|            | <p>aquifers and that groundwater travel time will be exponentially faster than predicted. Water quality data collected from two deep boreholes in the area where the Project mine pit(s) will be located found tritium and un-ionized ammonia nitrogen. Both tritium and un-ionized ammonia indicate a strong connection with surface water. Tritium indicates that the water found in the deep boreholes was on the surface sometime after 1950, during or after nuclear testing when atmospheric deposition of this pollutant occurred. Un-ionized ammonia is produced by ore blasting activities. The bore holes where this pollution was measured are approximately one mile southwest of the Peter Mitchell Pit, which is the closest potential source of this pollution. Therefore, this data indicates that the PolyMet mine site is already hydrologically connected to the Peter Mitchell Pit through fractures. Upon review of the Peter Mitchell pit discharge monitoring data for SD001, the Band found that the average concentration of un-ionized ammonia exceeded the 0.04 mg/l NPDES permit in 2006 and 2008. The distance between the Peter Mitchell pit and the Project proposed pit(s) is approximately one mile, indicating that groundwater travel time through bedrock fractures will be orders of magnitude faster than Project modeling suggests. Such a connection means that dewatering of the mine pits will cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams. This also indicates that when the mine pit(s) refill, polluted water will seep and leak out into groundwater surrounding the project.</p> | <p>water was introduced during the drilling process. There are many documented cases where tritium in borehole water could be traced to makeup water introduced during the drilling process to help maintain circulation. Experience indicates that conclusions about the age of groundwater based on tritium and non-ionized ammonia are unreliable unless it can be absolutely verified that no foreign (makeup) water was introduced during the drilling process. Given the isolated occurrences additional verification is not warranted for the EIS.</p> <p>Impact assessment modeling relies on site characterization data that indicate the bulk hydraulic conductivity of upper bedrock is two to three orders of magnitude lower than the hydraulic conductivity of the surficial aquifer. Thus, groundwater flow and transport at both the Mine Site and Plant Site are dominated by the hydraulics of the surficial aquifer. Bedrock plays a negligible role in transporting site-derived chemicals to the Partridge and Embarrass Rivers.</p> <p>It is acknowledged that there could be some hydraulic connections between bedrock and the surficial aquifer where transport is expected to be negligible. Given these factors, the approach was to not consider this possible connection in the NorthMet Project Proposed Action water quality models, but to recommend extensive monitoring during operations and closure to assess if interactions occur and if they would raise concerns for permitting agencies. If monitoring data indicate trends toward permit non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate what is expected to be a small transport-related bedrock impact relative to surficial flows. See FEIS Section 5.2.2.3.5 for more information on adaptive mitigation measures and FEIS Section 5.2.2.3.6 for more information on monitoring.</p> <p>The FEIS further evaluated the possibility of fractures and faults at the Mine Site and Plant Site to determine what (if any) changes need to be made to model assumptions to accurately predict potential environmental effects for purposes of environmental review. Although no change was made to the Plant Site GoldSim model, the FEIS Mine Site GoldSim model was modified to include a flow/transport zone 15 meters thick from that present in the SDEIS. The results of the analysis are included in FEIS Section 5.2.2.3.5. The response to theme WR 169 also contains additional information on faults and fractures.</p> | <p>WR 013<br/>                     WR 061<br/>                     WR 071<br/>                     WR 087<br/>                     WR 099<br/>                     WR 168<br/>                     WR 169</p> |

|            | <p>are commonly thin and limited in their extent and yield. Bedrock aquifers have limited yield, generally from fractures; groundwater movement is difficult to define. There are no large-scale regional aquifers. The Biwabik Iron Formation is the only source of groundwater for many Iron Range cities... Over the decades of operations at the LTVSMC tailings basin, thousands of gallons per minute of polluted tailings basin water were discharged through the bottom of the basin into groundwater... The monitoring wells that do exist near the tailings basin have concentrations of pollutants including iron, sulfate, manganese, aluminum, and fluoride that exceeded drinking water standards. But because of the limited distribution of monitoring wells, the extent of the existing contaminant plume is not known. No bedrock monitoring wells have been drilled in the vicinity of the tailings basin. However, domestic wells near the northern property line show substantial contamination of the groundwater aquifer... Despite this, the SDEIS entirely skirts the question of overall impacts on the groundwater aquifer from putting an already-contaminated [tailings basin] site back into production... Blasting and shoveling ore will increase both the number of fractures and the connectivity of fractures potentially increasing baseflow and pit leakage into the bedrock layers below the bottom of the pit.</p> | <p>Tailings Basin. The solute release rates from tailings (NorthMet Project Proposed Action and existing LTVSMC) were based directly on laboratory measurements conducted on representative samples of these two materials, including tailings generated as part of the Proposer's processing and metallurgical pilot-testing. Specific measurements included total concentrations of metals and other elements in the tailings (e.g., based on elements extracted in dissolution by a strong acid "aqua regia" digest), or for the more soluble constituents, the rate at which they leach in multi-year humidity cell tests (Table 1-13 of PolyMet 2015j, as cited in the FEIS). Modeled groundwater concentrations at the Plant Site of the NorthMet Project Proposed Action are described in Section 5.2.2.3.3. This assessment of the GoldSim results provides strong evidence that the NorthMet Project Proposed Action would not cause impacts to Plant Site groundwater quality above and beyond what would occur without the NorthMet Project Proposed Action. Moreover, bedrock monitoring wells are likely to be included in the water quality permit. Case histories of open pit excavations show that effects of blasting and shoveling do not extend very far from the pit walls, extending at most, several tens of meters.</p> | <p>WR 060<br/>WR 071</p> |
| 9056       | <p>Project baseline data used for both the Mine Site and the Tailings Basin are insufficient. A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor in the area of basic hydrology, much less mitigation. Moreover, given the utility of the many existing studies of area hydrology, it is perplexing that the preparers have continually refused to use them, even as tribal cooperating agencies have repeatedly</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>The Co-lead Agencies rely upon the expertise and experience of their staff who bring to bear their knowledge of various studies and analyses performed on mine sites in Minnesota and elsewhere. This knowledge is applied in the review of documents prepared to evaluate the NorthMet Project Proposed Action potential effects. It should be noted that the NorthMet Project Proposed Action is different from other mining projects in this part of Minnesota in the following ways: different ore type, designs for groundwater containment systems, and use of long-term mechanical treatment. While experiences gained on other projects are informative, they do not necessarily apply to the NorthMet</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>WR 023<br/>WR 071</p> |

|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
|            | <p>requested that they be used. Just a few publicly available examples include: the Minnamax Project; the LTVSMC Dunka Pit; historic MNDNR fisheries documents; and data required under the Cliffs Erie Consent Decree. All these resources should be used to supplement the hydrologic analysis and fully inform the permitting agencies and the public.</p> | <p>Project Proposed Action. This is particularly true for groundwater containment systems because the NorthMet Project Proposed Action uses a design that differs from those at other Iron Range mine sites.</p> <p>The mitigation designs of the NorthMet Project Proposed Action are unlike measures discussed in the Regional Copper-Nickel Study (MSPA 1979, as cited in the FEIS). The NorthMet Project Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater containment systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet Project Proposed Action Site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the NorthMet Project Proposed Action Site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. In fact, the unique designs and high-quality construction measures proposed are a response to past events.</p> <p>The detailed and sophisticated modeling work performed to support the FEIS exceed those conducted for some existing mines in Minnesota. The models used for the NorthMet Project Proposed Action represent years of development, with input from PolyMet, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modifications were made to the models to improve FEIS impact evaluations. It is the Co-lead Agency position that incomplete or inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling to be used in the NorthMet FEIS.</p> <p>The FEIS reflects consideration of information pertaining to the Dunka Pit that was directly relevant to the NorthMet Project Proposed Action. It is noteworthy that many aspects of operations at the Dunka Pit are dissimilar to the NorthMet Project Proposed Action in terms of hydrogeology and mine design.</p> |                                                                               |
| 9059       | <p>The proponent's claim that 90 percent of the seepage from this tailings basin can be captured is unrealistic, to say the least. Tribes requested any example of the "90 percent or better" capture efficiency rate to be provided by the Co-Lead Agencies, but they were not able to provide a single example anywhere in the world. In fact, the</p>      | <p>The design of the Tailings Basin capture system includes 1) a slurry wall keyed into bedrock, 2) a collection trench on the tailings side, 3) permanent pumping of the collection trench to depress the groundwater level on the tailings side, and 4) a discharge pipe on the downgradient side to raise groundwater levels to near ground surface. As shown by the cross-section MODFLOW models, this design insures a reversal of hydraulic gradients across the slurry wall (complete capture in surficial deposits) and complete</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>WR 017<br/>                     WR 018<br/>                     WR 020</p> |

|            | <p>only authority the Co-Leads have ever cited is from an EPA guidance document that provided: Most barriers in the study have been in place for fewer than 10 years; therefore, long-term performance can only be extrapolated. . . All sites included in the study were existing sites that had vertical barriers and, in many cases, caps. None of the sites has an engineered bottom barrier. Therefore, the effect of leakage through aquitards was not evaluated in this study. That report also indicated that “10% of the containment systems reviewed failed to meet the performance objectives and required corrective action, and 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not.” In other words, even the Co-Leads’ own authority does not support a 90 percent capture efficiency rate here. Actual examples in northeastern Minnesota, from U.S. Steel Minntac and the LTVSMC tailings basin seep SD0026 (the very tailings basin PolyMet proposes to re-use), demonstrate capture rates of less than 60 percent. Elsewhere, and similar to the Project’s proposal, the Zortman-Landusky Mine in Montana installed containment and pump-back systems to be used in conjunction with a wastewater treatment facility. However, they “did not capture all surface and subsurface drainage.” The Molycorp, Inc. Mine site in New Mexico concluded that “[t]he pathway for contaminant migration is the leaching of tailing seepage downward from the tailing facility to ground water that migrates through fractures to surface water.” Therefore, it appears extremely unlikely that PolyMet will be able to capture 97 percent of the shallow seepage and 90 percent of the deep seepage from an unlined, leaking tailings basin.</p> | <p>or very high capture efficiency in bedrock below the slurry wall. The examples cited in the comment for Northeastern Minnesota are very different designs and cannot be compared to the proposed design for the Tailings Basin. Modeling performed for the NorthMet Project Proposed Action capture system indicates that the overall capture efficiency would be substantially greater than 90%.</p> |          |

| 9062       | <p>The SDEIS provides that seepage from the existing LTV tailings basin continues to drain south to Second Creek long after LTVSMC operations have ceased. Because the seepage will continue to be pumped back under the PolyMet Proposed Action, it “is not considered further in this discussion.” In Chapter 5, the SDEIS ensures the reader that the seepage collection system installed at the south side of the existing tailings basin has “essentially eliminated the flow of Tailings Basin seepage into Second Creek.”</p> <p>However, the Project proponent is well aware that that the seepage pump-back system is not nearly as effective as claimed in the SDEIS. Because the pump-back system hasn’t created the water quality improvements that were needed, the current owner of the tailings basin, Cliffs Erie, now offers two proposed modifications: (1) dewater the pond that is an additional source of water contributing to water quality concerns (pending an EPA wetlands determination); or (2) create another barrier (dam) for collection and pump back between the existing dam and monitoring station SD026. Contrary to SDEIS claims, all of the seepage from SD026 is not being captured and therefore must be considered further in the SDEIS and project modeling. In fact, most of the tailings basin seepage flowing to SD026 is not being captured. Additional work will have to be done to achieve desired water quality improvements. It is unknown at this time if the modifications to the seepage capture system that have been proposed for SD026 will result in the required water quality improvements, or substantially increase capture efficiency. Contrary to SDEIS claims, all of the seepage from SD026 is not being captured and therefore must be considered further in the SDEIS and project modeling.</p> | <p>It is acknowledged that there is currently incomplete capture of impacted water at SD-026. The FEIS has been modified to reflect this fact. Cliffs Erie is currently addressing this issue by upgrading the performance of the existing capture system and, if necessary, constructing new systems to enhance capture. If 100% capture is not attained by the Cliffs Erie upgrades, PolyMet has committed to installing additional systems in Second Creek to achieve this level of performance regardless of the types of measures required.</p> | WR 117   |
| 9063       | The SDEIS provides that construction of a                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The FEIS relies on revised cross-section models from the SDEIS to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | WR 010   |

|            | <p>groundwater containment system along the north, northwest, and west sides of its unlined tailings basin “would capture virtually all of the Tailings Basin seepage”... without installing a single monitoring well in the bedrock to test this assumption...the SDEIS’s conclusion that the method would be effective essentially is unsupported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in PolyMet 2015j (as cited in the FEIS). These new models consider the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed capture system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin capture systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed capture system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation, and depth to top of bedrock. This information was used to develop MODFLOW cross-section models at three locations on the alignment to assess capture efficiency. The models included bedrock below the slurry wall.</p>                                                                        | <p>WR 018<br/>                     WR 061<br/>                     WR 071<br/>                     WR 079<br/>                     WR 090<br/>                     WR 099<br/>                     WR 108</p> |
| 9069       | <p>Moreover, the tailings basin model uses storage coefficients that are not found anywhere in peer-reviewed scientific literature. This is significant because how much groundwater a geologic formation can contain (storativity or storage coefficient) and the rate of flow (hydraulic conductivity) is a function of the amount of open-pore spaces or fractures/faults in rock, the amount of water that infiltrates from the surface, and the groundwater gradient. The storage coefficients claimed for the entire plant site including the tailings basins is 0.20 for bedrock and 0.0002 for the surficial deposits, meaning that the bedrock contains orders of magnitude more water than the surficial deposits. When questioned about these extraordinary storage coefficients the explanation was that the model was calibrated to match predicted and measured groundwater levels. In sum, this model simulates a bedrock storage tank where lots of water goes in and virtually nothing</p> | <p>In response to these issues, the Plant Site MODFLOW model was modified and recalibrated as follows:</p> <ol style="list-style-type: none"> <li>1) Updated areal distribution of surficial deposits and bedrock outcrops,</li> <li>2) established surficial deposits below and adjacent to the East Embankment,</li> <li>3) used drain and river cells along the East Embankment to allow surface seepage of tailings water,</li> <li>4) incorporated the hydrologic effects of the future swale to drain surface water from the East Embankment area,</li> <li>5) recalibrated model material properties and boundary conditions using all available data through 2013 (this is mostly new hydraulic head information), and</li> <li>6) expanded the use of river and drain cells to provide a more accurate representation of wetlands outside the Tailings Basin.</li> </ol> <p>As a result of these changes, the FEIS Plant Site MODFLOW model no longer has a no-flow boundary condition at the toe of the East Embankment, and river and drain cells in surficial deposits are in place to allow the potential for surface seepage along the embankment toes (See Attachment A, Plant Site Water Modeling Data Package [PolyMet 2015], as cited in the FEIS). The model was checked to ensure that hydraulic heads in the tailings and adjacent surficial deposits were not well above ground surface. In the FEIS Plant Site MODFLOW model, storage</p> | <p>WR 018<br/>                     WR 019<br/>                     WR 093<br/>                     WR 095<br/>                     WR 097</p>                                                                 |

|            | <p>comes out. Because this is not possible, these modeled hydraulic conductivity and/or modeled storage coefficients cannot reliably estimate the amount of seepage that will bypass the seepage capture system, nor the amount of time before seepage upwells in nearby wetlands or in the Embarras River. Additionally, the model, although using “artesian” coefficients, does not allow the artesian water to surface, even in an area east of the tailings basin where head pressure suggests that the water would be 150 feet above the ground surface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                               |
| 9073       | <p>There is unquestionably a need for a slurry wall at the existing tailings basin if it is to be re-used by PolyMet - but in order to work even reasonably well, it would have to be flawlessly “keyed” into the bedrock without creating new fractures, and operate at an unrealistically high efficiency, in order to capture most of the seepage from the surficial aquifer. As noted previously, “[t]he pathway for contaminant migration is the leaching of tailing seepage downward from the tailing facility to ground water that migrates through fractures to surface water, and even though the SDEIS states that 90% of the seepage from the surficial aquifer will be captured there are no plans to capture any seepage flowing through bedrock fractures. In fact, bedrock is the part of this seepage capture system that is supposed to prevent seepage from escaping from the east side of the tailings basin. At the Plant Site, most groundwater flow occurs in an unconfined surficial groundwater system composed of unconsolidated sands, silts, and clays, and has a saturated thickness on the order of 7 meters. Below the surficial groundwater system is a low-permeability fractured bedrock unit consisting of several rock types. Groundwater flow rates in the bedrock unit are much less than flow in the overlying surficial groundwater</p> | <p>The design of the Tailings Basin capture system includes 1) a slurry wall keyed into bedrock, 2) a collection trench on the tailings side, 3) permanent pumping of the collection trench to depress the groundwater level on the tailings side, and 4) a discharge pipe on the opposite side to raise groundwater levels to near ground surface. As shown by the cross-section MODFLOW models, this design insures a reversal of hydraulic gradients across the slurry wall (complete capture in surficial deposits) and complete or very high capture efficiency in bedrock below the slurry wall. The model results predict that the overall capture efficiencies of the proposed Tailings Basin capture systems would be substantially greater than 90%. The design and modeling analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> | <p>WR 019<br/>                     WR 020<br/>                     WR 102</p> |

| 9074       | <p>system.</p> <p>“Semi-analytical flowpaths” for the tailings basin have been constrained in the Modflow model so that water cannot seep out of the east side of the tailings basin. However, winding underneath the east side of the tailings basin is a bedrock valley that used to be the headwaters of Trimble Creek...More water likely flows out of the east side of the tailings basin than does out the southern toe at monitoring site SD026. Therefore, without constructing the slurry wall containment system around the east end of the tailings basin, hundreds of gallons per minute of polluted water will drain into the Embarrass River watershed.</p> | <p>The water quality modeling has been updated for the FEIS to include the potential for water to seep from the east side of the Tailings Basin. The FEIS Section 5.2.2.3.3 describes that a containment system would be constructed around a portion of the east side of the Tailings Basin for seepage collection.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>WR 102<br/>WR 104<br/>WR 133</p> |
| 9077       | <p>Even though the PolyMet project proposes to use a double-liner to prevent leakage from the [HRF], head pressure from the existing seeps and springs at this site mean that the liners, even installed perfectly will not last long before rupturing.</p>                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Monitoring and maintenance would include routine inspections of the Hydrometallurgical Residue Facility, including the liners and collection system. The Residue Management Plan (PolyMet 2014r) presents the monitoring and maintenance plan proposed for the Hydrometallurgical Residue Facility at this time. Additional monitoring and maintenance requirements would be outlined by the responsible regulatory agency as part of facility permitting.</p> <p>The liner system components have been selected specifically to perform well, given the characteristics of the residue, which consists primarily of gypsum. The liner system components selected for the Hydrometallurgical Residue Facility are routinely used for similar facilities in other industries and have demonstrated the expected levels of performance. The design produces a liner system with virtually no leakage due to the system’s ability to maintain a very low hydraulic head on the composite liner portion of the overall liner system.</p> <p>The two liner layers on the Hydrometallurgical Residue Facility would be separated by a leakage collection system, which is designed to collect any potential leakage from the bottom of the cell, as well as leakage from LTVSMC Cell 2W. Each liner layer would consist of a geomembrane layer above a geosynthetic clay layer. A drainage collection system would also be installed during reclamation to collect drainage above the upper liner. The cap would consist of a geotextile fabric, overlain by a clay barrier layer, and a 40-mil low-density polyethylene layer. This would be covered with additional LTVSMC coarse tailings or common borrow and cover</p> | <p>PD 17</p>                        |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | soils to sustain a vegetated cover. During reclamation and long-term closure, leakage would be routed and cycled through the Plant Site WWTP. The FEIS includes additional details from the updated Residue Management Plan.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                            |
| 9081       | 20 feet of pit wall will never be submerged and as such constitutes a perpetual source of mine related contaminants. Because of continued inputs from the stockpiles, the tailings basins, and the pit walls, the pit lake could exceed surface water quality standards for thousands of years. Therefore, it is likely that the wastewater treatment facility ("WWTF") would need to operate for thousands of years in order to treat leachate from the tailing basin, stockpiles, and contaminated pit water. | <p>When the West Pit Lake water level reaches the outlet elevation (between 1573 and 1578 ft amsl), ~200,000 ft<sup>2</sup> of wall rock would remain above the water level and exposed to the atmosphere, including some Category 1, Category 2/3, Category 4 Duluth Complex, and ore (See Figure 1-4 and Figure 1.3b, respectively, in Barr 2012c, as cited in the FEIS). The load to the West Pit Lake produced by oxidation in this wall rock above the lake surface is incorporated explicitly in the GoldSim model of the Mine Site. The model estimates for loads from each wall rock type (along with other sources to the West Pit) are presented in Attachment I, figures I-02-01.2 through I-02.27.2 in PolyMet 2015m (as cited in the FEIS). The estimate of load from exposed wall rock in the West Pit Lake decreases over time in the GoldSim Mine Site model, reflecting the depletion of sulfide minerals in wall rock by oxidation. Wall-rock loading continues beyond mine-year 40, when the West Pit would be full; but for most solutes the predicted wall rock loading is much smaller than the load expected for water flow to the West Pit Lake from the East Pit wetland. Thus results presented in the FEIS, including predicted solute concentrations in the West Pit Lake, the West Pit groundwater flowpath, and the Partridge River, do include the load from wall rock exposed above the pit lake surface.</p> <p>Water quality modeling performed in support of the FEIS indicates that water treatment systems in some form and at some scale would be needed at the Mine Site and Plant Site indefinitely. The water models constructed to assess the potential effects from the NorthMet Project Proposed Action were not designed to predict the duration of treatment nor do they capture all the factors that influence the duration of treatment, for example potential future regulatory and technological changes. Therefore, the models cannot be used to predict a year treatment would end. Actual treatment requirements would be assessed on a reoccurring basis throughout operations and closure based on results of ongoing discharges, performance and water resource monitoring ensuring continuous protection of ground and surface water quality and compliance with applicable water quality standards. This reassessment process would rely on measured monitoring results (evaluated through modeling) rather than the results of the</p> | WR 035<br>WR 036<br>WR 173 |

