all entities involved. The Co-lead  
99 Agencies reviewed all comments and incorporated suggested edits or provided additional  
100 clarification or analysis in the PSDEIS as required. All substantive comments were reviewed and  
101 discussed by work groups comprised of technical experts from the Co-lead Agencies and MPCA.

102 The Co-lead Agencies worked diligently with the Cooperating Agencies over the course of the  
103 PSDEIS’s development to consider and resolve any concerns prior to its release for Cooperating  
104 Agencies’ review and comment. While the USEPA provided comments and suggested edits on  
105 the PSDEIS, none of these were identified as representing an MDO. For comments from the  
106 Tribal Cooperating Agencies on the PSDEIS, there were cases where the Co-lead Agencies  
107 disagreed with the comments and determined that the PSDEIS analysis was valid and best  
108 disclosed potential environmental effects and permitting requirements as directed by NEPA and  
109 MEPA. Those comments were identified as potentially representing MDOs. Three workshops  
110 were held to identify the specific issue areas and reach consensus on the language summarizing  
111 tribal views. Ultimately, 18 issue areas were identified in the workshops as being “unresolved”  
112 and determined to represent MDOs in the SDEIS.

113 Supporting documentation and independent analyses for the 18 issue areas were also provided by  
114 the Tribal Cooperating Agencies (see Section 8.4). Although this information was considered,  
115 the Co-lead Agencies ultimately determined that the analyses and supporting documentation  
116 presented in the SDEIS were valid and best disclose potential environmental effects as directed  
117 by NEPA and MEPA.

118 All Cooperating Agencies submitted comment letters on the SDEIS. The USEPA gave the  
119 SDEIS a rating of EC-2 (Environmental Concerns – Insufficient Information) and provided  
120 detailed recommendations to improve the analysis. The Tribal Cooperating Agencies provided  
121 comments that included the previously identified MDOs, as well as additional comments on the  
122 SDEIS. In order to address the comments received on the SDEIS, the Co-lead Agencies  
123 considered new information, and also engaged with the Cooperating Agencies to fully  
124 understand their comments prior to addressing or responding to them in the FEIS.

125 As a result of addressing the SDEIS comments, the analysis relating to some of the Tribal  
126 Cooperating Agencies’ MDOs was updated.

127 Table 8-1 summarizes the information presented by the Tribal Cooperating Agencies by  
128 providing:

- 129 • the 18 issue areas as identified in the SDEIS;
- 130 • the Tribal Position Summaries as identified in the SDEIS;
- 131 • the Tribal Cooperating Agency(ies) holding the MDO;
- 132 • the Co-lead Agencies' responses on the issues for the SDEIS and updated responses for the  
133 FEIS; and
- 134 • the location in the FEIS of reference material supporting the Co-lead Agencies' opinion on  
135 the issues.

| 1     | Impacts to flow in Embarrass and Partridge Rivers | Grand Portage, Fond du Lac, and GLIFWC believe that projected reductions in average stream flows in the Partridge and Embarrass Rivers, and subsequent impacts to aquatic habitat in these same systems, result in measurable impacts. They believe that the interaction of the project's impacts with natural variability in precipitation would be more adverse than reported in the SDEIS. This is because effects of climatic variability are additive to the project-related change, which would be especially true for drier periods. These agencies believe there is very little understanding of the hydrology of the Upper Partridge River, and the XP-SWMM model used to extrapolate flow data is flawed and does not produce usable results. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS. | <p>The Co-lead Agencies believe the understanding of the hydrology of the Partridge and Embarrass rivers is sufficient to assess effects and that the SDEIS adequately predicts potential changes to flow in the Embarrass and Partridge rivers.</p> <p>The NorthMet Project Proposed Action is not predicted to result in any substantial changes to average stream flow when compared to existing conditions. Underlying impact assessment methodologies are presented in SDEIS Section 5.2.2.2 and provide readers with specific information and cited reference documents that support the basis for the Co-lead Agencies' position.</p> <p>Surface water flow monitoring is proposed for both rivers and is presented in SDEIS Section 5.2.2.3.5 for permitting agencies to consider. If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects.</p> | <p>The Co-lead Agencies believe the understanding of the hydrology of the Partridge and Embarrass rivers is sufficient to assess effects and that the FEIS adequately predicts potential changes to flow in the Embarrass and Partridge rivers.</p> <p>The NorthMet Project Proposed Action is not predicted to result in any substantial changes to average stream flow when compared to existing conditions. FEIS Section 5.2.2.2 describes the methodology and results of the water impact analysis. Surface water flow monitoring is proposed for both rivers. Section 5.2.2.3.5 describes the monitoring and adaptive management measures that could be applied to minimize impact on flow, including impacts to tributaries extending from the Tailings Basin (as appropriate). Section 5.2.6 describes the impacts on aquatic species.</p> |
| 2     | Predicted decrease in mercury loading             | Fond du Lac, Grand Portage, and GLIFWC do not believe the proposed project will result in a decrease in mercury loading to the Embarrass and Partridge River aquatic systems. For the Embarrass River, they do not believe that: 1) the tailings basin will function as a mercury sink; and 2) mercury                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>The Co-lead Agencies believe that the SDEIS thoroughly considers potential sources of mercury, including those identified by the Tribal Cooperating Agencies.</p> <p>The SDEIS discloses in Section</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> <p>The mercury mass balance presented in the SDEIS has been revised to reflect updates to the water models and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| MDO # | Specific Major Difference of Opinion Area | Tribal Position Summary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Co-lead Agency Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|       |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | FEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|       |                                           | <p>methylation would decrease due to projected reductions in sulfate contributions. For the flows for the Partridge River, Embarrass River, or their tributaries, they disagree that the project would not significantly impact flow and water level fluctuations, thus leading to increased mercury methylation and bioaccumulation, which taken together may be sufficient to impact habitat leading to alterations of species composition, food web structure, and ultimately mercury bioaccumulation. Potential mercury contributions from peat stored at the Overburden Laydown and Storage Area have also not been addressed. Mercury-related concerns are present for created wetlands at the East Pit and mercury concentrations in water discharged from the West Pit. Air-related mercury emissions do not account for sources from energy generation of vehicle use at the site. For the Lake Superior watershed, any additional mercury releases to the environment are exacerbating already existing impairments including fish advisories set for recreational fishing. Increased fish mercury levels will also have direct impacts on both the cultural and recreational resources of the region. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>5.2.2.3.4 that the Embarrass River is predicted to result in a net increase in mercury-loadings of up to 0.6 grams per year, from 22.3 grams to 22.9 grams. For the Partridge River, the SDEIS indicates mercury-loading is predicted to decrease 1.2 grams per year, from 24.2 grams to 23.0 grams. This represents a projected 0.6 grams per year reduction across both river systems.</p> <p>Mercury-related analyses include water mass-balances, human health air risk assessments, potential bioaccumulation, and wetland/riparian sources of methylmercury generation. Impact assessment methodologies are presented in SDEIS Section 5.2.2.1.2 and provide readers with specific information and cited reference documents that support the basis for the Co-lead Agencies' position.</p> <p>The Co-lead Agencies understand the NorthMet Project Proposed Action includes features to control air emissions such that statewide TMDL reduction goals would not be impeded. The wastewater treatment facilities are also expected to provide mercury removal from the process water waste streams. The Co-lead Agencies respectfully disagree with the Tribal Cooperating Agencies and believe the Tailings Basin would act as a mercury sink, at least similar to other media like soils, and believe it cannot be predicted</p> | <p>air emissions inventory. The new results disclosed in Chapter 5, Section 5.2.2 are consistent with the conclusions made in the SDEIS that predict a net decrease of mercury-loadings of approximately 0.6 grams per year (i.e., a net decrease of 1.2 grams per year in the Partridge River and a net increase of 0.6 grams per year in the Embarrass River), resulting in a net decrease in overall mercury loadings to the St. Louis River. Total potential mercury emissions to air are estimated to be 4.6 lbs/year from the Plant Site and less than 1.0 lb/yr for the Mine Site.</p> <p>Mercury-related effects are addressed in FEIS Sections 5.2.2, 5.2.5, 5.2.6, 5.2.7, 5.2.9, 5.2.10, and 6.2.3. Surface water quality monitoring and adaptive management methods are presented in FEIS Section 5.2.2.3.5 for permitting agencies to consider.</p> |

|       |                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>whether methylmercury production may or may not change under the NorthMet Project Proposed Action.</p> <p>In addition, surface water quality monitoring and adaptive management methods are presented in SDEIS Section 5.2.2.3.5 for permitting agencies to consider. If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                          |
| 3     | <p>Wild rice standard regulatory applicability determinations and areas of production</p> | <p>Grand Portage, Fond du Lac, GLIFWC, and The 1854 Treaty Authority disagree with the MPCA's draft staff recommendations about the applicability determination of the wild rice 10 mg/L sulfate surface water standard to the NorthMet Project. These agencies do not agree with a seasonal application of the standard, or the reaches of waters determined as used for the production of wild rice, and compliance points for the sulfate standard, nor do they agree with basing a determination of a wild rice production water on the density of wild rice found growing there. The 1854 Treaty Authority states that it is arbitrary to define how much rice presence is required, especially given the lack of long-term monitoring data on a given water. Embarrass Lake is considered a water used for the production of wild rice under current MPCA draft staff recommendations; water quality is not meeting the wild rice water quality</p> | <p>The Co-lead Agencies acknowledge that both the proper application of the existing standard and the questions of whether and how that standard should be applied are the subjects of continuing general controversy. The Co-lead Agencies believe the MPCA's project-specific guidance on the applicability of the wild rice standard is a relevant and appropriate water quality evaluation criterion to use in the SDEIS.</p> <p>The Co-lead Agencies acknowledge that the MPCA's project-specific guidance may change as their NPDES/SDS permitting process progresses. If their guidance were to change in the future while the EIS is underway, the new guidance would be considered as appropriate for use in the FEIS and permitting.</p> <p>The wild rice standard is based in rule where applicability is determined by the MPCA. Any future regulatory</p> | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> |

|       |                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | FEIS                                                                                                     |
|       |                                                                                          | <p>standard there and wild rice is also found further upstream in the Embarrass River because it is an existing use defined by the Clean Water Act. Grand Portage states that the wild rice sulfate standard for waters used in the production of wild rice applies in the Embarrass River. The 1854 Treaty Authority notes that research and evaluation of the standard are ongoing, and that application of the standard may change. All believe the State's application of the wild rice standard is not in compliance with the Clean Water Act.</p> <p>This difference of opinion is directed at an element of the State's water quality regulatory program, but is offered in the SDEIS because the effects analysis presented in the SDEIS is based on the regulatory program. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>determinations and basis for applicability of the wild rice standard is outside of the scope of this SDEIS.</p> <p>The Co-lead Agencies also note there will be opportunities for Grand Portage, Fond du Lac, GLIFWC, and The 1854 Treaty Authority to engage the MPCA in these regulatory determinations outside of this project-specific EIS, and these opportunities would be the more appropriate venue to raise these concerns.</p>                                                          |                                                                                                          |
| 4     | Impaired waters list regulatory designation should be made for Embarrass River watershed | <p>Grand Portage and Fond du Lac believe that sulfate concentrations should be a criteria used for designation of an impaired wild rice water. They note that no wild rice waters in the state have been designated impaired by the MPCA. Grand Portage states that all segments of the Embarrass River that are identified as wild rice waters by MPCA are impaired due to water quality exceedances for sulfate. Grand Portage further notes waters where wild rice historically occurred, all exceed the 10 mg/L sulfate standard and therefore should be on the impaired waters list because it is</p>                                                                                                                                                                                                                                                                                                                            | <p>The Co-lead Agencies believe it is appropriate to rely on the MPCA's Clean Water Act Section 303(d) final 2012 TMDL List of impaired waters in the SDEIS. The Co-lead Agencies recognize that there are segments of the Embarrass River on the 2012 List, but the listing is for an impairment not specific to sulfate and/or wild rice.</p> <p>The Co-lead Agencies give regulatory deference to the MPCA and USEPA's process for determining the basis for, and finalizing, the impairments</p> | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> |

| MDO # | Specific Major Difference of Opinion Area | Tribal Position Summary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Co-lead Agency Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                          |

|       |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | FEIS                                                                                                     |
|       |                                           | <p>known that wild rice previously grew in these waters. These agencies contend the Embarrass River is already impaired so any sulfate additions constitute cumulative effects.</p> <p>This difference of opinion is directed at the MPCA's impaired waters regulatory program, but is offered in the SDEIS because the effects analysis impact criteria presented in the SDEIS are based on information developed with respect to this regulatory program. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p>                                                                                                                                                                                                                                                 | <p>assigned to a given reach of water on the 303(d) list. The development of the 303(d) list is a separate biennial process outside the scope of the EIS.</p> <p>Furthermore, the Co-lead Agencies will continue to rely on MPCA's project-specific guidance on the applicability of the wild rice standard as a relevant and appropriate water quality evaluation criterion to use in the SDEIS.</p>                                                                                                                                                                                                                                                                                                                         |                                                                                                          |
| 5     | Underground Mining analysis               | <p>GLIFWC believes that the Underground Mine Alternative has been prematurely eliminated from consideration in the NorthMet Project SDEIS and it would provide significant environmental benefits when compared to the proposed project. An underground mine would largely eliminate impacts to wetlands, and would substantially limit water quantity and quality impacts for surface- and groundwater resources. GLIFWC concurs that underground mining is technically feasible and available at the site, leaving only the lack of economic feasibility as the rationale used by the Co-lead Agencies to eliminate the alternative. On this GLIFWC's opinion is that the Co-lead Agencies did not fully assess information on economic feasibility provided by the proposer. Deficiencies noted by GLIFWC are related to the: error term for economic</p> | <p>The Co-lead Agencies believe that adequate consideration was given to the Underground Mining Alternative prior to eliminating it from further consideration for the SDEIS. This option was screened against specific alternatives-consideration criteria in terms of purpose and need, technical and economic feasibility, availability, and environmental and socioeconomic benefit.</p> <p>Both the SDEIS Section 3.2.3.4.1 and the Co-lead Agency position paper (Appendix B) disclose that an underground mine would result in a smaller footprint, thus offering certain environmental benefits such as reduced effects on wetlands, vegetation, and wildlife habitat.</p> <p>However, both the SDEIS and the Co-</p> | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> |

|       |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | FEIS                                                                                                                                                                                                                  |
|       |                                           | projections; rates on return on investment; costs of the land exchange; environmental goods and services provided by natural systems; economic impact and inconsistency with state mineland reclamation program goals regarding perpetual maintenance and water treatment at the site. Appendix C provides additional information from this agency on this major difference of opinion revealed in the development of the SDEIS.                                                                                                            | lead Agency position paper also disclose that the tonnage/volume and grade (amount of metals) of rock would not generate enough revenue to pay for all costs associated with underground mining. Therefore, underground mining would not be economically feasible. The Co-lead Agencies also considered that a smaller mining operation would employ fewer workers for a shorter amount of time, resulting in fewer socioeconomic benefits than the NorthMet Project Proposed Action. Also, preliminary economic screening by PolyMet determined that sale of metal precipitates produced from an underground mine would not meet the NorthMet Project Proposed Action Purpose and Need, which is integral to whether an alternative should be evaluated in the SDEIS. Therefore, it was found to not be a reasonable alternative and was eliminated from further consideration. |                                                                                                                                                                                                                       |
| 6     | West Pit backfill option analysis         | GLIFWC believes that the West Pit Backfill option has been prematurely eliminated from consideration in the NorthMet Project SDEIS. They believe the potential environmental benefits to long term water quality have not been fully assessed and mineral encumbrance issues can be avoided. This alternative meets the purpose and need, is available, and is technically and economically feasible. By limiting the consideration of environmental benefits to only a screening-level analysis, the full effect of the alternative on the | The Co-lead Agencies believe that the West Pit Backfill option was given adequate consideration prior to eliminating it from further examination for the SDEIS.<br><br>SDEIS Section 3.2.3.4.2 details the factors considered by the Co-lead Agencies regarding this potential alternative, including: backfill sequencing; volume of material; water quality and WWTP treatment; visual aesthetics; operational air, noise, and                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS. FEIS Section 3.2.3.4.2 details the factors considered by the Co-lead Agencies regarding this potential alternative. |

|       |                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | FEIS                                                                                                                                                                                   |
|       |                                                      | <p>environment is not known, especially for water quality and potential need for perpetual treatment (contrary to state mineland reclamation program goals). The issue of mineral encumbrance is raised as proposer concern, but is avoided by employing standard underground mining techniques from other locations. GLIFWC’s opinion is that economic considerations of a future mine expansion are the only concrete reasons for not conducting a full analysis, and every available option that might improve long term impacts should be explored regardless of mineral lease commitments. Appendix C provides additional information from this agency on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>dust impacts; footprint impacts for wetlands; mineral encumbrance lease provisions; and costs.</p> <p>These factors were weighed against specific alternatives-consideration criteria in terms of purpose and need, technical and economic feasibility, availability, and environmental and socioeconomic benefit.</p> <p>The screening analysis revealed the opportunity to reclaim wetlands and vegetation at the Category 1 Stockpile footprint would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because the stockpile would have to be constructed anyway even under a backfilled option, these impacts would still occur with mitigation required under wetlands-related permitting or site reclamation requirements under the Permit to Mine.</p> <p>On balance, it is the Co-lead Agencies’ opinion that the West Pit Backfill option would not provide substantial environmental benefit to the project as proposed. As such, the option to backfill the West Pit was eliminated from further consideration in the SDEIS.</p> |                                                                                                                                                                                        |
| 7     | Partridge River baseline base flow and XP-SWMM model | Grand Portage, Fond du Lac, and GLIFWC believe that basic site surface water flow hydrology at the Mine Site is inadequately characterized. The XP-SWMM model predictions may have underestimated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The Co-lead Agencies believe that the SDEIS adequately predicts Partridge River baseline baseflow and that the XP-SWMM model calibration was                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The Co-lead Agencies have concluded after additional analysis and discussion that the USGS gage data and derived XP-SWMM values used in the EIS remain the most reasonable estimate of |

|       | calibration                               | <p>baseflow conditions in the Partridge River by a factor of five (5). If true, this mis-characterization might affect water quality compliance projections in that although more baseflow might mean more dilution of contaminants, it could also mean transport of greater quantities of pollutants or drawdown for the Partridge River. They also contend that XP-SWMM's projections, which are based on data from 17 miles away collected from 1978 to 1987, do not align with the rating curve from new MDNR winter monitoring data, or the results of GLIFWC's own projections taken from two years of new data from the Dunka Road gage. Because XP-SWMM's low estimates of baseflow are used in the calibration of the MODFLOW model, it will influence many aspects of the baseline site characterization and impact prediction. These include pit inflow, dewatering impacts to the Partridge River and wetlands, water treatment needs, groundwater flow rates, contaminant transport times and concentrations, and contaminant dilution in the Partridge River watershed. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>appropriate.</p> <p>Baseflow estimation methodologies, including limitations, and data sources are presented in SDEIS section 4.2.2.2.2 and provide readers with specific information and cited reference documents that support the basis for the Co-lead Agencies' position. Section 5.2.2.2.2 identifies the methods to assess existing conditions in the Partridge River, while Table 5.2.2-4 provides the results of the XP-SWMM modeling for various reaches of the river.</p> <p>Regarding the use of the 1978 to 1987 flow data, the Co-lead Agencies believe it is reasonable to rely on this information because there have not been any relevant changes in the watershed since that time. In addition, the SDEIS acknowledges the issue by noting in Section 4.2.2.2.2 the implications of using a lower modeled baseflow are that any changes of flow volume due to withdrawals, discharges, or augmentation would result in greater effects during the impact modeling than if higher baseflow values were used, such as showing higher concentrations of solutes in the rivers and creeks.</p> <p>Surface water flow monitoring is proposed for the Partridge River and is presented in SDEIS Section 5.2.2.3.5 for permitting agencies to consider. If actual NorthMet Project Proposed Action effects were found to be higher</p> | <p>groundwater baseflow conditions in the Partridge River for the purposes of MODFLOW and GoldSim modeling. Groundwater baseflows for the Partridge River developed in the SDEIS are best-estimate values and were retained for the FEIS.</p> <p>In addition, a groundwater baseflow sensitivity analysis was performed to consider the effect of variable groundwater baseflow inputs on water quality. Results show that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow.</p> <p>As per the SDEIS, FEIS Section 5.2.2.2.2 describes the methodology and results of water impact analysis. Surface water flow monitoring is proposed for the Partridge River, with Section 5.2.2.3.5 describing the monitoring and adaptive management measures that could be applied to minimize impacts to water resources. Section 5.2.6 describes the impacts on aquatic species.</p> |

| 8     | Analog method to assess indirect impacts from mine dewatering | Grand Portage, Fond du Lac, GLIFWC, and The 1854 Treaty Authority believe that the Co-lead Agencies' proposed analog method of assessing potential indirect impacts from mine site pit dewatering is not rigorous, and as such should not be the sole means of indirect impact assessment for the SDEIS. Resource assessment areas of concern include wetlands, groundwater, and surface waters. All these agencies consider the impact zones and distances to be somewhat arbitrary, and also challenge the automatic exclusion of ombrotrophic wetlands from potential drawdown effects. Accounting for these factors GLIFWC conducted an independent assessment using the same methods as the Co-lead Agencies, along with additional analog data from other mining-impacted sites, which found an estimated total of 5719.75 acres of wetlands would be potentially susceptible to severe indirect impacts from mine pit drawdown. These agencies are of the opinion that the USACE should require up front mitigation for all severely impacted wetlands, but at a minimum up front mitigation should be required for wetlands occurring in zone 1. They also contend that additional up front mitigation should be considered for wetlands that are classified in the moderate to severe category, with robust monitoring being required for wetlands in the moderate category. These agencies also note that the upper Partridge River is located in Zone 2; | <p>The Co-lead Agencies believe that the SDEIS adequately uses the analog method to assess potential indirect effects from mine dewatering. The complex mixes of bedrock, glacial till, and wetland soils at the Mine Site impede the ability to reasonably model and accurately assess the potential effect of pit dewatering on wetlands.</p> <p>In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in SDEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>The Co-lead Agencies respectfully believe reliance on potential impact zones is appropriate but recognize uncertainty remains. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented, such as hydrologic controls or additional off-site compensatory mitigation, which may be identified through annual reporting.</p> | The Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. Section 5.2.3.2.2 of the FEIS applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the "no effect" category to the "low likelihood" category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, glacial till, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in |

|       |                                           | GLIFWC’s independent analysis estimated drawdowns of 3 to 5 ft under the river, which would severely reduce baseflow in the channel, indirectly impact riparian wetlands downstream, and affect other surface water features. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Sections 5.2.2.3.2 and 5.2.3.1.2 of the FEIS.<br><br>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but would monitor wetlands for potential indirect effects if the NorthMet Project Proposed Action were approved. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts were identified during monitoring and annual reporting. |
| 9     | Mine Site groundwater impact travel times | Grand Portage and GLIFWC believe that assumed groundwater pollutant travel times at the mine site are underestimated. They contend that relevant literature and data suggest otherwise, and this has not been captured in the modeling of bedrock aquifer transport of pollutants from the mine pit to surface water features. Grand Portage further disagrees with the Co-lead Agencies’ assumption that the Duluth Complex would remain highly competent with extremely low hydraulic conductivities post-blasting. If true, resulting groundwater travel times through bedrock would be shorter than predicted in the SDEIS. They recommend conducting a greater characterization of the entire Partridge River watershed and mine site. | The Co-lead Agencies believe that the SDEIS adequately predicts groundwater impact travel times at the Mine Site as a function of bedrock hydraulic conductivity. The hydrogeology of the mine site bedrock units has been evaluated as detailed in SDEIS Section 4.2.2.2.1, including the potential that fractures, including faults and fracture zones, may exist that could permit transmission of groundwater through the bedrock over distances of thousands of feet.<br><br>SDEIS Section 5.2.2.2.1 considers how fractures may affect hydraulic conductivities at the Mine Site, and although the presence of fractures | The Mine Site GoldSim model was changed following the SDEIS in response to comments and additional analysis occurred relating to hydraulic conductivities.<br><br>The modeled bedrock and surficial aquifers contribute groundwater baseflow to the Partridge River. FEIS Section 5.2.2.2.1 describes that the Duluth bedrock hydraulic conductivity was increased and a bedrock flowpath thickness was established at 15 m at the Mine Site to better represent the likelihood of an upper zone of more fractured bedrock than deeper in the formation. The increased bedrock hydraulic conductivity is still less than           |

|       |                                           | Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.                                                                                                                                                                                                                                                                                                                                                            | <p>cannot be completely ruled out, site-specific data such as boring logs indicate the bedrock appears competent. Deep fractures are rarely encountered near the surface, and hydrogeologic investigations have indicated that the bulk of hydraulic conductivity of bedrock at this Mine Site is very low.</p> <p>Blasting-related effects within the pit wall have also been considered. They are expected to be limited in terms of lateral extent and do not have much effect on solute transport in bedrock.</p> <p>In addition, bedrock groundwater monitoring to evaluate bedrock water quality trends is proposed at the Mine Site as presented in SDEIS Section 5.2.2.3.5 for permitting agencies to consider. If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be taken to reduce those effects.</p> | <p>the value for the surficial deposits. For the bedrock flowpaths that originate at the mine pits, the travel time for water to reach the property boundary is much longer than the modeled 200-year period.</p> <p>Surficial groundwater travel times are related to river groundwater baseflow estimates. Partridge River groundwater baseflow estimates used in the SDEIS are reasonable. A groundwater sensitivity analysis was completed which predicted higher peak concentrations that occur sooner for some constituents. However these peaks remain below evaluation criteria for most parameters.</p> <p>Groundwater monitoring and adaptive measures to manage pit groundwater flows, including for any water conducting features or faults if encountered, are described in FEIS Section 5.2.2.3.5.</p> |
| 10    | No Action Alternative analysis            | Fond du Lac, Grand Portage and GLIFWC believe CEQ guidance require that water quality modeling of a No Action alternative should include activities that will occur under the existing Cliffs Consent Decree. The consent decree requires mitigation for water quality exceedances from Area Pit 5, the LTVSMC tailings basin, and the Dunka Pit, all of which under the No Action alternative would cause compliance with all water quality standards with no additional reductions in flows. Further, | <p>The Co-lead Agencies believe that the SDEIS adequately analyzes effects on water resources under the No Action Alternative as required by NEPA/MEPA. Future remedial actions that would be required at the LTVSMC Tailings Basin under the consent decree and other permits are not established so it is not possible to model those conditions.</p> <p>The No Action Alternative is described in SDEIS Section 5.2.2.4 and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> <p>To further refine the impact assess and consistent with this position, the Co-lead Agencies have elected to remove the Northshore Pit discharges to the Partridge River from both the continuation of existing conditions and project model scenarios at year 2070. This was done because the timing and the effects of the Northshore Pit</p>                                                                                                                                                                                                                                                                                                                                                           |