| 9083       | <p>As stated previously, many mitigation measures were not identified in the SDEIS, including the LEDPAs, nor are they evaluated using the required NEPA “hard look.” There is no agency-preferred alternative identified in the SDEIS either. Combined, this makes it exceptionally difficult, and meaningless, to provide any input on the 404 permit or the corresponding 401 certification.</p> | <p>predictive modeling included in the FEIS. Regardless of the precise duration of effects or water treatment at either the Mine Site or Plant Site, there are adaptive and contingency mitigation measures available to address unexpected impacts to water resources.</p> <p>Neither Minnesota Rules nor CEQ regulations require the Co-lead Agencies to identify a preferred alternative in the SDEIS (40 CFR 1502.14(e)). The FEIS includes available details regarding the identification of an Agency Preferred Alternative. The FEIS contains sufficient information to identify and substantiate the LEDPA. The USACE is not required to identify a LEDPA in the FEIS; the final determination on the LEDPA would be made in the ROD for the USACE, which serves as the USACE’s decision document and the basis for the Department of the Army permit decision. The USFS would utilize the FEIS to show the factors relating to how the public interest would be served by the Land Exchange and the ROD for the USFS would incorporate the findings of those factors and identify the preferred alternative. The MDNR is not required to identify a preferred alternative under MEPA. The FEIS Sections 3.2 and 3.3 further detail this process.</p> <p>The agency preferred alternative and LEDPA process is described in FEIS Sections 7.4 and 7.5. The ROD would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD would recommend issuance, issuance with conditions, or denial of the Project.</p> <p>The USACE is not anticipating the need to re-issue the Section 404 public notice for the NorthMet Project Proposed Action. However, MPCA would need to re-issue the Section 401 public notice for the Project. Under the provisions of the Clean Water Act, the MPCA has one year from the public notice (December 3, 2014) to act upon an application for 401 Certification. However, the MEPA (Minn. Stat. 116.04, subd. 2b) and rules regarding environmental review (Minn. R. 4410.3100) prohibit final agency decisions, such as the Section 401 Certification, until all environmental review steps are completed. The environmental review process being undertaken by the Co-lead Agencies would not be completed within the one year time frame for issuance of the Section 401 Certification. Therefore, PolyMet has made a procedural decision to withdraw the Section 401 application before MPCA and resubmit it in the near future to allow for</p> | COE 04   |

|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 20089      | <p>After an agency preferred alternative and the LEDPAs are identified, the USACE should re-notice the 404 permit and MPCA should re-notice the 401 certification.</p>                                                                                                | <p>processing of the application.</p> <p>The agency preferred alternative and LEDPA process is described in FEIS Sections 7.4 and 7.5. The ROD for the USACE will include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD. The ROD for the USACE will recommend issuance, issuance with conditions, or denial of the Project.</p> <p>The USACE is not anticipating the need to re-issue the Section 404 public notice for the NorthMet Project Proposed Action. However, MPCA will need to re-issue the Section 401 public notice for the Project. Under the provisions of the Clean Water Act, the MPCA has one year from the public notice (December 3, 2014) to act upon an application for 401 Certification. However, the MEPA (Minn. Stat. 116.04, subd. 2b) and rules regarding environmental review (Minn. R. 4410.3100) prohibit final agency decisions, such as the Section 401 Certification, until all environmental review steps are completed. The environmental review process being undertaken by the Co-lead Agencies will not be completed within the one year time frame for issuance of the Section 401 Certification. Therefore, PolyMet has made a procedural decision to withdraw the Section 401 application before MPCA and resubmit it in the near future to allow for processing of the application.</p> | COE 04   |
| 9091       | <p>There has been no analysis of the 1854 Ceded Territory as a discrete area of impact. The Band continues to ask that it be included. Tribal Cooperating Agencies believe the Cumulative Effects Analysis for land use should encompass the 1854 Ceded Territory</p> | <p>The Co-lead Agencies have previously consulted with the Bands on the 1854 Ceded Territory as a discrete area of impact (i.e., traditional cultural property) and its use as an expanded area for determination of potential resource-specific Project effects. With regards to the 1854 Ceded Territory as a discrete area of impact, the Cultural Resources sections of FEIS Chapters 4 and 5 address the Co-lead Agencies' consideration of the 1854 Ceded Territory as a traditional cultural property. With regards to the 1854 Ceded Territory's use as the cumulative effects analysis area for land use, the vast majority of the 1854 Ceded Territory, along with the potential resources that may be within these areas, would not be directly or cumulatively affected by the Proposed Connected Actions. At this time, the Co-lead agencies believe that additional identification and evaluation efforts within these areas would be outside of the scope of this review. The Land Use section of FEIS Chapters 4, 5, and 6 address the Co-lead Agencies' determination of the NorthMet Project Proposed Action's direct, indirect, and cumulative areas of potential effect.</p>                                                                                                                                                                                                                                                                                                                                                             | PER 08   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                 | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Theme(s) |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 9093       | Tribal Cooperating Agencies consider a 216,300 acre area bounded by the St. Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources.                                                                                                    | <p>The historic district proposed by the Grand Portage Band in a June 27, 2013 letter was addressed. The federal Co-lead Agencies have considered an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the CEAA. Use of the 1854 Ceded Territory as the CEAA for cultural resources would actually diminish the significance of any cumulative effects. By evaluating the effects of the NorthMet Project Proposed Action along with other past, present, and reasonably foreseeable future projects in the context of a much larger area with a much larger number of resources similar to those affected by the NorthMet Project Proposed Action, the effect of the NorthMet Project Proposed Action on those resources is diminished. The cumulative effects analysis focuses on the specific resources, or types of resources, affected by the NorthMet Project Proposed Action within an area that is geographically meaningful considering the project under review.</p> <p>Cumulative effects are discussed and addressed differently based on the affected resource. Discussions related to socioeconomic, for instance, use an expanded analysis area compared to other resources. Such expanded analysis areas are used as appropriate. The Cultural Resources sections in FEIS Chapters 4, 5, and 6 address the Co-lead Agencies' determination of the NorthMet Project Proposed Action's direct, indirect, and cumulative areas of potential effect.</p> | CR 04    |
| 9097       | The SDEIS also fails to analyze cumulative effects on water quality and quantity. The relevant spatial scale for water quality and hydrologic cumulative effects analysis is the entire St. Louis River watershed.                                                                                                                                                                      | <p>The cumulative effects section in the FEIS (Section 6.1.1.1) describes the rationale for the identification of Cumulative Effects Assessment Areas (CEAAs). The CEAAs for individual resource areas vary based on the potential for cumulative effects, and not on a single overall assessment area. FEIS Table 6.1.1-2 summarizes the spatial areas used for each resource area.</p> <p>Please also refer to Section 8.3, MDO 12 for the Co-lead Agencies' rationale for the CEAA identified for water resources.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CU 01    |
| 9101       | Also missing is cumulative-impacts analysis of culturally-important plant and animal species that are listed as "Species of Concern." There is no basis to dispute that the Project will have cumulative effects on the moose herd and Tribal harvest in the 1854 Ceded Territory. At a time when moose populations in Minnesota are declining, this analysis is particularly important | <p>The FEIS wildlife sections provide an analysis of wildlife species used for subsistence/harvest, as well as those culturally important to the Bands. FEIS Section 4.2.9.3.3 identifies species potentially harvested in the 1854 Ceded Territory, while FEIS Section 5.2.9.2.2 explains that a lack of data regarding use of such species in the NorthMet Project area likely indicates limited present day use in that area due to general inaccessibility. FEIS Section 5.2.5.2.5 discusses the types of potential effects to common and/or game species, which are similar to effects on ETSC species. The FEIS has</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | WI 03    |

|            | and should have been done as part of this SDEIS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | been revised to include additional detail regarding moose, and this discussion has been moved to the state ETSC species discussion, due to its new state listing status.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |          |
| 9104       | The Cumulative Effects Assessment Area defined by the Co-Leads for impacts to aquatic species is overly limited. It includes only the Partridge and Embarrass Rivers...The appropriate spatial scale for considering cumulative impacts to aquatic species is the entire St. Louis River watershed and Lake Superior Basin.                                                                                                                                                                                                                                                                       | The NorthMet Project Proposed Action is not considered to have the potential for cumulative effects on hydrology and water quality in the lower St. Louis River Watershed (below the confluence with the Embarrass River). As a result, the Cumulative Effects Assessment Area (CEAA) for aquatic species is defined by the Partridge River and Embarrass River watersheds.                                                                                                                                                                                                                                                     | AQ 26    |
| 9105       | The SDEIS states that the current fish tissue concentration in five local lakes results in Hazard Quotients (“HQs”) that exceed 1, but gives no further information...In fact, Barr Engineering’s July 2012 “Cumulative Impacts Analysis, Local Deposition and Bioaccumulation in Fish” showed modeled contributions from both the Mesabi Nugget Large Scale Demonstration Plant (“LDSP”) on the site and PolyMet. And the Barr report further provides the actual HQs, rather than just saying “they exceed 1.”...This information should be explicitly included in the SDEIS for public review. | Information pertaining to the specific Hazard Quotients summarized in Barr 2012b (as cited in the FEIS) has been included in FEIS Section 6.2.6, summarizing the cumulative effects assessment for mercury deposition.                                                                                                                                                                                                                                                                                                                                                                                                          | MERC 02  |
| 9107       | Meeting ambient noise standards is a different question than assessing impacts. Impacts should be fully characterized and contour maps showing overlapping noise pollution from different projects provided. Without this information, it is not possible to review the cumulative impacts of noise.                                                                                                                                                                                                                                                                                              | FEIS Section 6.2.8 has been updated, and provides more detailed analysis on the cumulative noise and vibration impacts on nearby residents and recreational visitors. In addition, see the response to theme N 03.                                                                                                                                                                                                                                                                                                                                                                                                              | N 03     |
| 9109       | The cumulative risk analysis of transportation of hazardous materials has not been analyzed. This should include rail car spills, pipeline ruptures, and truck transport accidents.                                                                                                                                                                                                                                                                                                                                                                                                               | FEIS Section 5.2.13.2.1 addresses transportation and incident response of hazardous materials.<br><br>Accidental spills or incidents resulting from rail or truck transportation of hazardous material or any materials would initially be assessed by the nearest local community fire department or other emergency responder, using the 2012 Emergency Response Guidebook (PHMSA 2012, as cited in the FEIS), if necessary. The NorthMet Project Proposed Action would not involve the use of pipelines for hazardous materials. Depending on the severity of the local responder’s initial assessment, additional resources | HAZ 06   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                  | may be requested via the State Duty Officer and/or the National Response Center. If needed, the Homeland Security and Emergency Management Division of the Minnesota Department of Public Safety, along with other appropriate state and federal agencies and the carrier company, among others, would be notified. Additional emergency resources would come from the City of Duluth-based HazMat team.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                         |
| 9111       | Post-closure impacts should also be included in the cumulative effects analysis because some mine features (e.g., pit lakes) would become permanent features of the landscape.                                                                                                                                                                                                                   | The FEIS describes the cumulative effects of the NorthMet Project Proposed Action, including those expected during closure and post-closure. The FEIS discloses post-closure effects in Section 6.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CU 16                   |
| 9115       | A key piece of the work that still has not been completed, despite some progress, is the traditional cultural property (“TCP”) studies...An appropriate investigation of the Project site using this standard, and in cooperation with all involved THPOs, must be performed and properly documented. As noted in the chapter, consultation is underway on this topic, but is far from complete. | The federal Co-lead Agencies have made a reasonable and good-faith effort to identify cultural resources potentially affected by the NorthMet Project Proposed Action. The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting on the NorthMet Project Proposed Action. Historic properties affected by the NorthMet Project Proposed Action have been identified and the impacts to those properties have been assessed through the traditional Section 106 methods/process. This also includes an assessment of actual use of those historic properties, as well as other resources in the APE, by tribal members. In addition to traditional methods, elder interviews were conducted in 2010 and 2011 with members of the Bois Forte, Fond du Lac, and Grand Portage. Elders recalled that some Band members had utilized the general NorthMet Project area for hunting, fishing, and plant gathering of wild rice, maple-sugar, berries, and birch bark; however, they could not provide specific locations or uses within the NorthMet Project area. The federal Co-lead Agencies also conducted reconnaissance of trail corridors with participation from the Bands. The purpose of the traditional research and survey was to provide historic documentation and context for and to identify places important to the Bands. The elder interviews were to be used to further identify and understand tribal use areas and places of importance. The field investigation component was informed by the results of those efforts. | CR 05<br>CR 06          |
| 9117       | The SDEIS must include language to the effect that the Band continues to take the position that the Ceded Territory is itself a TCP and does not agree with the USACE’s determination that it is not.                                                                                                                                                                                            | FEIS Section 4.2.9.2.3 states that the “the consulting Bands [have] proposed the 1854 Ceded Territory as a historic property.”                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | CR 02<br>CR 05<br>CR 06 |

|             | <p>cultural resources is divided into two separate sections surrounding the proposed mine site and the proposed plant site. These areas do not encompass the true extent of the APE...Until the cumulative effects analysis of the Project is better represented, the agency preferred alternative is defined, and the LEDPAs identified, it is premature to delineate the APE.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>area in which cultural resources may be affected by the NorthMet Project Proposed Action. The APE takes into account both direct and indirect effects using a geographically expansive area that accounts for direct effects, as well as visual, audible, atmospheric, hydrological, and water quality effects. The APE is based on extensive modeling and other analysis completed for the NorthMet Mining Project and Land Exchange and includes an area much broader than the Plant Site and Mine Site. Since the SDEIS, the APE has been modified to encompass the proposed Mine Site and Plant Site, the Dunka Road Corridor, several federal parcels included in the Land Exchange Proposed Action, and the Colby Lake Pump house and pipeline.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>CR 03</p>                                                                                                  |
| <p>9124</p> | <p>The Beaver Bay to Lake Vermilion Trail ("BBLVT")... is "associated with the lives of persons significant in our past"... To date, the BBLVT has not been fully researched or rigorously field-verified within the project area. Additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>The federal Co-lead Agencies believe that the work to justify consideration of the BBLV Trail Segment as an historic property is complete. There has been sufficient background research and fieldwork completed to date as discussed in FEIS Section 4.2.9.2.3. A additional research and fieldwork may be part of any resolution of adverse effect.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>CR 05</p>                                                                                                  |
| <p>9132</p> | <p>Wild rice is a culturally significant resource for the tribes in Minnesota. From historical reports, Band member accounts, and current MNDNR and tribal reports, wild rice has declined significantly throughout Minnesota, and in southern Minnesota wild rice has virtually disappeared. The Embarrass River, Second Creek, the Partridge River, and the St. Louis River all contain wild rice beds downstream of the Project...The MPCA has determined that the 10 mg/l standard can be applied seasonally, only when wild rice is in its growing season...Correspondingly, the SDEIS provides: PolyMet is not seeking application of the seasonal component of this standard for the NorthMet Proposed Action as currently proposed and evaluated in this SDEIS. During closure, PolyMet has indicated a desire to transition to non-mechanical treatment once pilot-testing and</p> | <p>The FEIS recognizes the MPCA is overseeing a variety of studies on wild rice beds. At applicable surface water locations, the FEIS evaluated impacts using an impact criteria based on the current MPCA 10 mg/L standard for sulfate concentration in waters used for the production of wild rice. This impact assessment metric is keyed to the current regulation and does not rely upon a seasonal application of the standard for the mechanical or non-mechanical treatment options.</p> <p>It is recognized that MPCA is currently evaluating the current wild rice sulfate water quality standard and as part of that process, new information on potential contributing factors on the growth of wild rice has been generated. However, that information has not yet been holistically reviewed in the context of its possible influence on the wild rice standard. Future change to the wild rice sulfate standard, if any, is speculative and outside the scope of the FEIS; applying research findings outside the basis of the current rule is not appropriate.</p> <p>The FEIS includes descriptions of the Plant Site WWTP and Mine Site WWTF, both of which would be capable of discharging treated wastewater at concentrations at or below 10 mg/L as demonstrated by pilot-testing</p> | <p>VEG 04<br/>                     WR 152<br/>                     WR 153<br/>                     WR 157</p> |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Theme(s) |

|            | <p>modeling indicate water quality standards could be met, which potentially could include application of the wild rice seasonal standard, but these are beyond the scope of this SDEIS. . . Several other sections indicate that the Project closure goal is to transition from mechanical water treatment to passive water treatment systems. . . The Band fundamentally disagrees with any seasonal sulfate release in wild rice waters, whether now or later. There is no scientific basis for stating that seed is not affected by high sulfate levels while it lays dormant over the winter, or that the effects of high-sulfate water would not remain or continue into the summer. . . Field data collected by Barr Engineering in 2011 indicates that mining effluent has already impacted the Embarrass River, exceeding the Minnesota WQS criteria for the protection of wild rice by orders of magnitude. Any language casting doubt on the current applicability of this standard, or suggesting that seasonal discharge is acceptable, should be removed. Wild rice in the Embarrass River endures despite degraded water quality. . . Impacts to wild rice in the vicinity of the Project must be more rigorously analyzed and reported, and cumulative impacts to wild rice in the 1854 Ceded Territory also need to be addressed. The Project must also provide mitigation for impacts to wild rice.</p> | <p>already conducted. More detailed information on these treatment systems would be available as part of the permitting process. However, should a more stringent standard be developed in the future, operation of the reverse osmosis treatment systems can be adjusted to meet a more stringent effluent limit.</p> <p>FEIS Sections 5.2.2 and 5.2.4 includes a description of the NorthMet Project Proposed Action's effects on wild rice beds. The response to themes WR 152, WR 156, and WR 157 discuss wild rice beds and the sulfate standard for wild rice beds. FEIS Section 5.2.2 states that for MPCA-recommended wild rice beds, the proposed engineering controls would prevent an increase in sulfate concentrations in the Partridge River and would decrease sulfate concentrations in the Embarrass River.</p> |          |
| 9135       | <p>There still has not yet been sufficient evaluation of Band member use of vegetation and other usufructuary resources in the APE, and there is no permissible basis to omit such evaluation where the USA CE and other federal permitting agencies have a trust responsibility to the Band to maintain treaty resources in the 1854 Ceded Territory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>The Cultural Resources sections of FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6 also address effects on, and any proposed mitigation for effects on cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations providing the federal authorities for the review of the NorthMet Project Proposed Action.</p>                                                                                                                            | CR 01    |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>The federal Co-lead Agencies have made a reasonable and good-faith effort to identify natural resources of cultural importance to the federally recognized Bands potentially affected by the NorthMet Project Proposed Action. The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting on the NorthMet Project Proposed Action. This included an assessment of actual use of historic properties, as well as other resources in the APE, by tribal members. Elder interviews were conducted in 2010 and 2011 with members of the Bois Forte, Fond du Lac, and Grand Portage. Elders recalled that some Band members had utilized the general NorthMet Project area for hunting, fishing, and plant gathering of wild rice, maple-sugar, berries, and birch bark; however, they could not provide specific locations or uses within the NorthMet Project area. The elder interviews were to be used to further identify and understand tribal use areas and places of importance.</p>                        |                 |
| 9138       | <p>in the SDEIS Socioeconomics chapter, none of the issues identified [in Executive Order 12898] Executive Order have been addressed...It is the Band's position that any impacts to natural resources will disproportionately affect tribes due to their subsistence consumption of wild rice, fish, and other wildlife, and gathering of traditional plants and medicines within the 1854 Ceded Territory.</p> | <p>FEIS section 5.2.10.2.6 discusses the NorthMet Project Proposed Action's potential Environmental Justice (EJ) impacts, as required by EO 12898. The NorthMet Project Proposed Action is within the 1854 Ceded Territory. FEIS Section 4.2.10.1.6 as well as Table 4.2.9-1 in FEIS Section 4.2.9 summarize available information about subsistence patterns and resources within the 1854 Ceded Territory. Construction of the NorthMet Project Proposed Action would make the Mine Site unavailable for subsistence use. The degree to which construction of the NorthMet Project Proposed Action would affect individual subsistence resources (i.e., fish, game, and plant species) outside of the Mine Site, Transportation and Utility Corridor, and Plant Site is discussed in FEIS Section 5.2.9 (Cultural Resources).</p> <p>FEIS Section 5.2.10.2.6 discusses consumption of fish. Increased mercury concentrations and associated increases in mercury bioaccumulation in fish tissue could constitute an EJ impact for Band members and other subsistence consumers of fish.</p> | SO 09           |
| 17731      | <p>Furthermore, the tailings basin seepage capture rate of 90 percent assumed in the preferred alternative has not been demonstrated anywhere in the U.S. and is simply not possible because the tailings basin was built without a liner. In fact, at the Project site, the existing seepage capture system that was installed as a requirement of the Cliffs Erie Consent Decree for SD026 is so</p>           | <p>The FEIS relies on revised cross-section models from the SDEIS to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in PolyMet 2015j (as cited in the FEIS). These new models consider the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed capture system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | PD 08<br>WR 018 |

|            | <p>ineffective that Cliffs Erie is proposing to build an additional dam and capture system further downstream.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin capture systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed capture system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation data, and depth to top of bedrock. This information was used to develop MODFLOW cross-section models at three locations on the alignment to assess capture efficiency. The models included bedrock below the slurry wall.</p>                                                                                                                                                |                          |
| 17732      | <p>In fact, at the Project site, the existing seepage capture system that was installed as a requirement of the Cliffs Erie Consent Decree for SD026 is so ineffective that Cliffs Erie is proposing to build an additional dam and capture system further downstream. Therefore, paste tailings placed on a liner and covered could have a profound, minimizing effect on pollution reaching the Embarrass River watershed wetlands and the Embarrass River. The SDEIS does not even mention this modern technique used by many mines in U.S. and around the world, without justification. Converting to paste tailings technology from conventional slurry tailings at most mines makes sense both environmentally and economically. Paste tailings use less water; require less land; do not require engineered containment dams; generate less acid and contaminants; reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.</p> | <p>A thickened tailings (paste tailings) alternative (A1) was considered but eliminated in the DEIS and post-DEIS as it was determined not to offer significant environmental benefits over the NorthMet Project Proposed Action.</p> <p>A co-disposal of waste rock and tailings on a lined Tailings Basin alternative (E14) was considered but eliminated in the DEIS because the technical feasibility and cost of doing so were uncertain. Several different Tailings Basin alternatives (TB2-TB6) were reconsidered but eliminated since the DEIS. These Tailings Basin alternatives did not afford meaningful environmental benefits compared to the enhanced engineering controls (seepage collection and RO mechanical water treatment) built into the NorthMet Project Proposed Action. Dry cap seepage was predicted to result in substantially higher concentrations, which would make the future transition from mechanical to non-mechanical water treatment more difficult during post-closure.</p> | <p>ALT 06<br/>ALT 16</p> |
| 17733      | <p>Perpetual pumping of the mine pits to prevent formation of a pit lake is required by the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>An interagency memorandum was prepared regarding the West Pit Water Elevation Alternative (MDNR et al. 2014, as cited in the FEIS). |            | <p>State of New Mexico, Office of Natural Resource Trustee, for the Chino and Tyrone copper mines expressly to protect groundwater and waterfowl.<sup>29</sup> Numerous western mines have discharged plumes of polluted water into the bedrock aquifer from leaking mine pits, tailings basins and waste rock piles, a problem that is not only difficult but expensive to fix. Requiring perpetual pump out of the mine pit would minimize leakage of contaminated water into the surrounding bedrock aquifer thereby protecting groundwater that the State is required to protect as source of drinking water.</p> | <p>alternative includes both the option to maintain a dry West Pit through perpetual pumping and maintaining pit water levels below the elevation of the Partridge River. The alternative was screened against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The screening level assessment concluded that the alternative would meet all criteria except for the environmental or socioeconomic benefit criterion. Continuous dewatering of the West Pit would keep the pit walls exposed instead of covered by a pit lake as in the NorthMet Project Proposed Action. This exposure would potentially result in increased solute loading to a smaller pit lake volume, and thus higher concentrations of pollutants than under the NorthMet Project Proposed Action. Consequently, treatment would be required for a longer period of time. The Co-lead Agencies recommend that the alternative be considered as an adaptive mitigation measure in the event that monitoring during operations and reclamation indicate that implementing this action is better able to meet future environmental objectives compared to the NorthMet Project Proposed Action.</p>                                                                                                                                                                                                                                              |                                                                               |
| 17734      | <p>This alternative would prevent the need for a separate seepage capture system around an unlined waste rock pile, as proposed in the preferred alternative, that would have to work at an above optimum capture rate in perpetuity. Capping and re-vegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation. In combination, perpetual pumping and backfilling the Category 1 waste rock pile would substantially reduce the risk of polluting groundwater and wetlands in the Partridge River watershed.</p>                                                    | <p>The two alternatives are not fully compatible together, as backfilling of the Category 1 waste rock into the West Pit would eliminate the opportunity to perpetually pump the West Pit lake.</p> <p>The West Pit Backfill alternative (E20) was considered but eliminated during the development of the DEIS. It was eliminated from further consideration because it was determined that it would not offer significant environmental or socioeconomic benefits compared to the NorthMet Project Proposed Action and because backfilling the West Pit would prevent recovery of additional mineral resources. These factors are sufficient to qualify the West Pit Backfill alternative as unreasonable under NEPA, and justify its exclusion under <i>Minnesota Rules</i> 4410.2300, Subpart G. It was reconsidered in the SDEIS in response to comments from the Cooperating Agencies. A Co-lead Agency memorandum (MDNR et al. 2013b, as cited in the FEIS) was prepared to summarize the decision-making process, which is referenced in the FEIS Section 3.2.3.4.2. The Co-lead Agencies screened the alternative against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The opportunity to reclaim wetlands and vegetation at the Category 1 Stockpile footprint area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However,</p> | <p>ALT 04<br/>                     ALT 06<br/>                     ALT 13</p> |

|            |                                                                                                                                                                 | <p>because of the temporal impact that the stockpile would have, these impacts would be required to be mitigated regardless of future backfilling or not.</p> <p>An interagency memorandum was prepared regarding the West Pit Water Elevation Alternative (MDNR et al. 2014, as cited in the FEIS). This alternative includes both the option to maintain a dry West Pit through perpetual pumping and maintaining pit water levels below the elevation of the Partridge River. The alternative was screened against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The screening level assessment concluded that the alternative would meet all criteria except for the environmental or socioeconomic benefit criterion. Continuous dewatering of the West Pit would keep the pit walls exposed instead of covered by a pit lake as in the NorthMet Project Proposed Action. This exposure would potentially result in increased solute loading to a smaller pit lake volume, and thus higher concentrations of pollutants than under the NorthMet Project Proposed Action. Consequently, treatment would be required for a longer period of time. The Co-lead Agencies recommend that the alternative be considered as an adaptive mitigation measure in the event that monitoring during operations and reclamation indicate that implementing this action is better able to meet future environmental objectives compared to the NorthMet Project Proposed Action.</p> |          |
| 17735      | <p>The OSLA will contain peat that has sequestered mercury. When water flows through the OSLA the seepage will transport some of the mercury from the peat.</p> | <p>This comment was originally presented as part of the Tribal Position Summary included in MDO 2, which was previously addressed in SDEIS Table 8-1. Further explanation is provided below.</p> <p>Any mercury released from the peat decomposition process is thought to occur relatively rapidly. The mercury released from organic matter decomposition and in solution would have the potential to move with precipitation that falls on the Overburden Storage and Laydown Area. The Overburden Storage and Laydown Area would be unlined; therefore, there would be some potential for seepage to enter the groundwater system from peat that has decomposed and released as a pulse of mercury.</p> <p>Water contacting the Overburden Storage and Laydown Area is considered to be process water and would be routed to Pond PW-OSLA. In years 1 to 11, the water from Pond PW-OSLA would be routed to the Tailings Basin, and any mercury in the routed water would have the chance to be sequestered in the tailings. In years 12 to 20, some of the water from Pond PW-OSLA would be used to backfill the East Pit. Any mercury in the water</p>                                                                                                                                                                                                                                                                                                                                                                                                                                  | MERC 24  |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | routed to the East Pit would mix with waste rock and become sequestered at depth in the East Pit. In addition, any contributions of water in years 21 to 65 from the East Pit to the West Pit would reflect water from the East Pit and its associated watershed runoff, and would not reflect process water from Pond PW-OSLA. Because peat removal from the areas to be mined would be completed between years 5 and 11, any potential release of mercury from stored peat materials would have occurred, or be ending, by the time water is routed from Pond PW-OSLA to the East Pit beginning in year 12. All water that is discharged would meet the GLI mercury standard of 1.3 ng/L.                                                                                                                                                                                                                                                                                                                                     |          |
| 17736      | As the Project is currently proposed, after operations, the mine site wastewater treatment plant will be converted to RO to treat the west mine pit lake and Category 1 stockpile seepage for discharge to the west pit outlet creek that flows into the Partridge River. An alternative that was not considered in the SDEIS would use RO at the plant site to begin with to treat storm water, mine infiltration, and waste rock pile seepage. Using RO treated water for stream and wetland water augmentation in the Partridge River watershed would provide mitigation for the some of the adverse effects of mine pit dewatering. | The WWTP would include an RO treatment unit that would provide mechanical treatment of Tailings Basin seepage during operations and closure and tailings pond water in closure. Some of this treated effluent would ultimately be discharged to several Embarrass River tributaries to augment flow.<br><br>During operations, water from the mine pits and Waste Rock stockpiles would be treated at the WWTF. Effluent from the WWTF and runoff from the Overburden Storage and Laydown Area would be pumped to the Tailings Basin for reuse. During this time, extensive monitoring would be required, and adaptive management would be used to ensure minimization of effects and compliance into the future. During reclamation, water from the West Pit would be treated at the WWTF, which would be upgraded to include an RO treatment unit. Treatment at this unit would result in an effluent that meets all applicable water quality standards. This effluent would ultimately be discharged to the Partridge River. | ALT 13   |
| 17737      | As the Band already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, U.S. Steel, which actually recommended underground mining. 43 PolyMet is well aware of this study, given that the company included it in a 2003 filing with the   | The Underground Mine alternative was first considered but eliminated during the FSDD process. FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet's consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it                                                                                 | ALT 01   |

|            | <p>Securities and Exchange Commission. In fact, by examining cross-sections showing the distribution of ore by depth,45 it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine. The ecological costs of open-pit mining and above-ground disposal of tailings and waste rock are immense. This ecological cost, combined with the most current understanding of deposit ore grades and reasonably possible metals prices, and the costs associated with perpetual treatment must be evaluated to determine the viability of [the underground] alternative.</p> | <p>would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project's Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies' rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>The FEIS Section 5.2.10.1.4 states, "Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may results from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the "cost") of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section." CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, "for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations."</p> |                                     |
| 17738      | <p>the SDEIS does not disclose appraisal information [for the Land Exchange]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Appraisal reports completed in 2013 indicate that the Land Exchange Proposed Action would meet federal value requirements if all five non-federal land tracts (6,722.5 (GLO) acres) offered by PolyMet would be exchanged for 6,650.2 (GLO) acres of federal land. The appraisal reports indicate that Land Exchange Alternative B would meet the federal value requirements if non-federal Tract 1, Hay Lake (4,651.5 (GLO) acres), would be exchanged for a smaller federal parcel of 4,887.34 (GLO) acres. If the ROD approves the Land Exchange, a current appraisal, approved by the USFS, will be required to verify equal value. Copies of appraisal reports and appraisal review reports are not released to parties outside the USFS, except through the Freedom of Information Act (FOIA) process and only after a preferred alternative is selected or a decision is made.</p>                                                                                                                                                                                                                                                                                                                                                                                                                | LAN 03                              |
| 17739      | <p>Of the approximately 6,025 acres of MCBS Sites of High Biodiversity Significance under the Land Exchange Proposed Action, nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate, and therefore effectively lost to the Bands, if the proposed land exchange takes place. This is significant because many tribally harvested</p>                                                                                                                                                                                                                                                                       | <p>FEIS Sections 4.2.4 and 4.3.4 discuss and provide maps of MBS Sites (Figures 4.2.4-1, 4.2.4-2, 4.2.4-5, 4.3.4-1, and 4.3.4-2) to provide clarity on the location and extent. FEIS Sections 5.2.4 and 5.3.4 include information about the impacts to MBS sites and native plant communities. The vegetation analysis cross-references the cultural resources section (5.2.9) to ensure consistency and to discuss potential impacts on tribally harvested resources. FEIS Section 5.2.3 discusses restoration of coniferous bogs in</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | CR 01<br>WET 05<br>WET 14<br>VEG 02 |

|            | resources are only available in coniferous bogs (e.g. cranberries, labrador tea, creeping snowberry), and restoration of coniferous bogs is a very difficult and long process that has extremely low success rates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | mitigation wetlands.<br><i>Minnesota Rules</i> 6132.2700 requires that a project site be reclaimed once mining has ceased. The goals of such reclamation are to “control erosion, to screen mining areas from non-compatible uses, and to provide for subsequent land uses such as wildlife habitat or timber production.” The rules also include requirements about the characteristics and planting schedule for vegetation used in reclamation.<br><br>The WCA rules (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities ( <i>Minnesota Rules</i> 8420.0515, Subpart 3). The Permit to Mine would address special consideration of wetlands that include rare natural communities. Additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions. |                |
| 17740      | The proposed action land exchange would trade water resources within the Lake Superior Basin for wetlands and surface water outside the Lake Superior Basin [resulting in] a loss of 3,791 acres of federally-managed wetlands within the Lake Superior Basin under the proposed exchange.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | The proposed land exchange non-federal lands are not mitigation sites and are not required to be exchanged within the same watershed. The non-federal lands being considered are all lands that are located within the proclamation boundary of the SNF and would consolidate land ownership management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WET 15         |
| 17741      | Furthermore, the SDEIS acknowledges that the Land Exchange Proposed Action would create a “net increase of third-order streams and decrease in first- and second-order streams which would likely add more habitat diversity to the Superior National Forest.” But the SDEIS underestimates the impact of this increase: “Headwater streams are the smallest parts of river and stream networks, but make up the majority of river miles in the United States. Many headwater streams have been lost or altered due to human activities ... and this can impact species and water quality downstream.” The SDEIS states that the decrease of first-order streams to the federal estate would “slightly reduce the amount of available spawning habitat for some aquatic species as headwater streams provide specialized spawning habitat for | The SDEIS and FEIS acknowledge a possibility that habitat could be affected from water chemistry changes resulting from the Land Exchange Proposed Action. Habitat loss from flow changes or riparian activities is not expected as a result of the NorthMet Project Proposed Action.<br><br>It is noted that under the Land Exchange, the net reduction to the Superior National Forest of 0.3 miles of first order streams may result in slightly less habitat available for headwater stream dependent species.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | WR 114<br>AQ29 |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Theme(s)                   |

|            | <p>some species.” Again, this underestimates the impacts. While greater diversity is desirable, protection of headwater streams is critical because they powerfully influence both the character and functions of downstream waters. Headwater streams transport vegetation, woody debris, organic matter, macroinvertebrates, and other organisms downstream, while providing spawning areas for brook trout. Headwaters provide most of the water to rivers, which in turn provides temperature mitigation and oxygenation which are necessary for healthy fish communities.</p>                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                            |
| 17742      | <p>The SDEIS also erroneously concludes that no known cultural resources exist on the nonfederal lands, despite impacts to wild rice waters, and the proposed exchange will not sufficiently compensate for the loss. The Land Exchange Proposed Action would result in additional wild rice beds by the acquisition of Tract 1. Tract 1 contains Little Rice Lake, which supports a continuous population of wild rice. Wild rice also grows along the Pike River south of Little Rice Lake and in isolated populations on Hay Lake. The wild rice waters in Tract 1 are accessible to the Bands via the Pike River. Therefore, adding Tract 1 to the federal estate does not provide additional wild rice harvesting opportunities to Band members in the 1854 Ceded Territory.</p> | <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. The Land Exchange Proposed Action would result in the public ownership of additional wild rice beds by the acquisition of Tract 1. Tract 1 contains Little Rice Lake, which supports a continuous population of wild rice. Wild rice also grows along the Pike River south of Little Rice Lake and in isolated populations on Hay Lake.</p> <p>Section 4.3.4.2.5 provides further discussion of wild rice beds on Tract 1. As a result, the public would have better opportunities for wild rice harvesting on Tract 1, where there is currently no opportunity to harvest wild rice directly on the federal lands (i.e., no known wild rice populations) despite the public water access onto the federal lands. A carry-down boat launching access is located on Tract 1, which may provide private access for wild rice harvesting on the Tract 1 lands. Access to wild rice beds on the federal lands would not be lost as a result of the Land Exchange Proposed Action, but access to wild rice beds on Tract 1 would be gained. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange</p> | LAN 05<br>VEG 08<br>WR 155 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                      |
| 17743      | <p>It is commonly acknowledged that “[w]ater has been called ‘mining’s most common casualty’.... Mining affects fresh water through heavy use of water in processing ore, and through water pollution from discharged mine effluent and seepage from tailings and waste rock impoundments.” Acid mine drainage (“AMD”) is one of the greatest environmental liabilities associated with mining, especially in pristine environments like the Project mine site, that have economically and ecologically valuable natural resources. There are no hardrock surface mines that exist today that can demonstrate that AMD can be stopped once it occurs on a large scale. Inaccurate pre-mining characterization and interpretation often results in a failure to recognize or predict impacts to water quality and aquatic life. Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation imparts a substantial and unquantifiable risk to water quality and fisheries. In a report comparing predicted and actual water quality at hardrock mines, there were two types of characterization failures that were key to explaining differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began. These included: 1. Insufficient or inaccurate characterization of the hydrology: The authors reported primary causes of hydrologic characterization failures as overestimations of</p> | <p>The Co-Lead Agencies have requested additional hydrologic and geochemical data and the incorporation of those data into EIS analyses periodically throughout the environmental review process. The criteria the Co-Lead Agencies used to determine what data is included in the FEIS are as follows.</p> <p>Is the updated data:</p> <ul style="list-style-type: none"> <li>• Significantly different than the data already used in the model?</li> <li>• An integral component of a calibrated variable?</li> <li>• Linked to other data such that updating one necessitates updating the other?</li> <li>• Considered background information important to assessing the project’s impacts?</li> <li>• Part of a greater dataset such that updating all of the dataset is necessary for consistency?</li> <li>• A type of input variable where GoldSim is sensitive?</li> <li>• Necessary for permitting-level analyses?</li> </ul> <p>Data collection and use in the FEIS are summarized in various data sufficiency documents.</p> <p>Nevertheless, a degree of uncertainty in the predictions of environmental effects remains, as it would for any study of this type. The Co-Lead Agencies have addressed this uncertainty in several ways. Water quality modeling results (concentrations) are presented in terms of a probability, which communicates the likelihood actual concentrations could be higher or lower than best estimate modeling results. Sensitivity analyses were performed on temperature and precipitation inputs, baseflows in the Partridge River and other inputs to provide greater certainty in the model results.</p> <p>The FEIS identifies monitoring and reliable mitigation measures that have been incorporated in the NorthMet Project Proposed Action, possible improvements to these measures and additional mitigation that could be implemented if effects to water quality are worse than predicted. Additionally, on-going monitoring would be used in modeling to help</p> | <p>AQ01<br/>                     AQ08<br/>                     WR071<br/>                     WR126<br/>                     WR128<br/>                     WR134<br/>                     WR136</p> |

|            | <p>dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size. 2. Insufficient or inaccurate geochemical characterization of the proposed mine: The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy. The primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. The SDEIS suffers from all of these characterization failures. An egregious lack of hydrologic characterization allows PolyMet to pretend that there will be no water pollution resulting from the Project. In fact, the SDEIS arbitrarily concludes water quality will actually improve as a result of the Project. The following is a short list of the problems with water modeling in the SDEIS.</p> | <p>predict any issues before they occur.</p> <p>The Co-Lead Agencies have been working to produce accurate predictions of water quality impacts of the NorthMet Project Proposed Action for nearly a decade. A decrease of concentrations of some water quality parameters at some evaluation locations is not a surprise and PolyMet is adding environmental mitigation measures at an existing tailings basin that has seepage with elevated levels of some water quality parameters.</p> <p>The FEIS considers the release of acidity from proposed NorthMet facilities in that leachate from all acid-generating material (Waste Rock and pit wall rock composed of Category 2/3 and Category 4 material) would be captured and treated prior to discharge. The permanent surficial waste facilities (Category 1 Stockpile and Tailings Basin) would contain material that is not expected to produce acidic leachate. The non-acid generating waste was identified using multi-year kinetic tests (humidity cells) on NorthMet rock samples. Waste rock with 0.12 percent sulfide S or less is the threshold for selecting non-acid generation mine waste and, is supported by long-term humidity cell tests on NorthMet waste (i.e., 42 samples of Category 1 waste rock, with tests now run for over 450 weeks; and 33 humidity cell tests run between 84 and 304 weeks [see Section 4.3 and Attachment E, respectively, of PolyMet 2015q, as cited in the FEIS]). These tests demonstrate that tailings and Category 1 waste rock materials do not generate acidic leachate, and acid generation rates decreases over time as sulfide S minerals are depleted. The NorthMet Project Proposed Action design thus prevents the introduction of acidic leachate to surface water that could affect fisheries.</p> <p>A detailed financial assurance analysis would be part of the permitting phase. The financial assurance process would fully consider long-term monitoring and periodic replacement of equipment including, but not limited to, water treatment hardware and synthetic liners/covers. The Financial Assurance package for the NorthMet Project Proposed Action would insure that future funding would be available if and when adaptive mitigation measures or component replacements are needed to achieve performance specifications.</p> <p>Taking the data, modeling, proposed monitoring, mitigation, adaptive management and financial assurance together, the NorthMet EIS sufficiently discloses and accurately predicts to the degree necessary potential effects to water quality for purposes of environmental review.</p> |          |

|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 17744      | <p>Moreover, data collected specifically for the Project was selectively used, with several well and surface water monitoring stations' data completely excluded from the water quality models used to predict Project impacts. Specifically, all data collected from groundwater monitoring wells GW008 (13 sampling events), GW009 (12 sampling events), and GW010 (9 sampling events), were excluded from the models. These monitoring wells are northeast and north of the tailings basin in between the tailings basin and the Embarrass River. Furthermore, none of the nine surface water quality sampling events collected at PM 11, a sampling station on unnamed creek located northwest of the tailings basin half-way between the tailings basin and the Embarrass River, were used in the Projects models. Also excluded from the models were data from nine sampling events collected at Station PM 12.1 in the Embarrass River upstream of the tailings basins. Instead, the model includes 53 sampling events in the Embarrass River at PM-13.85 PM-13 is 7.3 river miles downstream of the northwest corner of the tailings basin, and 16.2 river miles from monitoring location PM-12.2 - long past the first water quality compliance points in the Embarrass River.</p> | <p>Data at GW-008, GW-009 and GW-010 were not used for water quality modeling because these wells were not considered useful for developing probabilistic distributions for background surficial groundwater quality or establishing concentration targets for the calibration of existing conditions. For example, GW-009 and GW-010 are out in the adjacent watershed away from the tailings basin, impacted both by tailings basin seepage and background surficial groundwater. GW-008 is located essentially at the toe of the tailings basin, but the water quality data suggests it is not primarily tailings basin seepage but a mixture. Chloride data is around 0.8 mg/L to 1 mg/L. Chloride data in background wells is generally less than 1 mg/L if not non-detect at less than 0.5 mg/L. Chloride data in wells composed of seepage show concentrations closer to 20 mg/L. Therefore GW-008 is closer to background water quality with respect to chloride. However, sulfate data in GW-008 does not appear to show concentrations as low as is observed in the other background wells (GW-002 or GW-015 for example). In GW-008, sulfate concentrations are middle teens to nearly 20 mg/L, whereas sulfate data in the background wells is generally below 10 mg/L and closer to 5 mg/L. Therefore, though this well is close to the tailings basin, it appears to be a mix of seepage and background water, and therefore not useful for characterizing one or the other.</p> <p>Model results were checked against the observed data at PM-11, PM-13, PM-19, and MLC-2 in the validation step which had been presented earlier on in the modeling process. The report "Corroboration of Existing Conditions at the Plant Site", dated June 2012, includes a comparison of the model results to the observed water quality data and was reviewed by the agencies and used in the initial reviews of the modeling work to approve the modeling.</p> <p>Data at PM-12.1 was not used because the major sources of water contributing to this location are the natural contributing watershed and outflow at SD033. The water quality data at PM-12 was used to calibrate the water quality of the natural watershed, and the observed data at SD033 was used to define the water quality input to the model. The observed data at PM-12.1 was not needed to define any additional inputs to the model, but perhaps may have been used to validate the model if this specific location had been modeled. However, this location was not included as one of the modeled surface water locations.</p> | WR 072<br>WR 076 |