|       |                                           | <p>they contend the current modeling of the “continuation of existing conditions,” which omits the dilution effect of precipitation on the water quality of the basin, is not appropriate. Claims that the basin’s water quality has stabilized and that current conditions will not change over time is based on pond water sampling for only 4 years (2001-2004). If precipitation since 2004 has not influenced water quality by further diluting water chemistry in the pond, then more recent data on basin pool water chemistry is needed to support the assumption. These agencies are of the opinion while the CEQ makes it clear that a blind “continuation of existing conditions” model is inappropriate as a No Action alternative, a “continuation of existing conditions” model that ignores simple environmental processes such as precipitation is even less appropriate. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>acknowledges it is not static, but at this time the exact nature, timing, and effectiveness of measures under the consent decree are unknown, and thus are not quantifiable for the SDEIS.</p> <p>The Co-lead Agencies have considered the water quality implications of the No Action Alternative and believe it is reasonable to expect that water quality within the Embarrass River could improve over time, absent other unforeseen activities that could affect water quality.</p> <p>The Co-lead Agencies are not relying on the continuation of existing conditions modeling scenario in consideration of the No Action Alternative. This model run represents conditions in the absence of the NorthMet Project Proposed Action and allows for a direct comparison of the predicted water quality model results with the same run with the proposed project.</p> <p>The Continuation of Existing Conditions Scenario facilitates the assessment of the extent to which the NorthMet Project Proposed Action would result in changes in water quality as captured in the model. The Co-lead Agencies believe this comparison is valuable in considering the efficacy of measures available to mitigate potential NorthMet Project Proposed Action-related adverse water quality effects for both the mine and plant sites. These</p> | <p>discharge cessation are reasonably known.</p> |

| 11    | Cumulative Effects to groundwater and surface water quality and quantity | Grand Portage, Fond du Lac, GLIFWC, and The 1854 Treaty Authority disagree with the Final SDD and SDEIS conclusion that no cumulative effects to groundwater resources are expected. They note bedrock and surficial groundwater pollution is already documented at the old LTVSMC site (i.e., plant site; area pits 5, 6, and 9S) and the Dunka Pit. Cumulative effects at these locations should be assessed with the proposed project along with potential groundwater pollution from the Peter Mitchell Pit, Laskin Energy, Arcelor-Mittal, United Taconite, and US Steel Minntac. They suggest a future action that should be considered in a cumulative effects analysis is any potential future backfill of Virginia Formation waste rock for in-pit disposal at the Cliffs Peter Mitchell Pit. And they contend that potential dewatering-related interaction effects between the proposed NorthMet Project and the Peter Mitchell Pit should be evaluated for cumulative effects. Appendix C provides additional information on this major difference of opinion revealed in the development of the SDEIS. | <p>The Co-lead Agencies believe that the SDEIS appropriately considered the potential for cumulative groundwater effects and accurately predicts cumulative effects to surface water quality and quantity. Cumulative effects impact assessment methodologies for both groundwater and surface water resources are presented in SDEIS Section 6.2.3.3 and provide readers with specific information and cited reference documents that support the basis for our position.</p> <p>The Co-lead Agencies believe the potential for cumulative effects on groundwater resources from the NorthMet Project Proposed Action is not supported. The SDEIS reports the NorthMet Project Proposed Action would affect groundwater levels, but this effect would be limited geographically and temporally, the latter being that groundwater levels would begin to be restored once pit dewatering ceases, and is subject to interactions causing cumulative effects.</p> <p>The Co-lead Agencies do believe, however, that assessment of cumulative</p> | <p>The Co-lead Agencies believe that the FEIS appropriately considers cumulative effects for both groundwater and surface water resources. Water-related cumulative effects assessment methodologies and results are presented in FEIS Section 6.2.2.</p> <p>In addition to the NorthMet Project Proposed Action, water-related cumulative actions considered in the FEIS include: ArcelorMittal Deposits (Laurentian and East Reserve deposits), City of Aurora POTW, City of Babbitt POTW, City of Biwabik POTW, City of Hoyt Lakes POTW, Former LTVSMC Pits and Tailings Basin, Mesabi Nugget (formerly Mesabi Nugget Phase I), Mesabi Mining Project (formerly Mesabi Nugget Phase II), Minnesota Power Laskin Energy Center, Northshore Mine, and Northshore Mine Closure.</p> <p>Cumulative impacts result when the effects of an action are added to or interact with other effects in a particular place and within a particular time. The modeled groundwater</p> |

|       |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | effects on surface water quality does require consideration of potential groundwater solute contributions. SDEIS Section 6.3.3.3 provides a complete examination of this concern, including existing and potential future actions. The actions considered are: Arcelor-Mittal; Northshore Mine; Area 5 NW Pit; four POTWs; Cliffs Erie LTVSMC site; Mesabi Nugget; Mesabi Mining; Mesaba Energy – East Range Site; and Minnesota Power Laskin Energy Center. | flowpaths of the NorthMet Project Proposed Action do not interact with other groundwater flowpaths. There may be other plumes from other projects in the vicinity of the NorthMet Project Proposed Action, but the effects of these plumes would only interact with NorthMet Project Proposed action impacts within surface waters. This has been evaluated. The only exception is the seepage effects from existing LTVSMC Tailings Basin that the NorthMet Project Proposed Action would supplant. This combined effect has been considered in the groundwater quality models presented in Section 5.2.2. The Northshore Mine Progression Ultimate Pit Limit project which includes the in-pit stockpiling of Virginia Formation waste rock in the Peter Mitchell Pit would have no impact on the Partridge River, as all operations discharges would be primarily to Langley Creek. |
| 12    | CEAA for Partridge and Embarrass Rivers   | Fond du Lac, Grand Portage, GLIFWC, and The 1854 Treaty Authority believe that limiting the cumulative effects analysis area (CEAA) for water resources to the Partridge and Embarrass River watersheds is too small. Rather, they contend the analysis should be expanded to include the St. Louis River. Impacts associated with United Taconite’s proposal for 1,200 acres of wetland destruction to build a new tailings basin should be considered. More broadly, they contend the project would | The Co-lead Agencies believe that the SDEIS uses an appropriate cumulative effects assessment area, or CEAA. The Co-lead Agencies have appropriately defined the spatial extent for the water resources CEAA to be at the scale of contributing watersheds. This is reasonable geographic area because the Plant Site is within the Embarrass River watershed and the Mine Site is within the Partridge River watershed as                                   | The Co-lead Agencies’ position as reflected in the SDEIS response remains unchanged for the FEIS. Section 6.2.2.1.1 describes the water resources CEAA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|       |                                                    | <p>add to the load of pollutants that are already causing an excursion from the water quality standards in the St. Louis River and would reduce tributary flows to the river. If true, then project-related impacts that may occur due to the project could be underestimated (due to modeling concerns), and would not stop before reaching the St. Louis River. This would mean that any added impact from the project to the St. Louis River would in turn impact Lake Superior, so this should be the scale to analyze cumulative effects. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>detailed in SDEIS Section 6.2.3.3.1</p> <p>The Co-lead Agencies have also considered the appropriateness of defining the CEAA for surface water quality to include the St. Louis River. Because the NorthMet Project Proposed Action would result in only minor changes in surface water hydrology and quality of the Embarrass and Partridge rivers, cumulative effects to the St. Louis River cannot be definitively assigned so it is not included in the CEAA.</p>                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 13    | Effects on groundwater and surface water hydrology | <p>Fond du Lac, Grand Portage, and GLIFWC disagree with the conclusion that the Proposed Project is not predicted to result in any significant effects on groundwater or surface water hydrology. XP-SWMM relies on antiquated data from far downstream, which means the model's projection of hydrologic effects cannot be supported. They believe GoldSim cannot reliably predict whether the 28 solutes modeled at both the plant and mine sites would meet the Minnesota water quality standards. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p>                                          | <p>Similar and related to MDOs #1 and #7 above, the Co-lead Agencies believe that the SDEIS adequately predicts effects on groundwater and surface water hydrology. Overall water impact assessment methodologies are presented in SDEIS Section 5.2.2.2 and provide readers with specific information and cited reference documents that support the basis for the Co-leads Agencies' position.</p> <p>The Co-lead Agencies approved GoldSim to be programmed with a suite of complex algorithms to estimate the release of 28 solutes or contaminants from the mine facilities and their transport to groundwater and surface water evaluation locations. A probabilistic method was also approved</p> | <p>The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS.</p> <p>The water models were updated to address comments received on the SDEIS and to consider new information. As described in FEIS Section 5.2.2.2 the conclusions of the updated model results support those in the SDEIS.</p> <p>In addition, a groundwater baseflow sensitivity analysis was performed to consider the effect of variable baseflow inputs on water quality. Results show that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However,</p> |

|       |                                           |                         | <p>to estimate the probability of a given water quality outcome occurring as a means to account for uncertainties. This is unlike deterministic modeling where all inputs are known or estimated, and when modeled, always produce a single result without accounting for uncertainty. Lack of accounting for uncertainty was identified as a concern regarding the original DEIS's analyses.</p> <p>The Co-lead Agencies believe focusing on the P90 threshold in assessing the NorthMet Project Proposed Action's potential to meet applicable water quality standards is logical because it generally equates to a reasonable worst-case scenario and has been adopted for other mining NEPA documents where probabilistic modeling was used.</p> <p>Regardless, the Co-lead Agencies' reliance on the P90 criterion does not supersede how water quality-based effluent limits (WQBELs) would be developed for NPDES/SDS permitting. Appropriate WQBELs would be derived based on water quality standards and implemented in the permit.</p> <p>In addition, water monitoring and adaptive management methods are presented in SDEIS section 5.2.2.3.5 for permitting agencies to consider. If actual NorthMet Project Proposed Action effects were found to be higher than predictions, then steps could be</p> | <p>the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in groundwater baseflow</p> |

| 14    | GoldSim not able to replicate Tailings Basin water/Partridge River Water Quality under the No Action Alternative | GLIFWC believes that the GoldSim model does not accurately predict existing water quality conditions, such as the existing exceedance of the aluminum standard in the Embarrass River, or existing conditions in the Partridge River. This agency contends that if a model is unable to accurately predict current conditions, then it is even less likely to accurately predict future project conditions. GLIFWC notes that for many parameters at several water bodies, the No-Action P50 model of annual average value is substantially different than the observed average under existing conditions. The GoldSim model(s) need to be better calibrated to existing conditions. Without new calibrations, the GoldSim model's projections are not adequate to ensure protection of water resources. Appendix C provides additional information from this agency on this major difference of opinion revealed in the development of the SDEIS. | <p>The Co-lead Agencies believe that the GoldSim model adequately replicates NorthMet Project Proposed Action water quality for Tailings Basin water and the Partridge River under the Continuation of Existing Conditions modeling scenario for the SDEIS. The same hydrology and water quality existing conditions datasets that were used for modeling the Proposed Action were used for the Continuation of Existing Conditions modeling scenario. Also, this scenario never introduces any NorthMet mine features or activities and conducts the same simulations for the same durations.</p> <p>Models calibrated for the SDEIS to address differences between observed and simulated values include Mine Site MODFLOW and XP-SWMM models, Mine Site Natural Runoff, Plant Site MODFLOW, Plant Site Natural Runoff, and existing LTVSMC Tailings Basin loading. The existing tailings basin calibration included aluminum, as well as a number of other solutes. The Co-lead Agencies evaluated the various model calibrations underlying GoldSim and believe the differences between the observed and simulated values for each of the calibration targets are minimized within accepted modeling norms.</p> <p>The GoldSim model set up and calibration information is presented in</p> | <p>While the Co-lead Agencies' position remains consistent with that reflected in the SDEIS, the Mine Site and Plant Site water models were updated to address SDEIS comments, including using new, available data collected since the SDEIS. This required new calibrations to better reflect existing conditions. In addition for the Mine Site modeling, a new variable was added to account for runoff contributions to Colby Lake.</p> <p>The FEIS water sections for the NorthMet Project, Sections 4.2.2, 5.2.2, and 6.2.2, have been updated accordingly.</p> <p>The conclusions of the updated model results are consistent with those in the SDEIS.</p> |

|       |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | SDEIS section 5.2.2.2.3. Model predictions are also reliable and are presented in the “GoldSim Model Operations and Output” and “Application of Evaluation Criteria to Probabilistic Modeling Results” subsections in SDEIS Section 5.2.2.2.3.                                                                                                                                                                                                     |                                                                                                   |
| 15    | Mineral fibers                            | Fond du Lac, Grand Portage, and The 1854 Treaty Authority believe the risks associated with exposure to mineral fibers are greater than portrayed in the SDEIS. Fond du Lac disagrees that 9% amphibole fibers identified by PolyMet testing can be considered a “small” percentage of the fibers identified, while Grand Portage notes chrysotile fibers that would be expected to be found in the NorthMet deposit are not considered. Grand Portage and Fond du Lac indicate that information cited from studies in this section is outdated and that the section should be updated to rely on the most recent reports (i.e., U of M study released in April 2013). The Bands contend that one year of monitoring as currently proposed is not adequate to account for the variability and unpredictable mineralogy in the rock to be mined, and that monitoring for mineral fibers should be conducted for the duration of the mining operation. Fond du Lac identifies that risks associated with ingestion should be considered in addition to inhalation; risks from ingestion are not discussed in the air quality section or the human health risk section of the document. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the | The Co-lead Agencies believe that the SDEIS adequately describes the risks associated with mineral fibers, including chrysotile (or serpentine) minerals, and potential ingestion risks. Findings from the University of Minnesota study updates to the Minnesota Legislature in April 2013 are considered in the mineral fibers portion of the document. The SDEIS also includes monitoring and mitigation measures described in Section 5.2.7.5. | The Co-lead Agencies’ position as reflected in the SDEIS response remains unchanged for the FEIS. |

| 16    | Rail car spillage and dust                                   | GLIFWC disagrees that the amount of ore that could escape from rail cars would be small because the rail cars proposed for use are not sealed. GLIFWC states that, given the design and current condition of rail cars proposed for transport, an ecologically significant amount of spillage could occur into streams, wetlands, and their watersheds. GLIFWC believes that fugitive dust escaping through gaps in the rail cars is also a concern. GLIFWC does not believe that the method described to segregate fines in the center of the rail car, away from the gaps, is realistic. Further, GLIFWC does not believe that monitoring of the creeks along the rail line will be effective in preventing or minimizing impacts because once detected in monitoring, the impact will have already occurred. GLIFWC states that cleanup of ore dust in an aquatic environment is a long and difficult process. Appendix C provides additional information from this agency on this major difference of opinion revealed in the development of the SDEIS. | <p>The Co-lead Agencies believe that the SDEIS adequately predicts the rail car spillage and potential environmental effects. No substantial reactive airborne fugitive dust emissions from rail transport are expected. However, the Co-lead Agencies note that estimates of potential spillage are presented in SDEIS Section 5.2.2.3.2, and potential effects are presented in Sections 5.2.2.3.2, 5.2.3.2.2, and 5.2.7.1.3. These sections provide readers with specific information and cited reference documents that support the basis for the Co-lead Agencies' position.</p> <p>Water quality monitoring for the streams located along the Transportation and Utility Corridor is recommended. If streams along the railroad corridor between the Mine Site and Plant Site were to show degradation in water quality as a result of material spilled from railcars, then contingency mitigation would be available through developing catchment areas adjacent to the tracks at stream crossings to minimize the amount of material that reaches the streams. This information is available for permitting agencies to consider as necessary.</p> | While the Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS, the proposer has made a commitment to refurbish the proposed rail cars to minimize gaps and therefore spillage between the Mine Site and the Plant Site. Further detail on the rail cars is provided in FEIS Section 3.2.2.2.4. |
| 17    | Use of water evaluation criteria vs. water quality standards | Fond du Lac and Grand Portage do not agree with statements in the document that indicate there is "no impact" when that assertion is based on not exceeding an                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | The Co-lead Agencies believe that the SDEIS appropriately considers effects on water, including the evaluation criteria specific to the NorthMet Project                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The Co-lead Agencies' position as reflected in the SDEIS response remains unchanged for the FEIS. Section 6.2.2.4.1 contains details on                                                                                                                                                                                                 |

| MDO # | Specific Major Difference of Opinion Area             | Tribal Position Summary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Co-lead Agency Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|       |                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | SDEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | FEIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|       |                                                       | <p>evaluation criteria. They believe the SDEIS should acknowledge where there is a change, regardless if a criteria or standard is exceeded. With regard to the water quality effects analysis, Grand Portage and GLIFWC note that evaluation criteria are not equivalent to water quality standards. Grand Portage further notes that some evaluation criteria are high enough to cause human health impacts and evaluation criteria are not equal to or a substitute for water quality standards compliance. GLIFWC notes that in some areas, for example the cumulative effects section for the Partridge River, the text states all water evaluation criteria would be met, though water quality standards would be exceeded for several constituents. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS.</p> | <p>Proposed Action. It is also appropriate for the reporting of effects to reflect specific evaluation criteria based on the applicable water quality standard. CEQ guidance identifies that whether an action threatens to violate a federal, state, or local law or requirements imposed for the protection of the environment is an appropriate intensity factor for evaluating significance.</p> <p>The SDEIS also discloses where any given evaluation criterion differs from the water quality standards, which is necessary for some constituents because a specific standard has not been formulated.</p> <p>Regarding assessing effects on the Partridge River, relevant cumulative effect water evaluation criteria are described in SDEIS Section 6.2.3.3.4.</p> | <p>cumulative effects for the Partridge River.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 18    | Loss of “High Biodiversity Significance Values” sites | <p>Fond du Lac, GLIFWC, and Grand Portage believe that native plant communities identified by the Minnesota Biological Survey will be impacted by the proposed mine site and related transportation and utility corridor without appropriate mitigation for their landscape-scale and ecosystem values. There are two MBS sites of high biodiversity significance (18.8 acres) located within the transportation and utility corridor, including the 100 mile swamp and the upper Partridge River. They state that forty-one percent of the mine site consists of imperiled/vulnerable communities, but there is no proposed</p>                                                                                                                                                                                                                                                                            | <p>The Co-lead Agencies believe that the SDEIS appropriately discloses potential effects (loss) to high biodiversity significant sites as listed in the Minnesota Biological Survey characterization data. There is no policy or requirement to mitigate effects on MBS Sites of High Biodiversity Significance for those attributes. SDEIS Section 4.2.4 discloses these MBS sites. Sections 3.2.2 and 5.2.4 also describe mine reclamation that would be completed as part of the NorthMet Project Proposed Action, some of which may allow such MBS sites to re-</p>                                                                                                                                                                                                     | <p>Based on consideration of comments received on the SDEIS, the Co-lead Agencies have clarified information regarding sites of biodiversity significance in the FEIS and believe that the FEIS appropriately discloses potential effects (loss) to high biodiversity significant sites as listed in the Minnesota Biological Survey characterization data. In addition, FEIS Sections 4.2.4 and 4.3.4 discuss and provide maps of the MBS Sites (Figures 4.2.4-1, 4.2.4-2, 4.2.4-5, 4.3.4-1, and 4.3.4-2) to provide clarity on locations and extent. |       |                                           | mitigation. Fond du Lac and Grand Portage’s opinion is that there will be a net loss to the federal estate of these MBS communities that would not be compensated with equivalent MBS land exchange parcels gained through the USFS land exchange. Appendix C provides additional information from these agencies on this major difference of opinion revealed in the development of the SDEIS. | establish.              | (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities ( <i>Minnesota Rules</i> 8420.0515, subp 3).<br><br>There is no state or federal policy or requirement to mitigate effects on MBS Sites of High Biodiversity Significance that are not wetlands. However, FEIS Sections 3.2.2 and 5.2.4 describe mine reclamation activities that would be completed as part of the NorthMet Project Proposed Action, some of which may allow such MBS sites to re-establish. The Permit to Mine would address special consideration of wetlands that include rare natural communities. Additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions. |

DRAFT

139 **8.4 TRIBAL AGENCY APPENDIX – SUPPORTING INFORMATION**  
140 **FOR TRIBAL COMMENTS**

141 Although not required by NEPA and MEPA, the Co-lead Agencies committed to providing an  
142 appendix in the SDEIS that contained the Tribal Cooperating Agencies' comments and  
143 supporting documentation representing MDOs. The Co-lead Agencies have engaged the Tribal  
144 Cooperating Agencies extensively on these issues in preparation of the SDEIS and FEIS, and  
145 examined the information provided in the appendix in support of Tribal Cooperating Agency  
146 comments submitted on the SDEIS. Response to the Tribal Cooperating Agency comments on  
147 the SDEIS is provided in Appendix A.

148 See Appendix C for comments and supporting documentation from the Bois Forte, Grand  
149 Portage, Fond du Lac, GLIFWC, and the 1854 Treaty Authority. These take the form of eight  
150 position papers and a Co-lead Agencies' PSDEIS comment disposition spreadsheet for the Tribal  
151 Cooperating Agencies. The Tribal Cooperating Agency submittals in Appendix C are provided  
152 verbatim and in identical form as they were for the SDEIS. They were considered in the  
153 development of the FEIS.

154 Issue areas provided in Appendix C include:

- 155 • Hydrology Section;
- 156 • Mercury Section;
- 157 • Wild Rice Section;
- 158 • Underground Mine and West Pit Backfill Alternatives Section;
- 159 • Wetlands Section;
- 160 • Cumulative Effects Analysis Section;
- 161 • Proposed Transport of Ore Section;
- 162 • Perpetual Maintenance and Water Treatment at the NorthMet Project Section; and
- 163 • Tribal Responses to Co-lead Agencies' Disposition of Tribal PSDEIS Comments.

## 1 LIST OF REFERENCES

### 2 GENERAL INFORMATION

3 The Reference Section follows the general Chicago Manual of Style Guidelines, in that the  
4 following information is included in each citation, where possible, and in this order:

- 5 1. Author Last Name, First Name [followed by second author First Name Last Name, and  
6 third author First Name Last Name, etc., if applicable].
- 7 2. Year of Publication.
- 8 3. *Title of Document*.
- 9 4. Publication Information.

10 For Example:

- 11 • Smith, David. 2013. *Updated Formatting Guide for NorthMet Reference List*. St. Paul,  
12 MN: The Best Printing Press.
- 13 • Smith, David and Mark Jones. 2012. *Basic Formatting for NorthMet Master Reference*  
14 *List*. *References Today*, 4(31), 50-62. April 1, 2012.
- 15 • Smith, David, Mark Jones, and John Doe. 2011. *Guidelines for Creating Consistency in*  
16 *Formatting*. Accessed: September 22, 2013. Retrieved from:  
17 <http://www.allaboutnorthmetrefs.com>

18 The intext citations help the reader locate the full reference information in the Master Reference  
19 List. There are unique intext citations for each reference, and they include the following  
20 information:

- 21 1. First author last name and second author last name, if applicable (first author last name  
22 followed by et al. for three or more authors)
- 23 2. Year of publication

24 For Example:

- 25 • (Smith 2013)
- 26 • (Smith and Jones 2012)
- 27 • (Smith et al. 2011)

DRAFT

## **A.0 RESPONSE TO COMMENTS ON THE NORTHMET MINING PROJECT AND LAND EXCHANGE DRAFT AND SUPPLEMENTAL DRAFT EIS**

### ***A.1 INTRODUCTION***

The Supplemental Draft Environmental Impact Statement (SDEIS) for the NorthMet Mining Project and Land Exchange was published on December 13, 2013. A 90-day public comment period followed publication of the SDEIS, extending from December 14, 2013, to March 13, 2014. This Appendix summarizes the process used by the Co-lead Agencies' Final EIS (FEIS) to organize, analyze, and respond to the comments received on the SDEIS, and includes the responses to those comments. This Appendix also includes the comment themes received on the 2009 Draft EIS (DEIS) and shows the relationship between those DEIS comment themes and the SDEIS comments themes and responses.

#### ***A.1.1 Opportunities for Public Comment on the Supplemental Draft EIS***

The SDEIS was made available to the public for download on MDNR's Project-specific website, <http://www.dnr.state.mn.us/input/environmentalreview/polymet/index.html>. Paper copies of the SDEIS were also sent to Cooperating Agencies and other entities that requested them, as described in FEIS Section 2.3.4. Public review copies of the SDEIS were also placed in libraries in Minnesota: St. Paul, Grand Rapids, Hibbing, Hoyt Lakes, Babbitt, Duluth, and Minneapolis. A limited number of paper copies and CD-ROMs were distributed upon request to MDNR.

As discussed in the FEIS Section 2.3.5, three public meetings were held during the public comment period:

- January 16, 2014, at the Duluth Entertainment Convention Center;
- January 22, 2014, at Mesabi East High School in Aurora, MN; and
- January 28, 2014, at the Saint Paul River Center.

Attendees were provided three options to submit public comments at these meetings:

- Public oral testimony, transcribed by a court reporter;
- Individual oral testimony, also transcribed by a court reporter; and/or
- Written comments, placed in designated collection boxes.

In addition to the testimony and comments received at the public meetings, commenters were instructed to submit comments via a Project-specific email address or via mail.

#### ***A.1.2 Amount and Type of Input Received***

In total, the Co-lead Agencies received 57,872 e-mails, written and typed letters, postcards, and instances of public testimony (henceforth referred to as *submissions*) during the public comment period for the SDEIS. Senders included federal, state, and local representatives; members of the public; federal, and state government agencies; American Indian tribes; non-governmental organizations (NGOs); and other interested groups and stakeholders. Table A-1 summarizes the

number and type of submissions received. Copies of these submissions are available in Attachment 1.

**Table A-1**      **Number and Type of Public Comment Submissions on the SDEIS**

| Submission Type          | Definition                                                                                                               | Number | Percent of Total |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------|--------|------------------|
| All Submissions          |                                                                                                                          | 57,871 | 100%             |
| Form Letters             | Identical or substantively identical submissions                                                                         | 53,906 | 93%              |
| Form Letter Variants     | Standard form letter text that was altered by the sender by deleting standard text and/or by adding sender-composed text | 3,469  | 6%               |
| Form Letter Non-Variants | Standard form letter text was not substantively altered.                                                                 | 50,437 | 87%              |
| Unique Submissions       | Submissions composed entirely by the sender.                                                                             | 3,965  | 7%               |
| Comments                 | Unique, substantive comments extracted from within the submissions                                                       |        | 16,498           |

Of the 57,871 total submissions, 53,906 submissions (93 percent of the total) were duplicate *form letters* sponsored by outside entities (NGOs, unions, and other groups). A total of 43 distinct form letters were received from 14 outside entities, in addition to 6 form letters whose source could not be determined. Form letters were identified when two or more unrelated individuals submitted identical or substantively identical submissions, or when a submission was determined to consist entirely (or nearly so) of text provided by a website (such as a website maintained by an NGO) for the purpose of mass e-mailing.

Within the 53,906 form letter submissions were 3,469 form letter *variants*, submissions that consist of standard form letter text that was altered by the sender by deleting standard text and/or by adding sender-composed text (the remaining 50,437 form letters are referred to as *non-variant*). Variants were identified through use of a computer algorithm that evaluated the similarity of a submission against the known form letter “template.” The algorithm’s results were confirmed through a manual review of a statistically significant sample of submissions.

The 3,965 submissions (7 percent of the total) not identified as form letters were *unique* submissions composed entirely by the sender (including oral testimony at public meetings).

The 57,871 submissions, including both form letters and unique submissions, contained 16,498 unique, substantive comments. However, not all unique submissions contained substantive comments. For example, many only stated an opinion as to whether the proposed Project should or should not be built, with minimal or no additional content. A *comment* is defined as an individual statement, question, or concern within a submission that substantively addresses the proposed Project and that contains more than just a statement of approval or disapproval of the Project. Comments were extracted from all unique and variant submissions. One copy of each standard form letter was also reviewed for the purpose of extracting comments. Each unique, substantive comment received on the SDEIS is provided in Attachment 1.

Previously published materials, such as newspaper or journal articles, website content, or submissions provided during previous phases of the EIS process were not reviewed for

comments, but were retained for reference by the Co-lead Agencies. In cases where the same comment appeared more than once in a submission, only one instance was recorded.

## ***A.2 COMMENT REVIEW METHODOLOGY***

Under the Minnesota Environmental Protection Act (MEPA) (*Minnesota Rules 4410.2600 Subpart 10*) and National Environmental Policy Act (NEPA) (40 CFR 1503.4), the Co-lead Agencies considered and responded to all substantive comments received during the SDEIS public comment period. Given the large number of submissions and individual comments received on the SDEIS, the Co-lead Agencies determined that the comment analysis process would be more effective by grouping similar comments into broad *themes* and responding to those themes, instead of responding to each comment individually.