| 17745      | An additional problem is that the models intended to predict impacts from the Project were not calibrated to existing water quality in Colby Lake. Most of the data used to represent Colby Lake in the model was extrapolated from sampling sites well upstream in the Partridge River.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The Mine Site GoldSim model used for the SDEIS (Barr 2013f, as cited in the FEIS) was modified for the FEIS (Mine Site GoldSim model) (PolyMet 2014v, as cited in the FEIS) include a new chemical loading source in Colby Lake and was calibrated to the measured chemical concentrations in the lake. This calibration considered new surface water chemistry data collected through the end of 2013. The same chemical loading source was applied to both the Continuation of Existing Conditions model and Proposed Action model (PolyMet 2014v, as cited in the FEIS). The chemical loading source was constant and did not exhibit seasonal or long-term variations for future conditions. Incorporation of the loading source addressed the issue by providing predicted chemical concentrations in Colby Lake for existing conditions that are similar to currently measured concentrations. The average arsenic concentration based on 33 samples in Colby Lake is 0.95 µg/L. The GoldSim Continuation of Existing Conditions modeling scenario (PolyMet 2014v, as cited in the FEIS) predicts an average concentration of 0.80 µg/L at P50 over the 200 year modeling period.                                                                                                                                                      | WR 046                               |
| 17746      | Despite this selective use of water modeling data, the SDEIS claims “[t]he NorthMet Project Proposed Action is also not predicted to result in any significant changes to groundwater and surface water flows when compared to existing conditions.” To achieve this prediction, the hydrologic models for the Project were built using modeled inputs rather than actual measurements or estimates from scientific literature. This makes the Project models unable to accurately characterize groundwater flow direction, water tables, potentiometric surface in the aquifers, fluxes to rivers and streams drawdown mounding impacts to the water tables or surface waters, or to predict water quality impacts. The models for the Project must be re-calibrated using all available measured data and scientifically credible basic model inputs. | The GoldSim models are informed by a combination of groundwater flow (MODFLOW) models, surface water runoff (XP-SWMM) models, and direct field measurements (groundwater levels, field borehole tests, groundwater and surface water sampling, and laboratory geochemical tests). For the FEIS, virtually all models (except XP-SWMM) were re-calibrated based on new field data obtained through the end of 2013. Where field data were not available, GoldSim inputs were based on a combination of literature values, experience at similar field sites, and best professional judgment.<br><br>Reliance on site-level data provides a finer scale of resolution than afforded by regional assessments and associated estimates from scientific literature. Potentially important factors that are captured using site-level data include geologic, topographic, and hydrologic characteristics of the Partridge and Embarras Rivers’ basins respectively. The hydrologic assessments reflect: 1) the thin, discontinuous glacial drift; 2) the shallow depth to bedrock; 3) the low, hummocky topography; 4) the extensive wetlands; and 5) the generally shallow groundwater table. The re-calibration step allows for the modeling to achieve the most reasonable range of model inputs and outputs as the basis of impact assessment. | WR 056<br>WR 071<br>WR 086<br>WR 105 |
| 17747      | Chapter 5 of the SDEIS acknowledges that “[t]he NorthMet Project Proposed Action would have the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The GoldSim models are informed by a combination of groundwater flow (MODFLOW) models, surface water runoff (XP-SWMM) models, and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | WR 003<br>WR 052                     |

|            | <p>potential to affect groundwater and surface water hydrology and quality in both the Partridge River and Embarrass River watersheds.” However, the hydrology model that was developed to determine Project impacts relied on outdated data collected too far from the site. Because the Project proponent was not required to install stream gauges at the site, they used a model (XP-SWMM) to extrapolate baseflow far upstream from where the data was collected to the areas where the proposed mine pit(s) and tailings basin would be located. The extrapolated baseflow used twenty-year-old stream gauging data collected seventeen miles downstream of the mine site in the Partridge River, and stream gauging data that is more than fifty years old collected eleven miles downstream of the plant site in the Embarrass River... Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site.</p> | <p>direct field measurements (groundwater levels, field borehole tests, groundwater and surface water sampling, and laboratory geochemical tests). For the FEIS, virtually all models (except XP-SWMM) were re-calibrated based on new field data obtained through the end of 2013. Where field data were not available, GoldSim inputs were based on a combination of literature values, experience at similar field sites, and best professional judgment.</p> <p>Reliance on site-level data provides a finer scale of resolution than afforded by regional assessments and associated estimates from scientific literature. Potentially important factors that are captured using site-level data include geologic, topographic, and hydrologic characteristics of the Partridge and Embarrass Rivers’ basins respectively. The hydrologic assessments reflect: 1) the thin, discontinuous glacial drift; 2) the shallow depth to bedrock; 3) the low, hummocky topography; 4) the extensive wetlands; and 5) the generally shallow groundwater table. The re-calibration step allows for the modeling to achieve the most reasonable range of model inputs and outputs as the basis of impact assessment.</p>                                                                                                                                                                            | <p>WR 071<br/>WR 073<br/>WR 086<br/>WR 091</p> |
| 17748      | <p>During subzero temperatures January 25-26 and February 15-16, 2011, the minimum baseflow measured by the MNDNR in the Partridge River at the point nearest the proposed mine pits was of 3.4 cubic feet per second (cfs). Values calculated by staff from Great Lakes Indian Fish and Wildlife Commission (“GLIFWC”) and MNDNR from low flow stream gauge data in the Partridge River ranged from 1.2 to 1.8 cfs, while the XP-SWMM model predicted a baseflow of 0.5 cfs. Not only is the Project modeled baseflow inconsistent with published literature, none of the measured data supports the baseflow predicted by XP-SWMM at SW003 of 0.5 cfs. XPSWMM’s extrapolation of unrealistically low baseflows was used to calibrate the MODFLOW model and therefore influences virtually all aspects of the Project water quality and quantity characterization and impact prediction, including: groundwater flow rates and</p>                                  | <p>The GoldSim models are informed by a combination of groundwater flow (MODFLOW) models, surface water runoff (XP-SWMM) models, and direct field measurements (groundwater levels, field borehole tests, groundwater and surface water sampling, and laboratory geochemical tests). |            | <p>pit inflow, dewatering impacts to the rivers and wetlands, water treatment needs, contaminant transport times and concentrations, and contaminant dilution. Higher baseflows in the Partridge River indicate that the wetlands and river are connected to the groundwater aquifer, that mine pit inflow will be greater; and that groundwater will travel through the aquifer will occur at a much faster rate. During subzero temperatures January 25-26 and February 15-16, 2011, the minimum baseflow measured by the MNDNR four miles south of the LTVSMC tailings basin in 13.9 to 15 cfs in the Embarrass River. Model estimated the average annual baseflow for the Embarrass River, based on data more than 50 years old, at 8.7 cfs.</p>                                                                                                                                                                                                       | <p>from a station installed during 2011 at SW003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore PMP pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>A sensitivity analysis for the Mine Site was also conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. It also reflected consideration of the flow data collected at SW003 in requiring groundwater baseflows at all locations on the Partridge River be increased by a factor of 4 (e.g., 0.5 to 2.0 cfs at SW-003). The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p>           |                                                                                                                                               |
| 17749      | <p>Surface water quality at the Project remains insufficiently characterized or left uncharacterized, and the defects in analysis in this area are profound. The limited data the SDEIS uses indicates that surface waters have already been adversely impacted by mining activity--which should give rise to more scrutiny, not less. Contaminant transport modeling suggests that the Project will cause manganese, aluminum, and sulfate to exceed Minnesota Water Quality Standards ("MN WQS"). Mercury, sulfate, and specific conductance have already exceeded surface water criteria in surface water samples collected near the tailings basin at nearby Area Pit 5, and mercury and aluminum exceed surface water criteria in the Partridge River downstream of Colby Lake. Aluminum, iron, manganese, and mercury all exceed MN WQS in Colby Lake. Contaminants from the Project will likely contribute additional loading to these existing</p> | <p>The FEIS identifies potential impacts to water resources and measures available to anticipate and control these same impacts.</p> <p>It is a fundamental regulatory premise that water resources are ruled to not be negatively impacted if water quality criteria are met at applicable evaluation locations. If water quality criteria are not met under current non-project conditions, it is ruled that project is not creating an impact if the range and average concentrations are not greater for project compared to non-project conditions and the frequency of exceedances are not greater for project compared to non-project conditions.</p> <p>Surface water quality criteria apply in stream after the groundwater discharge has mixed with ambient surface water (independent of proximity to the NorthMet Project Proposed Action property boundary). The evaluation criteria that are used in the FEIS are based on a combination of health-based water quality standards for drinking water sources (such as groundwater and Colby Lake) and mercury in surface water (fish consumption) and on aquatic life-based standards for surface waters. Evaluation criteria can be found in Section 5.2.2.</p> <p>Groundwater evaluation criteria apply to groundwater at the project property boundary and the GoldSim models predict that these criteria</p> | <p>WR 064<br/>                     WR 075<br/>                     WR 109<br/>                     WR 123<br/>                     WR 197</p> |

|            | <p>exceedances of MN WQS in the Embarrass River, Colby Lake, and the Partridge River. And, as a result of the Project, it appears that arsenic will exceed drinking water standards in Colby Lake. No water samples have been collected from lakes near the tailings basin (including Hiekkilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies. The SDEIS even acknowledges current exceedances: "...the existing LTVSMC Tailings Basin is not lined and currently releases seepage with elevated concentrations of sulfate, TDS, and hardness, among other constituents." It just does not propose any effective means of remediating them.</p>                                                     | <p>would be met. For the different flowpaths, groundwater travel times to groundwater evaluation locations and surface water discharge points are presented in the FEIS, including the times for initial change in chemical concentrations and the times to reach peak concentrations. Once chemicals discharge from groundwater to surface water, it is assumed that migration is instantaneous to surface water evaluation locations.</p> <p>Regarding the lakes listed, sampling of them would not have added substantially to the overall Plant Site characterization for the purpose of impacts assessment. It should be noted that Spring Mine Lake is located upstream of the east side of the Tailings Basin and has been sampled for water quality.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |          |
| 17800      | <p>The Band is profoundly concerned at the preparers' refusal to consider past state agency experience with this site that had disastrous consequences for water quality. The Band has located an MPCA document from the Minnamax Exploration Project, a test shaft drilled into the Duluth Complex, the rock formation where the mine would be sited, by AMAX Corporation in the 1970s, approximately three miles from the Project mine site. This document states that water was encountered 147 feet below the surface infiltrating into the test shaft at approximately 14 gallons per minute and identified another potentially water bearing fracture zone at 900 feet below the surface. This means that the volume of bedrock groundwater that may be encountered by the Project mine pit has been vastly underestimated.</p> | <p>Comments cite MPCA 1976a (Office Memorandum: AMAX Exploration, Incorporated Salt Water Spill. From Curtis Sparks, EIS Coordinator, to Louis Breimhurst, Director, September 8, 1976), which pertains to the historical Minnamax/Ammax exploration project located 1 to 2 miles east of the NorthMet project sites. The relevant text in this memo is as follows:</p> <p>"The depth of the [exploration] shaft, at the time of the inspection was approximately 520 feet. At the 147 foot level, a fracture zone was encountered. Approximately 14 gallons a minute of water was infiltrating into the shaft. The fracture was grouted and sealed. In the core drilling operation, the fracture was noted, however, it was not identified as a water bearing fracture. In the core drilling, another fracture zone was identified at the 900 foot level. It is possible that additional water would be encountered at 900 feet."</p> <p>It is uncertain if the observations made during this shaft excavation can be realistically applied to bedrock at the NorthMet Project Proposed Action site. The historical Minnamax/Ammax project was located many miles away from the NorthMet Project Proposed Action and it is uncertain if geologic units and structures penetrated by the shaft are similar to those in the location of the NorthMet Project Proposed Action. Further, it is not stated in the memo if the 14 gpm inflow was a sustained flow or if it decreased over time as commonly occurs in fractured rocks. The comments do not indicate if the fracture zone identified by core drilling at 900 feet caused</p> | WR 007   |

| 17802      | <p>Other MPCA documents detail an unexpected saline water discharge that resulted as part of the AMAX Exploration Project from a water pocket 1,391 feet below the surface. The large quantities of saline water discharged, as much as 275 gallons per minute to Langley Creek, killed much of the vegetation en route. Data show severe impacts to wetlands in the vicinity of the project. Water from stockpiles that were minuscule in comparison to the stockpiles proposed for the PolyMet Project drained water with very high concentrations of nickel, cobalt, copper, zinc, and sulfate, and discharged that water into Langley Creek and the Partridge River. The project polluted streams, groundwater, and a large wetland complex in its vicinity in order for the MNDNR to study potential impacts and mitigation strategies for non-ferrous mining. Yet the data collected from the AMAX project was not used to predict water quality or wetlands impacts presented in the PolyMet SDEIS.</p> | <p>significant inflows when the shaft reached that depth. It would be speculative to characterize the NorthMet Project Proposed Action Site using observations made in the referenced MPCA memorandum.</p> <p>The comment cites MPCA 1976b. (Office Memorandum: Minnamax Exploration Project Tour. From Curtis Sparks, EIS Coordinator, to Louis Breimhurst, Director. November 24, 1976), which discusses saline water encountered in an air-driven downhole hammer borehole at the Minnamax/Amamax site. The relevant text in this memorandum is as follows:<br/>                     The [saline] discharge began after hitting a confined pocket of water at the 1391 foot level on July 13, 1976. Although large quantities of water, as much as 275 gallons a minute, were being discharged, the drilling operation was continued to July 15.</p> <p>It is uncertain if observations described in the MPCA memorandum are relevant to the NorthMet Project Proposed Action Site including bedrock types and hydrogeologic conditions. The maximum depths of NorthMet Project Proposed Action pits (approximately 700 feet) would be far less than the 1,391-ft depth at which saline water was encountered at the Minnamax/Amamax site. It is also uncertain if the 275 gpm flow rate was short-term or maintained for an extended period of time. Note that inflows to the PolyMet mine pits would be treated by the WWTF during operations, reclamation, and closure, so if saline water were encountered, it would be treated and discharged at concentrations meeting applicable water quality standards. See FEIS Section 5.2.2.3.2 for a discussion of potential impacts from saline waters.</p> <p>The FEIS relies on AMAX-derived data in a variety of circumstances. Examples include: 1) assessment of pH-dependent concentration caps for Category 1 waste rock; 2) use of exploratory shaft data on stockpile hydrology for estimating evapotranspiration rates; and 3) comparison of modeled sulfate release to observed released values in collected drainage from AMAX stockpiles.</p> | WR 007          |
| 17807      | <p>Also ignored was experience with the Dunka Pit, located on the old LTVSMC site approximately five miles north and east of the PolyMet Project mine site. In the Dunka Pit, LTVSMC contacted the Duluth Complex and the Virginia Formation while mining for taconite in the Biwabik Iron Formation. By 1991, LTVSMC had removed about 50 million tons of Duluth Complex material</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The Co-lead Agencies rely upon the expertise and experience of their staff who bring to bear their knowledge of various studies and analyses performed on mine sites in Minnesota and elsewhere. This knowledge is applied in the review of documents prepared to evaluate the NorthMet Project Proposed Action potential effects.</p> <p>It should be noted that the NorthMet Project Proposed Action is different from other mining projects in this part of Minnesota in the following ways:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | CU 06<br>WR 023 |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Theme(s) |

|            | <p>from the Dunka pit and placed it in “gabbro” stockpiles. Monitoring of the drainage from these stockpiles beginning in 1976 revealed a decrease in pH and an increase in trace metals. Copper and nickel concentrations as high as 1.7 and 40 mg/l respectively were observed in seepage/run-off from the Duluth Complex waste rock stockpiles and pH was observed as low as 5.0 at seep 1 between 1976 and 1980. Most of the seepage from waste rock piles at the Dunka site was discharged to Bob’s Bay in Birch Lake via Unnamed Creek. A 1976-1977 study of trace metals in Bob’s Bay found that concentrations of copper, nickel, cobalt, and zinc in the water of the Bay were higher than regional average concentrations and decreased with distance from the mouth of Unnamed Creek. Additionally, it was determined that Unnamed Creek contributed more than 90 percent of the trace metals to Bob’s Bay load. The October 2001 NPDES permit for this discharge expired in 2005 and another variance request is expected. The 2001 Dunka mine area permit has a variance provision allowing toxic pollutants to exceed the final acute value. A Waste Water Treatment Facility (“WWTF”) located at the site has been inactive because Cliffs Erie, LLC, the owner after LTVSMC, declared bankruptcy and claims it is simply too expensive to continue running. Unfortunately, the passive wetland treatment system did not function well enough to remove nickel and copper in waters still discharging from the mine pit and stockpiles to a concentration that comports to comply with Minnesota WQS, and was rebuilt in 2010. Unfortunately, by 2012, copper, nickel, zinc, sulfate, and hardness concentrations from the treatment wetlands discharges (SD 8 and SD 9), were exceeding WQS. In accordance with a Consent Decree with the MPCA, Cliffs Erie is required to submit a plan</p> | <p>different ore type, designs for groundwater containment systems, and use of long-term mechanical treatment. While experiences gained on other projects are informative, they do not necessarily apply to the NorthMet Project Proposed Action. This is particularly true for groundwater containment systems because the NorthMet Project Proposed Action uses a design that differs from those at other Iron Range mine sites.</p> <p>The mitigation designs of the NorthMet Project Proposed Action are unlike measures discussed in the Regional Copper-Nickel Study. The NorthMet Project Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater containment systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet Project Proposed Action Site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the NorthMet Project Proposed Action Site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. In fact, the unique designs and high-quality construction measures proposed are a response to past events.</p> <p>The detailed and sophisticated modeling work performed to support the FEIS exceeds that conducted for some existing mines in Minnesota. The models used for the NorthMet Project Proposed Action represent years of development, with input from PolyMet, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modifications were made to the models to improve FEIS impact evaluations. It is the Co-lead Agency position that incomplete or inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling used in the NorthMet FEIS.</p> <p>The FEIS reflects consideration of information pertaining to the Dunka Pit that was directly relevant to the NorthMet Project Proposed Action (including Dunka Mine field data that was used to develop scaling factors for the Category 1 Stockpile. It is noteworthy that many aspects of operations at the Dunka Pit are dissimilar to the NorthMet Project Proposed Action in terms of hydrogeology and mine design.</p> |          |

|            | <p>for compliance with toxicity final concentration limits at SD008 and SD009 without a variance. Water quality impacts from prospecting and mining operations that have contacted the Duluth Complex are well known to the MNDNR and MPCA. The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5-volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex. Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were ignored when the technical documents and SDEIS were drafted for PolyMet. Therefore, water quality impacts have likely been underestimated and the mitigations proposed may not be effective.</p>                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |
| 17811      | <p>Similarly, the Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. The study clearly identified those state ground and surface water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present, and prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source, and rejected using natural wetlands for mine effluent treatment (“as a toxic metals dumping ground”).</p> | <p>Evaluation criteria are based on applicable water quality standards. Evaluation criteria can be found in Section 5.2.2. Where a water body is classified as Domestic Consumption (1B) or for groundwater, USEPA primary drinking water standards apply. The USEPA primary drinking water standards set mandatory maximum contaminant levels for drinking water to protect the public from consuming water that presents a risk to human health.</p> <p>For purposes of the FEIS, the MPCA has provided guidance as to what waters in the Embarrass River and Partridge River are waters used for production of wild rice to which the current 10 mg/L wild rice sulfate standard applies. The MPCA reviewed all available relevant information in making their recommendation; however, that recommendation in itself is a policy decision of the MPCA that is not part of the EIS process</p> <p>Water treatment using natural wetlands is not included in the NorthMet Project Proposed Action project description. The NorthMet Project Proposed Action would rely upon mechanical treatment for as long as necessary. During operations and closure, the use of wetland treatment may be considered as an adaptive management measure if pilot and other studies indicate that this method has potential utility and is cost-effective.</p> | WR 110<br>WR 154 |
| 17812      | <p>Finally, the SDEIS lists the sulfur concentrations of Project waste rock ranging between 0.01-5.0%</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>From November 2005 to January 2006 information was gathered on the hydrogeologic characteristics of the Virginia Formation at the Mine Site</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | WR 173           |

|            | <p>with an average mass-weighted concentration of 0.15%. The Virginia Formation has the highest concentrations of sulfur 0.4 - 5.0%, and the Duluth Complex 0.13 – 0.6% sulfur. These concentrations are much higher than in Montana’s Zortman-Landusky Mine waste rock (0.2% sulfur) that has required perpetual wastewater treatment. And, like Zortman-Landusky, the Project proponent has suggested that “most (70 percent) of the NorthMet waste rock would be the low-sulfur, non-acid-generating” and will never cause acid mine drainage. However, the north wall of the east pit is composed of the Virginia Formation meaning that it will be exposed to both air and water and will likely contribute a substantial load of sulfate and metals to mine pit water.</p> | <p>and the chemical characteristics of the groundwater within the formation because the Virginia Formation is anticipated to make up a portion of the north wall of the East Pit. Field activities included installing four pumping wells (and six observation wells targeting the Virginia Formation along the north boundary of the East Pit. Another investigation was conducted from October 2006 to November 2006 to evaluate the possible effects of mine dewatering on the wetland areas in the vicinity of the Mine Site, to gather additional specific capacity data from wells completed in the Virginia Formation, and to gather additional water-quality data for groundwater within the unconsolidated deposits, the Virginia Formation, and the Duluth Complex. The investigation consisted of conducting a 30-day pumping test. Water levels during the pumping test were monitored in five wetland piezometers located north of the pumping well. In addition, specific capacity tests were conducted at in two wells which are open exclusively to the Virginia Formation. Information gathered during this field work was used in FEIS water modeling (PolyMet 2015m).</p>                                                                                                                                                                                                                                                                                                                                                       |          |
| 17867      | <p>The USACE has not developed a monitoring plan to assess after-the-fact Project impacts to lands, but claims that will be the way to best determine and mitigate indirect wetland impacts...So the SDEIS simply lacks sufficient detail even to comply with NEPA, and contains much less detail than is required to permit sufficient evaluation of potential wetland impacts.</p>                                                                                                                                                                                                                                                                                                                                                                                             | <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the Wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-lead Agencies ultimately decided the use of the analog method and the 20% metric described in Section 5.2.3 as factors considered in identifying potential indirect effects to wetlands is a credible and reasonable approach consistent with the requirements of NEPA.</p> | COE 02   |