Initially, the text of all submissions was entered into a database to facilitate the review. Non-variant form letters were identified via computer matching algorithm. Each unique and variant submission was reviewed in order to identify substantive comments.

Each comment was categorized according to the overall topic area, or *issue*, addressed in the comment. Issues are listed in Table A-2 and generally correspond to the resource areas addressed in Chapters 4, 5, and 6. Issue codes were used for ease of comment management. A total of 23 issue areas were identified. In many cases, a comment was categorized as applicable to more than one issue. Submissions and issue assignments were each reviewed by at least two separate individuals to ensure accuracy. The unique, substantive SDEIS comments and their associated theme linkages are provided in Attachment 1.

***Table A-2 Issue Codes for Public Comments on the SDEIS***

| Issue                                 | Issue Code | Description(Comments related to...)                                                                                                                                                   |
|---------------------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Air Quality                           | AIR        | The Project's impacts on local and regional air quality and visibility.                                                                                                               |
| Alternatives                          | ALT        | Alternatives to the proposed Project that meet the Purpose and Need, such as underground mining, as well as the No Action Alternative.                                                |
| Aquatic Species                       | AQ         | The Project's effects on aquatic species.                                                                                                                                             |
| US Army Corps of Engineers 404 Permit | COE        | The USAACE permit issued under Section 404 of the Clean Water Act.                                                                                                                    |
| Cultural Resources                    | CR         | The Project's impacts on historic and cultural resources, including Tribal resources, as well as the process for interacting with the Bands and other Tribal entities.                |
| Financial Assurance                   | FIN        | The Co-lead Agencies' approach to, and/or the proponent's ability to provide sufficient financial assurance for potential impacts of the Project.                                     |
| General Topics                        | GEN        | General statements regarding the Project that are substantive (i.e., that express more than simple approval or disapproval), but that are too general to belong in other issue areas. |
| Geotechnical Stability                | GT         | The geotechnical stability of the stockpiles, mine pit, and other elements of the NorthMet Project Proposed Action.                                                                   |
| Hazardous Materials                   | HAZ        | Hazardous materials used, generated, transported, and/or disposed of as part of the NorthMet Project Proposed Action.                                                                 |
| Human Health and Safety               | HU         | The Project's effects on human health and safety.                                                                                                                                     |
| US Forest Service Land                | LAN        | The nature, extent, and/or appropriateness of, and/or the process for                                                                                                                 |

| Wilderness and Special Designation Areas   | WILD       | The Project's impacts on the Boundary Waters Canoe Area Wilderness (BWCAW), national, state, and local parks, portions of Superior National Forest designated for environmental conservation, and other special-designated areas. |
| Water Resources                            | WR         | The Project's impacts on water quality, water quantity, and the modeling of water resources conditions and effects.                                                                                                               |

Some comments that did not fall within one of the issue areas listed in Table A-2 were tracked to ensure that they received consideration by the Co-lead Agencies. These include the categories listed below (issue codes are listed in parentheses):

- Suggestions for editorial changes (EDIT), such as grammar, punctuation, or word choice, or suggested text revisions (as long as those suggested revisions did not constitute a change in the intent of the FEIS's findings or conclusions).
- Requests for information (RFI), such as requests for CD-ROM copies of the SDEIS.
- Suggestions that the Co-lead Agencies review specific publications or other references (REF).

The comment evaluation process used a thematic response approach. Subject matter experts from the Co-lead Agencies and their consultants reviewed and grouped comments within each issue area according to the common topic they addressed; each topic area is referred to as a *theme*.

Each of the 23 issue areas includes multiple themes in order to characterize the specific topics addressed by comments. Each comment was assigned to at least one theme. In cases where a comment addressed more than one theme, it was either assigned to the most appropriate theme or, in some cases, was assigned concurrently to multiple themes. A total of 580 themes were identified. For ease of sorting, each theme was given a code corresponding to its issue; for example, the third theme in the Financial Assurance issue is referred to as FIN 03.

For each theme, the Co-lead Agencies developed a concise statement that paraphrased and/or summarized the intent of each group of similar comments. Subject matter experts developed a *thematic response* for each theme statement. The response briefly describes how the theme is addressed in the FEIS. Where applicable, the actual text of the FEIS should be referenced for a more complete response to comments. Theme statements and responses are provided in Section A.4.

Comments characterized as REF were passed along to FEIS authors, while RFI were passed along to Co-lead Agency representatives. Editorial (EDIT) comments received direct responses. Comments from Cooperating Agencies were assigned to issues and themes as described above, but also received direct responses (see Section A.3).

### ***A.3 COMMENTS RECEIVED AFTER END OF PUBLIC COMMENT PERIOD***

The public comment period on the SDEIS closed on March 13, 2014. Comments received after this date were retained and were provided to FEIS authors for their review; however, these comments are not included in the theme statements and responses in Section A.4, nor in the list of individual comments in Section A.6.

### ***A.4 COOPERATING AGENCY COMMENTS AND RESPONSES***

Cooperating Agencies provided seven submissions, within which 465 discrete comments were identified. Table A-3 lists each of these comments, the response to each comment, and the theme(s) to which each Cooperating Agency comment was assigned.

**Table A-3 Cooperating Agency Comments and Responses**

| Comment ID                                           | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Theme(s) |

| <i>Comments from the USEPA (Submission ID 47834)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |          |
| 2981                                                 | <p>Comment # 1. Spill prevention is an important part of the mitigation for this project. Using new or retrofit side dump rail cars (possibly with hydraulic air-operation conversions) should be considered as part of the mitigation package for the proposed action. Proactive mitigation through the use of updated rail infrastructure would help reduce spillage and subsequent environmental concerns, possibly including the need for additional long-term water treatment.</p> <p>Recommendation: Consider use of new or retrofit side-dump rail cars when producing the spilled ore plan.</p> | <p>To guard against possible adverse effects from spilled ore, PolyMet plans to refurbish the ore cars, tightening or replacing the couplings and linkages to minimize gaps along the hinges and joint areas where spillage would occur. The quantity of ore that could potentially spill through the door and hinge gaps of a refurbished ore car is estimated to be 0.20 ton per year. This is a 97% reduction from the originally calculated value of 6.14 tons per year.</p> <p>Water quality monitoring is recommended downstream from the rail line on the Partridge River tributary streams to check for any potential deteriorations of water quality over time from ore spillage, and, if detected, adaptive water management measures would be implemented. Dust could be mitigated by spraying water on the loaded ore prior to transport. If significant accumulation of ore spillage occurs, it would be removed. The Permit to Mine would further address rail cars design in a section titled Ore Management, Handling and Transport.</p> <p>The Permit to Mine (PTM) would address detail design of rail cars (this topic/consideration) in a section titled Ore Management, Handling and Transport.</p> | WR 151   |
| 2982                                                 | <p>Comment # 2. Pages 5-50 forward describe how the company has classified its waste rock and tailings into four categories based on their likelihood to generate acid rock drainage. We understand from discussion with the co-lead agencies that lime will be added to Category 1 waste rock, which is expected to result in neutral to slightly basic pH.</p> <p>Recommendation: The FEIS should indicate that Category I waste rock leachate is expected to have a neutral to slightly basic pH due to the addition of lime.</p>                                                                    | <p>Mine waste rock would be sorted and stored into four categories based on its potential to contaminate water. Category 1 waste rock would have a low potential and Category 4 waste rock would have a high potential. Category 1 waste rock would be stored in a permanent stockpile that would be encompassed by a water containment system to capture surface and groundwater from the stockpile and direct it to a water treatment facility and would have a geomembrane cover at closure. Because Category 1 waste rock has a low potential to generate acid, and because water from the stockpile would be captured and treated, lime is not anticipated to be needed for neutralization, and, therefore, the addition of lime for Category 1 waste rock is not proposed. Category 2/3 and Category 4 waste rock would be stored temporarily in lined stockpiles, and then backfilled into the East Pit following completion of mining there. Lime may be added to the waste rock during East Pit backfilling to maintain pH in the pit pore water as needed. The volume of lime required would be based on monitoring results. Waste rock characterization and categorization, as well as</p>                    | WR 027   |

| 2983       | <p>Comment # 3. Page 5-157, Section 5.2.2.3.3, 2nd Paragraph: information on the design, operations, and monitoring plans for the hydrometallurgical research facility (HRF) is insufficiently detailed.</p> <p>Recommendation: The FEIS should provide information on the HRF's design and operations in sufficient detail for the reader to understand potential impacts associated with this facility and how those impacts will be avoided or mitigated. This includes explaining that a detailed Residue Management Plan for this facility will be required during permitting.</p> | <p>management and storage during operations and closure, and water management at the stockpiles, are addressed in FEIS Sections 3.2.2.1.7, 3.2.2.1.8, 3.2.2.1.9, and 3.2.2.1.10.</p> <p>FEIS Section 5.2.14.2.3, which expands upon the discussion from the SDEIS on the design and construction of the Hydrometallurgical Residue Facility, and Geotechnical Data Package Volume 2 (PolyMet 2014c as cited in the FEIS), indicate that the design would meet appropriate factors of safety. The Hydrometallurgical Residue Facility would be constructed over the LTVSMC emergency basin. During operations, the double liner system for the Hydrometallurgical Residue Facility would minimize release of residue leachate, and any collected leakage through the primary liner would be collected in the leakage collection and recovery system (LCRS) and pumped back to the Hydrometallurgical Residue Facility pond. During reclamation and closure and long-term maintenance, any leakage would be routed and cycled through the WWT.</p> <p>The Hydrometallurgical Residue Facility would be double-lined at the bottom to facilitate collection of water that has contacted the hydrometallurgical residue. More specifically, the double liner would consist of a composite liner system that utilizes a geomembrane liner above a geosynthetic clay liner with a second liner placed above the first, separated by a LCRS, substantially reducing hydraulic head from the lower liner. This design is intended to mitigate leakage from the Hydrometallurgical Residue Facility to groundwater resources. The collection system capture rate was calculated and included in Section 5.2.2.5.4 of Geotechnical Data Package Volume 2 (PolyMet 2014c as cited in the FEIS). The Residue Management Plan (PolyMet 2014r, as cited in the FEIS) includes a description of the operating plans, monitoring procedures, and adaptive management approaches for the Hydrometallurgical Residue Facility. Information on the design of the Hydrometallurgical Residue Facility is in FEIS Section 3.2.2.3.10.</p> <p>The FEIS includes available details from Mine Site Water Management Plan (PolyMet 2015r as cited in the FEIS), which is updated from the version used in the SDEIS. The management plan details proposed operational plans, monitoring activities, annual reporting requirements, and plans for reclamation and closure and long-term maintenance for the Hydrometallurgical Residue Facility. Details would be finalized in permitting and be subject to periodic reassessment.</p> | PD 17<br>WR 066 |

| 2984       | <p>Comment # 4. Page 4-336 discusses the possibility of inundating an existing coal ash landfill located within the proposed tailings basin. Based on current knowledge of leachate concentrations found in groundwater at such landfills, inundation may lead to future water quality impacts.</p> <p>Recommendation: The FEIS should discuss how constituents found in the coal ash landfill may impact water quality in the Embarras River, how this landfill will be protectively managed, and how any impacts will be mitigated.</p>                                                                                                                                                      | <p>The coal ash landfill (landfill) is located on the east side of the former LTVSMC Tailings Basin in Cell 1E in approximately the northeast quarter. The landfill was operated by LTVSMC to accept coal ash from LTVSMC's Taconite Harbor facility, and coal contaminated soil from the LTVSMC abandoned coal yard. The landfill was closed per the "Closure Plan for the Tailings Basin Coal Ash Disposal Area." The final footprint of the landfill (AOC 36) is estimated to cover approximately 4 acres and contain approximately 260,000 cubic yards total of material (including coal ash, tailings, and soil covers). As the current footprint of the landfill lies within the future footprint of an area to be inundated by placement of NorthMet Project flotation tailings, the plan is to relocate the contents of the landfill to the future NorthMet Hydrometallurgical Residue Facility, which has a design capacity of 6,170,000 cubic yards, and would be a double-lined storage facility. The double liner would consist of a composite liner system utilizing a geomembrane liner above a geosynthetic clay liner, with a second liner placed above the first, separated by a leakage collection system. This would substantially remove hydraulic head from the lower liner and thereby virtually eliminate leakage to groundwater from the Hydrometallurgical Residue Facility. Leakage that is collected would be pumped back to the Hydrometallurgical Residue Facility pond, which is collected and pumped back for use at the Hydrometallurgical Plant. This facility is currently planned to be constructed and in use prior to the time period at which the landfill would be inundated with NorthMet flotation tailings (mine year 7).</p> | WR 028           |
| 2985       | <p>Comment # 5. CWA requirements for antidegradation ("nondegradation" in Minnesota's terminology) help ensure that a proposed project will not result in a loss of existing uses of surface waters, and preclude reduced water quality unless the State determines it is necessary to accommodate important social and economic development (see 40 CFR 131.12). This review must occur before project activity that may result in a new or increased discharge commences, and should not be deferred until NPDES permitting. EPA understands from discussion with MPCA that much, if not all, of the information needed for an antidegradation review is already contained in the SDEIS.</p> | <p><i>Minnesota Rules</i> 7050.0180 describes the nondegradation rules applicable to discharges to Outstanding Resource Value Waters (ORVW) and waters upstream of ORVWs. The NorthMet Project Proposed Action would not discharge to listed ORVWs, nor would there be any deterioration of water quality in Lake Superior, the nearest ORVW downstream of the proposed NorthMet Project area. Thus, the requirements of this rule are not applicable. <i>Minnesota Rules</i> 7080.0185 describes the nondegradation requirements applicable to discharges to all waters of the state. As part of the permitting process for the project, the MPCA would determine whether additional control measures are required to minimize the impact of the project on downstream waters while considering the factors identified in the rule. <i>Minnesota Rules</i> 7052.0300 describes the nondegradation requirements applicable to waters in the Lake Superior basin for bioaccumulative chemicals of concern (BCCs) and bioaccumulative substances of immediate concern (BSICs) of which mercury is the only one</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | PER 09<br>WR 109 |

|            | <p>Recommendation: The FEIS should include an evaluation of which of Minnesota's nondegradation rules (7050.0180, 7050.0185, 7052.0300) apply to this project, and explain how the project complies with the applicable nondegradation rules</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>applicable to the NorthMet Project Proposed Action. As part of the permitting process, the MPCA would apply these requirements to mercury discharges as appropriate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                          |
| 2986       | <p>Comment # 6. The proposed project provides significant overall environmental improvements over the proposal in the DEIS through installation of seepage containment and other controls at the former LTV tailings basin. However, the SDEIS modeling predicts increases in aluminum (Al) and lead (Pb) in surface waters affected by the proposed project- including exceedances of evaluation criteria for Al and Pb at locations on four tributaries to the Embarrass River (p. 5-7 to 5-8). These predicted increases are based on a number of assumptions, including the contribution from remediation of the former LTV tailings basin. The SDEIS modeling also predicts other increases and exceedances of evaluation criteria based on the "Continuation of Existing Conditions" scenario. EPA understands that monitoring of receiving waters down gradient of the existing tailings basin is being carried out now. This monitoring data will be an important source of information to consider along with modeling results.</p> <p>Recommendation: Available monitoring data should be used to inform NPDES permitting. Monitoring should continue throughout the life of the project to inform permitting, adaptive management, and additional measures to prevent or mitigate impacts to aquatic life as necessary.</p> | <p>Monitoring would be a critical component of the NorthMet Project Proposed Action to better understand impacts and to inform facility operation and maintenance and the selection and implementation of possible adaptive or contingency mitigation measures. Overviews of the water monitoring plans at the Mine Site and Plant Site, with PolyMet proposed monitoring locations and frequencies, are presented in the FEIS. The specifics of monitoring—including specific locations, frequencies, and parameters—would be finalized during the permitting process after a detailed evaluation. An NPDES permit would be required for any point source water discharge that adds pollutants to waters of the United States.</p> | AQ 12<br>AQ 30<br>WR 139 |
| 2987       | <p>Comment # 7. The SDEIS anticipates that pollutants will be discharged from mine site features, travel via groundwater pathways and reach the Partridge River several years following the start of the mining project. See SDEIS Table</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>It is acknowledged that while there could be groundwater discharge to jurisdictional wetlands along a flowpath, this process is not incorporated into the GoldSim model because it is considered speculative and quantitatively uncertain. The EIS considers that permitting for the NorthMet Project Proposed Action, if approved, would require monitoring</p>                                                                                                                                                                                                                                                                                                                                                                 | PER 05                   |

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            | <p>5.2.2-26. However, as EPA has stated previously, the pollutants originating from mine site features may discharge to jurisdictional wetlands and tributaries prior to reaching the Partridge River. CWA Section 301 prohibits any point source discharge of pollutants to waters of the United States, either directly or via directly connected groundwater, unless the discharge complies with a NPDES permit. Waters of the United States include jurisdictional wetlands and tributaries. See 40 CFR 122.2.</p> <p>Recommendation: The FEIS should reflect the fact that a NPDES permit is required before the pollutants from the mine site reach waters of the U.S. (including jurisdictional wetlands and tributaries). Statements in the SDEIS about when discharges will reach waters of the U.S. should be revised, and these changes should be reflected in the FEIS.</p>                                                                        | <p>that would likely include water levels and water quality in groundwater and potentially affected waters of the U.S., including wetlands and tributaries. The goal of this monitoring is to anticipate or predict the potential for an NPDES discharge so that the NPDES discharge can either be eliminated, or alternatively permitted with NPDES permit coverage prior to its occurrence. See FEIS Section 5.2.2.3.6 for more information on groundwater and wetland monitoring and possible future mitigations.</p> <p>The FEIS states that an NPDES permit would be required for any point source water discharge that adds pollutants to waters of the U.S. The Final EIS correctly identifies the waters of the U.S.</p>                                                                                                                                                                                                                                                                                                                   |          |
| 2988       | <p>Comment # 8. The Tribal Cooperating Agencies Cumulative Effects Analysis (September 2013) included in Appendix C of the SDEIS states: "PSDEIS Table 4.2.2-18 reports Colby Lake as currently having an observed mean for Arsenic of 0.78 to 1.4 ug/L (depending on the data set), whereas Figure 5.2.2-35, the No-Action (continuation of current conditions) P50 model for Colby Lake Arsenic shows annual maximum values of 0.5 ug/L." In addition, the SDEIS shows Colby Lake's current mean arsenic concentration as 0.78-1.4 ug/L on Table 4.2.2-18, with a range of 0.25-2.3 ug/L, while the modeled P90 maximum value in Figure 5.2.2-35 lists the maximum concentration of arsenic in Colby Lake as 0.70 ug/L. Comparing the modeled mean for arsenic in Colby Lake to existing site-specific data in the SDEIS, the model outputs underestimate arsenic concentrations by up to 100%. Colby Lake is currently modeled as a continuation of the</p> | <p>The Mine Site GoldSim model used for the SDEIS was modified for the FEIS (PolyMet 2015m) to include a new chemical loading source in Colby Lake and was calibrated to the measured chemical concentrations in the lake. This calibration considered new surface water chemistry data collected through the end of 2013. The same chemical loading source was applied to both the Continuation of Existing Conditions model and Proposed Action model (PolyMet 2015m). The chemical loading source was constant and did not exhibit seasonal or long-term variations for future conditions. Incorporation of the loading source addressed the issue by providing predicted chemical concentrations in Colby Lake for existing conditions that are similar to currently measured concentrations. The average arsenic concentration based on 33 samples in Colby Lake is 0.95 ug/L. The GoldSim Continuation of Existing Conditions modeling scenario predicts an average concentration of 0.80 ug/L at P50 over the 200 year modeling period.</p> | WR 046   |

|            | <p>Partridge River because there is insufficient data to model it as a lake, which may be causing this discrepancy. We understand that monitoring is ongoing, which may provide additional information on observed arsenic concentrations.</p> <p>Recommendation: The FEIS should document an analysis that addresses this discrepancy between existing conditions in Colby Lake and modeling results, taking into account all necessary data. The FEIS should include any follow-up actions that will be necessary based on this analysis.</p>                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| 2989       | <p>Comment # 9. Modeling using MODFLOW assumes no seepage through the berm on the east side of the tailings basin. The co-lead agencies have agreed to reexamine this assumption. MODFLOW outputs are used as an input to the GoldSim model, so changes to these outputs may require updated GoldSim modeling as well.</p> <p>Recommendation: Recalibrate MODFLOW as necessary to reflect seepage on the east side of the tailings basin, and update GoldSim modeling as necessary. The FEIS should explain how this comment was addressed.</p>                                                                                                                                                                                | <p>The Plant Site MODFLOW and GoldSim water quality models were updated to incorporate the east side of the Tailings Basin to reflect a surficial material layer at this site. The FEIS also addresses inclusion of a new containment system at this site in Section 5.2.2.</p>                                                                                                                                                                                                                                                                                                                     | WR 054<br>WR 102 |
| 2990       | <p>Comment # 10. Modeling of water quality parameters is subject to inherent uncertainties that call for ongoing evaluation. For example, acid rock drainage (ARD) in cold, wet climates raises uncertainty due to climatic factors including distinct freeze-thaw cycles, varying contributions from rain and snow, and a period of significant melting during the spring thaw.</p> <p>Recommendation: The permit to mine should require water quality modeling throughout the life of the mine, assuring that the model uses input from actual monitoring discharge data as it becomes available, so this information can be used to support adaptive management. The model should accommodate specific climatic factors</p> | <p>The NPDES/SDS permit and MDNR Permit to Mine would require a periodic 'model verification analysis' for as long as is necessary (during both operation and closure) to compare actual monitoring data against model assumptions, inputs and predictions generated during the EIS process. This analysis can then be used to support adaptive mitigation as appropriate. The details of the analysis procedures and methods would be developed during permitting but are likely to utilize on-site 'internal' performance data and groundwater data in addition to discharge monitoring data.</p> | WR 130<br>WR 139 |

| 2991       | <p>associated with the site.</p> <p>Comment #11. MDNR has collected new Partridge River flow data that vary from the base flow calculations used for modeling in the SDEIS. The co-lead agencies have explained that the model accounts for this discrepancy, which is correlated with pit dewatering from the upstream Peter Mitchell Pit, a factor that was not present during the time period used for continuous flow data in the SDEIS (1978-1987). Details are provided in a technical memorandum from the colead agencies. While the flow data used in the SDEIS was appropriate, low-flow conditions may not represent the most conservative conditions, though they are conservative in that they assume less dilution of contaminants. However, dilution is the only variable considered. High-flow conditions, while increasing dilution, may mobilize contaminants to a greater extent than expected under low-flow conditions.</p> <p>Recommendation: The FEIS should evaluate how base flow affects variables other than dilution, taking into account high-flow as well as low-flow scenarios.</p> | <p>The FEIS reports a formal sensitivity analysis of groundwater baseflow for the Partridge River. The analysis used the FEIS Mine Site GoldSim model (PolyMet 2015m) with groundwater baseflows at all locations on the Partridge River artificially increased by a factor of 4 (e.g., from 0.5 to 2 cfs at SW-003 and 5.3 to 21 cfs at SW-006). Other hydrologic parameters affected under the sensitivity analysis include aquifer recharge values and hydraulic conductivities of surficial deposits. Both of these increased by a factor of 3 to 4 as a function of recalibrating the Mine Site MODFLOW model to measured groundwater heads and the higher groundwater baseflows. The higher values of groundwater baseflow, aquifer recharge, and hydraulic conductivity of surficial deposits were input into the Mine Site GoldSim model (PolyMet 2014v, as cited in the FEIS). In a separate but related analysis using the GoldSim existing conditions model, surface runoff concentrations were also recalibrated to new values based on higher groundwater baseflows and these were also incorporated into the GoldSim Mine Site model to create the "high groundwater baseflow scenario." This scenario accounted for all GoldSim parameters that would be directly or indirectly affected by considering higher groundwater baseflows in the Partridge River, not just the dilution effect.</p> <p>Results of the GoldSim high groundwater baseflow scenario were compared with the best-estimate scenario to evaluate the degree to which predicted Proposed Action impacts are sensitive to groundwater baseflow and related inputs. The sensitivity GoldSim run indicated that groundwater and surface water concentrations did not change appreciably when higher groundwater baseflow (and associated input parameters) were modeled for the Mine Site (i.e., water quality impacts were not sensitive to groundwater baseflow). The only substantive changes in GoldSim results were: 1) migration velocities in the surficial groundwater flowpaths increased by approximately a factor of 3-4; 2) groundwater travel times to Evaluation Locations and the Partridge River were reduced by approximately a factor of 3-4; 3) peak groundwater concentrations increased for some constituents at some locations; and 4) mine pit groundwater inflow rates increased nominally. However, there were no exceedances of water quality impact criteria at the groundwater Evaluation Locations and no exceedances of new constituents at the surface water Evaluation Locations. The frequency of exceedances for sulfate in the Partridge River did not increase significantly relative to the best-estimate GoldSim analysis.</p> <p>The interpretation of these results is that the increased chemical loadings at</p> | <p>WR 091<br/>                     WR 165</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                         | <p>the upgradient end of the flowpaths (due to higher groundwater flow rates) are offset by: 1) increased dilution from aquifer recharge water along the flowpath; and 2) increased dilution in the river from higher groundwater baseflows during winter low-flow conditions. In other words, for low (i.e., winter) streamflow conditions, the higher chemical mass loading into the river was offset by dilution associated with the higher river groundwater baseflows.</p> <p>In regard to chemical concentrations and regulatory criteria, it is reasonable to conclude from the results of the sensitivity analysis that the Mine Site GoldSim model is relatively insensitive to the Partridge River groundwater baseflow variable. By analogy, the Plant Site GoldSim model is also considered insensitive to groundwater baseflows in the Embarrass River (PolyMet 2015j, as cited in the FEIS). The FEIS reports the results of the Partridge River groundwater baseflow sensitivity analysis in Section 5.2.2.3.2.</p>                              |          |
| 2992       | <p>Comment # 12. There is insufficient detail to explain why “outlier” data were excluded from consideration in the GoldSim model.</p> <p>Recommendation: The FEIS should provide a specific justification to support excluding any such data from modeling.</p>                                                                                                                                        | <p>Various data sufficiency documents within the FEIS record support decisions related to the exclusion or inclusion of data. The primary data sufficiency document for the FEIS is titled, “Technical Memorandum: Ongoing Groundwater and Surface Water Data Collection for NorthMet Water Quality Modeling Version 1” (Barr 2014d, as cited in the FEIS)..</p> <p>The FEIS does not provide specific justification to include or exclude data from modeling because the FEIS is focused on evaluating effects to the human and natural environment, alternatives, and mitigation. .</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WR 072   |
| 2993       | <p>Comment # 13. Page 5-61: the SDEIS shows that tailings leachate pH increases after 300 weeks, but does not show how leachate pH was extrapolated to the longer term, such as 50-100 years.</p> <p>We understand this data is already available.</p> <p>Recommendation: The FEIS should show how leachate pH was extrapolated to the longer term, such as 50-100 years, through a graph or chart.</p> | <p>The pH in leachate from the various mining features was not predicted by the GoldSim model. However, the permanent subaerial waste facilities (e.g., Category 1 Stockpile and Tailings Basin) would contain material that testing results indicate would not produce acidic leachate. The nonacid generating waste was identified using multi-year kinetic tests (humidity cells) on NorthMet Project Proposed Action rock samples.. The long-term humidity cell tests on NorthMet waste rock consist of 42 samples of Category 1 waste rock, with tests that have run for over 450 weeks; and 33 LTVSMC tailings humidity cell tests run between 84 and 304 weeks. This information is presented in Section 4.3 and Attachment E, respectively, of PolyMet 2015q, as cited in the FEIS. These tests demonstrate that tailings and Category 1 waste rock do not generate acidic leachate, and acid generation rates decreases by depletion of sulfide S minerals.</p> <p>Regarding the tailings in particular, the pH in the flotation tailings humidity</p> | WR 001   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>cells have been observed to be stable or increasing between 100 and 300 weeks of humidity cell testing. However, pH of the flotation tailings in the GoldSim model is not directly based on, or extrapolated from, the observed pH in the humidity cells. This is because the neutralization mechanism for NorthMet Project Proposed Action tailings is understood to be silicate mineral dissolution, not carbonate weathering.</p> <p>As noted above, the humidity cells provide information on rates of acid producing and acid neutralizing reactions, which are similar for flotation tailings and Category 1 waste rock due to the similar sulfur content of these materials. A separate geochemical model was used to estimate long-term pH resulting from these reactions, including the conservative assumption that CO<sub>2</sub> is elevated above atmospheric levels throughout the tailings. See FEIS Section 5.2.2.2.3 for more information.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |          |
| 2994       | <p>Comment # 14. The SDEIS could be interpreted to imply that the plant site is expected to need water treatment for up to 500 years, and the mine site for up to 200 years. We understand from discussion with the co-lead agencies that this interpretation is incorrect.</p> <p>Recommendation: The FEIS should clearly explain the timeframe during which water treatment is projected, for both the plant and mine sites.</p> | <p>The water quality objective of closure is to provide mechanical or non-mechanical treatment for as long as necessary to protect regulatory standards at applicable groundwater and surface water compliance points. Water quality modeling performed in support of the FEIS indicates that water treatment systems would be needed at the Mine Site and Plant Site indefinitely. The water models constructed to assess the potential effects from the NorthMet Project Proposed Action were not designed to predict the duration of treatment nor do they capture all the factors that influence the duration of treatment, for example potential future regulatory and technological changes. Therefore, the models cannot be used to predict when treatment would end. Actual treatment requirements would be assessed on a recurring basis throughout operation and closure based on results of ongoing discharges, performance, and water resource monitoring, ensuring continuous protection of ground and surface water quality and compliance with applicable water quality standards. This reassessment process would rely on measured monitoring results rather than the results of the predictive modeling included in the FEIS. Regardless of the precise duration of effects or water treatment at either the Mine Site or Plant Site, there are measures available to address impacts to natural resources, such as those identified in the Adaptive Water Management Plan (PolyMet 2015d, as cited in the FEIS) and permit conditions. PolyMet would be held accountable for maintenance and monitoring required under the permit and would not be released until all conditions have been met. PolyMet would be required to provide financial assurance to MDNR (managed independently) for closure and maintenance costs as a contingency if PolyMet or the operating company at that time were unable to fulfill the obligations under</p> | WR 036   |