| 17870      | the mitigation measures that the SDEIS does identify are inadequate as to wetlands, just as they are for purposes of water modeling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the indirect wetland effects.</p> <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The indirect effects analyses performed for the FEIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. As a result of these analyses performed to determine where monitoring should occur, quantification of wetland types and acres of potential indirect wetland effects were also generated. FEIS Section 5.2.3 provides these quantitative values of potential indirect wetland effects. The identification of specific mitigation for indirect effects and a monitoring plan is not a requirement for an EIS; however, the FEIS has been updated with additional information on the approach for determining mitigation if the monitoring shows indirect effects are occurring. The monitoring and mitigation for potential indirect effects would be determined during permitting. FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects. The proposed wetland impact, avoidance, minimization, mitigation and monitoring plan presented in the FEIS would be reviewed, modified as required, and approved during permitting; therefore, this information could change during permitting.</p> | WET 01<br>WET 04 |
| 17873      | <p>The SDEIS's failure to properly model and mitigate seepage and baseflow rates could result in profound impacts on wetlands. The estimates of groundwater drawdown are currently based on anecdotal and limited observations. Because of the generally flat topography and extensive wetlands, mine pit dewatering would likely cause substantial dewatering in nearby wetlands. Estimated indirect impacts to wetlands due to groundwater drawdown at the mine site are summarized in SDEIS, but without the use of a reliable groundwater model. Instead, dewatering impacts are assessed using an analogue method where wetlands impacted by another "equivalent" site are compared with wetlands surrounding the Project to provide an estimate of both the depth and distance from the</p> | <p>Monitoring well response to pit dewatering at the Canisteo Pit, located approximately 65 miles west of the NorthMet Project Proposed Action area in similar surficial geology, indicated significant aquifer heterogeneity. Modeling of aquifer response at the Canisteo site using MODFLOW resulted in differences between simulated and measured water levels ranging from +28 ft to -4 ft (Jones 2002, as cited in the FEIS). The model clearly could not accurately estimate water level changes of a few feet or less as would be desirable for assessing potential effects on nearby surface water features such as wetlands. Therefore, it was concluded that it was not reasonable to attempt to quantify drawdown at the Mine Site using the MODFLOW model.</p> <p>In lieu of using MODFLOW to estimate pit drawdown at the Mine Site, an analog approach was developed using available well data from the Canisteo Pit, which is the only mine pit within the Mesabi Iron Range that has an associated water balance study with well data that could be used to assess potential drawdown effects. Sixteen Canisteo wells were used for the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | WR 071<br>WR 120 |

|            | <p>mine pit(s) that dewatering occurs. The decision to use an analogue method came from the Wetlands Impact Assessment Planning work group process, in spite of Tribal Cooperating Agency objections. These objections include: (1) the PolyMet proposed mine pit will be hundreds of feet deeper than any of the “analogue” mine pits; (2) PolyMet mine pit walls will be crystalline and sedimentary bedrock versus the analogue mine pits in sedimentary bedrock only; (3) data collected from the site would be relatively inexpensive and should be used to inform impact assessment; and (4) relying on only a partial set of available “analogue” data as the source of information to estimate dewatering impacts is selective and not scientifically robust. Without a quantitative assessment of the mine-related drawdown of the regional water table, there is no mechanism to develop an adequate indirect impact assessment method for wetlands. Based on the vegetation data collected from wetland delineations, it appears that groundwater-supported wetlands are common in the Project area. The hydraulic conductivity in the unconsolidated deposits around the mine site ranges between 0.012 to 31 feet per day, indicating significant water movement within the surficial aquifer. In spite of the range of conductivities provided, however, the SDEIS states that perched wetlands cover over 50% of wetlands at the mine site.</p> | <p>analogue evaluation. An additional shallow well near Kinney, Minnesota, adjacent to Minntac’s West Pit, and one deep bedrock well, also near Kinney, were also used for the evaluation. A comparison of the hydrogeologic conditions at the Canisteo Mine Pit, the Kinney area wells, and the Mine Site concluded that the geologic and hydrogeologic settings of the Mine Site are relatively similar to the Canisteo and Minntac sites (Barr 2011i, as cited in the FEIS).</p> <p>The Canisteo Pit is not as deep as the proposed NorthMet mine pits. However, the surficial deposits at the Canisteo site ranges from 50 to 100 ft thick, while the surficial deposits at the Mine Site average only about 14 ft thick. Also, the underlying bedrock at the Canisteo site is composed exclusively of the Biwabik Iron Formation, which generally has a higher hydraulic conductivity than the Duluth Complex, Virginia Formation, and Giants Range Granite that underlie surficial deposits at the Mine Site. Despite the difference in pit depths, it is interpreted that there is potential for greater drawdown at the Canisteo site compared to the Mine Site. Overall, the Canisteo data are believed to provide a reasonably conservative estimate of the maximum extent of surficial aquifer drawdown that would result from the proposed PolyMet mine pits.</p> |                                                                                                                                                                               |
| 17874      | <p>the Co-Lead Agencies suggest ombrotrophic bogs (meaning wetlands that receive all of their water and nutrients from precipitation) have no connection to groundwater, and therefore assume that drawdown will not affect these wetlands. But data supports at least a partial connection between ombrotrophic wetlands and groundwater. Therefore, if groundwater under these “perched” wetlands was drawn down by several feet, the new</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>The FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>WET 09<br/>                     WR 058<br/>                     WR 071<br/>                     WR 166<br/>                     WR 167<br/>                     WR 177</p> |

|            | <p>head pressure would lead to impacts to the wetlands because water would seep out of ombrotrophic wetlands in areas where there was a hydrologic connection to the saturated layer. Even the SDEIS acknowledges that saturated conditions exist within the unconsolidated deposits and the underlying bedrock, and that that recharge to the bedrock comes from leakage from the overlying surficial aquifer. Given these statements describing vertical movement of water in the mine site area, a vertical hydrologic connection between ombrotrophic wetlands and the surficial aquifer is likely and the extent of the hydrologic connection should be investigated.</p> | <p>the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in FEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>Using an observational approach based on data from similar nearby mine sites (i.e., analog method), the Co-lead Agencies concluded that drawdowns in the surficial aquifer would not be expected to extend very far from the mine pits. This is explained by the following factors: 1) the surficial aquifer is thin and moderately permeable, 2) the surficial aquifer is subject to aerial recharge, and 3) the surficial aquifer is underlain by low-permeability bedrock that limits downward leakage from the surficial unit. These factors support the conclusion that wetland drawdown did not need to be included in the Mine Site GoldSim model. See FEIS Section 5.2.2.3.2 for more information on the analog method.</p> <p>It is acknowledged that there is some degree of hydraulic interaction between wetlands and the surficial aquifer at the Mine Site. However, attempts to quantitatively model the effects of these interactions on drawdown and water quality would be highly uncertain and potentially misleading. The FEIS approach was to not model hydraulic connections between wetlands and the surficial aquifer in the Mine Site GoldSim model, but rely on future monitoring and adaptive mitigation measures in the event that some wetlands are affected by the NorthMet Project Proposed Action. See FEIS Sections 5.2.2.3.6 and 5.2.2.3.5 for more information on Closure monitoring and adaptive mitigation.</p> |          |
| 17875      | <p>Despite specific and repeated requests from tribal cooperating agencies, the Co-Leads did not elect to utilize a tool developed in 2011 by the EPA in cooperation with tribes, Applying Cumulative Impact Analysis Tools to Tribes and Tribal Lands, in order to discern potential cumulative effects to resources important to the tribes who retain usufructuary rights within the 1854 Ceded Territory.</p>                                                                                                                                                                                                                                                              | <p>The Co-lead Agencies consulted a wide range of sources to conduct the cumulative effects assessment of the NorthMet Project Proposed Action and Land Exchange Proposed Action. In addition, the Co-lead Agencies followed USEPA (USEPA 1999b) and CEQ (CEQ 1997 and Connaughton 2005) guidance on how to conduct the cumulative effects analysis. FEIS Section 6.1.1.1 describes the cumulative effects analysis approach. The cumulative effects analysis meets the requirements of MEPA/NEPA. Please also refer to the response to theme CR08.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CU 03    |

| 17899      | It is reasonably foreseeable that an additional 3,000 acres of wetlands within the watershed will be directly impacted by proposed new mining projects and expansions that are in active permitting and/or environmental review: the Project, U.S. Steel Minntac mine expansion; U.S. Steel Keetac expansion; United Taconite Tailings Basin 3 construction; and Cliffs Erie's mine pit expansion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | The following projects were not considered in the wetland resources cumulative analysis, because they are outside the Partridge and Embarrass River watersheds: U.S. Steel Minntac mine expansion, U.S. Steel Keetac expansion, United Taconite Tailings Basin, and Cliffs Erie's mine pit expansion. Those projects that were considered reasonably foreseeable and within the Partridge and Embarrass River watersheds were considered in the wetland cumulative analysis. Please refer to the responses to themes CU 02 and WET 18, as well as Section 8.3, MDO 12 for more information on the spatial boundary of the CEAA for water resources. | CU 02    |
| 17900      | The SDEIS also fails to adequately analyze cumulative impacts to the water quality of the Partridge and Embarrass Rivers, much less the St. Louis River.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Section 5.2.2 of the FEIS discloses in-stream water quality concentrations as a result of the NorthMet Project Proposed Action which is added to existing impacted conditions from past projects. The FEIS goes on to discuss loading of sulfate and mercury from future projects in Section 6.2.2.<br><br>The SDEIS and FEIS provide a rationale for not including the St. Louis River Basin in the cumulative effects analysis in Section 6.2.2.1.1. The SDEIS and FEIS considered in the cumulative effects analysis for water resources all of the facilities identified in FEIS Table 6.2-1. standards.                                        | WR 024   |
| 17901      | In fact, in Colby Lake (the community water supply for the City of Hoyt Lakes), aluminum, iron, copper, and mercury concentrations already exceed Minnesota WQS. Modeled concentrations of arsenic also exceed Minnesota WQS. This existing, large number of water-quality exceedances and the suite of constituents, particularly trace metals, that exceed WQS not only confirm the total lack of remediation for the previous mining activities at the LTVSMC site, but demonstrate the importance of evaluating the cumulative losses to water quality. Community drinking water wells, wetland degradation resulting from dewatering, and pollution of community and private drinking water aquifers by previous mining activity must be assessed throughout the St. Louis River watershed as part of this Project, as well as for all the other mining projects currently underway. | Groundwater and surface water flow models predict that the NorthMet Project Proposed Action would have a minimal effect on drinking water standard-based evaluation criteria in the groundwater at the project area boundaries or in Colby Lake (the locations at which drinking water standards apply). Based on this, it is therefore expected that the NorthMet Project Proposed Action would not have any significant impacts on water quality downstream of the proposed NorthMet Project area or significantly contribute to any cumulative effects on drinking water resources.                                                              | WR 042   |

| 17903      | <p>The SDEIS does not determine climate change implications of the proposed Project. But the Project has proposed the largest direct wetland fill ever permitted in this region and would disturb extensive areas of peat, which is known to be an important carbon and methane sink. Wetlands in general are recognized as important carbon sinks and areas where wildlife seeks refuge as the climate warms. Nevertheless, to date, virtually all required wetland mitigation for mining impacts has been implemented out of the basin, representing a permanent loss of high quality ecological resources and functions. This omission undermines even the MNDNR's own work. The MNDNR's Moose Advisory Committee, which studies the decline of the moose population in northeastern Minnesota, has recommended preserving wetlands as sanctuaries for moose from heat stress related to climate change.</p> | <p>Estimates of monthly and annual rainfall amounts were based on best available data obtained from weather stations near the Proposed Action site. In the GoldSim models, these parameters were treated as uncertain inputs and assigned probability distributions to capture the range of possible future conditions. While climate change may occur in the future, it cannot be stated at this time if in the long term there would be more or less rainfall. Thus, the probabilistic approach to rainfall used in GoldSim represents a technically defensible method for dealing with this issue.</p> <p>Individual storm events and frequency are not incorporated into the GoldSim models. Rainfall inputs are monthly and annual rainfall amounts. The effects of individual storms are considered by designing facilities to handle a 100-year, 24-hour storm event based on current data. If over time, climate change causes a gradual increase in annual rainfall, the 100 year storm event would be redefined to a larger precipitation value and mine facilities would be upgraded to handle a larger storm.</p> <p>For the Mine Site, a GoldSim sensitivity analysis was conducted to assess the possible effects of future climate change on groundwater and surface water impacts. It was concluded that reasonably foreseeable climate change would have little effect on pit inflows, pit lake water quality, groundwater chemical concentrations, and surface water chemical concentrations. These results are reported in the Water Modeling Data Package - Mine Site (Barr; December 2014). By analogy, the Plant Site is also expected to be minimally affected by possible future climate change.</p> <p>The NorthMet Project Proposed Action would not result in the release of methane (CH<sub>4</sub>) from the proposed loss of wetland habitats. Wetlands act as carbon sinks that sequester carbon dioxide (CO<sub>2</sub>). As a result of carbon cycling through the wetland system, a portion of sequestered carbon is mineralized to gaseous end products resulting in the production of CH<sub>4</sub>, which is released to the atmosphere. As such, the assumption that the NorthMet Project Proposed Action would result in an increase of methane stored in the peat bogs is incorrect. The loss of wetland habitat at the NorthMet Project area would result in a one-time release of 12,535 metric tons per year of greenhouse gas emissions (i.e., CO<sub>2</sub>-equivalents approximately stored carbon within those habitats (Barr 2012), as cited in the FEIS). It is important to note that the loss of carbon sequestration capacity is fundamentally different from emission rates since it represents a loss of greenhouse gas absorptive capability (i.e., how effective the system is at absorbing carbon) and capacity (i.e., the amount of carbon able to be</p> | WR 077<br>WR 180 |

|            |                                                                                                                                                                                                                                                                                                                                                            | <p>absorbed) as opposed to an actual contributing emission. However, Barr (2012), as cited in the FEIS) also noted that the net effect of the loss of carbon sequestration capacity is essentially the same as emissions. The Barr report also noted that the projected calculated release of CO<sub>2</sub>-equivalents is a one-time event; however, it should not be assumed that all aboveground forest carbon would necessarily be released over a short timescale and that net carbon cycle impacts are highly dependent on the end-use of the cleared vegetation. For example, timber harvested for boards manufactured into furniture or buildings which is typically maintained for an extended period of years or decades, will degrade and decompose (i.e., release their stored carbon) at a much slower pace than timber that is utilized for firewood or woodchips which will ultimately decompose at a much faster rate. Harvested timber is typically utilized for a multitude of purposes dependent on numerous variables including market value, stand quantity and quality, tree species, demand, among others. As such, predetermining the end-use of an entire stand of timber is unfeasible.</p> <p>Additionally, the assumption that the NorthMet Project Proposed Action would result in the destruction of the carbon storage potential of the region is erroneous. That assumption discounts the contributions of the proposed compensatory wetland mitigation. The NorthMet Project Proposed Action would result in the loss of approximately 913.8 acres of directly impacted wetlands whereas the NorthMet Project Proposed Action would result in 1,799.7 acres of wetland mitigation (an impact to mitigation ratio of approximately 2:1).</p> <p>The NorthMet Project Proposed Action would be located within the St. Louis River Watershed (#3) (8-digit HUC) within the Great Lakes Basin (4-digit HUC). The Zim Site is located within the same watershed as the NorthMet Project Proposed Action; however, the Aitkin and Hinckley sites are located within the Mississippi River Basin (4-digit HUC) and 8-digit HUC watersheds of Elk-Nokasippi #10 and Snake River #36, respectively. |            | <p>be changing. These and other cumulative effects of climate change must be addressed.</p>                                                                                                                                                                                                                                                                                                       | <p>area from 1981 to 2010, which is the Climate Normal period. In the GoldSim models, these parameters were treated as uncertain inputs and assigned probability distributions to capture the range of possible future conditions. While climate change may occur in the future, it cannot be stated at this time if in the long term there would be more or less rainfall. Thus, the probabilistic approach to rainfall used in GoldSim represents a technically defensible method for dealing with this issue.</p> <p>The effects of individual storms are considered by designing facilities to handle a 100-year, 24-hour storm event based on current data. If over time, climate change causes a gradual increase in annual rainfall, the 100 year storm event would be redefined to a larger precipitation value and mine facilities would be upgraded to handle a larger storm.</p> <p>For the Mine Site, a GoldSim sensitivity analysis was conducted to assess the possible effects of future climate change on groundwater and surface water impacts. It was concluded that reasonably foreseeable climate change would have little effect on pit inflows, pit lake water quality, groundwater chemical concentrations, and surface water chemical concentrations. These results are reported in the Water Modeling Data Package - Mine Site (Barr, December 2014). By analogy, the Plant Site is also expected to be minimally affected by possible future climate change.</p> <p>The NorthMet Project Proposed Action facilities would be designed with excess storage to handle large storm events. If climate change gradually increases the frequency and size of storms, there would be ample time to identify the issue and increase storage and treatment requirements at the site.</p> |          |
| 17916      | <p>Section 106 consultation between the USA CE and Tribes is ongoing. Therefore, despite significant changes through recent, increased consultation with tribal cooperators, the Cultural Resources chapter of the SDEIS is still incomplete, and the requirements of the National Historic Preservation Act (“NHPA”) have not yet been fulfilled. The Project cannot proceed until they are.</p> | <p>The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting for the NorthMet Project Proposed Action. Historic properties affected by the NorthMet Project Proposed Action have been identified and the impacts to those properties have been assessed. This also includes an assessment of actual use of those historic properties, as well as other resources in the APE, by tribal members. Effects on historic properties would be fully considered prior to the issuance of any permit or land exchange pursuant to the NHPA and its implementing regulations. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | CR 06    |

|            | adverse-effects assessment that must be performed, again in coordination with consulting agencies. 207 In light of these rules, and as the chapter itself acknowledges, it is apparent that far more consultation and site work must be done to comply with Section 106.                                                                                                                                        | Proposed Action and determine which resources qualify for inclusion in the NRHP as historic properties. Impacts to historic properties have been appropriately assessed and the federal Co-lead Agencies are actively consulting with the federally recognized Bands, the SHPO, and other consulting parties to develop appropriate mitigation measures. Effects on resources significant to the Bands that do not qualify as historic properties, as well as general effects on natural resources have been considered within the parameters of the statutes that shape this review. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                |
| 17925      | The Bands remain skeptical of the Co-Lead Agencies' claim that there will be no adverse effect to the Spring Lake Mine Sugarbush from the Project. Indirect effects, through dust deposition and unauthorized collection of historic objects, are anticipated because the sugarbush is situated immediately adjacent to the proposed plant site.                                                                | As discussed in FEIS Section 5.2.9.2.1, the federal Co-lead Agencies have determined that the NorthMet Project Proposed Action would adversely affect the Spring Mine Lake Sugarbush. As part of an MOA, the federal Co-lead Agencies would ensure the avoidance, minimization, and/or mitigation of impacts to cultural resources that may be encountered, such as unauthorized collection, during construction or operation of the NorthMet Project Proposed Action. The federal Co-lead Agencies, in consultation with the Bands, SHPO, and PolyMet, are currently working to resolve adverse effects on this property.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | CR 02<br>CR 05 |
| 17929      | The three properties would benefit from additional investigation. The sugarbush has not been formally recorded. The trail has been adequately documented within the SNF proposed land exchange, but requires additional survey in the upland areas of the project area. Mesabe Widjiu should be considered in its entirety. All three should be formally nominated to the National Register of Historic Places. | The federal Co-lead agencies have officially documented the Spring Lake Mine Sugarbush with SHPO. The federal Co-lead Agencies believe that there has been sufficient background research and fieldwork to justify consideration of the BBLV Trail Segment as an historic property. Additional research and fieldwork may be part of any resolution of adverse effect. The federal Co-lead Agencies have determined the Partridge River section of the Mesabe Widjiu and the Partridge River section of the BBLV Trail Segment eligible for inclusion in the NRHP under Criterion A; however, the federal Co-lead Agencies are assessing the effects of the NorthMet Project Proposed Action on only the portion of those properties within the APE. The federal Co-lead Agencies recognize that the two properties discussed above extend beyond the APE. All three historic properties have been determined eligible for the NRHP. The federal Co-lead Agencies, in consultation with the Bands, SHPO, and PolyMet, are currently working to resolve adverse effects on these properties. National Register Nomination of these properties may be part of an MOA; however, the federal Co-lead Agencies are currently in the process of considering what mitigations may be appropriate. | CR 02<br>CR 05 |
| 17932      | The Project is predicted to increase mercury                                                                                                                                                                                                                                                                                                                                                                    | Colby Lake water would not be directly discharged to tributaries north or                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | MERC 12        |

|            | <p>loadings in the Embarrass River, but decrease mercury loadings in the Partridge River. Treated effluent would be used to augment flow in several Embarrass River tributary streams and Second Creek in the Partridge River watershed that would otherwise experience reduced flow because of the groundwater containment system. Additional water for flow augmentation in the nearby tributaries would be pumped from Colby Lake at periods during mine operations and reclamation. On the face of it, stream augmentation mitigation seems like a good idea. Unfortunately, Colby Lake water has high mercury concentrations that exceed the Minnesota WQS for wildlife. Colby Lake water used for augmentation will add mercury to the Embarrass River watershed both directly and indirectly by drying and re-wetting peat.</p> | <p>south of the Tailings Basin under the NorthMet Project Proposed Action, as described in the FEIS. The NorthMet Project Proposed Action includes treatment of all water that would be discharged at the Plant Site, including water used for flow augmentation. Additional information has been included in FEIS Section 5.2.2.3.6. The FEIS recommends that tributaries be monitored that extend from the Tailings Basin. In the event that the monitoring identifies the potential for any water quality standard exceedances, the Proposer would be obligated to take action to ensure compliance. Potential mitigation measures are included in FEIS Section 5.2.2.3.5.</p>                                                                                                                                                                                        | <p>WR 184</p>                                |
| 17933      | <p>High mercury concentrations in fish is a significant concern in the Embarrass River now, and mercury will only increase if the Project is allowed to use Colby Lake water for stream augmentation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Colby Lake water would not be directly discharged to tributaries north or south of the Tailings Basin under the NorthMet Project Proposed Action, as described in the FEIS. The NorthMet Project Proposed Action described in the FEIS includes treatment of all water that would be discharged at the Plant Site, including water used for flow augmentation. The amount of water from Colby Lake used for flow augmentation would be low; however, any water used for augmentation would be treated prior to discharge. The FEIS recommends that tributaries be monitored that extend from the Tailings Basin. In the event that the monitoring identifies the potential for any water quality standard exceedances, the Proposer would be obligated to take action to ensure compliance. Potential mitigation measures are included in FEIS Section 5.2.2.3.5.</p> | <p>MERC 02<br/>WR 184</p>                    |
| 17934      | <p>Dewatering peatlands will also amplify water table fluctuations because peat has high water storage capacity and releases water more slowly than other surficial deposits. Drying and re-wetting peat will increase mercury methylation and release. Peatlands store methane and carbon that will be released into the environment when overburden is removed from the mine pits or during periods of dewatering. This is important in the context of</p>                                                                                                                                                                                                                                                                                                                                                                           | <p>Any mercury released from the decomposition of excavated peat temporarily stored in the Overburden Storage and Laydown Area (OSLA) is thought to occur relatively rapidly. The mercury released from organic matter decomposition would have the potential to move with precipitation that falls on the OSLA. However, water coming in contact with materials in the OSLA is considered to be process water and would not be directly discharged, but rather would be routed to pond PW-OSLA. In years 1 to 11 the water from pond PW-OSLA would be routed to the tailings basin and any mercury in the routed water would have the chance to be sequestered in</p>                                                                                                                                                                                                   | <p>AQ 16<br/>AQ 28<br/>WET 03<br/>WR 086</p> |