| 2995       | <p>Comment # 15. Page 5-20: the SDEIS states that “mercury was not included in the GoldSim model, as insufficient data and a general lack of definitive understanding of mercury dynamics prevented modeling mercury like the other solutes.” It also states that “regardless, the NorthMet Project Proposed Action would still need to demonstrate consistency with the mercury evaluation criteria (see Section 5.2.2.1).” Given the absence of modeling data for mercury, it is unclear how consistency with mercury evaluation criteria will be determined.</p> <p>Recommendation: The FEIS should either provide a supporting rationale that explains why elemental mercury does not warrant modeling, and how consistency with mercury evaluation criteria will be determined; or include modeling and evaluation of elemental mercury. If GoldSim is not suitable to model this pollutant, elemental mercury can be modeled using a different water quality model, such as the Water Quality Analysis Simulation Program (WASP), which is commonly used by EPA to model elemental mercury.</p> | <p>Elemental mercury is unlikely to exist in the water column. However, elemental mercury was evaluated using the MPCA’s Mercury Risk Estimation Method to assess the potential incremental change in fish mercury concentrations and the potential incremental risks to human health.</p> <p>The FEIS assesses NorthMet Project Proposed Action-related mercury contributions using a mass-balance methodology. This approach was identified during scoping of this EIS as the appropriate analytic tool for predicting mercury concentrations during scoping of this EIS and it is a common and reliable analytical tool used by agencies to assess mercury impacts in impact assessments. This estimation method is preferred over a detailed mechanistic model because it incorporates the important input and removal processes for mercury, it is transparent with regard to data inputs, it typically provides conservative estimates of aqueous mercury concentrations, and it allows for easy assessment of the effect of changing parameter values on mercury concentrations. The RO treatment plant is expected to discharge mercury at or below the mercury standard of 1.3 ng/L, which includes all surface water that would be discharged at the Plant Site, including water used for flow augmentation. Mercury loadings from the Mine Site are projected to decrease due to the NorthMet Project Proposed Action and the combined contributions from the Embarras River and Partridge River are unchanged when estimated at the St. Louis River at the Fond du Lac reservation boundary. Therefore, the potential effects are expected to be less than significant, and the mass balance approach is appropriate to provide a reasonable estimate of potential contributions for purposes of environmental review.</p> <p>West Pit inflows during pit flooding are not projected to exceed the 1.3 ng/L water quality standard; RO would further reduce these concentrations in closure. The WWTP and WWTF would use mercury-capturing greensand filtration for pretreatment prior to RO. A adaptive management would be implemented as necessary based on monitoring for total mercury to determine whether the treated water could be discharged to surface waters, or whether some additional treatment is needed.</p> <p>PolyMet has identified the following adaptive management strategies:</p> <ul style="list-style-type: none"> <li>• Pretreatment modifications such as chemical scavenger addition to obtain additional metals;</li> <li>• Use of tighter RO membranes for the primary RO system;</li> </ul> | MERC 13  |

| 2996       | <p>Comment # 16. Page 5-509, Section 5.2.10.2.6, 5th paragraph: The SDEIS states that “increased mercury concentrations, and associated increases in mercury bioaccumulation in fish tissue could therefore constitute an environmental justice impact for Band members and other subsistence consumers of fish;” and that “deposition of mercury from the NorthMet Project Proposed Action would cease at closure, but mercury bioaccumulation in fish tissue and existing fish consumption limits could persist beyond the mine’s operational life.” Table 5.2.2-51 shows how much elemental mercury is expected to leave the project site under currently-proposed control measures. Further consideration of mercury impacts is needed.</p> <p>Recommendation: The FEIS should refine the quoted statement to more clearly characterize the risks associated with mercury releases. Based on this risk characterization, the FEIS should explain what has been and will be done to avoid, minimize, and mitigate mercury releases from the project.</p> | <p>FEIS Table 1.7-1 provides a summary of FEIS sections that address mercury. Specifically, FEIS Section 5.2.7.2.5 discloses results of the MPCA’s Mercury Risk Estimation Method to assess the potential incremental change in fish mercury concentrations and the potential incremental risks to human health; and FEIS Section 5.2.2.3.4 explains the status of mercury science, FEIS Section 5.2.2.3.5 lists methods to reduce mercury discharges, and FEIS Section 5.2.7.2.5 identifies mercury air emissions controls.</p> <p>Adaptive management would be implemented as necessary based on monitoring for total mercury to determine whether the treated water could be discharged to surface waters, or whether some additional treatment is needed. Adaptive management strategies would include pretreatment modifications such as chemical scavenger addition to obtain additional metals, the use of tighter reverse osmosis membranes for the primary reverse osmosis system, treatment of some portion of the Vibratory Shear Enhanced Processing (VSEP) permeate by the primary reverse osmosis system to further remove some dissolved constituents, and addition of polishing treatment units for removal of trace metals (e.g., ion exchange).</p> | MERC 02<br>MERC 24 |
| 2997       | <p>Comment # 17. The SDEIS describes current site conditions, including the acreage, type, and quality of the wetland resources at the tailings basin and mine sites. The SDEIS also describes the proposed direct impacts remaining after measures to avoid or minimize direct impacts. However, the SDEIS does not quantitatively assess indirect impacts or measures to minimize and mitigate these impacts, except with respect to wetland losses due to fragmentation. The SDEIS also omits all indirect impacts from the cumulative impacts analysis for</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects.</p> <p>In addition, the SDEIS and FEIS Section 5.2.3 quantitatively assessed all potential indirect wetland effects. Indirect wetland effects from the NorthMet Project Proposed Action were assessed as a result from one of the following six factors: 1) wetland fragmentation; 2) change in wetland hydrology from changes in watershed area; 3) changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering; 4) changes in wetland hydrology from groundwater drawdown resulting from operation of the Plant Site, including groundwater mounding and seepage containment; 5) changes in stream flow near the Mine Site and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                        | COE 02<br>WET 18   |

|                                                                                                                                                                                                                                 | <p>wetlands (Section 6.2.3.4).</p> <p>Recommendation: The FEIS should quantitatively assess all indirect impacts. The FEIS should more clearly describe the proposed mitigation plan, including mitigation for indirect impacts. The monitoring and mitigation plans in the CWA Section 404 permit should clearly explain proposed measures to minimize and mitigate indirect wetland impacts during the project.</p> <p>Recommendation: The FEIS should include indirect impacts in the analysis of cumulative impacts to wetlands.</p> | <p>Plant Site and associated effects on wetlands abutting the streams; and 6) change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations. The assessments provided wetland type and acreage for all six factors; however only wetland acreages were provided for change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations. The following table summarizes the page location of where the indirect wetland effects were discussed in the SDEIS.</p> <table border="1" data-bbox="756 814 1360 1444"> <thead> <tr> <th data-bbox="756 814 984 869">Indirect Effects Factor Assessed</th> <th data-bbox="984 814 1057 869">Mine Site</th> <th data-bbox="1057 814 1198 869">Transportation and Utility Corridor</th> <th data-bbox="1198 814 1279 869">Plant Site</th> <th data-bbox="1279 814 1360 869">Second Creek</th> </tr> </thead> <tbody> <tr> <td data-bbox="756 869 984 911">Wetland fragmentation</td> <td data-bbox="984 869 1057 911">page 5-239</td> <td data-bbox="1057 869 1198 911">page 5-239</td> <td data-bbox="1198 869 1279 911">page 5-291</td> <td data-bbox="1279 869 1360 911">page 5-291</td> </tr> <tr> <td data-bbox="756 911 984 966">Change in wetland hydrology from changes in watershed area</td> <td data-bbox="984 911 1057 966">page 5-243</td> <td data-bbox="1057 911 1198 966">---</td> <td data-bbox="1198 911 1279 966">---</td> <td data-bbox="1279 911 1360 966">---</td> </tr> <tr> <td data-bbox="756 966 984 1100">Changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering</td> <td data-bbox="984 966 1057 1100">pages 5-247, 5-259, 5-260; Tables 5.2.3-3, 5.2.3-4</td> <td data-bbox="1057 966 1198 1100">---</td> <td data-bbox="1198 966 1279 1100">---</td> <td data-bbox="1279 966 1360 1100">---</td> </tr> <tr> <td data-bbox="756 1100 984 1213">Changes in wetland hydrology from groundwater drawdown resulting from operation of the plant site including groundwater seepage containment</td> <td data-bbox="984 1100 1057 1213">---</td> <td data-bbox="1057 1100 1198 1213">---</td> <td data-bbox="1198 1100 1279 1213">pages 5-297 and 5-298; Table 5.2.3-10</td> <td data-bbox="1279 1100 1360 1213">pages 5-297 and 5-298</td> </tr> <tr> <td data-bbox="756 1213 984 1289">Changes in stream flow near the Mine Site and Plant Site and associated effects to wetlands abutting the streams</td> <td data-bbox="984 1213 1057 1289">page 5-273</td> <td data-bbox="1057 1213 1198 1289">---</td> <td data-bbox="1198 1213 1279 1289">page 5-299</td> <td data-bbox="1279 1213 1360 1289">page 5-299</td> </tr> <tr> <td data-bbox="756 1289 984 1444">Change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations as well as leakage from Stockpiles/Mine Features and Seepage from Mine Pits</td> <td data-bbox="984 1289 1057 1444">page 5-276, 5-284; Table 5.2.3-7</td> <td data-bbox="1057 1289 1198 1444">page 5-277</td> <td data-bbox="1198 1289 1279 1444">page 5-302, 5-307; Table 5.2.3-13</td> <td data-bbox="1279 1289 1360 1444">page 5-291</td> </tr> </tbody> </table> <p data-bbox="740 1472 1377 1518">It is difficult to predict potential indirect wetland effects within the CEAA, as well as to know what the potential indirect wetland effects would be for</p> | Indirect Effects Factor Assessed      | Mine Site             | Transportation and Utility Corridor | Plant Site | Second Creek | Wetland fragmentation | page 5-239 | page 5-239 | page 5-291 | page 5-291 | Change in wetland hydrology from changes in watershed area | page 5-243 | --- | --- | --- | Changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering | pages 5-247, 5-259, 5-260; Tables 5.2.3-3, 5.2.3-4 | --- | --- | --- | Changes in wetland hydrology from groundwater drawdown resulting from operation of the plant site including groundwater seepage containment | --- | --- | pages 5-297 and 5-298; Table 5.2.3-10 | pages 5-297 and 5-298 | Changes in stream flow near the Mine Site and Plant Site and associated effects to wetlands abutting the streams | page 5-273 | --- | page 5-299 | page 5-299 | Change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations as well as leakage from Stockpiles/Mine Features and Seepage from Mine Pits | page 5-276, 5-284; Table 5.2.3-7 | page 5-277 | page 5-302, 5-307; Table 5.2.3-13 | page 5-291 |  |

|            |         | <p>the projects assessed other than the NorthMet Project Proposed Action. However, based on the amount of potential indirect wetland effects that could occur from the NorthMet Proposed Action, there could be 0.1 to 12.0% cumulatively lost, in addition to the direct wetland impacts assessed, within the Partridge and Embarrass River watersheds as a result of the NorthMet Project Proposed Action.</p> <p>The total wetland resources within the two watersheds during the time periods assessed are as follows:</p> <ul style="list-style-type: none"> <li>• Pre-settlement wetland resources - 68,251 acres;</li> <li>• Existing conditions wetland resources - 65,567 acres;</li> <li>• Foreseeable future conditions with the NorthMet Project Proposed Action and the other foreseeable projects assessed, which includes direct wetland impacts and future deepwater habitat - 64,979 acres; and</li> <li>• Foreseeable future conditions without the NorthMet Project Proposed Action but with the other foreseeable projects assessed, which includes direct wetland impacts and future deepwater habitat (No Action Alternative) - 65,292 acres.</li> </ul> <p>Based on the wetlands crossing analog zones analysis approach, the acreage of wetlands whose hydrology would have a high likelihood of being affected by drawdown at the Mine Site is 866.9 acres. The wetlands categorized as high likelihood are dominated by one alder thicket (848 acres) that has approximately 4 acres (less than 1%) within the 0-1,000 ft analog impact zone. The remainder of this wetland (more than 99%) is located more than 1,000 ft away from the edge of the mine pits and extends out to the edge of Area 1 (see Figure 5.2.3-6 in the FEIS). Furthermore, based on this method, there would be 1,854.5 acres of wetlands within the 0-2,000 ft zone and 2,147.6 acres within the 0-3,500 ft zone that could be affected by potential drawdown. Based on this approach, the total projected potential indirect effects from all six factors that were assessed under this method could be up to 7,694.2 acres of wetlands potentially indirectly affected by the NorthMet Project Proposed Action. Therefore, the potential indirect cumulative effect from the NorthMet Project Proposed Action, in addition to the direct wetland impacts assessed, under this method would range between 1.3 to 12.0%.</p> <p>Based on the method approach of wetlands within analog zones, the acreage of wetlands whose hydrology would have a high likelihood of being affected by drawdown at the Mine Site is 46.4 acres. Furthermore,</p> |          |

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | based on this method, there would be 348.4 acres of wetlands within the 0-2,000 ft zone and 733.3 acres within the 0-3,500 ft zone that could be affected by potential drawdown. Based on this approach, the total projected potential indirect effects from all six factors that were assessed under this method could be up to 6,568.8 acres of wetlands potentially indirectly affected by the NorthMet Project Proposed Action. Therefore, the potential indirect cumulative effect from the NorthMet Project Proposed Action, in addition to the direct wetland impacts assessed, under this method would range between 0.1 to 10.2%.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 2999       | <p>Comment # 18. The SDEIS uses wetland assessment sites as an approach for evaluating impacts. The location of these assessment sites is discussed in the SDEIS, and Figure 4.2.3-2 shows locations of wetland assessment sites as points in a diagram. There are few wetland assessment site locations north and south of the mine site, and those shown on Figure 4.2.3-2 are far from the site boundary. The SDEIS does not sufficiently explain the assessment approach.</p> <p>Recommendation: The FEIS should describe in more detail the wetland assessment protocol and the assessment sites used, including the assessment methods used at those locations, why these locations were chosen, and how will they be used (e.g., for monitoring future wetland conditions).</p> | <p>FEIS Section 4.2.3 provides a discussion of the wetland functional assessment that was performed for the wetlands in the NorthMet Project areas; this discussion notes that the MnRAM was used to assess wetland functions on the Mine Site, along the Transportation and Utility Corridor, and the Plant Site. During the field wetland surveys for the NorthMet Project areas, data was collected related to the functions of each wetland within the proposed Project areas (i.e., Mine Site, Transportation and Utility Corridor, Plant Site) under an abbreviated MnRAM approach. A total of 87 wetlands were evaluated at the Mine Site for vegetative diversity/integrity and overall functional quality rating and is summarized in FEIS Table 4.2.3-4. Wetland data forms with the MnRAM information collected in the field was presented in Wetland Delineation and Wetland Functional Assessment Report (Barr 2006d, as cited in the FEIS). Approximately 92% of the wetland resources in the Mine Site are of high overall wetland quality and 8% are of moderate overall wetland quality. The wetlands along the Transportation and Utility Corridor have all been rated as high quality. The wetland resources along the Railroad Connection Corridor are moderately affected and have a high vegetative diversity/integrity. The majority (92%) of the wetlands within the Plant Site are currently rated as low-quality with low vegetative diversity/integrity. Eight percent are rated as moderate quality. The wetlands within the Hydrometallurgical Residue Facility are currently rated as low-quality. FEIS Section 5.2.3 discusses the percentage of high, medium, low quality wetlands to be affected by the mine features. In addition, FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects.</p> <p>The wetland assessment sites that were shown on SDEIS Figure 4.2.3-2 are wetland assessment sites, using MnRAM, that were collected for the federal lands and are now shown on FEIS Figure 4.3.3-1. | 3000       | <p>Comment # 19. Section 5.2.3 states that 26.9 acres will be impacted by fragmentation, and that these losses will be mitigated. The criteria used to determine fragmentation are broadly described in Section 5.2.3.1.2, but lack sufficient detail. Recommendation: The FEIS should describe in more detail the criteria used to determine fragmentation losses.</p> | <p>4.3.3 includes a discussion on these findings.</p> <p>For each wetland that would not be directly impacted at the Mine Site, along the Transportation and Utility Corridor, or at the Plant Site, an estimate of indirect wetland effects (wetland acres by wetland type, and type of effect) from wetland fragmentation by NorthMet Project area features (e.g., open pits, stockpiles, haul roads) was determined based on an analysis of the various factors that may contribute to fragmentation. A wetland may be fragmented as the result of direct impacts that may split a wetland resource area into multiple parts. These fragmented parts could potentially be isolated from other wetlands and would no longer have any adjacent upland watershed area, which could result in the loss of functions in the wetland fragments. While a wetland may be fragmented by direct impacts, this does not necessarily mean the remaining fragmented part of the wetland resource area would be affected. These fragmented parts therefore required further evaluation to determine if these areas would remain viable and/or would retain its functions (PolyMet 2015b; PolyMet 2015j).</p> <p>PolyMet’s evaluation (PolyMet 2015b; PolyMet 2015j) to determine if a wetland resources area would remain viable included the following criteria: change in the size of remaining wetland, wetland type, source of hydrology, direction of flow in the area, location in the current watershed, location in the future watershed, and connectivity to other wetlands. The criteria used are described below:</p> <ul style="list-style-type: none"> <li>• <b>The Size of Remaining Wetland:</b> Wetland fragments that were identified using GIS as having less than about 0.5 acres in size were determined to small to retain their functions. These wetlands were determined for the analysis to be considered fragmented.</li> <li>• <b>Wetland Type:</b> The wetland types for the wetland fragments that were greater than 0.5 acres in size were reviewed to determine if they were bogs vs. non-bogs. Ombrotrophic bogs that would become fragmented were not identified as indirectly impacted by fragmentation because they would maintain their functions since their sole source of hydrology is precipitation (see below). Minerotrophic bogs and small non-bog wetlands that were fragmented were further evaluated to determine their hydrologic sustainability.</li> <li>• <b>Source of Hydrology:</b> Wetlands were further subclassified as ombrotrophic (solely precipitation-fed) or minerotrophic (receives surface and/or groundwater inputs). The hydrology of ombrotrophic</li> </ul> | WET 08   |

|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |         | <p>bogs is solely supported by precipitation; therefore, these wetlands are not dependent on the watershed size to maintain their functions and were not identified as indirectly impacted by fragmentation. The hydrology of minerotrophic bogs and non-bog wetlands is primarily supported by shallow, groundwater systems that are connected with in different scales – wetland watershed, local (e.g., Mine Site) watershed, or regional watershed. Therefore, these minerotrophic bogs and non-bog wetlands were further evaluated because they are considered to be dependent on their watershed size to maintain their functions and their watersheds would be altered due to construction of Project infrastructure.</p> <ul style="list-style-type: none"> <li> <b>Direction of Flow in the Area:</b> The Mine Site is located in the Upper Partridge River watershed and water on the Mine Site eventually drains to the Partridge River. Under this criterion, PolyMet evaluated the locations of the minerotrophic bogs and non-bog wetlands relative to the sub-watersheds on each side of the Mine Site groundwater divide which is generally located from southwest to northeast near the northern boundary of the Mine Site. Under existing conditions, water in the northernmost area of the Mine Site generally drains (flows) north and water in the southern area of the Mine Site generally drains (flows) south. There are several sub-watersheds on each side of the divide. Based on the location of predicted wetland fragments on the Mine Site, their locations within the sub-watersheds in relation to direct impacts within that same sub-watershed and the direction of flow were noted. A wetland is more likely to retain its function if the fragment that remains is located in the upper portion of its sub-watershed than in the lower portion. Ultimately, if the area of the wetland’s watershed is modified, it could result in a change to the equivalent flow (expressed as ac-ft/yr per acre of wetland), a measure of hydrologic support.                 </li> <li> <b>Determination of the Wetland’s Current Watershed:</b> The current watersheds for ombrotrophic bog wetlands were not analyzed since they are not dependent on watershed area for their hydrology as they are precipitation-fed. The current (existing) conditions include the wetlands and watersheds which represent the existing, relatively undisturbed conditions in the Mine Site Area. The watersheds for the minerotrophic bogs and non-bog wetlands are the land areas that contribute surface water to the wetlands (upland areas and wetland                 </li> </ul> |          |

|            |         | <p>areas). For each minerotrophic bog and non-bog wetland in the analysis, GIS was used to determine the acreage of its watershed area. The location of each minerotrophic bog and non-bog wetland in its current (existing) watershed was compared with its location in the future watershed.</p> <ul style="list-style-type: none"> <li>• <b>Location of the Minerotrophic Bog and Non-bog Wetland Fragment in the Wetland's Future Watershed:</b> During operations, some watershed areas would be directly impacted by the NorthMet Project Proposed Action and would no longer be considered as tributary areas to the minerotrophic bogs and non-bog wetlands. Using the same methodology as in the previous criteria, for each minerotrophic bog and non-bog wetland in the analysis, GIS was used to determine the acreage of upland area and wetland area within its watershed area. As a result, the amount of water potentially contributed by the watershed to support the hydrology of the remaining wetland may also change (increase or decrease). If the wetland fragments had a change in equivalent yield of +/- 20 percent, the minerotrophic bogs and non-bog wetlands were further determined to have a potential for indirect impacts. Depending on the results of the other criteria, the minerotrophic bog and non-bog wetland fragments were either considered to be indirectly affected or included as a monitoring location in the wetland hydrology monitoring plan.</li> <li>• <b>Connectivity to Other Wetlands:</b> Each wetland fragment was evaluated based on its location, adjacency to upland, and adjacent infrastructure characteristics to determine if it would be expected to maintain its functions. Some of the wetland fragments as a result being divided by Mine Site infrastructure would become isolated from other wetlands; therefore, no longer located within or adjacent to an intact, relatively undisturbed upland. These wetland fragments were not expected to maintain their functions. However, other wetland fragments would still be hydrologically connected to wetlands and would be located within or adjacent to an intact, relatively undisturbed upland. These fragmented wetlands would be located in the vicinity of the haul roads on the Mine Site. Construction of the haul roads would require excavation and fill with blasted rock that would allow groundwater connectivity for wetlands on either side of the haul road.</li> </ul> <p>The purpose of this analysis for the fragmentation factor was to provide an</p> |          |

| 3001       | <p>Comment # 20. Figure 5.2.3-4 highlights wetland acres at the mine site where the proposed mine features would indirectly impact wetlands by fragmentation. Fragmentation is defined in the SDEIS as causing a change in the watershed area by greater than 20%. The SDEIS (Page 5-226) briefly describes how fragmented wetlands were identified, but does not explain the method for determining the 20% threshold. Indirect impacts from fragmentation at the mine site will also include habitat fragmentation, divisions in vegetative communities, and the general loss of functions in wetlands that are divided from adjacent wetlands and made smaller by mine features. Wetland acres that are surrounded on all sides by mine features will be fragmented because their ecological functions will be impaired.</p> <p>Recommendation: The FEIS should explain how the 20% threshold was determined. The FEIS should also recognize that the term “fragmentation” may define indirect impacts other than changes in watershed size. These other factors should be included when estimating fragmentation</p> | <p>estimate of potential indirect wetland effects from fragmentation. The wetland fragments that are not expected to maintain their functions, approximately 26.9 acres, have been identified in FEIS Section 5.2.3 and on Figure 5.2.3-1. PolyMet’s proposed mitigation for the NorthMet Project Proposed Action would be providing upfront compensatory mitigation for the 26.9 acres of wetland fragmentation. The monitoring and mitigation requirements for potential indirect effects, including fragmentation, would be determined during permitting. The wetland fragments that have not been accounted for in the upfront mitigation would be included in the wetland hydrology and vegetation monitoring plan that would be developed and implemented for the NorthMet Project Proposed Action. FEIS Section 5.2.3.3 includes a detailed discussion on the monitoring and mitigation plan for the potential indirect wetland effects. The proposed wetland impact, avoidance, minimization, mitigation, and monitoring plan presented in the FEIS would be reviewed, modified as required, and approved during permitting; therefore, this information could change during permitting.</p> <p>Figure 5.2.3-4 of the FEIS has been clarified. The potential indirect wetland effects as a result of 1) fragmented wetlands and 2) change in watershed area share a common graphic, and the title of the figure has been revised. FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The indirect effects analyses performed for the EIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. As a result of these analyses performed to determine where monitoring should occur, quantification of wetland types and acres of potential indirect wetland effects were also generated. The Co-lead Agencies agree that multiple factors can affect whether a wetland would experience indirect effects due to a project. Fragmentation and a change in watershed area (20% or greater) are two of the six factors being considered in the identification of potential indirect wetland effects that would be actively monitored due to the NorthMet Project Proposed Action, if the project were to be permitted. Other factors in the consideration of monitoring for potential indirect wetland effects as described in the FEIS: changes in hydrology at the mine site (drawdown), changes in hydrology at the Plant Site (mounding or drawdown), changes in stream or river flow, and changes in water quality.</p> <p>PolyMet proposes that if a wetland would potentially experience three or</p> | <p>WET 01<br/>                     WET 08</p> |

|            | <p>impacts. Compensatory mitigation should also be proposed for all losses of wetland functions due to wetland fragmentation (in addition to adverse impacts from changes to a wetland's watershed).</p> | <p>more of these factors, a monitoring well and a vegetation plot would be installed at that wetland for use in monitoring for indirect effects. A rating system (0-6) was developed for the wetlands based on the number of factors that may potentially affect it. Wetlands that were not determined to be potentially indirectly affected would be rated as zero, and wetlands that were determined to be potentially indirectly affected by all six factors would be rated as a six; however, no wetlands were rated as a six (see FEIS Figures 5.2.3-24 through 5.2.3-29). Monitoring is proposed within all wetlands with a factor rating of 3 to 5 and also for a subset of those wetlands with factor ratings of 1 or 2 as described in FEIS Section 5.2.3.3 (see Figures 5.3.2-31 and 5.2.3-32).</p> <p>The 20% change in watershed area is a metric used to assist in identifying wetlands to be monitored for indirect effects (see FEIS Figure 5.2.3-4). It comes from a scientific paper (Richter, et al, 2011) and its use in the EIS indirect effects wetland assessment is based on the assessment of potential water-related impacts (including to aquatics) in the EIS. With regard to daily flow alterations (i.e., in streams or rivers), the paper states that, "Alterations greater than 20% will likely result in moderate to major changes in natural structure and ecosystem functions."</p> <p>Though the 20% metric discussed in this paper is applied to streams and rivers, the Co-lead Agencies believe that a 20% change is a reasonable metric to apply when identifying wetlands for monitoring, in particular with respect to potential ecological changes that may be triggered with a change in watershed contribution (water yield) of this magnitude or greater. As stated above, the 20% change in watershed is just one of six factors used to identify which wetlands would be proposed to be actively monitored for indirect effects.</p> <p>Fragmentation is another of the six factors described above. As noted in FEIS Section 5.2.3.2.2, wetlands were determined to be fragmented, and their associated remaining acreage identified as being indirectly affected if the remaining portions of the wetlands were small remnants of a directly impacted wetland located between project features (e.g., in the area between the Category 1 Waste Rock Stockpile and the West Pit). FEIS Section 5.3.2.1.2 provides a discussion of the criteria considered in identifying a wetland as fragmented.</p> <p>As noted in the FEIS, compensatory mitigation for the 26.9 acres of wetland fragmentation (see FEIS Figure 5.2.3-1) estimated to occur due to the NorthMet Project Proposed Action is proposed to occur up front (see</p> |          |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>FEIS Tables 5.2.3-17, 5.2.3-18, 5.2.3-19). Potential indirect effects to wetlands due to factors other than fragmentation would be identified through monitoring. The monitoring and mitigation for potential indirect effects would be determined during permitting. Additional compensatory mitigation for indirect wetland effects would also be addressed in permitting.</p> <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used as well as other suggested approaches have been carefully considered. The Co-lead Agencies ultimately decided the use of the 20 percent metric described in Section 5.2.3 as one of the factors considered in identifying potential indirect effects to wetlands is a credible and reasonable approach consistent with the requirements of NEPA.</p> |          |
| 3002       | <p>Comment # 21. Section 5.2.3 describes the proposed wetland mitigation plan. EPA previously commented on the proposed mitigation ratios, and supports the mitigation ratios proposed in USA CE's May 29, 2013 Draft Memorandum on The Application of the Federal Mitigation Rule and St. Paul District Policy Guidance on Compensatory Mitigation, as described on page 5-316. The SDEIS describes the proposed ratios, but also states, "The determination of final mitigation credits ... would be determined during permitting"</p> | <p>The USA CE has determined—based on the mitigation plans, information gathered on site, and review of the monitoring reports—that the three mitigation sites selected (Aitkin, Hinckley, and Zim) and the wetland mitigation credits generated at these sites would be acceptable for use in compensating for direct wetland losses. The USA CE has not made a final decision on the mitigation ratios that would be required to compensate for direct wetland impacts; however, if fully successful, it is likely these mitigation sites would generate sufficient credits to compensate for the 940 acres of direct and fragmented wetland impacts. In the event that not all of the credits generated at these sites are utilized to compensate for direct wetland impacts, any excess credits could be used to compensate for</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | WET 04   |

|            | <p>(p 5-224).<br/>                     Recommendation: The FEIS should provide a status update on development of final wetland mitigation credits. EPA will work with USACE during CWA Section 404 permitting to determine the final wetland mitigation credits needed, including mitigation for indirect impacts.</p>                                                                                                                                                 | <p>indirect losses (USACE 2015a, as cited in the FEIS). The FEIS (see FEIS Section 5.2.3.3) includes the proposed direct compensatory mitigation credits and ratios for the NorthMet Project Proposed Action (see FEIS Tables 5.2.3-17, 5.2.3-18, and 5.2.3-19), which are based on the federal guidance policies and state replacement ratio rules. The amount of credit generated by the mitigation sites would ultimately be determined by the permitting agencies. This would be based on the extent to which the sites meet the target goals established during permitting. These include, among other things, restoration of wetland appropriate hydrology and the establishment of a target plant community or type. Financial assurances for the direct wetland impact mitigation would be required until success of the mitigation sites can be assured. While this wetland mitigation is expected to be approved and constructed in advance of any authorized wetland impacts, it is unclear whether these sites would be well enough established for financial assurances to be waived. The USACE would also consider the application of financial assurances for potential indirect wetland effects and monitoring. Both the USACE and state would require consideration of financial assurances during the permitting process.</p> <p>The NorthMet Project Proposed Action is estimated to directly impact 913.8 acres of wetlands. Depending on the location, type, and timing of compensatory mitigation, the minimum required amount of replacement wetlands for direct impacts could range from 913.8 acres up to 1,827.6 acres (i.e., 1:1 up to 2:1 compensation ratios). In addition, compensatory mitigation for the 26.9 acres of wetland fragmentation would also be provided up front. The USACE St. Paul District guidance allows for in-kind, in-place, and in-advance incentives to reduce the recommended base ratios and these would be considered at the time of permitting.</p> <p>Please refer to the response to theme WET 01.</p> |          |
| 3003       | <p>Comment # 22. The proposed mitigation plan includes post-mining on-site wetland mitigation. Restoration of wetlands on the site as part of reclamation is positive and important, but EPA and USACE have agreed that mitigation credits are not appropriate given how long it will be before this mitigation is carried out. The SDEIS contains inconsistent statements regarding whether or not on-site mitigation is proposed to generate mitigation credits.</p> | <p>The post-closure establishment of the estimated 101.8 acres of on-site wetland is not included in the wetland mitigation credits. The generation of wetland credits in these areas has the potential to be used on a contingency basis, but compensatory credit would not be considered at this time for a variety of reasons including the fact that any restoration efforts would not occur for many years. The summary of proposed wetland mitigation credits, presented in FEIS Table 5.2.3-17, does not include the on-site wetland restoration. The Executive Summary and FEIS Section 5.2.3.3.3 have been updated to also note that the on-site wetland would not be considered in the wetland mitigation credits at this time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | COE 01   |

| 3004       | <p>Recommendation: The FEIS should be clear that post-mining, on-site mitigation will not be used for mitigation credits. The mitigation plan in the CWA Section 404 permit should exclude mitigation credits for post-mining, on-site wetland mitigation.</p> <p>Comment# 23. Page 6-36, Table 6.2-8 and Pages 6-40 to 6-42, Table 6.2-11: There appear to be some inconsistencies between Table 6.2-8 and Table 6.2-11 with respect to reported future wetland and water resource numbers, including the bullet summaries for the Partridge River (Page 6-40) and Embarrass River (Page 6-42). For the Partridge River, Table 6.2-11 and bullet summary text note future condition with 3,516 acres of deepwater resources, while Table 6.2-8 indicates 1,922 acres.</p> <p>Recommendation: The FEIS should resolve or explain these inconsistencies.</p> | <p>FEIS Table 6.2.3-1 shows the proposed net change in wetland and water resources for the eight specific projects that were included in the wetlands cumulative effects analysis. Table 6.2.3-4 shows the projected future resources in total for the two watersheds when combined with the eight projects that were assessed. For example, the 1,922 acres of deepwater resources shown in Table 6.2.3-1 is the amount that would be added to the Partridge River watershed from the projects that were evaluated, which would result in a net increase of 370 acres of deepwater habitat from these projects (existing deepwater habitat from these projects is 1,552 acres). The 3,516 acres of deepwater habitat discussed in the bullets on page 6-40 and in Table 6.2.3-4 is correct. There is a total of 3,146 acres of existing deepwater resources in the Partridge River watershed, which, when combined with the net increase of 370 acres of deepwater habitat from the four projects, results in 3,516 acres.</p> <p>Section 6.2.3 of the FEIS has been updated to clarify the information presented in the tables.</p> | EDIT 01  |
| 3005       | <p>Comment# 24. Page 6-21, Section 6.2.3.3.2: the “Contributing Past, Present, and Reasonably Foreseeable Actions” section, lists twelve foreseeable future actions with potential cumulative effects on surface water hydrology and quality in the Partridge River and Embarrass River watersheds. There is some inconsistency between this list and Table 6.2-1 (Page 6-7). “Cliffs Erie, LLC- Hoyt Lakes Area (former LTVSMC),” and “Cliffs Erie, LLC- Area 5 NW Pit” are not included in the table, at least not by these names.</p> <p>Recommendation: The FEIS should resolve or explain these inconsistencies, and use consistent names for foreseeable future actions to simplify cross-referencing by the reader.</p>                                                                                                                              | The FEIS has been revised to ensure consistency with project names.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | EDIT 01  |

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 3006       | <p>Comment # 25. Page 6-26 states: “In summary, the maximum cumulative effects of the NorthMet Project Proposed Action, plus present and reasonably foreseeable future actions on the hydrology of the Partridge River, would be expected to reduce average annual flow in the Lower Partridge River at any time during operations by no more than 8.4 cubic feet per second (cfs) and 2.4 cfs (2 percent) during closure of the NorthMet Project Proposed Action, based on average annual flow of 112 cfs at USGS gauging station 04016000 downstream of Colby Lake.” In some cases, this effect is well above the mean recorded flow of the Upper Partridge River during certain times of the year. The SDEIS does not address how flow reductions will affect the Partridge River and its resources.</p> <p>Recommendations:</p> <p>The FEIS should include a total or net effect calculation for each table in the water resources section, similar to that provided for the wetlands analysis in Table 6.2-8, (Page 6-36) which shows total and incremental cumulative effects. The FEIS should add a row for the total or net effect to Table 6.2.2.</p> <p>The FEIS should discuss the magnitude and significance of these flow reductions, including additional analysis or information as necessary. Potential impacts caused by these reductions should be discussed in section 6.2.3.3.3.</p> | <p>Upper Partridge River flows are currently influenced by the timing and magnitude of Northshore Mine discharges from the Peter Mitchell Pit at SD-009 and would be influenced by the cessation of those discharges in approximately mine year 55. Available records show an average annual discharge to the Partridge River ranging from 6.8 to 15.1 cfs, with a highest reported monthly discharge of 34 cfs (Barr 2008f). Over the past several years (2004 to present), the average annual daily discharge from the Northshore Mine has been approximately 5.8 cfs, but this rate is quite variable, ranging from zero (mostly during the winter and summer droughts) to as high as approximately 20 cfs. These flow contributions would cease around 2070.</p> <p>Monthly Peter Mitchell Pit pumping records for the Northshore Mine provide a poor estimate of actual contributions to the Upper Partridge River because the Northshore Mine does not discharge directly to it. The Northshore Mine’s actual contributions are uncertain due to the variability of the Peter Mitchell pit pumping, complex storage and release mechanisms (e.g. wetlands, ponds, losses in the Partridge River, and ice storage), and also seepage from the West Pond. To address these uncertainties the Co-lead Agencies relied on available sulfate and flow data to derive a continuous flow of 2.6 cfs from the Northshore Mine to use as the basis for water quality impact predictions in the FEIS (Co-Lead Agencies and ERM 2014c). This estimated flow is reasonable for purposes of both water quality impact predictions and cumulative effects to flow. The NorthMet Project Proposed Action would also influence future Partridge River flows through 1) WWTF discharges starting in mine year 52; 2) a watershed reduction; 3) pit inflows during operations and reclamation; and 4) groundwater flowpath contributions from stockpiles and pits during operations, reclamation, and closure. The WWTF would discharge continuously at rate of 0.65 cfs. Watershed area reductions resulting from the NorthMet Project Proposed Action for SW-001, SW-002, SW-003, SW-004, and SW-004a range from 0 percent to 2.1 percent, which translates to a reduction</p> | WR 024   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>of 0.39 cfs below current and future flows at SW-004a. Pit inflows would reduce Partridge River flows by less than 2 cfs.</p> <p>The P50 average annual modeled flows assessed for the 200-year simulation in the Partridge River at SW-004a considering the totality of these influences are estimated to decrease by no more than 4 percent and increase by no more than 2 percent. Figure 6.2.2-2 shows P10, P50 and P90 flow rates to represent the range of potential effects to flows to capture the uncertainty in the hydrology described above. The decrease in flows occurs during operations. The increase in flows would occur during closure for about a 3 year period when the WWTF and Northshore Mine are both discharging to the Partridge River.</p> <p>Change to groundwater flows are considered negligible.</p> |                  |
| 3008       | <p>Comment # 26. Pages 6-22 to 6-25 and 6-27 to 6-28, Section 6.2.3.3.3: This text does not reference sources of hydrological effects data for each action.</p> <p>Recommendation: The FEIS should reference sources of hydrological effects data for each action.</p>                                                                                                                                                                                                                                                                                                                                            | Change has been made, as requested.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | EDIT 01          |
| 3009       | <p>Comment# 27. Table 6.2-15 shows the direct effect of other actions in terms of populations of each plant species affected. However, the SDEIS notes that for 4 out of 9 potentially contributing actions, "The NHIS data and MDNR take permit data were reviewed and no vegetation records were available for these actions. As a result, these actions are not considered in the cumulative effects analysis for vegetation."</p> <p>Recommendation: The FEIS should indicate whether the lack of vegetation records indicate no cumulative effects on vegetation, or simply lack of data on the subject.</p> | The FEIS uses MDNR Natural Heritage Information System (NHIS) data to analyze the statewide status of each species, and Table 6.2.4-3 summarizes the percentage of statewide populations affected. The NHIS data also clarifies whether there is a lack of data in the cumulative project footprints or an absence of species in surveys conducted on site. The FEIS has been updated to include the new state ETSC status listings from August 19, 2013, as well as any new federal status listing changes to assess effects to species in the cumulative analysis.                                                                                                                                                                                                                                                                    | VEG 08           |
| 3010       | Comment # 28. We understand that MDNR will not calculate detailed financial assurance until the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | FEIS Section 3.2.2.4 provides available details regarding financial assurance. A additional details on the cost estimates and calculations that                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | FIN 01<br>FIN 08 |

|            | Permit to Mine process, although it may have additional information before the FEIS is issued.<br>Recommendation: The FEIS should include additional information on financial assurance as available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | would be required for the project would be addressed during permitting. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine.                                                                                                                                                                                                                                                                                                                                                                                                                                              |          |
| 3011       | Comment # 29. The SDEIS does not identify the least environmentally damaging practicable alternative (LEDPA). This information will be required for CWA Section 404 permitting under CWA Section 404(b)(1).<br>Recommendation: The FEIS should describe the process that will be used to determine the LEDPA, and should provide LEDPA information to the extent it is available.                                                                                                                                                                                                                                                                                                       | The LEDPA process is described in FEIS Section 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the Project.                                                                                                                                                                                                 | COE 02   |
| 3012       | Comment # 30. The Noise section and page 5-370 of the SDEIS does not sufficiently describe potential noise impacts from blasting and vibrations on wildlife. A cited Federal Highway Administration technical document in Appendix C of the SDEIS provides information on the sound threshold and frequency range for four biologic classes (mammals, birds, reptiles, and amphibians). Recommendation: The FEIS should contain analyses of noise and vibration impacts to wildlife based on the above biologic classes' sound threshold and frequency range, based on information included and cited in the SDEIS. Any impacts and/or mitigation measures should be noted in the FEIS. | FEIS section 5.2.5 (Wildlife Impacts) has been updated to include noise and vibration impacts to wildlife, including Canada lynx and song birds at the local and regional level. Appropriate mitigation and impact areas have been clearly defined. For more details please see response to Theme Code WI05 (under wildlife). In addition, please see the Biological Assessment for further details on noise impacts to the Canada lynx, gray wolf, and northern long-eared bat, as well as the Biological Evaluation for details on noise impacts to wildlife.                                                                                                                     | N 04     |
| 3013       | Comment # 31. On pages 1-14 and 1-15, the SDEIS notes that the USFS must determine that "the public interest will be well served" before it can enter into a discretionary, voluntary real estate transfer (36 CFR 254.3(b)). This analysis is included in the SDEIS, but should be made clearer and more focused.<br>Recommendation: The FEIS should clearly and                                                                                                                                                                                                                                                                                                                       | CEQ regulations (40 CFR 1502.14) state that an EIS should present the environmental impacts of a proposal and its alternatives in comparative form to provide a clear basis for choice among the alternative options by the decision makers and the public. The regulations further state (40 CFR 1502.14(e)) that agencies shall identify their preferred alternative (or alternatives, if one or more exists) in the DEIS as well as the FEIS, unless another law prohibits the expression of such a preference; however, the regulations do not require a rationale for the choice. The ROD from the USFS would contain the rationale for the selected alternative, as well as a | LAN 01   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                      | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Theme(s)                 |

|            | <p>concisely summarize the analysis of the proposed land exchange (Alternative A) and Alternative B under 36 CFR 254.3(b), including a clear explanation of the rationale and criteria for selecting the preferred land exchange alternative, and of how protecting cultural resources is included in the public interest determination.</p> | <p>discussion of how the public interest is served under 36 CFR 254.3(b).</p> <p>The FEIS includes the factors relating to how the public interest would be served by the Land Exchange Proposed Action, Land Exchange Alternative B, and the Land Exchange No Action Alternative. The ROD would incorporate these findings in its determination. As stated in FEIS Section 1.4.3, factors that must be considered include:</p> <ul style="list-style-type: none"> <li>• the opportunity to achieve better management of federal lands and resources;</li> <li>• to meet the needs of state and local residents and their economies; and</li> <li>• to secure important objectives, including but not limited to: protection of fish and wild life habitats, cultural resources, watersheds, and wilderness and aesthetic values; enhancement of recreation opportunities and public access; consolidation of lands and/or interests in lands, such as mineral and timber interests, for more logical and efficient management and development; consolidation of split estates; expansion of communities; accommodation of existing or planned land use authorizations; promotion of multiple-use values; implementations of applicable Forest Land and Resource Management Plans; and fulfillment of public needs. See 36 CFR 254.3(b) and 254.4(c)(4).</li> </ul> <p>Table 7.3.5-1 of the FEIS presents a comparison of how the alternatives address these factors.</p> <p>To determine that a land exchange serves the public interest, the authorized officer must find that:</p> <ol style="list-style-type: none"> <li>1. The resource values and the public objectives served by the non-federal lands or interests to be acquired must equal or exceed the resource values and the public objectives served by the federal lands to be conveyed; and</li> <li>2. The intended use of the conveyed federal land will not substantially conflict with established management objectives on adjacent federal lands, including Indian Trust lands (36 CFR 254.3(b)(2)).</li> </ol> <p>The findings and supporting rationale for the public interest determination would be documented and made part of the administrative record pursuant to 36 CFR 254.3(b)(3).</p> |                          |
| 3014       | <p>Comment# 32. The SDEIS states that modeled groundwater capture system efficiency at the tailings basin is at least 90%. However, it does not explain the basis for this estimate.</p>                                                                                                                                                     | <p>The design of the Tailings Basin capture system includes 1) a slurry wall keyed into bedrock, 2) a collection trench on the tailings side, and 3) permanent pumping of the collection trench to depress the groundwater level on the tailings side. The proposed capture system uses pumping on the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>PER 05<br/>WR 018</p> |

|            | <p>Recommendation: The FEIS should provide the specific model assumptions that were used to make this determination.</p> <p>Recommendation: The FEIS should indicate that any discharge not captured by the proposed capture systems and entering waters of the U.S. (e.g., jurisdictional wetlands, the Partridge and Embarrass Rivers and their tributaries) is subject to NPDES permitting.</p> | <p>tailings side of the slurry wall to reverse hydraulic gradients across the slurry wall and in underlying bedrock inward back toward the Tailings Basin. The conceptual hydraulics of this type of system predicts that it would achieve complete or nearly complete groundwater capture in the surficial aquifer. See FEIS Figure 5.2.2-7.</p> <p>To more fully assess capture efficiencies, the FEIS relies on revising cross-section models from the SDEIS to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin. The updated modeling relies on data from a 2014 field program that investigated bedrock along the alignment of the proposed capture system on the northern, northwestern, and western sides of the Tailings Basin. New data were collected on bedrock hydraulic conductivity, Rock Quality Designation, and depth to top of bedrock. Along with the new data, the revised model also considers the presence of an upper more permeable bedrock zone directly below the slurry wall. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet.</p> <p>The cross-section model results predict that the groundwater capture efficiencies of the proposed Tailings Basin capture systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency of groundwater in the surficial aquifer is justified.</p> <p>If the NorthMet Project Proposed Action moves ahead with permitting, the MPCA would issue a combined NPDES/SDS permit. The requirements of such a combined NPDES/SDS permit would directly address the potential for contaminants in the groundwater to impact surface waters. The NPDES/SDS permit covering the facility would prohibit a point source water discharge from the containment system that adds pollutants to waters of the U.S. See response to comment 2987 for more information.</p> |          |

|            | <p>hunted by the Chippewa Tribe. The SDEIS does not adequately describe how the proposed project will impact moose population and habitat of moose. Based on information in the SDEIS, it appears that there are unconsidered impacts to moose population and habitat, such as the proposed impacts to two local wildlife corridors, moose reliance on wetlands during warm weather, and impacts on foraging.</p> <p>Recommendation: The FEIS should more completely explain how the proposed action will impact moose population and habitat.</p> | <p>status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 3018       | <p>Comment # 35. On March 13, 2014, MPCA released preliminary findings on the effects of sulfate on wild rice growth.</p> <p>Recommendation: The FEIS should provide the most current available information on MPCA's findings, and on next steps based on these findings.</p>                                                                                                                                                                                                                                                                     | <p>The MPCA is overseeing a variety of studies on wild rice. At applicable surface water locations, the FEIS evaluates impacts using an impact criteria based on the current MPCA 10 mg/L standard for sulfate concentration in waters used for the production of wild rice. This impact assessment metric is keyed to the current regulation.</p> <p>It is recognized that the MPCA is currently evaluating the current wild rice sulfate water quality standard and, as part of that process, new information on potential contributing factors on the growth of wild rice has been generated. However, that information has not yet been holistically reviewed in the context of its possible influence on the wild rice standard. Future change to the wild rice sulfate standard, if any, is speculative and outside the scope of the FEIS; applying research findings outside the basis of the current rule is not appropriate.</p>               | WR 152   |
| 3019       | <p>Comment # 36. Section 5.2.14 addresses geotechnical issues at the mine. Reasonable stability analyses were conducted for the permanent waste rock pile, but it is unclear if the company has committed to designing this unit so it meets conservative static stability Factors of Safety (FOS) (static FOS of 1.5 and seismic FOS &gt;1). The company has committed to meeting conservative FOS for both the tailings basin and the HRF.</p> <p>Recommendation: The FEIS should clarify the company's commitment with respect to design of</p> | <p>The design of the Category 1 Stockpile would need to conform with Minnesota Rule 6132.2400. FEIS Section 5.2.14.2.1 provides a summary of the design requirements for the stockpiles, including angles of repose, configured stockpile slopes, factors of safety, as well as the material tests that have occurred to date and that would be required prior to stockpile construction approval under the Permit to Mine.</p> <p>At closure, the Category 1 Stockpile would be covered with a geomembrane system that would be vegetated to meet the requirements of <i>Minnesota Rules</i> part 6132.2200, subpart 2, item B. The design of the Category 1 Stockpile cover system was derived from landfill requirements in <i>Minnesota Rules</i> part 7035.2815, subpart 6, item D. Long-term maintenance of the Category 1 Stockpile would include repair of erosional damage and removal of woody species and trees from the stockpile cover</p> | GT 04    |

|            | the permanent waste rock pile.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>system. The Factors of Safety estimated during slope stability are not anticipated to change due to long-term performance variation in the geomembrane.</p> <p>FEIS Sections 3.2.2.1.7 and 3.2.2.1.10 provide a summary of the Category 1 Stockpile, including reclamation. Further information on the design and management of the stockpiles is provided in the Geotechnical Data Package, Volume 3 (Stockpiles) (PolyMet 2014p) and the Rock and Overburden Management Plan (PolyMet 2015h). Additional geotechnical investigations to address site conditions, materials and design would be required prior to stockpile construction approval under the Permit to Mine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |
| 3020       | <p>Comment # 37. Liquefaction analyses were not conducted for the HRF, based on the assumption that those wastes could compress and that the likelihood of liquefaction is remote. However, liquefaction and liner leakage could occur at the HRF because the HRF is proposed to be located above a hydraulically-active seep, which will place inward hydraulic pressure on the HRF liners.</p> <p>Recommendation: The potential for liquefaction should be analyzed. The FEIS should clearly summarize the results of this analysis, including next steps in response to this analysis.</p> | <p>The Hydrometallurgical Residue Facility would be constructed using the downstream construction method, whereby dams would be built from dense, well-compacted materials prior to the placement of hydrometallurgical residue. This allows for a constructed dam that is discrete from the residue it holds. The potential for liquefaction in the dams is very low due to the proposed downstream construction method, upstream liners, seepage collection system, and well-compacted materials. While liquefaction may happen in the residue, it would not affect the integrity of the separate dam materials. FEIS Section 5.2.14.2.3, expands upon the SDEIS discussion of the design and construction of the Hydrometallurgical Residue Facility. The Geotechnical Data Package, Volume 2 (PolyMet 2014c) indicates the design would meet appropriate factors of safety.</p> <p>The current Hydrometallurgical Residue Facility design acknowledges the presence of an active seep in the proposed area of construction. As such, a collection drain has been designed to collect water from the active seep below the proposed constructed embankment and liner systems, and to transmit the collected seep to the exterior of the facility. This seepage collection system would include a layer of free-draining soil that would reduce the potential for phreatic build-up below the liner. Details on this design consideration are provided in Section 5.1 of the Geotechnical Data Package, Volume 2 (PolyMet 2014c).</p> <p>FEIS Section 4.2.14.3 describes the details of the existing conditions at the location of the proposed Hydrometallurgical Residue Facility, including the fact that it is proposed to be constructed at the location of the LTVSMC Emergency Basin. FEIS Section FEIS 3.2.2.3.7 broadly describes the Hydrometallurgical Residue Facility, while Section 5.2.14.2.3 provides details on the construction, operation, monitoring, and maintenance for geotechnical stability, including potential liquefaction. |                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | details on design and construction, factors of safety analysis, operation and management, and reclamation and closure are found in the Geotechnical Data Package, Volume 2 (PolyMet 2014c) the Residue Management Plan (PolyMet 2014r). Details would be finalized in permitting and would be subject to periodic reassessment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |
| Comments from the USEPA Regarding Section 404 Permit (Submission ID 47835) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |
| 3021                                                                       | The alternatives analysis in the application references the 2009 Draft Environmental Impact Statement (DEIS) and 2013 Supplemental Draft Environmental Impact Statement (SDEIS), but does not include the necessary detail to determine that the preferred alternative is the Least Environmentally Damaging Practicable Alternative (LEDPA). Since the DEIS was published in 2009, the project has evolved and many alternative have been eliminated. Chapter 6 in the application describes some of those alternatives as they relate to direct wetland impacts; it is not a comprehensive list of alternatives, and it does not consider indirect impacts to wetlands and streams. EPA recommends that the applicant develop a table describing all alternatives considered during the environmental review process (e.g., mine methods, mine configurations, tailings processing options). The table would assist EPA in determining whether or not the preferred alternative is the LEDPA. The table should also include the reasons each alternative was eliminated, including references, and the potential direct and indirect effects to wetlands and streams. | The LEDPA process is described in FEIS Section 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the Project.<br><br>Please also refer to FEIS Sections 3.2.3, FEIS Tables 3.2-16 and 3.2-17 for information on alternatives for the NorthMet Project and Section 3.3.3 for information on alternatives for the Land Exchange and Chapter 7 for additional information on alternatives. This would be considered during the Section 404 permitting process. | COE 04   |
| 3022                                                                       | The application does not provide a quantitative assessment of all indirect impacts (except for fragmentation impacts). We recognize that the heterogeneity of the project site and the complexity of the wetlands and hydrology make it difficult to quantify indirect impact, but we recommend that specific impacts to wetlands                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The indirect effects analyses performed for the EIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. As a result of these analyses performed to determine where monitoring should occur, quantification of wetland types and acres of                                                                                                                                                                                                                                                                                           | COE 02   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Theme(s) |