|            | <p>subsistence fisheries and climate change because the temperature of water directly affects the oxygen content and defines what fish can survive. Mercury is also known to bioaccumulate in fish at a faster rate in warmer water.</p> | <p>the tailings. In years 12 to 20 some of the water from pond PW-OSLA would be used to backfill the East Pit. Any mercury in the water routed to the East Pit would have the chance to mix with waste rock and become sequestered at depth in the East Pit. In addition, any contributions of water in year 21 to 65 from the East Pit to the West Pit would reflect water from the East Pit and its associated watershed runoff, and would not reflect process water from pond PW-OSLA. Because peat removal from the areas to be mined would be completed between years 5 and 11, most of the potential release of mercury from stored peat materials would likely have already occurred, or be ending, by the time water is routed from pond PW-OSLA to the East Pit beginning in year 12.</p> <p>The hydrology of the wetlands outside the containment system would be maintained within an established range through flow augmentation so that wetlands would not experience substantial inundation or desiccation. Wetland hydrology is a complex mix of precipitation, surface runoff, and, in some cases, groundwater. Current understanding of how these factors interact at the project site is limited, making it beyond the current ability of the FEIS to predict site-specific changes in wetland hydrology. The FEIS recommends monitoring of wetland water quality at the Mine Site between Dunka Road and the Partridge River as well as the Partridge River itself.</p> <p>Effects of climate change on aquatic species were not identified as a concern during scoping, and are beyond the scope of the FEIS analysis, because the effects to aquatic species under future climate scenarios are speculative. A preliminary qualitative assessment of water resources impacts due to climate change is provided in Attachment W of the NorthMet Project Air Data Package, Version 5, January 15, 2015 (PolyMet 2015e, as cited in the FEIS).</p> <p>In aquatic systems, there is generally a positive correlation between warmer water temperatures and accumulation of heavy metals. However, studies on the relationship between temperature and bioaccumulation of mercury in aquatic life are ongoing. Therefore, the degree to which the NorthMet Project Proposed Action could potentially affect aquatic species due to changes in temperature cannot be determined. Water monitoring would ensure that water quality standards would be met with engineering controls and adaptive management. Specific monitoring details would be addressed in permitting. In addition, spill prevention plans would be implemented.</p> |          |

|            | <p>impact fish species and thus the Band's 1854 Treaty rights to harvest fish in those water bodies. The SDEIS as written fails to mitigate the costs to fisheries and wildlife species that are protected under the 1854 Treaty...Treaty-reserved fishing rights cannot be fully exercised when fish consumption must be restricted for health reasons to one or two meals per week.</p> | <p>1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6 also address effects on, and any proposed mitigation for effects on cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations providing the federal authorities for the review of the NorthMet Project Proposed Action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |          |
| 17937      | <p>The SDEIS does not adequately address the potential impacts to Band members of a significant increase in mercury in fish harvested both on-Reservation and in Ceded Territory waters...Yet the SDEIS offers no mitigation for these known losses. The SDEIS must be revised to include sufficient analysis and mitigation.</p>                                                         | <p>Based on the results of water quality modeling, the water quality of the West Pit Lake, East Pit wetland, and Tailings Basin pond is predicted to be at concentrations not injurious to wildlife. On-site monitoring of waterbodies within facility boundaries would likely be a part of a monitoring program. Monitoring details would be finalized in the permitting process. FEIS Section 5.2.5.2.3 discusses potential impacts to wildlife from incidental contact with the Tailings Basin pond and pit lakes. FEIS Section 7.3.4 discusses potential human health impacts. FEIS Section 5.2.2.3.6 discusses on-site monitoring. FEIS Section 5.2.2.3.4 discusses bioaccumulation of methylmercury.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | CR 01    |
| 17939      | <p>Minnesota's mercury TMDL process will not adequately address the fish consumption impairment in these waterbodies, and any new discharges that would result in further degradation to waters with an existing water quality impairment are not be legally permissible under the CWA.</p>                                                                                               | <p>This comment was originally presented as part of the Tribal Position Summary included in MDO #2, which was previously addressed in SDEIS Table 8-1. Further explanation is provided below.</p> <p>The MPCA's goal is to protect high-quality waters and improve the quality of impaired waters, so water quality standards are met and beneficial uses are maintained and restored, where these uses are attainable. As summarized in FEIS Section 5.2.7.2.5, widespread contamination of fish from atmospheric pollution is why Minnesota established a statewide mercury TMDL. The TMDL seeks to reduce atmospheric deposition everywhere in the state, in order to make the state's lakes and streams fishable, as required by federal regulations, and is intended to provide the long-term framework to reduce mercury in fish. The MPCA published Guidelines for New and Modified Mercury Air Emission Sources, and revised those guidelines in 2012 (MPCA 2012h, as cited in the FEIS). The guidelines were developed to limit the mercury emissions from new and expanding sources in order to meet the TMDL goal of total statewide mercury emissions of 789 lbs/year by 2025. The MPCA has conducted a review of the NorthMet Project Proposed Action mercury emissions, and has determined that it would not impede the reduction goals (MPCA 2013b, as cited in the FEIS).</p> | MERC 11  |

|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Further, the NorthMet Project Proposed Action is not anticipated to be a major source of mercury into the environment. The RO treatment plant is expected to discharge mercury at or below the mercury standard of 1.3 ng/L, which includes all surface water that would be discharged at the Plant Site including water used for flow augmentation. Mercury loadings from the Mine Site are projected to decrease due to the NorthMet Project Proposed Action and the combined contributions from the Embarrass River and Partridge River are unchanged when modeled for the St. Louis River at the Fond du Lac reservation boundary. Therefore, further degradation of surface water quality, and by extension increased mercury in fish, is not expected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |              |
| 17940      | The cumulative effects of invasive species, mining, and Project effects on sturgeon must be considered and the SDEIS revised.                                                                                                                                                                                                                                                                                                                                                                                            | The NorthMet Project Proposed Action is not considered to have the potential for cumulative effects on lake sturgeon, because recent MDNR and Fond du Lac Band of Lake Superior Chippewa sturgeon data provided since the SDEIS indicated sturgeon are not known to occur within the Project Area (see Section 4.2.6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | AQ02<br>AQ26 |
| 17944      | Although the permitted area is significantly disturbed and will be for the foreseeable future, the closure and reclamation plans will have a significant effect on native vegetation as it is reintroduced. The prevalence of invasive, non-native species and their ability to outcompete native plants in disturbed areas, coupled with PolyMet's plan to introduce non-native and invasive species to this area, would result in significant impacts to cultural resources that have not been discussed in the SDEIS. | The FEIS vegetation sections include new details from the updated Reclamation Plan (PolyMet 2015g, as cited in the FEIS). In particular, invasive species would not be permitted in the seed mix. Some non-native species (e.g., oats, winter wheat) that are commonly used in seed mixes to temporarily stabilize soils in order to reduce erosion or dust potential could be planted. The species to be used for reclamation would be finalized during permitting. The FEIS Section 3.2.2.1.10 describes how the NorthMet Project area facilities would be operated to allow for progressive reclamation during operations. After mining ceases, PolyMet would finish reclamation activities under the Reclamation Plan, which is a required portion of the Permit to Mine. <i>Minnesota Rules</i> 6132.2700 states that the establishment of vegetation shall begin during the first normal planting period after site features are determined by the Permit to Mine to be no longer scheduled to be disturbed. Reclaimed areas would be monitored and maintained as needed in the Spring and Fall or as required under the Permit to Mine. Any areas damaged by erosion or that lost vegetation would be identified, and plans to repair or reseed would be developed and implemented. | VEG 09       |
| 17945      | While the SDEIS provides that displaced wildlife will face increased competition for resources, no mention is made whether the displaced animals may cause populations in adjoining territory to                                                                                                                                                                                                                                                                                                                         | The FEIS wildlife sections include an analysis of wildlife displacement effects due to the NorthMet Project Proposed Action. FEIS Section 5.2.5.2.3 discusses the potential effects to species based on habitat preferences, and uses available scientific literature to analyze displacement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | WI05         |

|            | <p>approach or exceed carrying capacity. The SDEIS fails to assess cumulative effects of wildlife population changes, not only in the project area, but the entire region.</p>                                                                                                                                                                                                                                                                                                                            | <p>effects on local and regional ecology due to noise or increased human activities.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |
| 17948      | <p>the value of natural resources maintained in good condition is simply not represented in the SDEIS. Nor is the economic value of clean water provided or assessed.</p>                                                                                                                                                                                                                                                                                                                                 | <p>EIS Section 5.2.10.1.4 states, "Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the "cost") of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section." CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, "for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations."</p> <p>The socioeconomic analysis provided in the FEIS satisfies NEPA and MEPA requirements. The NorthMet Project Proposed Action would take place in an area that has experienced mining previously. As discussed in FEIS Section 5.2.11.2.1, the presence of the NorthMet Project Proposed Action would not substantially affect regional recreation or visual resources, nor would it substantially affect air or water quality or increase noise levels in popular regional recreation lands such as the BWCAW (see FEIS Section 5.2.12).</p> | SO 04    |
| 17949      | <p>The SDEIS also speculates that the tribes will benefit economically from the Project through additional visitation to Band-operated Casinos, but provides no data to back up this statement: "Increased employment and income associated with the NorthMet Project Proposed Action could increase visitation and revenues at [area tribal gaming] facilities." This statement is entirely unsupported by any market analysis and must be deleted from the socioeconomic assessment of the Project.</p> | <p>No change made.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | EDIT 01  |

| <i>Comments from the Fond du Lac Band (Submission ID 42920)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                               |
| 2768                                                            | <p>The land Exchange Proposed Action, as described in the SDEIS, serves to confirm our concerns for permanent, unmitigated impacts to treaty resources in the 1854 Ceded Territory. The Band submitted comments on the Feasibility Analysis... including: A full consideration of the fair market value and future use of the federal land in the proposed PolyMet land Exchange would recognize a private windfall instead of an equal exchange, in violation of federal statutes, rules and policies. ... The Band is also concerned that most of the non-federal land proposed in the PolyMet land Exchange has a divided mineral estate. Divided ownership raises uncertainties about future benefits that that the non-federal surface could afford to the public, further diminishing the value of the non-federal lands, and is not consistent with Forest Service Conveyance policy (36 CFR 254.15). .... Further, any proposed federal land exchange that is not consistent with forest resource management plans must be rejected under 36 CFR. 254.3. ... The Band expects that the U.S. Forest Service, in facilitating the PolyMet land Exchange, would coordinate with the policies expressed in our plans to protect natural resources on the Reservation and in the Ceded Territories. .... The Band is extremely concerned about the loss of high quality, even exceptional, wetlands within the federal estate, without sufficient information to understand whether the proposed non-federal parcels provide equivalent functions and values. Access to treaty-protected resources is of prime importance to Band members. Loss of access to or use of public lands within the Ceded Territory can significantly impact exercise of treaty rights, and this issue should be thoroughly evaluated in the SDEIS process.</p> | <p>The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs;</p> | <p>LAN 03<br/>                     LAN 04<br/>                     LAN 05<br/>                     WET 14</p> |

|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
|            |                                                                                                                                                                                                                                            | <p>however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be effected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract I wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p> |                |
| 2782       | Wetlands also function as thermal refuge for moose when summertime temperatures exceed 14oC, the point at which moose become thermally stressed, and wetlands provide an important forage resource for moose during the open water season. | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement. The FEIS Section 4.2.5.1.1 discusses the role of wetlands with moose and thermal stress.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | WI 01<br>WI 02 |
| 2788       | In the co-lead agency evaluation of the underground mining alternative, the NorthMet Deposit is described as a “low- to medium-grade                                                                                                       | Information obtained through preliminary exploration in the region has indicated the area potentially contains one of the largest untapped deposits of copper, nickel, and other precious metals. The NorthMet Deposit is                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | PD 25          |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Theme(s) |

|            | <p>mineral resource” which is somewhat at odds with its description as “one of the largest untapped deposits of copper and nickel, and other precious metals” or “world class resource” as it is represented throughout the SDEIS and in continual media coverage. From the SDEIS, we are not able to determine whether mining this mineral deposit in accordance with environmental standards will be profitable enough to provide adequate environmental protections and financial assurance.</p> | <p>characterized as a low- to medium-grade mineral resource. These two characterizations are not in conflict as the commenter seems to suggest. One is a regional characterization while the other applies to the NorthMet Deposit proposed by PolyMet to be mined.</p> <p>See the response to theme ALT 01 for more details on the Underground Mining Alternative. FEIS Section 3.2.3.4.1 states that tonnage/volume and grade of rock would not generate enough revenue to pay for costs associated with underground mining. The FEIS Executive Summary and FEIS Section 3.2.2.1.2 states that the NorthMet Deposit is a low- to medium-grade deposit, matching the language in Appendix B.</p> <p>FEIS Section 3.2.2.4 includes available details regarding financial assurance. Additional details on the cost estimates and calculations that would be required for the project would be addressed during permitting. Specific infrastructure timelines and life expectancies of equipment would be accounted for during permitting as well. FEIS Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as for monitoring and mitigation costs. FEIS Section 3.2.2.4.1 discusses the activities that would be considered in cost estimates, and states that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate.</p> |          |
| 2799       | <p>while the co-lead agencies stipulate in the SDEIS that PolyMet will bear liability through financial assurance [legacy contamination at LTV], it is troubling to see that apparently, they will not be required to complete remedial activities until closure, many decades from now</p>                                                                                                                                                                                                         | <p>FEIS Section 4.2.1.4.2 discusses Legacy Contamination, and states that PolyMet would address AOCs “on a schedule to be approved by the MPCA”, some of which would likely occur prior to closure. In addition, FEIS Section 4.2.1.4.2 states that, “all historic and any potentially operational AOCs not already addressed by the start of mine closure would be investigated and remediated as necessary.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | LU 02    |
| 2845       | <p>The mass balance does not take into account seepage from the saturated overburden at the OSLA, or the load of mercury from Colby Lake stream augmentation. Given the known concentrations of mercury in Colby Lake, which consistently exceed the GLI standard, this mitigation measure is clearly not permissible as a discharge that would contribute to an existing water quality exceedance.</p>                                                                                             | <p>Any mercury released from the peat decomposition process is thought to occur relatively rapidly. The mercury released from organic matter decomposition and in solution would have the potential to move with precipitation that falls on the Overburden Storage and Laydown Area. The Overburden Storage and Laydown Area would be unlined; therefore, there would be some potential for seepage to enter the groundwater system from peat that has decomposed and releases as a pulse of mercury.</p> <p>Water contacting the Overburden Storage and Laydown Area is considered to be process water and would be routed to Pond PW-OSLA. In years 1 to 11, the water from Pond PW-OSLA would be routed to the Tailings Basin,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | MERC 20  |

|            |                                                                                                                                                                                                                                                                                                                                       | <p>and any mercury in the routed water would have the chance to be sequestered in the tailings. In years 12 to 20, some of the water from Pond PW-OSLA would be used to backfill the East Pit. Any mercury in the water routed to the East Pit would mix with waste rock and become sequestered at depth in the East Pit. In addition, any contributions of water in years 21 to 65 from the East Pit to the West Pit would reflect water from the East Pit and its associated watershed runoff, and would not reflect process water from Pond PW-OSLA. Because peat removal from the areas to be mined would be completed between years 5 and 11, any potential release of mercury from stored peat materials would have occurred, or be ending, by the time water is routed from Pond PW-OSLA to the East Pit beginning in year 12. All water that is discharged would meet the GLI mercury standard of 1.3 ng/L.</p> <p>Colby Lake water would not be directly discharged to tributaries north or south of the Tailings Basin under the NorthMet Project Proposed Action, as described in the FEIS. The NorthMet Project Proposed Action would include treatment of all water discharged at the Plant Site, including water used for flow augmentation. Additional information has been included in FEIS Section 5.2.2. The FEIS recommends that tributaries that extend from the Tailings Basin be monitored. In the event that the monitoring identifies the potential for any water quality standard exceedances, the Proposer would be obligated to take action to ensure compliance. Potential mitigation measures are included in FEIS Section 5.2.2.3.5.</p> |          |
| 2856       | <p>Hunting pressure has been ruled out as a major contributing factor to population-level declines, but the appearance of holding a hunt does not sit well with the public, so the DNR, 1854 Treaty Authority and Fond du Lac all closed the 2013 moose season.</p>                                                                   | <p>FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | WT101    |
| 2860       | <p>The Band's consistently expressed concerns for potential air quality impacts from the Proposed Project (a new source of mercury, visibility in a Class 1 airshed, fugitive dust impacts to terrestrial and aquatic resources, asbestos-like mineral fibers) from the Proposed Project remain largely unaddressed in the SDEIS.</p> | <p>Air quality impacts from the NorthMet Project are addressed in FEIS Section 5.2.7.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | AIR 08   |

|            | <p>farmer was found to be equal to the MDH additional lifetime cancer risk guidance level of 1E-05. Although this level is considered “guidance” and not a regulatory action level, the Band believes this value clearly indicates the potential for adverse health effects. The same result was found for the off-site worker inhalation additional lifetime cancer risk. The major drivers for these endpoints were cobalt, nickel, and dioxins (farmers only). Exposure to nickel has been linked with increased risk of lung cancer, cardiovascular disease, neurological and developmental deficits, and high blood pressure.</p> | <p>contracting cancer using very conservative assumptions. The increased risk of contracting cancer due to the Project’s emissions is extremely small. The AERA contains toxicological information for arsenic, diesel, nickel, manganese, mercury, and methylmercury (plus additional chemicals), as well as an analysis of the potential health effects of those chemicals. The toxicological information was included in the AERA summary in FEIS Section 7.3.4.</p> <p>Section 5.2.7.5 also includes a discussion of health risks from airborne fibers, as well as dust suppression measures that would be used to minimize fiber generation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>HU 05<br/>                     HU 07</p> |
| 2879       | <p>As shown in SDEIS Table 6.2-22, cumulative inhalation risks for non-cancer chronic and non-cancer acute effects from both the facility and existing sources are equal to the incremental acute risk guideline value of 1. This shows that the predicted impacts of NorthMet, when added to the toxic releases already prevalent in the area, have reached the level where health authorities begin to be concerned about cancer risks.</p>                                                                                                                                                                                          | <p>The cumulative inhalation risk estimate is a combination of modeled facility air emissions and background air concentrations measured at locations reflective of the proposed facility surroundings. These two pieces of information are based on several tiers of health protective (conservative) assumptions.</p> <p>Since there are no state or federal cumulative risk guidelines, the cumulative inhalation risk results are compared to facility risk guidelines for context and information. The cumulative respiratory acute non-cancer and chronic non-cancer risks were equal to facility risk guidelines. The cumulative inhalation cancer risk estimate is above facility risk guidelines (1 additional case of cancer in a population of 100,000 people), but lies within EPA’s excess cancer risk goal range of 0.1 in 100,000 and 10 in 100,000. This excess cancer risk range is generally considered to be acceptable by EPA according to the 1999 Residual Risk Report to Congress (<a href="http://www.epa.gov/ttn/oarp/t3/reports/risk_rep.pdf">http://www.epa.gov/ttn/oarp/t3/reports/risk_rep.pdf</a>).</p> <p>For further discussions, see FEIS Sections 6.2.3.8.11, and the responses to themes HU02, HU06.</p> | <p>HU 05</p>                                |
| 2897       | <p>Cumulative effects result in a relentless, unmitigated diminishment of treaty resources and access to those resources. Yet across virtually all resource categories, the SDEIS predicts that there</p>                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>The Co-lead Agencies considered the information included in the Tribal Cooperating Agencies’ cumulative effects assessment and found no compelling information or analysis to change the original approach or conclusions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>CU 11<br/>                     CU 12</p> |

|            | will be no adverse impacts....; this conclusion then enables the co-leads to determine 'no cumulative effects' from the project and the land exchange. ...over the course of the DEIS and SDEIS processes that support our misgivings for this circular logic. We presented a substantial alternative analysis of cumulative effects from the NorthMet Project Proposed Action as part of our commenting during the preliminary SDEIS review. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| 2905       | The Band's comments on the 2009 DEIS related to impacts to the 1854 Ceded Territory stand.                                                                                                                                                                                                                                                                                                                                                    | The Cultural Resources sections of FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6 also address effects on, and any proposed mitigation for effects on cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations providing the federal authorities for the review of the NorthMet Project Proposed Action. | NEPA 12          |
| 2906       | The Band's comments on the 2009 DEIS related to environmental justice impacts still stand.                                                                                                                                                                                                                                                                                                                                                    | FEIS Sections 5.2.10.2.7 and 5.3.10.2.1 discuss Environmental Justice effects. See also the response to theme NEPA 12.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | SO 09<br>NEPA 12 |
| 2907       | The Band's comments on the 2009 DEIS related to climate change impacts still stand.                                                                                                                                                                                                                                                                                                                                                           | Comments provided on the DEIS were considered for the SDEIS and therefore, in turn, the FEIS. Climate change is addressed in accordance with the requirements of NEPA and MEPA. Please refer to SDEIS comment themes AIR 01, AQ 16, COE 03, PD 22, VEG 03, WET 07, WET 13, WI 02, WI 03, WI 08, and WR 180, and DEIS comment themes AQ 03, and WR 2B.                                                                                                                                                                                                                                                                                                                                          | NEPA 12          |
| 2909       | The Band also shares concerns communicated by the Bois Forte Tribal Historic Preservation Officer. Mesabe Widjiu is correctly identified as a sacred landform, but needs to be considered in its entirety (see attached map as an example). The segment encountered within the project area is small, but integral to the property. A diverse affects to any portion impact the entire feature.                                               | The federal Co-lead Agencies have determined the Partridge River section of the Mesabe Widjiu to be eligible for inclusion in the NRHP under Criterion A for its association with important Ojibwe spiritual and cultural practices. Although the federal Co-lead Agencies are assessing the effects of the NorthMet Project Proposed Action on only the portion of the Mesabe Widjiu within the APE, it is recognized that the property and its significance extends beyond the APE. The federal Co-lead Agencies have updated the FEIS to include a graphic of the entire Mesabe Widjiu, as provided by the consulting Bands.                                                                | CR 02<br>CR 05   |