|            | <p>within the mine site be identified to the extent possible. The application should better estimate the changes in functions and values at wetlands, especially those surrounded by mine features.</p>                                                                                                                                                                                                                                                                                                                                                       | <p>potential indirect wetland effects were also generated. FEIS Section 5.2.3 provides these quantitative values of potential indirect wetland effects. Potential indirect wetland effects from the NorthMet Project Proposed Action were assessed as a result from one of the following six factors: 1) wetland fragmentation; 2) change in wetland hydrology from changes in watershed area; 3) changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering; 4) changes in wetland hydrology from groundwater drawdown resulting from operation of the Plant Site, including groundwater mounding and seepage containment; 5) changes in stream flow near the Mine Site and Plant Site and associated effects on wetlands abutting the streams; and 6) change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations. The assessments provided wetland type and acreage for all six factors; however, only wetland acreages were provided for factor 6 (change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations).</p> <p>Dust, ore spillage, and stockpile leakage is not a regulated discharge to wetlands under the Section 404 of the CWA; however, USAACE would consider these types of potential effects in their determination of the LEDPA under the Section 404(b)(1) permit alternative analysis. The potential effects of dust, ore spillage, and stockpile leakage would be evaluated by MPCA under the Section 401 Water Quality Certification and NPDES permitting.</p> |          |
| 3023       | <p>Specifically, EPA is concerned that there will be indirect impacts to remaining wetland areas in Wetlands Nos. 33A, 45, 48, 57, 68, 101, 88, 96, and 107. Indirect impacts in these wetland areas will include habitat fragmentation, divisions in vegetative communities, and the general loss of functions in wetlands that are separated from adjacent wetlands and made smaller by mine features. Specific compensatory mitigation should be proposed for all losses of wetland functions (including identification of ratios and site locations).</p> | <p>FEIS Section 5.2.3.1.2 has been updated to provide more information on the methodology and criteria for determining potential indirect fragmented wetland effects. The wetland fragments that are not expected to maintain their functions, approximately 26.9 acres, have been identified in FEIS Section 5.2.3 and on Figure 5.2.3-1. PolyMet's proposed mitigation for the NorthMet Project Proposed Action would be providing upfront compensatory mitigation for the 26.9 acres of wetland fragmentation (see FEIS Tables 5.2.3-17, 5.2.3-18, 5.2.3-19). The monitoring and mitigation requirements for indirect effects, including fragmentation, would be determined during permitting. The wetland fragments that have not been accounted for in the upfront mitigation would be included in the wetland hydrology and vegetation monitoring plan that would be developed and implemented for the NorthMet Project Proposed Action. FEIS Section 5.2.3.3 includes a detailed discussion on the monitoring and mitigation plan for the indirect wetland effects. The proposed wetland impact, avoidance,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | COE 01   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Theme(s) |

| 3024       | <p>Large Figure 9 and 10 and Large Table 2 in the application highlight wetland areas at the mine and plant sites where the proposed mine features would indirectly impact wetlands by fragmentation. Compensatory mitigation is proposed for those areas. Page 3 of the Wetland Analysis Workplan (Attachment B) gives a brief description of how fragmented wetlands were identified, but the application should also describe the impact thresholds and how the fragmentation impact criteria were developed.</p>                                                                                                                                                                                                                                                                         | <p>minimization, mitigation and monitoring plan presented in the FEIS would be reviewed, modified as required, and approved during permitting; therefore, this information could change during permitting.</p> <p>FEIS Section 5.2.3.1.2 has been updated to provide more information on the methodology and criteria for determining potential indirect fragmented wetland effects. The wetland fragments that are not expected to maintain their functions, approximately 26.9 acres, have been identified in FEIS Section 5.2.3 and on Figure 5.2.3-1. PolyMet's proposed mitigation for the NorthMet Project Proposed Action would be providing upfront compensatory mitigation for the 26.9 acres of wetland fragmentation (see FEIS Tables 5.2.3-17, 5.2.3-18, 5.2.3-19). The monitoring and mitigation requirements for indirect effects, including fragmentation, would be determined during permitting. The wetland fragments that have not been accounted for in the upfront mitigation would be included in the wetland hydrology and vegetation monitoring plan that would be developed and implemented for the NorthMet Project Proposed Action. FEIS Section 5.2.3.3 includes a detailed discussion on the monitoring and mitigation plan for the indirect wetland effects. The proposed wetland impact, avoidance, minimization, mitigation and monitoring plan presented in the FEIS would be reviewed, modified as required, and approved during permitting; therefore, this information could change during permitting.</p> | COE 02   |
| 3025       | <p>Page 58 of the application states that the purpose of the indirect impacts analysis is to inform the monitoring plan for indirect wetland impacts. The application should include a description of how the impacts analysis will be used to ensure that indirect impacts are avoided, minimized, and mitigated. Section 11-5 in the application implies that the indirect impact monitoring plan will focus on wetlands that are under threat by multiple indirect impact factors (Table 11-1); this is not a valid approach because even wetlands that are under risk of one factor (such as only drawdown or only decreased water quality) would result in a loss of wetland function. We recommend more comprehensive monitoring for indirect impacts at the plant and mine sites.</p> | <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The indirect effects analyses performed for the EIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. As a result of these analyses performed to determine where monitoring should occur, quantification of wetland types and acres of potential indirect wetland effects were also generated. FEIS Section 5.2.3 provides these quantitative values of potential indirect wetland effects. Potential indirect wetland effects from the NorthMet Project Proposed Action were assessed as a result from one of the following six factors: 1) wetland fragmentation; 2) change in wetland hydrology from changes in watershed area; 3) changes in wetland hydrology from groundwater drawdown resulting from open pit mine dewatering; 4) changes in wetland hydrology from groundwater drawdown resulting from operation of the Plant Site, including groundwater mounding and seepage containment; 5) changes in stream flow near the Mine Site and Plant Site and associated</p>                                                                                                                                                                                                                                                        | COE 02   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Theme(s) |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | effects on wetlands abutting the streams; and 6) change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations. The assessments provided wetland type and acreage for all six factors; however, only wetland acreages were provided for factor 6 (change in wetland water quality related to atmospheric deposition of dust and rail car spillage associated with Mine Site and Plant Site operations).                                                                                                                                                                                                                                                                                                   |          |
| 3026       | The application does not describe monitoring for stream impacts surrounding the project areas. We recommend that the U.S. Army Corps of Engineers (Corps) require monitoring for indirect impacts to headwater streams surrounding the site as well as impacts to wetlands.                                                                                                                                                                                                                                                                          | FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. Proposed wetland hydrology monitoring locations for determining whether potential indirect effects are occurring are shown on Figures 5.3.2-31 and 5.2.3-32 of the FEIS. Wetland hydrology and vegetation would be monitored, and additional monitoring locations may be considered during permitting. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process.                                                                                                                                        | COE 02   |
| 3027       | There is a potential for indirect impacts to wetlands, Spring Mine Creek, and Spring Mine Lake on the east side of the tailings basin, but no monitoring sites are proposed for that area. Wetland and stream monitoring sites should be required for the east side of the tailings basin.                                                                                                                                                                                                                                                           | FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. Proposed wetland hydrology monitoring locations for determining whether potential indirect effects are occurring are shown on Figures 5.3.2-31 and 5.2.3-32 of the FEIS which includes a wetland hydrology monitoring well located east of the Plant Site along Spring Mine Creek and west of Spring Mine Lake. Wetland hydrology and vegetation would be monitored, and additional monitoring locations may be considered during permitting. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process. | COE 02   |
| 3028       | Section 17.1 of the application describes that wetland monitoring wells 1, 4a, 6, 10, 12, 15, and 21 are "being removed because they are either within the direct project impacts or areas where no potential indirect impacts are anticipated". Figure 16 shows Wells 4a, 6, 10, 12, and 15 just outside the project boundary and between mine features and Yelps Creek and the Partridge River. These wells are in wetland areas that would likely be impacted by adjacent mine features because of their close proximity to the mine features and | FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. Proposed wetland hydrology monitoring locations for determining whether potential indirect effects are occurring are shown on Figures 5.3.2-31 and 5.2.3-32 of the FEIS. Wetland hydrology and vegetation would be monitored, and additional monitoring locations may be considered during permitting. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process.                                                                                                                                        | COE 06   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Response                                                                                                                                                                                                                                                                                                                                                                                                                                | Theme(s) |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            | wetland areas. For a more comprehensive impacts analysis, we recommend that the applicant continues to monitoring at the existing wells where they are outside the direct mine impact locations. Because there are baseline hydrologic data at these locations, changes in wetland hydrology, if they occur, should be evident.                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                         |          |
| 3029       | Some wetland types, such as coniferous and open bogs, are sensitive to subtle changes in hydrology. A 50% change in hydroperiod (the proposed impact criteria) may not be an adequate measure of adverse impacts to the wetland vegetation communities. The applicant should include a more complete description of impact criteria and rationale for the proposed monitoring and reporting schedule.                                                                                                                                          | The wetland mitigation and monitoring section of the FEIS, Section 5.2.3.3, has been revised to include additional details on the proposed monitoring and wetland adaptive monitoring plan. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process. Please refer to the response to theme COE 06. | COE 02   |
| 3030       | Section 17.4 of the application states that wetland baseline conditions for wetland vegetation will be established during the first growing season after permit issuance. EPA recommends that the Corps require baseline vegetation monitoring prior to permitted impacts to ensure that a true pre-impact baseline is established.                                                                                                                                                                                                            | FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan, which includes vegetation monitoring, for the potential indirect wetland effects.                                                                                                                                                                                                                                              | COE 06   |
| 3031       | The vegetation monitoring is proposed for every 5 years. The basis for the proposed monitoring frequency is not clear from the application. Effectively managing certain threats to the wetlands, such as invasive species or vegetation changes due to drawdown, requires early detection, and monitoring every 5 years might not be sufficient to adequately manage the threat. EPA recommends increasing monitoring for vegetation changes to every 2 years to better be able to identify and manage any adverse impacts to wetlands early. | The wetland mitigation and monitoring section of the FEIS, Section 5.2.3.3, has been revised to include additional details on the proposed monitoring and wetland adaptive monitoring plan. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process.                                               | COE 06   |
| 3032       | The adaptive management plan described in Section 17.8 uses a phased approach to assessing indirect impacts and providing compensatory                                                                                                                                                                                                                                                                                                                                                                                                         | The wetland mitigation and monitoring section of the FEIS, Section 5.2.3.3, has been revised to include additional details on the proposed monitoring and wetland adaptive plan. The wetland mitigation and monitoring would                                                                                                                                                                                                            | COE 02   |

|            | <p>mitigation for adverse impacts to aquatic resources. Phase I is described a broad based monitoring; while Phase II would be a more detailed assessment. In order to determine if the adaptive management plan is sufficient, EPA needs more information on the timing and methodology of Phases I and II of the monitoring plan. EPA is concerned that Phase II monitoring would not be designed unless deemed necessary, and that the threshold for determining a need for Phase II is not described.</p> <p>Clear impact criteria must be established and potential mitigation options must be developed prior to permit issuance. EPA recommends that Phase II be planned prior to permit issuance to ensure that wetland and stream impacts are not missed.</p> | <p>be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |          |
| 3033       | <p>The application lacks a description of cumulative effects to the aquatic resources within the watersheds except as they apply to wildlife corridors (Section 12.1.2.3). Cumulative Wetland Impacts (Section 5.3) is included in the March 1, 2013 Wetland Data Package V.7, but it is not referenced in the application. It is not clear if this analysis includes recently proposed projects, as it seems to be missing projects in the iron range (e.g., MINNTAC and UTAC). The cumulative effect assessment in the application should include the most recent and comprehensive information.</p>                                                                                                                                                                 | <p>FEIS Section 6.2.3.1 provides a description of the approach that was used for the wetland cumulative analysis. The direct, indirect, and cumulative assessments that were performed for the NorthMet Project Proposed Action were agreed upon by the Wetland Impact Assessment Planning Group and per the Wetland Analysis Work Plan (PolyMet 2011m). The following projects were not considered in the wetland resources cumulative analysis as they are outside the Partridge and Embarrass River watersheds: U.S. Steel Minntac mine expansion, U.S. Steel Keetac expansion, United Taconite Tailings Basin, and Cliffs Erie's mine pit expansion. Those projects that were considered reasonably foreseeable and within the Partridge and Embarrass River watersheds were considered in the wetland cumulative analysis. Please refer to the response to themes COE 07, CU 02, and WET 18. Please refer to FEIS Section 6.2.6 for a discussion of aquatic resources.</p> | COE 07   |
| 3034       | <p>Indirect impacts are not included in the cumulative impacts assessment for wetlands in the Wetlands Data Package V. 7. All adverse impacts to aquatic resources should be considered in this assessment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>It is difficult to predict potential indirect wetland effects within the CEAA, as well as to know what the potential indirect wetland effects would be for the projects assessed other than the NorthMet Project Proposed Action. However, based on the amount of potential indirect wetland effects that could occur from the NorthMet Proposed Action, there could be 0.1 to 12.0% cumulatively lost, in addition to the direct wetland impacts assessed, within the Partridge and Embarrass River watersheds as a result of the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                       | COE 07   |

Furthermore, based on this method, there would be 348.4 acres of wetlands within the 0-2,000 ft zone and 733.3 acres within the 0-3,500 ft zone that could be affected by potential drawdown. Based on this approach, the total projected potential indirect effects from all six factors that were assessed under this method could be up to 6,568.8 acres of wetlands potentially indirectly affected by the NorthMet Project Proposed Action. Therefore, the potential indirect cumulative effect from the NorthMet Project Proposed Action, in addition to the direct wetland impacts assessed, under this method would range between 0.1 to 10.2%.</p> |          |
| 3036       | <p>The mitigation ratios proposed in the application conform to the conditions included in the Corps' May 29, 2013 Memorandum: Application of the Federal Mitigation Rule and St. Paul District Policy Guidance on Compensatory Mitigation-Compensation Ratios for Loss of Wetlands/Aquatic Resources. EPA agrees that the mitigation ratios proposed in the Corps' Memorandum were reasonable.</p>      | <p>The USACE has not made a final decision on the mitigation ratios that would be required to compensate for direct wetland impacts. The FEIS (see Section 5.2.3.3) includes the proposed direct compensatory mitigation credits and ratios for the NorthMet Project Proposed Action (see FEIS Tables 5.2.3-17, 5.2.3-18, 5.2.3-19), which are based on the federal guidance policies and state replacement ratio rules. The amount of credit generated by the mitigation sites would ultimately be determined by the permitting agencies. This would be based on the extent to which the sites meet the target goals established during permitting. These include, among other things, restoration of wetland appropriate hydrology and the establishment of a target plant community or type.</p>                                                                                                                                                                                                                                                  | COE 12   |
| 3037       | <p>One concern that remains is that no compensatory mitigation plan exists for indirect impacts to wetlands and streams. Table 11-1 of the application indicates that more than 7,300 acres of wetland would be potentially impacted by the proposed project. Because in-watershed mitigation is so difficult to find, mitigation options for indirect impacts must be discussed in the application.</p> | <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The USACE would also consider the application of financial assurances for potential indirect wetland effects and monitoring. Both the USACE and state would require consideration of financial assurances during the permitting process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | COE 02   |
| 3038       | <p>EPA remains concerned that a majority of the compensatory mitigation for impacted wetlands will occur outside the St. Louis River and Lake</p>                                                                                                                                                                                                                                                        | <p>This comment provides general information regarding mitigation that should be considered for wetland mitigation in the future. No changes were made to the FEIS as a result of this comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | COE 13   |

|                                                         | <p>Superior Watersheds. This constitutes a permanent loss of aquatic resources within these watersheds. EPA understands that it is difficult to find in-watershed wetland mitigation opportunities, but the soon to be implemented Northeast Minnesota Wetland Mitigation Strategy may support the Corps and permit applicants to better implement a watershed approach to mitigation. Once implemented, EPA recommends that the strategy be used to find additional wetland mitigation sites within the St. Louis and Lake Superior Watersheds to compensate for indirect wetland impacts at the Polymet Site.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |
| Comments from the Bois Forte Band (Submission ID 42979) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                |
| 2974                                                    | <p>The Area of Potential Effect (APE) for cultural resources divided the project into two separate sections surrounding the proposed mine site and the proposed plant site should be revised. . . . An APE that encompasses the Mine and Plant sites and surrounding area affected by operations would better describe the undertaking for cultural resource investigations.</p>                                                                                                                                                                                                                                    | <p>FEIS Section 4.2.9.2.3 provides a detailed discussion and analysis of the area in which cultural resources may be affected by the NorthMet Project Proposed Action. The APE takes into account both direct and indirect effects using a geographically expansive area that accounts for direct effects, as well as visual, audible, atmospheric, hydrological, and water quality effects. The APE is based on extensive modeling and other analysis completed for the NorthMet Mining Project and Land Exchange and includes an area much broader than the Plant Site and Mine Site. Since the SDEIS, the APE has been modified to encompass the proposed Mine Site and Plant Site, the Dunka Road corridor, several federal parcels included in the Land Exchange Proposed Action, and the Colby Lake Pumphouse and pipeline.</p> | CR 02          |
| 2975                                                    | <p>Mesabe Widju is correctly identified as a sacred landform, but needs to be considered in its entirety (see attached map as an example). The segment encountered within the project area is small, but integral to the property. Adverse effects to any portion impact the entire feature.</p>                                                                                                                                                                                                                                                                                                                    | <p>The federal Co-lead Agencies have determined the Partridge River section of the Mesabe Widju to be eligible for inclusion in the NRHP under Criterion A for its association with important Ojibwe spiritual and cultural practices. Although the federal Co-lead Agencies are assessing the effects of the NorthMet Project Proposed Action on only the portion of the Mesabe Widju within the APE, it is recognized that the property and its significance extends beyond the APE. The federal Co-lead Agencies have updated the FEIS to include a graphic of the entire Mesabe Widju, as provided by the consulting Bands.</p>                                                                                                                                                                                                   | CR 02<br>CR 05 |

|            | features such as foot trails are less easily concealed by vegetation and more easily discerned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | discussed in FEIS Section 4.2.9.2.3. Additional research and fieldwork may be part of any resolution of adverse effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| 2977       | The Bois Forte THPO is skeptical of the co-leads claim that there will be no effect to the Spring Lake Mine Sugarbush from the proposed NorthMet Project. Indirect effects through dust deposition and unauthorized collection are anticipated since the Sugarbush is situated immediately adjacent to the proposed plant site. While the lead agencies dismiss particulate accumulation as a problem, based on visual effects analysis conducted for the project and a site visit in 2010, their lack of concern seems speculative. The proximity of the plant site to the Sugarbush and the cumulative effects of dust on leaves, trees and understory flora have not been examined in detail and their long term effects may well be detrimental to vegetation, other than maples, that comprise the Sugarbush. Furthermore, the potential for artifact collection is quite real. When the land containing the site was owned by Cleveland Cliffs, persons employed by the mine removed artifacts associated with Band member use of the Sugarbush. This assertion is based on a donation made to the Bois Forte Heritage Museum by an individual who conducted logging operations on LTV property in the 1970's. When asked where he had found the items, a ladle, bowl, birch bark sap baskets and cedar spiles, he described the location of the Spring Lake Mine Sugarbush and the wooden structure remnants noted by Michael Loftus (1977). Remnants of the structure still exist (see SDEIS 4.2.9.2.4). Loftus also removed artifacts when he visited the Sugarbush in the 1960's. | <p>The NorthMet project would have fugitive dust emissions. To evaluate the impact of those fugitive dust emissions, air quality modeling was conducted to assess impacts from those emissions. The modeled results determined impacts to be below applicable air quality standards. The FEIS used the evaluation criteria available to determine impacts. Secondary ambient air quality standards are used to provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.</p> <p>Significant impact on water resources or historic properties from dust is not expected because areas with the potential to generate dust would be controlled by a Fugitive Dust Control Plan and any dust leaving the site would most likely come from sources that would be characterized as having low sulfide/low metal content.</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project Proposed Action area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6 and 4.3.9 of PolyMet 2015a, as cited in the FEIS).</p> <p>As discussed in FEIS Section 5.2.9.2.1, the federal Co-lead Agencies have determined that the NorthMet Project Proposed Action would adversely affect the Spring Mine Lake Sugarbush. As part of an MOA, the federal Co-lead Agencies would ensure the avoidance, minimization, and mitigation of impacts to cultural resources that may be encountered, such as unauthorized collection, during construction or operation of the NorthMet Project Proposed Action. The federal Co-lead Agencies, in consultation with the Bands, SHPO, and PolyMet, are currently working to resolve adverse effects on this property.</p> | AIR 04<br>AIR 05 |
| 2978       | the three properties [Mesabe Widjiu, Beaver Bay to Lake Vermillion Trail, and Spring Lake Mine Sugarbush] would benefit from additional                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The federal Co-lead Agencies have officially documented the Spring Lake Mine Sugarbush with the SHPO. The federal Co-lead Agencies believe that there has been sufficient background research and fieldwork to justify                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | CR 02<br>CR 05   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Theme(s) |

|            | <p>investigation; the sugarbush has not been formally recorded, the trail has been adequately documented within the SNF proposed land exchange, but requires additional survey in the upland sections of the project area and Mesabe Widjiu should be considered in its entirety. Finally, all three must be formally nominated to the National Register of Historic Places.</p>                                                                                                               | <p>consideration of the BBLV Trail Segment as an historic property. Additional research and fieldwork may be part of any resolution of adverse effect. The federal Co-lead Agencies have determined the Partridge River section of the Mesabe Widjiu and the Partridge River section of the BBLV Trail Segment to be eligible for inclusion in the NRHP under Criterion A; however, the federal Co-lead Agencies are assessing the effects of the NorthMet Project Proposed Action on only the portion of those properties within the APE. The federal Co-lead Agencies recognize that the two properties discussed above extend beyond the APE. All three historic properties have been determined eligible for the NRHP. The Co-lead Agencies, in consultation with the Bands, SHPO, and PolyMet, are currently working to resolve adverse effects on these properties. National Register Nomination of these properties may be part of an MOA; however, the federal Co-lead agencies are currently in the process of considering what mitigations may be appropriate.</p> |          |
| 2979       | <p>Acknowledgement by the SDEIS authors that adjacent habitat is available signifies a lack of analytical rigor in effects assessment of wholesale population displacement in response to mining activity. . . . The SDEIS fails to assess cumulative effects to wildlife population changes, not only in the project area, but the entire region. The co-lead agencies should document how habitat destruction and concomitant wildlife migration will affect local and regional ecology.</p> | <p>The FEIS wildlife sections include an analysis of wildlife displacement effects due to the NorthMet Project Proposed Action. FEIS Section 5.2.5.2.3 discusses the potential effects to species at the NorthMet Project area based on habitat preferences, and uses available scientific literature to analyze displacement effects on local and regional ecology due to noise or increased human activities. FEIS Section 6.2.5.4.2 discusses displacement of wildlife by effects to wildlife corridors across the Mesabi Iron Range.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | WI 05    |
| 2980       | <p>Cooperating agencies' concerns with cumulative effects remain valid and germane, but have yet to be addressed by the Lead Agencies.</p>                                                                                                                                                                                                                                                                                                                                                     | <p>The Co-lead Agencies considered the information included in the Tribal Cooperating Agencies' cumulative effects assessment and found no compelling information or analysis to change the original approach or conclusions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | CU 12    |
| 3097       | <p>A 216,300 acres area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail better describes cultural resources to be effected by the NorthMet project.</p>                                                                                                                                                                                                                                                                                     | <p>The historic district proposed by the Grand Portage Band in a June 27, 2013 letter was addressed. The federal Co-lead Agencies have considered an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the CEAA. Use of the 1854 Ceded Territory as the CEAA for cultural resources would actually diminish the significance of any cumulative effects. By evaluating the effects of the NorthMet Project Proposed Action along with other past, present, and reasonably foreseeable future projects in the context of a much larger area with a much larger</p>                                                                                                                                                                                                                                                                                                                                                                                       | CR 04    |

|            |         | <p>number of resources similar to those affected by the NorthMet Project Proposed Action, the effect of the NorthMet Project Proposed Action on those resources is diminished. The cumulative effects analysis focuses on the specific resources, or types of resources, affected by the NorthMet Project Proposed Action within an area that is geographically meaningful considering the project under review.</p> <p>Cumulative effects are discussed and addressed differently based on the affected resource. Discussions related to socioeconomics, for instance, use an expanded analysis area compared to other resources. Such expanded analysis areas are used as appropriate. The Cultural Resources sections in FEIS Chapters 4, 5, and 6 address the Co-lead Agencies' determination of the NorthMet Project Proposed Action's direct, indirect, and cumulative areas of potential effect.</p> |          |