| 3102       | <p>Multiple mine plan alternatives exist that could provide mitigation for or prevent long-term environmental damage...</p> <ul style="list-style-type: none"> <li>• paste or dry tailings disposal to reduce the project footprint and use less water (decrease risk of surface and groundwater pollution);</li> <li>• perpetual pumping of the west pit to prevent a pit lake from forming (protect surface and groundwater);</li> <li>• back-filling all waste rock into the east, central and west mine pits (reduce the mine footprint at closure, reduce contaminant runoff to surface and groundwater, reduce volume of water requiring perpetual treatment, restore mine site wetlands);</li> <li>• provide reverse osmosis treatment at the mine site immediately rather than waiting until year 40 (augment water loss in adjacent high quality wetlands in the Partridge River watershed), and;</li> <li>• underground mining (multiple environmental benefits).</li> </ul> | <p>The Underground Mine alternative was first considered but eliminated during the Final Scoping Decision Document (FSDD) process. The FEIS Section 3.2.3.4.1 describes how it was re-considered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was re-considered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be economically feasible, regardless of the tonnage extracted. In addition, the lower rate of ore production would not meet the Purpose and Need of the project. Although the Underground Mine alternative would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>The West Pit Backfill alternative (E20) was considered but eliminated during the development of the DEIS. It was eliminated from further consideration because it was determined that it would not offer significant environmental or socioeconomic benefits compared to the NorthMet Project Proposed Action and because backfilling the West Pit would prevent recovery of additional mineral resources. These factors are sufficient to qualify the West Pit Backfill alternative as unreasonable under NEPA, and justify its exclusion under <i>Minnesota Rules</i> 4410.2300, Subpart G. It was re-considered in the SDEIS in response to DEIS comments from the Cooperating Agencies. A Co-lead Agencies memorandum (MDNR et al. 2013b) was prepared to summarize the decision-making process, which is referenced in FEIS Section 3.2.3.4.2. The Co-lead Agencies screened the alternative against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The opportunity to reclaim wetlands and vegetation at the Category 1 Waste Rock Stockpile footprint area would be a measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, some degree of these vegetation and wetland impacts would occur and would require mitigation regardless of future backfilling or not because of the need to “temporarily” store these materials until mining operations cease.</p> | <p>ALT 01<br/>                 ALT 03<br/>                 ALT 04<br/>                 ALT 06</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                      | <p>An interagency memorandum was prepared regarding the West Pit Water Elevation Alternative (MDNR et al. 2014, as cited in the FEIS). This alternative includes both the option to maintain a dry West Pit through perpetual pumping and maintaining pit water levels below the elevation of the Partridge River. The alternative was screened against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The screening level assessment concluded that the alternative would meet all criteria except for the environmental or socioeconomic benefit criterion. Continuous dewatering of the West Pit would keep the pit walls exposed instead of covered by a pit lake as in the NorthMet Project Proposed Action. This exposure would potentially result in increased solute loading to a smaller pit lake volume, and thus higher concentrations of pollutants than under the NorthMet Project Proposed Action. Consequently, treatment would be required for a longer period of time. The Co-lead Agencies recommend that the Alternative be considered as an adaptive mitigation measure in the event that monitoring during operations and reclamation indicate that implementing this action is better able to meet future environmental objectives compared to the NorthMet Project Proposed Action.</p> |                                                                            |
| 3105       | <p>The Fond du Lac Band of Lake Superior Chippewa conducted meetings in February 2011 to discuss past and current traditional uses by the Band of the area in the NorthMet project. It was expected from the beginning that the distance between the NorthMet area and the Fond du Lac Reservation would reduce the chances of documenting specific use of the area by Fond du Lac Band members.</p> | <p>The federal Co-lead Agencies have made a reasonable and good-faith effort to identify cultural resources potentially affected by the NorthMet Project Proposed Action, and to determine which resources qualify for inclusion in the NRHP as historic properties. Impacts to historic properties have been appropriately assessed, and the federal Co-lead Agencies are actively consulting with the federally recognized Bands, the Minnesota SHPO, and other consulting parties to develop appropriate mitigation measures. Effects on resources significant to the Bands that do not qualify as historic properties, as well as general effects on natural resources, are considered within the parameters of the statutes that shape this review. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>CR 01<br/>                     CR 05<br/>                     CR 06</p> |
| 19571      | <p>The NEPA “hard look” requires agencies to “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing alternatives. Contrary to the explicit requirements of the Council on Environmental Quality (CEQ) rules, the SDEIS</p>                                                                                                 | <p>The original NorthMet Project proposal and alternatives were developed during project scoping in 2005. The NorthMet Project Proposed Action was refined at various points in response to public and agency input. As a result, the NorthMet Project Proposed Action studied in the SDEIS is not identical to the proposed action in the 2009 DEIS. Because some of the alternatives to the proposed action were eliminated during the scoping and DEIS phases</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>ALT 14<br/>                     ALT 21</p>                              |

|            | <p>does not evaluate or examine in any substantive way potentially viable Project alternatives. Even the no action alternative is lacking in detail and analysis. Tribal cooperating agencies identified this deficiency in the DEIS, consistently brought it forward for discussions throughout the SDEIS process, and US EPA cited the lack of alternatives as a factor when issuing an EU-3 rating for the DEIS.</p>                                                                                                                                                          | <p>of the project, they were not re-evaluated in the SDEIS.</p> <p>Alternatives were eliminated from detailed evaluation if they did not offer substantial environmental or socioeconomic benefits, were not reasonable (technically or economically feasible), were not available, or would not meet the Purpose and Need. This review—beginning during the scoping process and concluding with the FEIS—is consistent with the alternatives review required by the National Environmental Policy Act (NEPA) and the Minnesota Environmental Policy Act (MEPA), and with the Council on Environmental Quality (CEQ) rules for analyzing alternatives.</p> <p>FEIS Section 3.2.3.2 discusses how the Consent Decree under the NorthMet Project No Action Alternative would require Cliffs Erie to complete closure and reclamation activities at the Plant Site. This would include completing activities for the localized affected areas under the Minnesota Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building, and management of seepage at the Tailings Bas embankment. The FEIS mentions in Table 3.2-1 that under the NorthMet Project no Action Alternative, there would be no mining activities, and that existing management and land use of the federal lands would continue. The NorthMet Project No Action Alternative is also analyzed under each resource area in FEIS Chapter 5, and summarized in FEIS Table 7.2-1. Several other alternatives for both the NorthMet Mining Project and Land Exchange were screened before the FEIS (see FEIS Section 3.2.3.3). These alternatives were eliminated as they did not offer a substantial environmental or socioeconomic benefit, were not reasonable (economically or technically feasible in accordance with CEQ guidelines), or would not meet the Purpose and Need.</p> |                                               |
| 195/3      | <p>Although the SDEIS was revised to reflect the Project proponent’s preferred action, the only alternative analyzed in any detail concerns simply the acreage of the proposed land exchange. This is not consistent with the CEQ regulations that require federal agencies to identify an agency-preferred alternative in a draft EIS. Yet the SDEIS states “At this time, the Co-lead Agencies have not identified a preferred alternative, and for the USA CE, Appendix B of 33 CFR Part 325 supersedes the CEQ requirement to identify an agency-preferred alternative.”</p> | <p>Neither Minnesota Rules nor CEQ regulations required the Co-lead Agencies to identify a preferred alternative in the SDEIS (40 CFR 1502.14(e)). The FEIS includes available details regarding the identification of an Agency Preferred Alternative. Additional Land Exchange alternatives were identified, screened, and eliminated during scoping leading up to the SDEIS (see FEIS Sections 3.3.3 and 7.2). FEIS Section 7.4 includes additional information about the Agency Preferred Alternative. The United States Forest Service (USFS) must identify a preferred alternative for the Land Exchange in the FEIS. The Minnesota Department of Natural Resources (MDNR) is not required to identify a preferred alternative under MEPA. FEIS Sections 3.2 and 3.3 further detail this process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>ALT 21<br/>                     ALT 23</p> |

| 19575      | There is no evaluation or identification in the SDEIS of the ‘least environmentally damaging practicable alternative’ (“LEDPA”) as required before approving a CWA §404 wetlands permit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The LEDPA process is described in FEIS Section 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the Project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | COE 04                             |
| 19577      | A fundamental operational component of the Proponent’s preferred alternative analysis described in the SDEIS is to deposit their reactive slurry tailings on top of existing taconite tailings in an unlined basin that is currently required, under a Consent Decree, to remediate seepage that has already polluted the nearby ground and surface waters. The SDEIS analysis assumes a tailings basin seepage capture rate of 95% – a performance efficiency that has not been demonstrated anywhere in the US, nor is it feasible since the tailings basin was constructed (per standard Minnesota ferrous mining practices) without a liner. There is an existing seepage capture system installed at SD026 as a requirement of the Consent Decree, yet it has proven to be so ineffective that Cliffs Erie LLC (the responsible party) has proposed building an additional dam and capture system further downstream. | <p>The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and discharge on the opposite side to reverse hydraulic gradients across the slurry wall and in underlying bedrock. Relatively few containment systems have been built with this degree of pumping and discharge to ensure effective containment. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed containment system on the northern, northwestern, and western sides of the Tailings Basin in Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation, and depth to top of bedrock. This information was used to develop revised MODFLOW cross-section models to evaluate containment system efficiencies on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the Plant Site Water Management Plan (PolyMet 2015i, as cited in the FEIS).</p> <p>These new models considered the presence of an upper more-permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. The assumption in the Plant Site GoldSim model of 90% or greater capture efficiency is justified by the analyses performed.</p> | GT 02<br>PD 12<br>WR 020<br>WR 117 |

| 19578      | <p>Dewatered or paste tailings placed on a liner and covered could substantially minimize the mass and concentration of pollutants reaching the Embarrass River watershed wetlands and the Embarrass River. This is a modern mine waste management technique used by many mines in the US and around the world, yet it has never been evaluated as an alternative for this project. “Converting to paste tailings technology from conventional slurry tailings at most mines makes sense, both environmentally and economically. Paste tailings use less water, require less land, do not require engineered containment dams, generate less acid and contaminants, reduce long-term costs and allow for early reclamation. Slurry tailings use and discharge large volumes of water, require dust control measures, require large land areas and containment dams for disposal, and create contaminated water that must be captured and treated.”</p> | <p>A thickened tailings (paste tailings) alternative (A1) was considered but eliminated in the DEIS and post-DEIS as it was determined not to offer significant environmental benefits over the NorthMet Project Proposed Action.</p> <p>A co-disposal of wasterock and tailings on a lined tailings basin alternative (E14) was considered but eliminated in the DEIS because the technical feasibility and cost of doing so were uncertain. Several different tailings basin alternatives (TB2-TB6) were re-considered but eliminated since the DEIS. These Tailings Basin alternatives did not afford meaningful environmental benefits compared to the enhanced engineering controls (seepage collection and reverse osmosis [RO] mechanical water treatment) built into the NorthMet Project Proposed Action. Dry cap seepage was predicted to result in substantially higher concentrations, under the current modeling approach, which would make the future transition from mechanical to non-mechanical water treatment more difficult during post-closure.</p>                                                                                                                                                                                                                                                                                                                                 | <p>ALT 10<br/>                     ALT 16</p> |
| 19580      | <p>The State of New Mexico, Office of Natural Resource Trustee, requires perpetual pumping of the mine pits to prevent formation of a pit lake at the Chino and Tyrone copper mines, specifically for the protection of groundwater. The experience of numerous western mines discharging plumes of polluted water into the bedrock aquifer from leaking mine pits, tailings basins and wasterock piles, highlights a predictable problem that is not only difficult but expensive to fix. By requiring perpetual pumping [alternative not considered in the SDEIS] of the mine pit, the regulatory agencies would minimize leakage of contaminated water into the surrounding bedrock aquifer, and thereby protect groundwater that the State of Minnesota is required to protect as source of drinking water.</p>                                                                                                                                    | <p>An interagency memorandum was prepared regarding the West Pit Water Elevation Alternative (MDNR et al. 2014). This alternative includes both the option to maintain a dry West Pit through perpetual pumping and maintaining pit water levels below the elevation of the Partridge River. The alternative was screened against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The screening level assessment concluded that the alternative would meet all criteria except for the environmental or socioeconomic benefit criterion.</p> <p>Continuous dewatering of the West Pit would keep the pit walls exposed instead of covered by a pit lake as in the NorthMet Project Proposed Action. This exposure would potentially result in increased solute loading to a smaller pit lake volume, and thus higher concentrations of pollutants than under the NorthMet Project Proposed Action. Consequently, treatment would be required for a longer period of time. The Co-lead Agencies recommend that the Alternative be considered as an adaptive mitigation measure in the event that monitoring during operations and reclamation indicate that implementing this action is better able to meet future environmental objectives compared to the NorthMet Project Proposed</p> | <p>ALT 04</p>                                 |

| 19581      | In the 2009 DEIS, the co-lead agencies maintained that all waste rocks should be considered reactive. SDEIS Table 3.2-8, Waste Rock Characterization Properties, acknowledges that the Category 1 waste rock (rock that is <0.12% sulfur), which constitutes 70% of the volume of wasterock, has a “low potential to generate acid, but may leach metals.” Back-filling all of the mine pits with all of the waste rock would reduce the final surface footprint of the mine at closure, and make possible 526 acres of wetland restoration where the Category 1 stockpile is now proposed to be stored in perpetuity. This alternative would prevent the need for a permanent separate seepage capture system around an unlined waste rock pile, as proposed in the preferred alternative, which would have to perform at an above-optimum capture rate in perpetuity to comply with Minnesota Water Quality Standards (“MN WQS”). Capping and revegetating the mine pits after backfilling with waste rock would prevent deep infiltration of precipitation and reduce mobilization of toxic metals. | Action.<br>FEIS Section 3.2.2.1.10 states that waste rock would be backfilled into the East Pit starting at year 11 and in the combined East Central Pit starting in year 16. After backfilling is complete, a wetland would be constructed over the combined East Central Pit. The West Pit Backfill alternative (E20) was considered but eliminated during the development of the DEIS. It was eliminated from further consideration because it was determined that it would not offer significant environmental or socioeconomic benefits compared to the NorthMet Project Proposed Action and because backfilling the West Pit would prevent recovery of additional mineral resources. These factors are sufficient to qualify the West Pit Backfill alternative as unreasonable under NEPA and justify its exclusion under <i>Minnesota Rules</i> 4410.2300, Subpart G. It was reconsidered in the SDEIS in response to comments from the Cooperating Agencies. A Co-lead Agency memorandum (MDNR et al. 2013b, as cited in the FEIS) was prepared to summarize the decision-making process, which is referenced in FEIS Section 3.2.3.4.2. The Co-lead Agencies screened the alternative against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The opportunity to reclaim wetlands and vegetation at the Category 1 Waste Rock Stockpile footprint area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal impact that the stockpile would have, these impacts would be required to be mitigated regardless of future backfilling or not. | ALT 06           |
| 19582      | The SDEIS inexplicably removes the stockpile liner described in the 2009 DEIS for Category 1/2 waste rock in the current project proposed action. From Table 3.2-16 Comparison of DEIS and SDEIS NorthMet Project Proposed Action:<br><br>DEIS: Category 1 and 2 waste rock would be stored in a permanent lined/covered stockpile (Category 1/2 Stockpile) north of the west pit (years 1-11)<br><br>SDEIS: Category 1 waste rock mined from years 1-13 would be stored in an unlined, permanent stockpile north of the West Pit. The stockpile                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | The Final Scoping Decision Document (FSDD) examined several modified design alternatives, as well as multiple mitigation and monitoring measures. The 2009 DEIS also discussed a liner system as part of its consideration of a modified design or layout at the Mine Site. Key aspects of this alternative from the 2009 DEIS were incorporated into the NorthMet Project Proposed Action and studied in the SDEIS.<br><br>As proposed in the FEIS, liners would be installed for stockpiles or areas where there is a potential to generate acid and metal leachate from potentially reactive waste. Temporary stockpiles (Category 2/3 and Category 4) and the Ore Surge Pile would contain a liner. The Category 1 Stockpile would have a containment system to collect seepage, which would be pumped to the Waste Water Treatment Facility (WWTF). The Overburden Storage and Laydown Area would hold peat soils and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | ALT 07<br>ALT 13 |

|            | <p>would have a geomembrane cover system at completion and surface water and groundwater collection system would encompass the entire stockpile and direct water to the Mine Site WWTF.</p> <p>If not backfilled, the Category 1 waste rock stockpile must be lined.</p> | <p>unsaturated overburden, which are not considered to be reactive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                               |
| 19583      | <p>However, combining the two alternatives of perpetual pumping and backfilling the Category 1 waste rock pile would substantially reduce the risk of polluting groundwater and wetlands in the Partridge River watershed.</p>                                           | <p>The two alternatives are contradictory together, as backfilling of the Category 1 waste rock into the West Pit would eliminate the opportunity to perpetually pump the West Pit lake.</p> <p>The West Pit Backfill alternative (E20) was considered but eliminated during the development of the DEIS. It was eliminated from further consideration because it was determined that it would not offer significant environmental or socioeconomic benefits compared to the NorthMet Project Proposed Action and because backfilling the West Pit would prevent recovery of additional mineral resources. These factors are sufficient to qualify the West Pit Backfill alternative as unreasonable under NEPA and justify its exclusion under <i>Minnesota Rules</i> 4410.2300, Subpart G. It was reconsidered in the SDEIS in response to comments from the Cooperating Agencies. A Co-lead Agency memorandum (MDNR et al. 2013b, as cited in the FEIS) was prepared to summarize the decision-making process, which is referenced in the FEIS Section 3.2.3.4.2. The Co-lead Agencies screened the alternative against criteria used for other alternatives, including Purpose and Need, Technical and Economic Feasibility, Availability, and Environmental or Socioeconomic Benefit. The opportunity to reclaim wetlands and vegetation at the Category 1 Waste Rock Stockpile footprint area would be the only measurable environmental benefit offered by backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal impact that the stockpile would have, these impacts would be required to be mitigated regardless of future backfilling or not.</p> <p>An interagency memorandum was prepared regarding the West Pit Water Elevation Alternative (MDNR et al. 2014, as cited in the FEIS). This alternative includes both the option to maintain a dry West Pit through perpetual pumping and maintaining pit water levels below the elevation of the Partridge River. The alternative was screened against criteria used for other alternatives, including Purpose and Need, Technical and Economic</p> | <p>ALT 04<br/>                     ALT 06</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Feasibility, Availability, and Environmental or Socioeconomic Benefit. The screening level assessment concluded that the alternative would meet all criteria except for the environmental or socioeconomic benefit criterion. Continuous dewatering of the West Pit would keep the pit walls exposed instead of covered by a pit lake as in the NorthMet Project Proposed Action. This exposure would potentially result in increased solute loading to a smaller pit lake volume, and thus higher concentrations of pollutants than under the NorthMet Project Proposed Action. Consequently, treatment would be required for a longer period of time. The Co-lead Agencies recommend that the Alternative be considered as an adaptive mitigation measure in the event that monitoring during operations and reclamation indicate that implementing this action is better able to meet future environmental objectives compared to the NorthMet Project Proposed Action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |          |
| 19584      | <p>The Minnesota Department of Natural Resources (DNR) and US Army Corps of Engineers (USACE) superficially evaluated and subsequently dismissed underground mining as an alternative to the proposed open pit Project for the 2009 DEIS. The co-lead agencies eliminated this alternative from further evaluation because it would have had “a significantly reduced rate of operation that would not be considered economically feasible, and, therefore, would not meet the Purpose and Need of the Project.” Tribal cooperating agencies urged the co-lead agencies, now including the US Forest Service (USFS), to do a more robust analysis of the underground mining alternative for the SDEIS, but the co-lead agencies did not “exercise a degree of skepticism in dealing with self-serving statements from the prime beneficiary of a project” when analyzing this alternative. This alternative was eliminated by the Project proponent based purely on an economic decision that underground mining would not be as profitable as open pit mining.</p> <p>The co-lead agencies claim that “it was not possible to undertake a quantitative, side-by-side</p> | <p>The Underground Mine alternative was first considered but eliminated during the Final Scoping Decision Document (FSDD) process. The FEIS Section 3.2.3.4.1 describes how it was re-considered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration. FEIS Section 5.2.10.1.4 states, “Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the “cost”) of environmental effects is often difficult to achieve. Therefore, the approach</p> | ALT 01   |

|            | <p>assessment of the underground mining alternative.” An underground mine would have a reduced mining rate and life of mine, employed fewer workers for a shorter period of time, and reduced state and local tax revenues. Although the underground mining alternative would offer substantial environmental benefits (significantly less wetland destruction, less mine-generated waste, less groundwater and surface water pollution generated and requiring treatment and control, less reclamation and closure activities, less nuisance and reactive dust to be controlled, less noise and vibration impacts, less visual impacts), the economic and intrinsic value of those benefits are not even estimated. In addition, an underground mine project would not require a federal land exchange, resulting in lower start-up costs and avoiding the permanent loss of high quality resources (as discussed in later comments on Land Exchange impacts). Based upon an incomplete analysis of the benefits of an underground mine, the co-lead agencies determined that this alternative would result in reduced socioeconomic benefits, and; “PolyMet would not move forward with an unprofitable project, thus any potential environmental or socioeconomic benefits associated with this alternative are moot.”</p> | <p>of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section.” CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, “for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”</p>                                                                                                                                                                                                                                                                                                                                          |          |
| 19585      | <p>The co-lead agencies determined that underground mining was considered technically feasible, but concluded that “PolyMet is a private sector and for-profit company, the value of the saleable material would need to provide sufficient income to cover operating cost (which includes, but is not limited to, the cost of mining, processing, transportation, and waste management), capital cost (to build and sustain facilities), an adequate return to investors, reclamation, and closure costs and taxes. An underground mining project would</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>The Underground Mine alternative was first considered but eliminated during the Final Scoping Decision Document (FSDD) process. The FEIS Section 3.2.3.4.1 describes how it was re-considered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was re-considered during development of the SDEIS. In response to a request from the Co-lead agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead agencies independently evaluated (see FEIS Appendix B). The Co-lead agencies concluded that an underground mine would not be profitable, regardless of</p> | ALT 01   |

|            | <p>leave most of the NorthMet Deposit unmined because of its low metal value relative to the cost of mining and mineral processing. Other material would have to be left in place for safety reasons, to prevent collapse.” Therefore, “the Co-lead Agencies found that while underground mining is technically feasible, available, and would offer significant environmental benefits over the proposed NorthMet Project, it would not be economically feasible and would not meet the Purpose and Need. Since the underground mining alternative would not meet all of the screening criteria, it is not considered to be a reasonable alternative. Therefore, the underground mining alternative was eliminated from further evaluation in the SDEIS.”</p> <p>The SDEIS does not contain the appropriate level of detail required to eliminate this alternative. The conclusion that underground mining is neither viable nor preferable remains substantially unjustified, despite repeated requests by the tribal cooperating agencies for further analysis.</p> | <p>the tonnage extracted. The lower rate of ore production would not meet the purpose and need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| 19587      | <p>The Project Proponent, without considering the economics of perpetual treatment, the purchase of thousands of acres of land for the federal land exchange, direct and indirect wetland mitigation costs, etc., concludes in their economic analysis that underground mining is “[n]ot economically viable” while simultaneously claiming that backfilling the west pit would create encumbrances not allowed in their mineral lease due to mineral resources located below the west pit that could only be accessed through underground mining. This is not the appropriate rigor in a cost-benefit analysis for thoroughly evaluating an EIS alternative. The CEQ regulations require that, where a cost-benefit analysis is “relevant to the choice among environmentally different</p>                                                                                                                                                                                                                                                                           | <p>The Underground Mine alternative was first considered but eliminated during the FSDD process. FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A</p> | ALT 01<br>ALT 03 |

|            | <p>alternatives,” there are a variety of additional requirements, including “analysis of un-quantified environmental impacts, values, and amenities,” in addition to other CEQ alternatives rules.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>The FEIS Section 5.2.10.1.4 states, “Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the “cost”) of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section.” CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, “for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |          |
| 19588      | <p>As already argued in the Tribal Position, significant additional study of the underground mining alternative is mandated, and the SDEIS offers no new discussion of the reasons for rejecting the alternative. The economic viability of an underground mine depends on a variety of factors including ore grade, market prices, cost of tailings management, and waste rock disposal. A study of this particular deposit was performed by the prior owner of the site, US Steel, which actually recommended underground mining. PolyMet is well aware of this study, given that the company included it in a filing with the Securities and Exchange Commission in 2003. In fact, by examining geologic cross-sections showing the distribution of ore by depth, it appears that there are substantial ore reserves at depths that likely could not be accessed by the proposed open-pit mine.</p> | <p>The Underground Mine alternative was first considered but eliminated during the FSDD process. The FEIS Section 3.2.3.4.1 describes how it was reconsidered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was reconsidered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet’s consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be profitable, regardless of the tonnage extracted. The lower rate of ore production would not meet the Purpose and Need of the project. Though it would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. They accordingly concluded that the Underground Mine alternative was not economically feasible, and would not meet the NorthMet Project’s Purpose and Need. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies’ rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>The FEIS Section 5.2.10.1.4 states, “Neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric; however, this EIS acknowledges that economic costs</p> | ALT 01   |