| <i>Comments from the Grand Portage Band (Submission ID 42994)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |          |
| 2362                                                              | Regardless of the time taken to prepare it, the Band is reissuing many of the same comments on the SDEIS that it has issued on the last DEIS calling for basic evaluation of Project impacts and application of well-established CEQ standards for EIS preparation, and incorporates all those comments by reference here. See Band's Cmts. on DEIS at Ex. A (Band's Cmts. on June 2008 PDEIS) and Ex. B (Band's Cmts. on Jan. 2009 PDEIS). | <p>Comments provided by the Cooperating Agencies were considered. FEIS Chapter 8 outlines the engagement process with the Cooperating Agencies through the development of the EIS.</p> <p>During the development of the SDEIS, major differences of opinion (MDOs) regarding the analysis presented in the document were identified. These MDOs are between the Co-lead Agencies and the Bands, GLIFWC, and the 1854 Treaty Authority, and represent comments from the Tribal Cooperating Agencies that the Co-lead Agencies determined were adequately addressed in the existing analysis. The MDOs are discussed in SDEIS (and FEIS) Chapter 8.</p> <p>Comments submitted by the Bands on the SDEIS included comments reflecting the MDOs. In addressing and developing detailed responses to those comments, the Co-lead Agencies also addressed many aspects of the MDOs. In developing the FEIS, the Co-lead Agencies engaged in ongoing interaction regarding MDOs with the Bands/Tribal Cooperating Agencies. The Co-lead Agencies shared with the Bands how they intended to respond to the Bands' comments, how the MDOs were addressed in the FEIS, and which MDOs had achieved some resolution. FEIS Table 8-1 in Chapter 8 notes where and how the MDOs are addressed in the FEIS.</p> <p>Although it is beneficial to resolve differences of opinion on a project, major differences of opinion often remain unresolved throughout the analysis process. In making decisions on proposed activities, responsible officials utilize information in the FEIS addressing differences of opinion to inform their decisions and to support rationale for those decisions.</p> | NEPA 12  |
| 2364                                                              | The co-lead agencies have refused to extend the 90-day comment period on the SDEIS, despite repeated requests.                                                                                                                                                                                                                                                                                                                              | The SDEIS was circulated for public comment for 90 days, which is twice the amount of time required by the federal regulations, and three times the amount of time required by state regulations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | NEPA 07  |
| 2365                                                              | The SDEIS does not take the required "hard look" at all the environmental consequences of the Project, including polluting surface and groundwater resources and drying up or inundating thousands of acres of wetlands in the 1854 Ceded Territory.                                                                                                                                                                                        | The Co-lead Agencies believe that the EIS contains adequate information and analyses consistent with NEPA and MEPA guidance and best practices. Please refer to the response to themes NEPA 14 and NEPA 09 for more detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | NEPA 14  |
| 2366                                                              | The lead agencies must significantly supplement the SDEIS [with study of the adverse effects and determination of possible mitigation measures]                                                                                                                                                                                                                                                                                             | The Co-lead Agencies believe that the EIS contains the best available data and analyses, consistent with NEPA and MEPA guidance and best practices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | NEPA 09  |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Theme(s) |

|            | and provide a full opportunity for agency and public review before issuing a final EIS.                                                                                                                                                                                                                                                                                                                                                                                                                     | The Co-lead Agencies reviewed all applicable documentation submitted by the proposer to fully understand the NorthMet Project Proposed Action. These included detailed technical design documents, including the Project Description, Mine Plan, and several resource-specific management plans, all of which are summarized in FEIS Chapter 3. The level of detail describing the NorthMet Project Proposed Action provided in the EIS is consistent with the requirements of NEPA/MEPA for similar projects at this stage of environmental review. The Co-lead Agencies believe that the project description was sufficient to support a comprehensive scientific analysis of potential impacts to allow decision makers to make informed decisions on the NorthMet Project Proposed Action. The proposer would be required to provide more detailed information as the project is refined during the permit process, much of which would require additional public review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |          |
| 2372       | In the SDEIS's evaluation of the underground mining alternative, the North Met Deposit is characterized as a "low- to medium-grade mineral resource," a far cry from the "one of the largest untapped deposits of copper and nickel, and other precious metals" or "world class resource" that is repeated throughout the SDEIS and in media coverage. The distinction is critical, as mining must provide sufficient profit to cover costs for adequate environmental protections and financial assurance. | <p>Information obtained through preliminary exploration in the region show that the area potentially contains one of the largest untapped deposits of copper, nickel, and other precious metals in the world. The NorthMet Deposit is characterized as a low- to medium-grade mineral resource. These two characterizations are not in conflict as the commenter seems to suggest. One is a regional characterization while the other applies to the specific NorthMet Deposit being proposed by PolyMet to be mined.</p> <p>See the response to theme ALT 01 for more details on the Underground Mining Alternative. FEIS Section 3.2.3.4.1 states that tonnage/volume and grade of rock would not generate enough revenue to pay for costs associated with underground mining. The FEIS Executive Summary and FEIS Section 3.2.2.1.2 states that the NorthMet Deposit is a low- to medium-grade deposit, matching the language in Appendix B.</p> <p>FEIS Section 3.2.2.4 includes available details regarding financial assurance. Additional details on the cost estimates and calculations that would be required for the project would be addressed during permitting. Specific infrastructure timelines and life expectancies of equipment would be accounted for during permitting as well. FEIS Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as for monitoring and mitigation costs. FEIS Section 3.2.2.4.1 discusses the activities that would be considered in cost estimates, and states that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate.</p> | PD 25    |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Theme(s)                                       |

| 2373       | The financial assurance for long-term treatment presented in the SDEIS, ranging from \$3.5 to 6 million appears to be an estimate for monitoring activities only, without any long-term wastewater treatment costs.                                                                                                                                                                                                                                              | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine.                                                                                                                                                                                                                            | FIN 05                                         |
| 2374       | Perpetual operation and maintenance of mechanical wastewater treatment is an additional cost that must be represented in the estimate of financial assurance.                                                                                                                                                                                                                                                                                                    | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. The WWTP and WWTF would undergo continued inspection and maintenance during operations, long-term treatment, and in closure. WWTP and WWTF replacement costs would be included in long-term financial assurance estimates. | FIN 05                                         |
| 2375       | The cursory estimate of financial assurance in the SDEIS provides little detail about how the dollar amount was derived. Instead, discussions have been postponed for the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates. | FEIS Section 3.2.2.4 provides available details regarding financial assurance as required under NEPA/MEPA. <i>Minnesota Rules</i> 6132.1200, Subpart 4 state that the Commissioner shall evaluate all financial assurance cost estimates and adjustments to cost estimates using individuals with documented experience in material handling and construction and mining costs. Additional details on the financial assurance that would be required for the project would be addressed during permitting. The Permit to Mine, which would include financial assurance information, includes an opportunity for public input. Neither NEPA nor MEPA rules require that all financial assurance mechanisms be in place before the EIS is finalized.                                                                  | FIN 13                                         |
| 2377       | Although the SDEIS was revised to reflect the Project proponents' preferred action, still, the only alternative analyzed in any detail concerns the acreage of the proposed land exchange. This failure is a serious violation of NEPA and must be remedied before the SDEIS can be finalized.                                                                                                                                                                   | The DEIS and SDEIS considered many different alternatives, which are discussed in FEIS Section 3.2.3 for the NorthMet Project and Section 3.3.3 for the Land Exchange.<br><br>Neither Minnesota Rules nor CEQ regulations required the Co-lead Agencies to identify a preferred alternative in the SDEIS (40 CFR 1502.14(e)). FEIS Section 7.4 includes details regarding the identification of an Agency Preferred Alternative.<br><br>The USFS has identified a preferred alternative for the Land Exchange in                                                                                                                                                                                                                                                                                                    | ALT 01<br>ALT 02<br>ALT 03<br>ALT 04<br>ALT 20 |

| 2389       | <p>PolyMet proposes to build a reverse osmosis (“RO”) wastewater treatment plant near the tailings basin to treat process water and tailings basin seepage. RO is very effective if sized correctly. While RO could successfully treat wastewater to comply with Minnesota WQS, it can only treat polluted water that has been collected. Therefore, the Project is not relying on RO during operations to comply with WQS; instead, it would rely on seepage capture efficiency. But as stated previously, seepage capture rates provided in the SDEIS are not realistic.</p> <p>After operations, the SDEIS contemplates that the RO plant would continue to treat tailings basin seepage and begin treating tailings pond water. The treated water would be used for augmentation of streams near the plant site. Colby Lake water is also proposed for stream augmentation. However, because Colby Lake water exceeds WQS for many pollutants including mercury, it would also need to be RO-treated before being used for augmentation.</p> | <p>Although relatively few containment systems have been built with this degree of pumping, the conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture. The FEIS relies on revised cross-section models from the SDEIS to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the revised NorthMet Project Proposed Action Water Management Plan - Plant Site (PolyMet 2015i). These new models consider the presence of an upper more-permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>Colby Lake water would no longer be directly discharged to the tributaries for augmentation. All augmentation water would be treated with the reverse osmosis water treatment system or equivalent technology that will meet water treatment targets</p> | WR 124<br>WR 125<br>WR 189 |
| 2391       | <p>In order to ensure compliance with Minnesota WQS, and based on the Project's own modeling, adequate financial assurance must be set aside to maintain and operate perpetual RO treatment at both the mine and plant sites.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 state that cost estimates shall be annually adjusted using current dollar value at the time of the estimate.</p> <p>FEIS Sections 3.2.2.1.10, 3.2.2.3.12, and 5.2.2.3.1 provide available information regarding long-term water treatment and maintenance. Temporal aspects of financial assurance are addressed in <i>Minnesota Rules</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | FIN 05<br>FIN 06           |

|            |                                                                                                                                                                                                                                                                                                                                                                                   | 6132.3200 Subpart 2, item E, which state that financial assurance is required for all areas that require continued maintenance following closure, and that no release from the Permit to Mine would be granted for portions of mining areas that require post-closure maintenance until the maintenance activities are no longer necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 2395       | While the use of RO is encouraged, further analysis and application is needed.                                                                                                                                                                                                                                                                                                    | Reverse osmosis is a well-tested water treatment technology. Pilot-testing results enhance Minnesota's knowledge of its performance relative to the NorthMet Project Proposed Action. Further analysis of the proposed system would occur in permitting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | WR 143   |
| 2399       | The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis... As the Band already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative. | <p>The Underground Mine alternative was first considered but eliminated during the FSDD process. The FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS phase as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet's consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project's Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies' rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>The FEIS Section 5.2.10.1.4 states, "Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the 'cost') of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section." CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, "for purposes of complying with the Act, the weighing of the merits and drawbacks of the</p> | ALT 01   |

| 2422       | Exchanging thousands of acres of diverse, high-quality land--land with some of the few remaining large game corridors in northeastern Minnesota that are available to the Bands to exercise reserved 1854 Treaty rights--for lands that have moderate diversity and lack big-game corridors is inconsistent with the fiduciary responsibilities that are shared by all federal agencies. | The FEIS wildlife sections include an analysis of the wildlife corridors, including their use by various species. The FEIS wildlife sections also include information about NorthMet Project Proposed Action impacts to wildlife habitat types and Minnesota Biological Survey (MBS) Sites of Biodiversity Significance. FEIS Sections 4.2.4 and 4.3.4 provide maps of the MBS Sites (Figures 4.2.4-1, 4.2.4-4, 4.3.4-1, 4.3.4-2). The WCA rules (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities ( <i>Minnesota Rules</i> 8420.0515, Subpart 3).<br><br><i>Minnesota Rules</i> 6132.2700 requires that a project site be reclaimed once mining has ceased. The goals of such reclamation are to “control erosion, to screen mining areas from non-compatible uses, and to provide for subsequent land uses such as wildlife habitat or timber production.” The rules also include requirements about the characteristics and planting schedule for vegetation used in reclamation. The Permit to Mine would address special consideration of wetlands that include rare natural communities. A additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions. | CR 01<br>WI 02<br>WI 03 |
| 2655       | It is well known that wetlands play an important role in the condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants, thereby benefiting the quality of downstream waters.                                                                                                                                                                    | This comment has been received and acknowledged by the Co-lead Agencies. The Co-Lead Agencies believe the identification of wetlands at the NorthMet Project area is accurately and adequately depicted in Section 4.2.3 for the purpose of the EIS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WET 24                  |
| 2656       | Wetlands may also function as thermal refuge for moose when summertime temperatures exceed 14 o C, the point at which moose become thermally stressed. Additionally, wetlands with aquatic vegetation provide an important forage resource for moose during the open-water season.                                                                                                       | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement. The FEIS Section 4.2.5.1.1 discusses the role of wetlands with moose and thermal stress.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WI 01<br>WI 02          |
| 2658       | [The SDEIS (Pg 5-643)] underestimates the impacts [to aquatic species due to the decrease of first-order streams to the federal estate]. While greater diversity is desirable, protection of headwater streams is critical because they                                                                                                                                                  | Effects of the Land Exchange Proposed Action on headwater streams are discussed in detail in Sections 5.3.6.2.2 and 5.3.6.3.2 of the FEIS. A paragraph in FEIS Section 5.3.6.2.2 has been edited to state “...however, the net reduction to the Superior National Forest of 0.3 miles of first order streams may result in slightly less habitat available for headwater stream                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | AQ 29                   |

|            | powerfully influence both the character and functions of downstream waters. Headwater streams transport vegetation, woody debris, organic matter, macroinvertebrates, and other organisms downstream, while providing spawning areas for brook trout. Headwaters provide most of the water to rivers, which in turn provides temperature mitigation and oxygenation which are necessary for healthy fish communities. | dependent species".<br>There are no designated trout streams in the Land Exchange Proposed Action parcels or the Federal parcel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| 2660       | The loss of critical wildlife corridors, along with high quality and diverse land and water resources, directly connects the federal regulatory agencies' trust responsibilities to the Bands. The land exchange, and the Project, cannot proceed where they require the agencies to approve permits that will have impacts to treaty resources without additional evaluation and mitigation.                         | The FEIS wildlife sections include an analysis of the wildlife corridors, including their use by various species. The FEIS wildlife sections also include information about NorthMet Project Proposed Action impacts to wildlife habitat types and Minnesota Biological Survey (MBS) Sites of Biodiversity Significance. FEIS Sections 4.2.4 and 4.3.4 provide maps of the MBS Sites (Figures 4.2.4-1, 4.2.4-4, 4.3.4-1, 4.3.4-2). The WCA rules (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities ( <i>Minnesota Rules</i> 8420.0515, Subpart 3).<br><i>Minnesota Rules</i> 6132.2700 requires that a project site be reclaimed once mining has ceased. The goals of such reclamation are to "control erosion, to screen mining areas from non-compatible uses, and to provide for subsequent land uses such as wildlife habitat or timber production." The rules also include requirements about the characteristics and planting schedule for vegetation used in reclamation. The Permit to Mine would address special consideration of wetlands that include rare natural communities. Additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions. | CR 01 WI 03      |
| 2686       | Also ignored [in the design of the Project] was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site.                                                                                                                                                                                                                               | NEPA/MEPA regulations do not require discussion or comparisons to other mining projects, as it is outside the scope of the project (see Minnesota Statutes 116D.04 and 40 CFR 1500). PolyMet would be required to address on-site legacy contamination and would provide financial assurance for the legacy components under a Permit to Mine application. FEIS Section 5.2.2 discusses how the NorthMet Project would address existing water contamination and/or comply with water standards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | PD 26            |
| 2689       | The cumulative public information regarding risks to area hydrology from mining the PolyMet site cannot be dismissed by inserting extrapolated data                                                                                                                                                                                                                                                                   | Where field measurements were not available, model assumptions were reviewed and approved for use in impact analyses. The Co-lead Agencies believe that the FEIS contains adequate information and analyses consistent                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | WR 072<br>WR 073 |

|            | in place of measured data, or by cherry-picking measured data. Impacts to surface waters, groundwater, and wetlands for a project of this size and complexity demand a scientific, data-driven approach, rather than one based on opinion and selectively used data.                                                                                                                                                                                                                                                                                                                                                                         | with the NEPA and MEPA guidance and best practices. Also refer to the response to theme NEPA 09 for more detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |          |
| 2694       | Some of the wetlands that will be directly and indirectly impacted at the mine site are part of the 100 Mile Swamp, identified by a United States Fisheries Service biologist in 1997 as “lacking ecosystem representation in protected areas.”                                                                                                                                                                                                                                                                                                                                                                                              | FEIS Section 5.2.3, Table 5.2.3-1, indicates that there would be a total of 758.2 acres of direct wetland impacts at the Mine Site. A portion of the approximate boundary for the One Hundred Mile Swamp would be located within the Mine Site boundary. PolyMet would ultimately need to satisfy both the federal and state mitigation requirements for providing compensatory mitigation for impacts to wetlands. The number of mitigation credits to be earned by replacement wetlands would be determined during permitting by the appropriate agencies reviewing the wetland mitigation plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WET 19   |
| 2700       | In response to the Co-Lead Agencies desire to use only analogue data to determine the Project dewatering effects, GLIFWC provided an independent analysis using information from other mine pits located on the Mesabi Range. . . The only substantial changes in GLIFWC’s method of analogue assessment were to use all available drawdown data for the Mesabi Iron Range, and to not automatically exclude wetlands classified as ombrotrophic from being considered impacted by drawdown. . . All analogue data must be used to estimate wetland impacts, and additional hydrologic data collected from the mine site should be required. | When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.<br><br>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000- | WET 08   |

|            |                                                                                                                                                                                                                                                                                                          | <p>fit analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in FEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but are monitoring wetlands for potential indirect effects. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts are identified during monitoring and annual reporting.</p>                                                                                                                                                                                                                            |          |
| 2701       | <p>The CWA does not allow a permit when there are practicable alternatives that would have fewer adverse effects, when the Project would lead to a violation of state water quality standards, or when a permit would cause or contribute to significant degradation of waters of the United States.</p> | <p>The USACE is the federal agency responsible for regulating the discharge of dredged or fill material into Waters of the United States, including wetlands under Section 404 of the Clean Water Act. PolyMet has applied for a Section 404 Individual Permit from the USACE for the proposed fill into the Waters of the United States. In addition, if a permit from the USACE is issued, it is not valid until the State has either certified under Section 401 of the CWA that the proposed discharges to aquatic resources comply with the State’s water quality standards or waived the 401 certification requirements. When making a decision, the USACE takes into consideration numerous factors. Permit decisions are based on the probable expected effects associated with a proposed project including direct, indirect, and cumulative impacts. Public interest review factors include: conservation, economics, aesthetics, general environment, wetlands, cultural values, fish and wildlife, land use, flood hazards, property ownership, flood plain values, navigation, recreation, shore erosion and accretion, water supply and water quality, energy needs, safety, mineral needs, safety, food and fiber production, and the needs and welfare of the people. The decision to grant or deny a permit by the USACE is explained and described in a ROD. If the permit is issued, a copy of the permit is sent to the project sponsor for their signature, which signifies that they accept the permit requirements. If the USACE decides to deny the permit or the</p> | COE 03   |

| 2702       | An agency-preferred alternative must be provided in addition to the LEDPA's before wetland impacts resulting from the Project can adequately be assessed, and before a 404 permit can be issued.                                                                                                                                                                                                                                                                                               | <p>project sponsor does not agree with the conditions contained in the permit, the project sponsor may request an administrative appeal of the permit decision. A decision by the USACE on whether to grant or deny a Section 404 Individual Permit has not yet been made.</p> <p>Neither Minnesota Rules nor CEQ regulations require the Co-lead Agencies to identify a preferred alternative in the SDEIS (40 CFR 1502.14(e)). The FEIS includes available details regarding the identification of an Agency Preferred Alternative. The FEIS contains sufficient information to identify and substantiate the LEDPA. The USACE is not required to identify a LEDPA in the FEIS; the final determination on the LEDPA would be made in the ROD for the USACE which serves as the USACE's decision document and the basis for the Department of the Army permit decision. The USFS will utilize the FEIS to show the factors relating to how the public interest would be served by the Land Exchange and the ROD would incorporate the findings of those factors and identify the preferred alternative. The MDNR is not required to identify a preferred alternative under MEPA. The FEIS Sections 3.2 and 3.3 further detail this process.</p> <p>The agency preferred alternative and LEDPA process is described in FEIS Sections 7.4 and 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30-day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the Project.</p> | COE 04   |
| 2707       | During the EIS scoping process for the Project, the Co-Leads failed to ever identify any cumulative impact issues associated with cultural resources, and Tribal Cooperating Agencies were not invited to participate in scoping. The Band's and other Tribal Cooperating Agencies' comments on the June 2008 PDEIS, the 2009 CPDEIS, and the 2009 DEIS detailed the nature of these substantial cumulative impacts and the need for further analysis, and are forced to do so yet again here. | Section 6.2.9 of the Final EIS provides a detailed discussion and analysis of the potential cumulative effects on cultural resources from the NorthMet undertaking within a defined cumulative effects analysis area. That discussion includes past, present, and reasonably foreseeable future federal, state, and private actions within that area. The approach to cumulative effects has been informed through consultation between the Co-lead Agencies and the Bands. Section 6.2.9 of the Final EIS acknowledges cumulative effects on cultural resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | CR 03    |
| 2713       | This omission [the SDEIS does not determine climate change implications of the proposed                                                                                                                                                                                                                                                                                                                                                                                                        | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | WI 01    |

|            | Project] undermines even the MDNR's own work. The MNDNR's Moose Advisory Committee, which studies the decline of the moose population in northeastern Minnesota, has recommended preserving wetlands as sanctuaries for moose from heat stress related to climate change.                                                                                                                                                                                                                                                                                                                            | status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement. The FEIS Section 4.2.5.1.1 discusses the role of wetlands with moose and thermal stress.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WI02                         |
| 2715       | A substantial moose population has been identified in the mine site area by aerial and ground surveys. Moose are likely to be impacted by the disturbance of two of the few wildlife corridors remaining along the Mesabi Range, not to mention by the massive wetland impacts of this project... There is no basis to dispute that the Project will have cumulative effects on the moose herd and Tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important and should have been done as part of this SDEIS. | The FEIS wildlife sections provide an analysis of wildlife species used for subsistence/harvest, as well as those culturally important to the Bands, such as moose. FEIS Section 4.2.9.3.3 identifies species potentially harvested in the 1854 Ceded Territory, while FEIS Section 5.2.9.2.2 explains that a lack of data regarding use of such species in the NorthMet Project area likely indicates limited present day use in that area due to general inaccessibility. FEIS Section 5.2.5.2.5 discusses the types of potential effects to common and/or game species, which are similar to effects on ETSC species. The FEIS has been revised to include additional detail regarding moose, and this discussion has been moved to the state ETSC species discussion, due to its new state listing status. The response to theme CR 01 also discusses effects to resources important to the Bands. | WI01<br>WI02<br>WI03<br>WI09 |
| 2721       | The cumulative impacts assessment deficiencies identified above and within Appendix C are not exhaustive. Instead, they are solely an attempt to illustrate the incredible lack of cumulative effects analysis in the SDEIS. Profound revision is needed to this section.                                                                                                                                                                                                                                                                                                                            | The Co-lead Agencies considered the information included in the Tribal Cooperating Agencies' cumulative effects assessment and found no compelling information or analysis to change the original approach or conclusions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | CU 12                        |
| 2723       | Additionally, the lead agencies must consult with any tribes that attach "religious or cultural significance to historic properties that may be affected by an undertaking," regardless of the location of the historic property.                                                                                                                                                                                                                                                                                                                                                                    | The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting on the NorthMet Project Proposed Action. Historic properties affected by the NorthMet Project Proposed Action have been identified and the impacts to those properties have been assessed. This also includes an assessment of actual use of those historic properties, as well as other resources in the APE, by tribal members. Effects on historic properties would be fully considered prior to the issuance of any permit or land exchange, pursuant to the NHPA and its implementing regulations. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6.                                                                                               | CR 06                        |
| 2729       | Mesabe Widjiu is correctly identified as a sacred landform but needs to be considered in its entirety instead of looking at only the area within the                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The federal Co-lead Agencies have determined the Partridge River section of the Mesabe Widjiu to be eligible for inclusion in the NRHP under Criterion A for its association with important Ojibwe spiritual and cultural                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | CR 02<br>CR 05               |

|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
|            | Project. The segment that is within the project area is small, but vital to the property. Adverse effects to any portion of the Mesabe Widjiu will negatively impact the entire feature.                                                                                                           | practices. In addition, the Co-lead Agencies have determined, in consultation with the Bands, that the Partridge River segment of the Mesabi Widjiu would be adversely affected by the NorthMet undertaking. Although the federal Co-lead Agencies are assessing the effects of the NorthMet Project Proposed Action on only the portion of the Mesabe Widjiu within the APE, it is recognized that the property and its significance extends beyond the APE. The federal Co-lead Agencies have updated the FEIS to include a graphic of the entire Mesabe Widjiu, as provided by the consulting Bands.                                                                                                                                                                                                                                                                                        |                                  |
| 2738       | Any increase of methylmercury bioavailability in the Embarrass River, Partridge River, or St. Louis River watersheds constitutes a significant adverse impact to a critical trust resource [(subsistence fisheries)]. Not only must this impact be fully evaluated, but it must be fully mitigated | The Cultural Resources sections in FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6, also address effects on and any proposed mitigation for cultural resources and culturally significant natural resources.<br><br>Effects from mercury deposition on fish, in particular, are addressed in Section 6.2.6.3.3, in the Human Health Impacts summary, Section 7.3.4.4.2, and in responses to Themes HU02, 03 and 04.<br><br>Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations pertaining to the federal authorities for the NorthMet Project Proposed Action review. | CR 01<br>HU 02<br>HU 03<br>HU 06 |
| 2742       | Wild rice waters are not only protected under the 1854 Treaty but under Minnesota State law. Given the obviousness of the threatened impact to such wild rice beds, additional analysis and mitigation must be included throughout the SDEIS.                                                      | Potential effects and mitigation actions are included in the FEIS. Wild rice beds impacts are addressed from an economic, environmental, and cultural perspective with input from the Bands.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | WR 156<br>WR 157                 |
| 2745       | The Project will certainly do nothing to aid in the recovery of moose and is likely to reduce available habitat, impact travel corridors, and increase greenhouse gases. Impacts on moose and habitat are impacts on the Band's cultural resources and must be analyzed as such in the SDEIS.      | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement. The FEIS Section 5.2.5.2.2 discusses effects to moose due to loss of habitat. The FEIS Sections 5.2.5.2.3 and 6.2.5.4.2 discuss effects to wildlife corridors.                                                                                                                                                                                                                                                                                                                                                                                    | WI 01<br>WI 02<br>WI 03<br>WI 09 |
| 2746       | The APE for the Project was not determined until August 11, 2009, after tribal cooperators insisted upon it, and tribal consultation is ongoing. Since 2009, the size of the APE has been significantly                                                                                            | The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting on the NorthMet Project Proposed Action. Historic properties affected by the NorthMet Project Proposed Action have been identified and the impacts to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | CR 02<br>CR 06                   |

|            | <p>diminished to the point of being the Project permitted area and nothing more.</p>                                                                                                                                                                                                                                                                                                                                               | <p>those properties have been assessed. This also includes an assessment of actual use of those historic properties, as well as other resources in the APE, by tribal members. Effects on historic properties would be fully considered prior to the issuance of any permit or land exchange, pursuant to the NHPA and its implementing regulations. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6.</p> <p>The APE takes into account both direct and indirect effects using a geographically expansive area that accounts for direct effects as well as visual, audible, atmospheric, hydrological, and water quality effects. The APE is based on extensive modeling and other analysis completed for the NorthMet Mining Project and Land Exchange, and includes an area much broader than the Plant Site and Mine Site. Since the SDEIS, the APE has been revised slightly to include the Dunka Road corridor, several federal parcels included in the Land Exchange Proposed Action, and the Colby Lake Pumphouse and pipeline.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                |
| 3039       | <p>The land exchange will cause irretrievable losses of resources for the Bands [including loss of the land itself, SDEIS pg 7-10]... Further, the SDEIS provides that the land exchange proposal could have direct and indirect effects on tribal cultural resources by creating noise, impeding access to area that are traditionally or culturally important to the bands and affecting species of importance to the Bands.</p> | <p>The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising</p> | CR 01<br>CR 05 |

|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |         | <p>their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands</p> |          |

|            |                                                                                                                                                                                                                                                                                                           | <p>via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |
| 2697       | <p>[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (1) the PolyMet proposed mine pit will be hundreds of feet deeper than any of the “analogue” mine pits;</p> | <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment</p> | WET 08   |

In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts are identified during monitoring and annual reporting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |          |
| 3098       | <p>[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (2) PolyMet mine pit walls will be crystalline and sedimentary bedrock versus the analogue mine pits in sedimentary bedrock only;</p> | <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the</p> | WET 08   |

The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in FEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but are monitoring wetlands for potential indirect effects. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts are identified during monitoring and annual reporting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |          |
| 3099       | <p>[The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include:] (3) data collected from the site would be relatively inexpensive and should be used to inform impact assessment;</p> | <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to</p> | WET 08   |

|            |                                                                                                                                                                                                                                                                                                                                                                                              | <p>“no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in FEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but are monitoring wetlands for potential indirect effects. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts are identified during monitoring and annual reporting.</p>                                                                                                                                                                                                                                            |                    |
| 3112       | <p>The SDEIS also does not provide any rationale for more mercury to be added to a system that is already so high in mercury, only suggesting that a future TMDL should take care of the problem. A more through cumulative effects analysis is required for mercury and the appropriate spatial scale for considering cumulative impacts includes the entire St. Louis River watershed.</p> | <p>This comment was originally presented as part of the Tribal Position Summary included in MDO #2, which was previously addressed in SDEIS Table 8-1. Further explanation is provided below.</p> <p>MPCA’s goal is to protect high-quality waters and improve the quality of impaired waters, so water quality standards are met and beneficial uses are maintained and restored, where these uses are attainable. As summarized in FEIS Section 5.2.7.2.5, widespread contamination of fish from atmospheric pollution is why Minnesota established a statewide mercury TMDL. The TMDL seeks to reduce atmospheric deposition everywhere in the state, in order to make the state’s lakes and streams fishable, as required by federal regulations, and is intended to provide the long-term framework to reduce mercury in fish. The MPCA published Guidelines for New and Modified Mercury Air Emission Sources, and revised those guidelines in 2012 (MPCA 2012h, as cited in the FEIS). The guidelines were developed to limit the mercury emissions from new and expanding sources in order to meet the TMDL goal of total statewide mercury emissions of 789 lbs/year by 2025. The MPCA has conducted a review of the NorthMet Project Proposed Action mercury emissions, and has determined that it would not impede the reduction goals (MPCA 2013b, as cited in the FEIS). Furthermore, WWTF and WWTP discharges are expected to meet the 1.3 ng/L standard for mercury, and overall the NorthMet Project Proposed</p> | MERC 10<br>MERC 22 |

| 3117       | <p>While the incremental risk [of mercury loading] from the Project may be small, the existing risk is large and has not yet been addressed through a total maximum daily load (“TMDL”) or other reduction program.</p> | <p>Action is predicted to result in a net decrease of mercury-loading.</p> <p>The comments in this theme were originally presented as part of the Tribal Position Summary included in MDO #2, which was previously addressed in Table 8-1 of the SDEIS. Further explanation is provided below.</p> <p>MPCA’s goal is to protect high-quality waters and improve the quality of impaired waters, so water quality standards are met and beneficial uses are maintained and restored, where these uses are attainable. As summarized in FEIS Section 5.2.7.2.5, widespread contamination of fish from atmospheric pollution is why Minnesota established a statewide mercury TMDL. The TMDL seeks to reduce atmospheric deposition everywhere in the state, in order to make the state’s lakes and streams fishable, as required by federal regulations, and is intended to provide the long-term framework to reduce mercury in fish. The MPCA published Guidelines for New and Modified Mercury Air Emission Sources, and revised those guidelines in 2012 (MPCA 2012h, as cited in the FEIS). The guidelines were developed to limit the mercury emissions from new and expanding sources in order to meet the TMDL goal of total statewide mercury emissions of 789 lbs/year by 2025. The MPCA has conducted a review of the NorthMet Project Proposed Action mercury emissions, and has determined that it would not impede the reduction goals (MPCA 2013b, as cited in the FEIS). Accordingly, no minimization and mitigation plan is required for the NorthMet Project Proposed Action. Based on the results of MPCA’s review, the NorthMet Project Proposed Action should not be required to buy mercury offsets at this time. Should an evaluation of the NorthMet Project Proposed Action determine that an additional mercury source has been added, mercury offsets would be sought in accordance with the Implementation Plan for Minnesota’s Statewide Mercury Total Maximum Daily Load (MPCA 2009d, as cited in the FEIS).</p> <p>Further, the NorthMet Project Proposed Action is not anticipated to be a major source of mercury into the environment. The RO treatment is expected to discharge mercury at or below the mercury standard of 1.3 ng/L, which includes all surface water that would be discharged at the Plant Site, including water used for flow augmentation. Mercury loadings from the Mine Site are projected to decrease due to the NorthMet Project Proposed Action. The combined contributions from the Embarrass River and Partridge River are unchanged when modeled for the St. Louis River at the Fond du Lac reservation boundary; therefore, further degradation of surface water quality, and by extension increased mercury in fish, is not</p> | MERC 22  |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Theme(s)                                                                                                      |

| 9007       | <p>In the SDEIS, there is no discussion regarding the type of financial assurance that would be used. No detail is provided regarding the estimated amount of financial assurance that would be sufficient for reclamation, closure, mitigation, and remediation of adverse effects from the Project. Even though the MNDNR has stated that PolyMet financial assurance will include clean-up costs for contamination resulting from LTVSMC operations, the SDEIS provides no discussion regarding financial assurance for the existing contamination associated with previous mining activities at the site.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, time frames, contingency plan amounts for unforeseen challenges, calculations that would be required for the project, monitoring, mitigation, and legacy contamination would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine, <i>Minnesota Rules</i> 6132.1200, Subpart 3, states that cost estimates shall be annually adjusted using current dollar value at the time of the estimate. To the extent the reclamation plan includes maintenance, mitigation, and cleanup of legacy contamination, those items would be covered by financial assurance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>FIN 01<br/>                     FIN 05<br/>                     FIN 08<br/>                     FIN 11</p> |
| 9008       | <p>Mining need not be synonymous with pollution: “In the right place – and with conscientious companies, new technologies and good planning – many of the potential impacts are avoidable. In fact, most mine pollution arises from negligence, not necessity.” The NEPA “hard look” requires agencies to “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing alternatives.</p> <p>The SDEIS does not evaluate or examine Project alternatives in any substantive way; even the no-action alternative is lacking in detail and analysis. Instead, the SDEIS states:</p> <p>Consistent with the CEQ regulations, the federal Co-lead Agencies are required to identify an agency-preferred alternative in a DEIS, if one exists, and in the FEIS unless another law prohibits the expression of such a preference. At this time, the Co-lead Agencies have not identified a preferred alternative, and for the USACE, Appendix B of 33 CFR Part 325 supersedes the CEQ requirement to identify an agency-preferred alternative.</p> | <p>The original project proposal and alternatives were developed during project scoping in 2005. The NorthMet Project Proposed Action was refined at various points in response to public and agency input. As a result, the NorthMet Project Proposed Action studied in the SDEIS is not identical to the proposed action in the 2009 DEIS. Some alternatives to the proposed action were considered and eliminated during the scoping and DEIS phases of the NorthMet Project Proposed Action, so did not require re-evaluation in the SDEIS.</p> <p>Alternatives were eliminated from detailed evaluation if they did not offer substantial environmental or socioeconomic benefits, were not reasonable (technically or economically feasible), were not available, or would not meet the Purpose and Need. This review—beginning during the scoping process and concluding with the FEIS—is consistent with the alternatives review required by NEPA and MEPA, and with the CEQ rules for analyzing alternatives. Refer to FEIS Section 3.2.3 for a discussion on the process and outcomes for consideration of the NorthMet Project alternatives, and Section 3.3.3 for a discussion on the Land Exchange alternatives. FEIS discusses in section 3.2.3.2 how the Consent Decree under the NorthMet Project No Action Alternative would require Cliffs Erie to complete closure and reclamation activities at the Plant Site. This would include completing activities for the localized affected areas under the Minnesota VIC Program, removal of the former Plant Site facilities that are not going to be reused, and management of seepage at the Tailings Basin embankment. The FEIS mentions in Table 3.2-1 that under the</p> | <p>ALT 01<br/>                     ALT 03<br/>                     ALT 14<br/>                     ALT 20</p> |

|            | <p>Part 57(4) of 33 C.F.R. Part 325 at Appendix B, NEPA Implementation, only states:<br/>                     Alternatives. See 40 CFR 1502.14. The Corps is neither an opponent nor a proponent of the applicant's proposal; therefore, the applicant's final proposal will be identified as the "applicant's preferred alternative" in the final EIS. Decision options available to the district engineer, which embrace all of the applicant's alternatives, are issue the permit, issue with modifications or conditions or deny the permit.</p> <p>To the extent this limits USACE's obligation to identify an agency-preferred alternative, which is not clear, nothing there limits the USFS's obligation to do so. Moreover, Part 57(4) of Appendix B does require that "reasonable alternatives" must be considered in detail, along with "geographic alternatives, e.g., changes in location and other site specific variables, and functional alternatives, e.g., project substitutes and design modifications."</p> <p>The Band has long cited this defect in its comments,<sup>21</sup> and EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS. Although the SDEIS was revised to reflect the Project proponents' preferred action, still, the only alternative analyzed in any detail concerns the acreage of the proposed land exchange. This failure is a serious violation of NEPA and must be remedied before the SDEIS can be finalized.</p> | <p>NorthMet Project No Action Alternative, there would be no mining activities, and that existing management and land use of the federal lands would continue. The NorthMet Project No Action Alternative is also analyzed under each resource area in the FEIS Chapter 5, and summarized in the FEIS Table 7.2-1. Several other alternatives for both the NorthMet Mining Project and Land Exchange were screened before the FEIS (see FEIS Section 3.2.3.3).</p>                        |          |
| 9011       | <p>No effort was made to discuss or evaluate the least environmentally damaging practicable alternative ("LEDPA") required before rendering a Clean Water Act Section 404 Permit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>The LEDPA process is described in FEIS Section 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the permit.</p> | COE 04   |

| 9014       | <p>The SDEIS failed to substantively consider many alternatives that may provide mitigation for, or prevent long-term environmental damage. Some of these alternatives include: paste tailings to reduce the project footprint and use less water thus decreasing risk of water pollution; perpetual pumping of the mine pit to prevent a pit lake from forming and by doing so protecting groundwater; back-filling waste rock into the east, central, and west mine pits to reduce the mine foot print and restore wetlands; engineered liners; providing reverse osmosis treatment at the mine site beginning in year one of operations to augment water loss in nearby high quality wetlands in the Partridge River watershed; and underground mining.</p> | <p>A thickened tailings (paste tailings) alternative (A1) was considered but eliminated in the DEIS and post-DEIS as it was determined not to offer significant environmental benefits over the NorthMet Project Proposed Action.</p> <p>See the response to Theme ALT 04, which describes the West Pit Water Elevation Alternative (see also MDNR et al. 2014, as cited in the FEIS).</p> <p>FEIS Section 3.2.2.1.10 states that waste rock would be backfilled into the East Pit starting at year 11 and in the combined East Central Pit starting in year 16. After backfilling is complete, a wetland would be constructed over the combined East Central Pit. See the response to Theme ALT03 for more information about the West Pit backfill alternative.</p> <p>The 2009 DEIS discussed a liner system as part of its consideration of a modified design or layout at the Mine Site. Key aspects of this alternative from the 2009 DEIS were incorporated into the NorthMet Project Proposed Action and studied in the SDEIS. Liners would be installed for stockpiles or areas where there is a potential to generate acid and metal leachate from potentially reactive waste. The Hydrometallurgical Residue Facility would contain a double-liner system. Temporary stockpiles (Category 2/3 and Category 4) and the Ore Surge Pile would contain a liner. The Category 1 Stockpile would have a containment system to collect seepage, which would be pumped to the WWTF. The Overburden Storage and Laydown Area would hold peat soils and unsaturated overburden, which would not be expected to be reactive.</p> <p>During operations, effluent from the WWTF and runoff from the Overburden Storage and Laydown Area would be pumped to the Tailings Basin for reuse. During this time, extensive monitoring would be required, and adaptive management would be used to ensure minimization of effects and compliance into the future. During reclamation, water from the West Pit would be treated at the WWTF, which would be upgraded to include a RO treatment unit. Treatment at this unit would result in an effluent that meets all applicable water quality standards.</p> <p>See the response to Theme ALT01 for more information about the underground mining alternative.</p> | <p>ALT 01<br/>                     ALT 04<br/>                     ALT 06<br/>                     ALT 10<br/>                     ALT 13</p> |
| 9020       | <p>The SDEIS summarily dismissed the possibility of backfilling:<br/>                     The opportunity to reclaim wetlands and vegetation at the Category 1 Stockpile footprint</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The West Pit Backfill alternative (E20) was considered but eliminated during the development of the DEIS. It was eliminated from further consideration because it was determined that it would not offer significant environmental or socioeconomic benefits compared to the NorthMet</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>ALT 03<br/>                     ALT 06</p>                                                                                                 |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Theme(s)                   |

|            | <p>area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal effect that the stockpile would have, those effects would be required to be mitigated regardless of future backfilling or not.</p> <p>Furthermore, the potential environmental benefit is moot or outweighed because encumbrance is not allowed in PolyMet’s private mineral leases and because the costs associated with backfilling, additional water treatment (rates), and encumbrance compensation determined in revised lease agreements may affect the ability of PolyMet to secure financing (MDNR et al. 2013b). As such, the option to backfill the West Pit was eliminated from further consideration in the SDEIS.</p> <p>Back-filling all of the mine pits with waste rock would reduce the surface footprint of the mine and make possible 526 acres of wetland restoration where the Category 1 stockpile is now proposed to be stored without a liner in perpetuity.</p> | <p>Project Proposed Action and because backfilling the West Pit would prevent recovery of additional mineral resources. These factors are sufficient to qualify the West Pit Backfill alternative as unreasonable under NEPA, and justify its exclusion under <i>Minnesota Rules</i> 4410.2300, Subpart G. It was reconsidered in the SDEIS in response to comments from the Cooperating Agencies. A Co-lead Agency memorandum (MDNR et al. 2013b, as cited in the FEIS) was prepared to summarize the decision-making process, which is referenced in the FEIS Section 3.2.3.4.2. The Co-lead Agencies screened the alternative against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The opportunity to reclaim wetlands and vegetation at the Category 1 Stockpile footprint area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal impact that the stockpile would have, these impacts would be required to be mitigated regardless of future backfilling or not.</p> |                            |
| 9022       | <p>Engineered liners for the Category 1 Waste rock Stockpile and the Overburden Storage Layout Area (“OSLA”) would ensure that seepage would not migrate into fractures below the storage facilities and increase the effectiveness of seepage capture...If the Category 1 Stockpile were lined, seepage capture efficiency would increase and less water carrying pollution would migrate from the pile into the fractures below the storage area thereby protecting groundwater.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Liners would be installed for stockpiles or areas where there is a potential to generate acid and metal leachate. The Category 1 Stockpile would have a containment system to collect seepage, which would be pumped to the WWTF for treatment. The Category 1 stockpile would contain material that is not expected to produce acidic leachate. The non-acid generating waste was identified using multi-year kinetic tests (humidity cells) on NorthMet rock samples. Waste rock with 0.12 percent sulfide S or less is the threshold for selecting non-acid generation mine waste and is supported by long-term humidity cell tests on NorthMet waste (i.e., 42 samples of Category 1 waste rock, with tests now run for over 450 weeks (Waste Characterization Data Package, Section 4.3 (PolyMet 2015q))</p> <p>The Overburden Storage and Laydown Area would hold peat soils and unsaturated overburden, which is not expected to be reactive.</p>                                                                                                                                                                                                                                      | PD 16                      |
| 9025       | <p>After operations, the SDEIS contemplates that the RO plant would continue to treat tailings basin seepage and begin treating tailings pond water. The treated water would be used for augmentation</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>The NorthMet Project Proposed Action described in the FEIS includes treatment of all water that would be discharged at the Plant Site including water used for flow augmentation. The amount of water from Colby Lake used for flow augmentation would be low; however, any water used for</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | WR 018<br>WR 124<br>WR 184 |

|            | <p>of streams near the plant site. Colby Lake water is also proposed for stream augmentation. However, because Colby Lake water exceeds WQS for many pollutants including mercury, it would also need to be RO-treated before being used for augmentation. RO-treated water should be used to augment streamflow at both the plant site and mine site. Colby Lake water should not be used for stream augmentation unless it is RO-treated first. RO will not cause waters in the vicinity of the plant site to comply with WQS due to low seepage capture efficiency at the tailings basin.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>augmentation would be treated prior to discharge. PolyMet recommends that tributaries that extend from the Tailings Basin be monitored, see FEIS Section 5.2.2.3.6 and comment ID 9022.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |          |
| 9029       | <p>The MNDNR and USACE considered underground mining as an alternative to the proposed open pit(s) for the DEIS in 2009, but eliminated it because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” Even though underground mining was reconsidered for the SDEIS, the Co-Lead Agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing alternatives. The Project proponent eliminated the alternative based solely on an economic decision that underground mining would not be as profitable as open pit mining. The co-leads state that “it was not possible to undertake a quantitative, side-by-side assessment of the underground mining alternative.”<sup>37</sup> An underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. Conversely, although the underground mining alternative would offer environmental benefits, the SDEIS includes no economic analysis of those benefits. Still, the Co-Lead Agencies determined that underground</p> | <p>The Underground Mine alternative was first considered but eliminated during the FSDD process. The FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>FEIS Section 5.2.10.1.4 states, “Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the “cost”) of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section.” CEQ regulations for implementing</p> | ALT 06   |

|            | <p>mining would result in reduced socioeconomic benefits, and “PolyMet would not move forward with an unprofitable project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>NEPA (40 CFR 1502.23) state that, “for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |          |
| 9031       | <p>Although underground mining was considered technically feasible, the Co-Leads provided that PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. Using underground mining would result in most of the NorthMet Deposit left unmined because of its low metal value (i.e., less value than the cost of mining and mineral processing). Other material would have to be left in place for safety reasons, to prevent collapse. Therefore:<br/>                     ...the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS.<br/>                     In no way does this constitute an appropriate level of detail. The conclusion that underground mining is not viable, or preferable, remains substantially unjustified, despite repeated requests for further analysis. Without considering the economics of perpetual treatment the economic analysis</p> | <p>The Underground Mine alternative was first considered but eliminated during the FSDD process. FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.<br/>                     FEIS Section 5.2.10.1.4 states, “Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the “cost”) of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section.” CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, “for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”</p> | ALT 01   |

|            | <p>provided by the Project proponent concludes that underground mining is “[n]ot economically viable,” while simultaneously claiming that backfilling the west pit would create encumbrances not allowed in their lease due to minerals located below the west pit that can only be accessed through underground mining. This is not the appropriate use of a cost-benefit analysis for purposes of analyzing an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is “relevant to the choice among environmentally different alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,”<sup>42</sup> in addition to other CEQ alternatives rules.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |          |
| 9033       | <p>Additionally, the SDEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The SDEIS FEIS Section 5.3.3 included a discussion of wetland resources to be gained or lost as part of the proposed action land exchange. The Land Exchange Proposed Action represents a transfer of surface rights of 6,495.4 acres from the SNF to PolyMet to eliminate the conflict between federal surface and private mineral estate. This action, if approved, would remove those acres from SNF management and public use and transfer them to private ownership. Effects to wetland resources as a result of the mining activities are discussed in FEIS Section 5.2.3. SDEIS Section 5.3.6 included a discussion of headwater streams to be gained or lost from the Land Exchange Proposed Action.</p> | WET 14   |
| 9036       | <p>The SDEIS attempts to diminish the significance of the loss of these high-quality lands by stating that “[g]iven the existing lack of overland public access and actual use of the federal lands, as well as historic use of this area for mineral exploration (see Section 4.2.9), the Land Exchange Proposed Action represents little to no change in the actual level of recent or current use of the federal lands.” In fact, historic trails key to both the exercise of treaty rights and of historic significance connect what is now Beaver Bay with Lake Vermillion.</p>                                                                                                                                                                                          | <p>As discussed in FEIS Section 5.3.1.2.1, the only public access to the federal lands is via the Partridge and Embarrass rivers. The remainder of the federal lands is surrounded by private lands (or by other public lands that are themselves surrounded by private lands) (see Figure 4.3.1-1). While members of the public may obtain permission to cross these private lands and access the federal lands, there is no designated land-based access for the federal lands.</p>                                                                                                                                                                                                                               | CR 05    |
| 9037       | <p>The Project proponent provides that “three</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>The SDEIS was based on data generally collected through October 2012.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WR 008   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Theme(s)                 |

|            | <p>monitoring wells were installed in 2005 and sampled quarterly or less frequently prior to 2011; an additional 21 wells were installed between October 2011 and February 2012 and were sampled monthly through August 2012. All 24 wells are currently sampled three times per year (quarterly, excluding winter (1st) quarter).” But no bedrock monitoring wells were installed near the tailings basin. Only nine bedrock wells were installed for the entire Project, all in the area where the proposed mine pit(s) would be located. Moreover, data collected specifically for the Project was selectively used, with several well and surface water monitoring stations’ data completely excluded from the water quality models used to predict Project impacts.</p> | <p>The FEIS relied on new data collected through the end of 2013, which included 12 new monitoring wells at the Mine Site. In addition, the FEIS made use of new geotechnical data collected in 2014 along the north, northwest, and west perimeter of the Tailings Basin, including: geologic logs, ten new surficial aquifer piezometers, slug tests in the piezometers, and ten bedrock packer tests performed in five boreholes advanced into upper bedrock. Hydrogeologic site characterization was sufficient for purposes of environmental review.</p> <p>All publicly available and relevant studies were considered in developing the SDEIS and FEIS. These include technical reports prepared by PolyMet, reports from state and federal agencies, technical papers in peer reviewed journals, and technical reports associated with other mine sites. The SDEIS and FEIS preparers drew on these information sources to the degree that they were reliable and relevant to the assessment of potential NorthMet Project Proposed Action impacts.</p> <p>The FEIS record provided a description of data used to assess impacts.</p> <p>It is correct that there are currently no bedrock monitoring wells at the Plant Site. Installation of bedrock monitoring wells would be specified as part of the permitting process, with the results used to assess project performance on an ongoing basis.</p> | <p>WR 071<br/>WR 072</p> |
| 9046       | <p>Baseflow is the component of streamflow attributed to groundwater discharge from both deep subsurface and delayed shallow subsurface flow. It is established by measuring the rate of streamflow during low flow conditions; either in the winter months when groundwater continues flowing under the frozen surface, or in warmer months during periods of time when there is no precipitation. Baseflow is used to define the amount of groundwater contribution to streamflow, and helps determine the speed at which groundwater travels. The baseflow rate predicted by XP-SWMM is three times lower than flow data indicates, and implies recharge to the groundwater system from precipitation that is not consistent with published literature.</p>               | <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 streamgaging in the Partridge River at SW-006 that occurred when there were no discharges from Northshore Mine and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTV tailings basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.</p> <p>The only other available gaging data is from a station installed during 2011 at SW-003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore pumped discharges, seepage from the Northshore Western Pond, and complex storage/release</p>                                                                                                                                                               | <p>WR 003<br/>WR 175</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>mechanisms in the wetlands that receive these flows.</p> <p>More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.</p> <p>To better understand the relationship of groundwater baseflow to the GoldSim model's water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. It also reflected consideration of the flow data collected at SW-003 in requiring groundwater baseflows at all locations on the Partridge River be increased by a factor of 4 (e.g., 0.5 to 2 cfs at SW-003). The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p> |                  |
| 9051       | <p>It is widely acknowledged that "[m]ining can deplete surface and groundwater supplies. Groundwater withdrawals may damage or destroy streamside habitat many miles from the actual mine site." The importance of accurate evaluation of geology cannot be underestimated in modeling. Hydrogeologic characterization studies should include geological descriptions of the site, including descriptions of rock types, intensity and depth of weathering, and the abundance and orientation of faults, fractures, and joints. Although difficult to evaluate, the hydrologic effects of fractures, joints, and faults are especially important to distinguish and characterize. Water moves more easily through faults, fractures, and dissolution zones, collectively termed secondary</p> | <p>Impact assessment modeling relies on site characterization data that indicate the bulk hydraulic conductivity of upper bedrock is two to three orders-of-magnitude lower than the hydraulic conductivity of the surficial aquifer. Thus, groundwater flow and transport at both the Mine Site and Plant Site are dominated by the hydraulics of the surficial aquifer. Bedrock plays a negligible role in transporting site-derived chemicals to the Partridge and Embarrass Rivers.</p> <p>It is acknowledged that there could be some hydraulic connections between bedrock and the surficial aquifer where transport is expected to be negligible. Given these factors, the approach was to not consider this possible connection in the NorthMet Project Proposed Action water quality models, but to recommend extensive monitoring during operations and closure to assess if interactions occur and if they would raise concerns for permitting agencies. If monitoring data indicate trends toward permit non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate what is expected to be a small transport-related</p>                                                                                                                                                                                                                                                                                                                                                                              | WR 010<br>WR 012 |

|            | <p>permeability, than through rock matrices. Secondary permeability can present significant problems for a mining facility because it can result in a greater amount of groundwater discharge to a mine than originally predicted. However, the SDEIS indicates that mine pit dewatering impacts will be very limited or non-existent based on the assumption that there is little or no connection between the bedrock and surficial aquifers. This assumption is not supported by the data used to characterize mine site hydrology; instead, it is based on an unsupported “professional opinion.”</p> | <p>bedrock impact relative to surficial flows. See FEIS Section 5.2.2.3.5 for more information on adaptive mitigation measures and Section 5.2.2.3.6 for more information on monitoring.</p> <p>The FEIS further evaluated the possibility of fractures and faults at the Mine Site and Plant Site to determine what (if any) changes need to be made to model assumptions to accurately predict potential environmental effects for purposes of environmental review. Although no change was made to the Plant Site GoldSim model, the FEIS Mine Site GoldSim model was modified to include a flow/transport zone 15 meters thick from that present in the SDEIS. The results of the analysis are included in FEIS Section 5.2.2.3.2. The response to theme WR169 also contains additional information on fractures and faults.</p> <p>The SDEIS disclosed that bedrock is variably fractured. The effects of fracturing are incorporated into the bulk hydraulic conductivity values used to characterize bedrock for the water quality impact assessment modeling. This is common practice in large-scale evaluations of bedrock hydraulics and the Mine Site GoldSim model was updated for the FEIS to better represent the likelihood of an upper zone of more fractured bedrock than deeper in the formation. Background bedrock-related conductivity information was also updated for the FEIS.</p> <p>Structural faults may exist between mine facilities and perennial streams that receive groundwater discharge. Because the landscape is covered with surficial deposits and there are few bedrock outcrops, the existence of faults is conjectural and locations at best can only be inferred. It is unknown if faults (if and where they exist) behave as conduits or barriers to groundwater flow. Given these uncertainties, it is unlikely that any reasonable field program would be able to identify the existence, location, and hydraulic characteristics of faults that may or may not be present at the site. The FEIS documents the need to require a robust monitoring program during operations and closure to provide direct or indirect evidence on the existence of hydrologically significant faults. If significant faults are identified (that is, faults which could lead to violation of water quality standards), then adaptive measures would be employed to mitigate the fault-related effects. See FEIS Section 5.2.2.3.5 and theme WR169 for additional information.</p> |                                                                               |
| 9052       | <p>In fact, information beyond the flow data collected by PolyMet implies that there may be substantial connection between the bedrock and surficial</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Tritium and non-ionized ammonia can be indicators of relatively young water. However, when these constituents are identified in water extracted from a borehole, the overriding question is whether or not foreign (young)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>WR 010<br/>                     WR 011<br/>                     WR 012</p> |