Also acknowledged is that the agreement on the value (i.e., the "cost") of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section." CEQ regulations for implementing NEPA (40 CFR 1502.23) state that, "for purposes of complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations."</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |          |
| 19589      | <p>The environmental costs of open-pit mining and the requisite wetland mitigation and above-ground disposal of tailings and waste rock are immense. These environmental costs, combined with the most current understanding of deposit ore grades, reasonably potential metals prices, and the costs associated with perpetual treatment must all be evaluated to determine the feasibility of this [underground mining] alternative.</p> | <p>The Underground Mine alternative was first considered but eliminated during the Final Scoping Decision Document (FSDD) process. FEIS Section 3.2.3.4.1 describes how it was re-considered during the DEIS process as alternative E7 in response to Cooperating Agency and stakeholder comments, but eliminated from further consideration. The economic feasibility of the Underground Mine alternative was re-considered during development of the SDEIS. In response to a request from the Co-lead Agencies, PolyMet's consultants prepared an updated economic assessment of underground mining, which the Co-lead Agencies independently evaluated (see FEIS Appendix B). The Co-lead Agencies concluded that an underground mine would not be economically feasible, regardless of the tonnage extracted. In addition, the lower rate of ore production would not meet the Purpose and Need of the project. Although the Underground Mine alternative would offer environmental benefits over the NorthMet Project Proposed Action, it would result in reduced socioeconomic benefits. A position paper (FEIS Appendix B) was prepared to document the Co-lead Agencies' rationale for eliminating the Underground Mine alternative from further consideration.</p> <p>FEIS Section 5.2.10.1.4 states, "neither NEPA nor CEQ requires the cost and benefits of a proposed action to be quantified in dollars or any other common metric. However, this EIS acknowledges that economic costs and loss of non-market value may result from environmental and social effects. Also acknowledged is that the agreement on the value (i.e., the "cost") of environmental effects is often difficult to achieve. Therefore, the approach of this EIS is to evaluate environmental and social impacts directly, in the appropriate resource-specific section." The Council on Environmental Quality (CEQ) regulations for implementing the National Environmental Policy Act (NEPA) (40 CFR 1502.23) state that, "for purposes of</p> | ALT 01   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>complying with the Act, the weighing of the merits and drawbacks of the various alternatives need not be displayed in a monetary cost-benefit analysis and should not be when there are important qualitative considerations.”</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| 19594      | <p>Even the No Action Alternative analysis is deficient:</p> <p>Under the NorthMet Project No Action Alternative, the NorthMet Project Proposed Action would not occur. The consideration of a No Action Alternative is required to be evaluated in the SDEIS in accordance with NEPA and MEPA.</p> <p>If the NorthMet Project Proposed Action is not approved, the Mine Site would be returned to pre-exploration conditions under the requirements of exploration approvals to reclaim surface disturbance associated with exploratory and development drilling activities. Other existing surface uses would be allowed to continue consistent with the Forest Plan.</p> <p>No further upgrades or new segments would be constructed along the existing power transmission line, railroad, or Dunka Road, which would continue to be used by their private owners.</p> <p>At the brownfield Plant Site, Cliffs Erie would continue to complete closure and reclamation activities as specified under state permits and plans and the Cliffs Erie Consent Decree. This would include completing activities for the localized affected areas under the Minnesota Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building, and management of seepage at the Tailings Basin embankment.</p> <p>This evaluation must also acknowledge that there would be no direct disturbance of over 900 acres</p> | <p>The FEIS discusses in Section 3.2.3.2 how the Consent Decree under the NorthMet Project No Action Alternative would require Cliffs Erie to complete closure and reclamation activities at the Plant Site. This would include completing activities for the localized affected areas under the Minnesota Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building, and management of seepage at the Tailings Basin embankment. The FEIS identifies in Table 3.2-1 that under the NorthMet Project No Action Alternative, there would be no mining activities, and that existing management and land use of the federal lands would continue. The NorthMet Project No Action Alternative is also analyzed under each resource area in the FEIS Chapter 5, and summarized in the FEIS Table 7.2-1. FEIS Section 5.2.3.4 identifies that under the NorthMet Project No Action Alternative there would be no direct or indirect effects on wetlands.</p> | ALT 14<br>WR 108 |

|            | <p>of high quality wetlands, thousands more wetland acres that would not be indirectly affected, no loss of high quality forested uplands, no further diminishment of wildlife habitat, no permanent loss of treaty resources under the land exchange, no cumulative effects to resources and environmental quality. In fact, water quality should improve substantially under the No Action Alternative, as the Cliffs Erie Consent Decree requires that the closed tailings basin ultimately achieves compliance with MN WQS.</p>           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |
| 19595      | <p>The SDEIS is approach to considering less environmentally degrading alternatives is fundamentally inadequate. CEQ rules require that the EIS “present the environmental impacts of the proposal and the alternatives in comparative form, thus sharply defining the issues and providing a clear basis for choice among options by the decision maker and the public.” The SDEIS must be revised to fully evaluate reasonable alternatives in the SDEIS, including identifying the federal agency preferred alternative and the LEDPA.</p> | <p>The original project proposal and alternatives were developed during project scoping in 2005. The NorthMet Project Proposed Action was refined at various points in response to public and agency input. As a result, the NorthMet Project Proposed Action studied in the SDEIS is not identical to the proposed action in the 2009 DEIS. Because some of the alternatives to the proposed action were eliminated during the scoping and DEIS phases of the project, they were not re-evaluated in the SDEIS.</p> <p>Alternatives were eliminated from detailed evaluation if they did not offer substantial environmental or socioeconomic benefits, were not reasonable (technically or economically feasible), were not available, or would not meet the Purpose and Need. This review—beginning during the scoping process and concluding with the FEIS—is consistent with the alternatives review required by NEPA and MEPA, and with the CEQ rules for analyzing alternatives.</p> <p>The FEIS explains in Section 3.2.3 how alternatives were eliminated or incorporated. Minnesota Rules and CEQ rules (40 CFR 1502.14) require that the effects of the NorthMet Project Proposed Action and alternatives must be compared. The FEIS compares the NorthMet Project Proposed Action, NorthMet Project No Action, Land Exchange Proposed Action, Land Exchange Alternative B, and Land Exchange No Action Alternative separately.</p> | ALT 20   |
| 19597      | <p>The land Exchange Proposed Action, as described in the SDEIS, serves to confirm our concerns for permanent, unmitigated impacts to treaty resources in the 1854 Ceded Territory.</p>                                                                                                                                                                                                                                                                                                                                                       | <p>As described in the FEIS, there would not be a net loss to the 1854 Ceded Territory. All of the non-federal lands proposed for exchange are located within the 1854 Ceded Territory. Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See Section 1.4.3 of the FEIS. Mitigation</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | LAN 05   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites (Zim Site) for wetland impacts is proposing to compensate for the loss of bogs and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be impacted as a result of the Land Exchange Proposed Action as no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action would result in additional wild rice beds to the federal estate. The FEIS, Section 5.3.2, clarifies that the Land Exchange Proposed Action would not result in a loss of wild rice beds, nor would the use of the wild rice beds change for the Bands.</p> <p>Please refer to theme LAN01 for more information on the public interest determination as part of the USFS process.</p> |          |
| 19599      | <p>The land Exchange Proposed Action does not meet the need of the Bands in the 1854 Ceded Territory. It results in a permanent loss of 382 acres, does not protect fish and wildlife habitat within the Mine Site, does not protect important cultural resources such as wild rice beds, historic trails, and a substantial portion of the Mesabi Widjiu, does not protect the Embarrass, Partridge or St. Louis River watersheds, does not consolidate mineral interests in the private parcels that would be conveyed to the federal estate, does not promote multiple-use</p> | <p>The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | LAN 05   |

|            | values, or fulfill public needs. | <p>Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (ZimSite) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would</p> |          |

|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |                                                                                                                                                                                                                                                                                                     | <p>not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |
| 19600      | <p>maintaining public land ownership is critical for the exercise of treaty rights. There are 382 acres of Lake County land proposed for the land exchange (Tract 2). This means a net loss, through the exchange, of publicly accessible land for band members exercising their treaty rights.</p> | <p>The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising</p> | LAN 05   |

|------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |         | <p>their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands</p> |          |

| 19601      | The Forest Service should consider exchange for private lands only in order to maintain - or better yet, increase - the total public land acreage within the 1854 Ceded Territory. | <p>via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p> <p>The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource</p> | LAN 05   |

|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
|            |                                                                                                                                                                                                                                                      | <p>values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract I wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p> |                  |
| 19603      | This language and description [SDEIS 3.1.2, Land Exchange Overview] is misleading; it downplays the largely undisturbed nature and ecological and biodiversity significance of most of the contiguous lands (i.e., the Hundred Mile Swamp, St. Louis | The FEIS includes information about the baseline conditions of the federal lands and MBS sites such as the One Hundred Mile Swamp Site in Sections 4.2.4.2.1 (Mine Site) and 4.3.4.1.1 (Federal Lands). The FEIS Sections 4.2.4 and 4.3.4 provide maps of the MBS Sites (Figures 4.2.4-1, 4.2.4-2, 4.2.4-5, 4.3.4-1, and 4.3.4-2) to provide further clarity on locations and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | LAN 06<br>VEG 02 |

| 19611      | <p>River Headwaters Site).</p> <p>Of the approximately 6,025 acres of MBS Sites of High Biodiversity Significance under the Land Exchange Proposed Action, nearly 2,000 acres of coniferous bog wetlands will be lost to the federal estate and therefore effectively to the Bands, if the Land Exchange Proposed Action is implemented. This is significant because many tribally harvested resources are only available in coniferous bogs (e.g. cranberries, soft-leaved blueberries, sweet flag), and mitigation for coniferous bogs is simply not feasible.</p> | <p>extent.</p> <p>The FEIS includes discussion about NorthMet Project impacts to habitat types, MBS sites, and native plant communities. The vegetation analysis cross-references the FEIS cultural resources section (Section 5.2.9) to ensure consistency and to discuss potential impacts on tribally harvested resources. FEIS Section 5.2.3 discusses restoration of coniferous bogs in mitigation wetlands. The WCA rules (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities (<i>Minnesota Rules</i> 8420.0515, Subpart 3). <i>Minnesota Rules</i> 6132.2700 require that a project site be reclaimed once mining has ceased. The goals of such reclamation are to “control erosion, to screen mining areas from non-compatible uses, and to provide for subsequent land uses such as wildlife habitat or timber production.” The rules also include requirements about the characteristics and planting schedule for vegetation used in reclamation. The Permit to Mine would address special consideration of wetlands that include rare natural communities. Additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions.</p> <p>The Agency’s obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and that the Bands’ usufructuary rights to resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effect posed to usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands. Through consultation, the Co-lead Agencies understand that the Bands’ principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing and gathering,</p> | <p>CR 01<br/>                     WET 05<br/>                     VEG 02</p> |

|            |                                                                                                                                                                                                                                                                                                                                                           | cultural or religious resources, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 ceded territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                 |
| 19612      | The exchange of thousands of acres of high quality wetlands and forests containing some of the few remaining wildlife corridors in northeastern Minnesota available to the Bands to exercise reserved 1854 Treaty rights, for lands that have moderate diversity is inconsistent with fiduciary responsibilities that are shared by all federal agencies. | The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands. Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. |            |         | <p>Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the</p> |          |

| 19613      | <p>The SDEIS attempts to diminish the significance of the loss of these high quality lands by stating “Given the existing lack of overland public access and actual use of the federal lands, as well as historic use of this area for mineral exploration (see Section 4.2.9), the Land Exchange Proposed Action represents little to no change in the actual level of recent or current use of the federal lands.” In fact, historic trails connect what is now Beaver Bay with Lake Vermillion. These trails “are associated with the lives of persons significant in our past” including John Beargrease, Peter Gagnon, and Alec Posey. In more recent history, Bois Forte Band members used a sugarbush near the plant site and harvested wild rice in the Embarrass River near the LTVSMC tailings basin.</p>                                                                                                                                                                                                      | <p>public interest determination.</p> <p>As discussed in FEIS Section 5.3.1.2.1, the only public access to the federal lands is via the Partridge and Embarrass rivers. The remainder of the federal lands are surrounded by private lands (or by other public lands that are themselves surrounded by private lands) (see Figure 4.3.1-1). While members of the public may obtain permission to cross these private lands and access the federal lands, there is no designated land-based access for the federal lands.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | CR 04                                       |
| 19614      | <p>The SDEIS does not provide adequate discussion of the adverse effects of the proposed land exchange on wetlands and headwater streams within the St. Louis River watershed/Lake Superior Basin, where the loss of first-order headwaters streams, second-order streams and wetlands have the potential to significantly adversely impact downstream water quality, fisheries, and wildlife that are important to the Bands. The Land Exchange Proposed Action would relinquish water resources within the Lake Superior basin for wetlands and surface water resources outside the Lake Superior basin and the St. Louis River watershed, although still within the 1854 Ceded Territory. Federal lands include 4,164 acres of wetlands within the Lake Superior basin; non-federal lands contain 4,669 acres of wetlands, of which only 373 acres are within the Lake Superior Basin, demonstrating there would be a permanent loss of 3,791 acres of federally managed wetlands within the Lake Superior Basin.</p> | <p>The SDEIS and FEIS acknowledge a possibility that habitat could be affected from water chemistry changes resulting from the Land Exchange Proposed Action. Habitat loss from flow changes or riparian activities is not expected as a result of the NorthMet Project Proposed Action. It is noted that under the Land Exchange Proposed Action, the net reduction to the Superior National Forest of 0.3 miles of first order streams may result in slightly less habitat available for headwater stream dependent species.</p> <p>The FEIS Section 5.3.3 included a discussion of wetland resources to be gained or lost as part of the Land Exchange Proposed Action. The Land Exchange Proposed Action represents a transfer of surface rights of 6,495.4 acres from the Superior National Forest to PolyMet to eliminate the conflict between federal surface and private mineral estate. This action, if approved, would remove those acres from Superior National Forest management and public use and transfer them to private ownership. Effects to wetland resources as a result of the mining activities are discussed in FEIS Section 5.2.3. The FEIS Section 5.3.6 included a discussion of headwater streams to be gained or lost from the proposed land exchange. The proposed land exchange non-federal lands are not mitigation sites and are not required to be exchanged within the same watershed. The non-federal lands being considered are all lands that are located within the proclamation boundary of the Superior National Forest and would consolidate land ownership</p> | AQ 29<br>CR 01<br>WET 14<br>WR 114<br>WI 02 |

|            | It is well known that wetlands play an important role in protecting the quality and condition of downstream waters by retaining floodwaters, sediment, nutrients, and other pollutants. Wetlands also function as thermal refuge for moose when summertime temperatures exceed 14oC, the point at which moose become thermally stressed, and wetlands provide an important forage resource for moose during the open water season.                                                                                                                                                                                                                                               | management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| 19615      | the SDEIS concedes that the land exchange will cause irretrievable losses of resources for the Bands                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The Cultural Resources sections of FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6 also address effects on, and any proposed mitigation for effects on cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations providing the federal authorities for the review of the NorthMet Project Proposed Action.                                                                                                                                                                                                             | CR 01            |
| 19616      | The SDEIS states, "The Land Exchange Proposed Action would result in additional wild rice beds by the acquisition of Tract 1. Tract 1 contains Little Rice Lake, which supports a continuous population of wild rice. Wild rice also grows along the Pike River south of Little Rice Lake and in isolated populations on Hay Lake." However, the wild rice waters in Tract 1 are already accessible to the Bands via the Pike River; adding Tract 1 to the federal estate does not provide additional wild rice harvesting opportunities to Band members in the 1854 Ceded Territories even though it would add an additional 126 acres of wild rice beds to the federal estate. | The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B as no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would result in additional wild rice beds to the federal estate. The FEIS, Sections 5.3.2 and 5.3.4, clarifies that though the Land Exchange Proposed Action would result in an increase in wild rice beds within the federal estate boundaries there would be no change to the existing public access to Tract 1 wild rice beds via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice beds are known to occur on the federal lands, and suitable habitat is limited. | LAN 05<br>WR 155 |
| 19617      | This is the essential argument against Alternative B, from the Bands' perspective. The additional lands would essentially be permanently removed from tribal access, habitat and resources would be degraded, and there would be no compensation via                                                                                                                                                                                                                                                                                                                                                                                                                             | The Agency's obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands' usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | LAN 05           |

|            | conveyance of lands to the federal estate. | <p>analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by</p> |          |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p> |          |
| 19618      | <p>The desire to resolve “conflict” between the USFS and the Project proponent, whose goal to develop an open pit mine is barred due to deed restrictions on the federal estate, should not prevail over the federal fiduciary responsibility to the Bands. The potential for more roads and hiking trails may provide more access to the public, but does nothing to promote habitat diversity and long-term ecosystems sustainability that are requirements for the preservation of tribal usufructuary rights. Although the Land Exchange Proposed Action may increase acreage in the federal estate, the countervailing permanent loss of Critical Wildlife corridors, high quality and diverse land and water resources that would result is simply not in the</p> | <p>The Agency’s obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands’ usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands’ principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the</p>                                                                                                                                                                                                                                                                                                                                                                        | LAN 05   |

|            | public interest. | <p>1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the</p> |          |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                 |
| 19619      | <p>Federal land exchanges are discretionary, and federal agencies cannot approve permits that will have impacts to treaty resources without additional evaluation and mitigation. No mitigation has been identified in the SDEIS for this permanent loss of lands and resources (natural and cultural) to the 1854 Ceded Territory. The public interest determination must include a specific finding that “The intended use of the conveyed Federal land will not substantially conflict with established management objectives on adjacent Federal lands, including Indian Trust lands” (36 CFR 254.3(b)(2)(ii)). This threshold has not been met, and the Fond du Lac Band objects to the implementation of the Land Exchange Proposed Action.</p> | <p>The Agency’s obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands’ usufructuary rights to treaty resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands’ principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the</p> | CR 01<br>LAN 05 |

|            |         | <p>potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (ZimSite) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>The Cultural Resources sections of FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the</p> |          |

|            | <p>the scale and appropriate instruments for financial assurance have been postponed until the permitting phase of this Project. This approach fundamentally contradicts federal and state environmental policy and the SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Additional details on the cost estimates, time frames, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine.</p> <p><i>Minnesota Rules</i> 6132.1200, Subpart 3, states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate.</p> <p><i>Minnesota Rules</i> 6132.1200 Subpart 4 state that the Commissioner shall evaluate all financial assurance cost estimates and adjustments to cost estimates using individuals with documented experience in material handling and construction and mining costs. Neither NEPA nor MEPA rules require that all financial assurance mechanisms be in place before the EIS is finalized.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                 |
| 19623      | <p>Long-term treatment of contaminated water; consistency with maintenance-free closure goals: The SDEIS lists the sulfur concentrations of Project waste rock ranging between 0.01 - 5.0% with an average mass-weighted concentration of 0.15%. The Virginia Formation has the highest concentrations of sulfur at 0.4- 5.0%, and the Duluth Complex 0.13 – 0.6% sulfur. These concentrations are at least equal to, or in some instances significantly higher than the Zortman-landusky mine waste rock (0.2% sulfur) that requires perpetual wastewater treatment. Just as Zortman-landusky predicted for their mine project, PolyMet has suggested that “most (70%) of the NorthMet waste rock would be the low-sulfur, non-acid-generating” and will never cause acid mine drainage. Yet the SDEIS speaks to the need for at least centuries of wastewater treatment at both the Mine Site and Plant Site: “Once the West Pit is full (approximately year 40), discharge of treated water from the WWTF to the West Pit would be terminated. The WWTF would be upgraded to RO and include evaporator/crystalizers to convert the RO reject concentrate to residual solids, which would be</p> | <p>The GoldSim model used probabilistic modeling to avoid improbable predictions that can occur when a deterministic simulation is done with a suite of “worst case” inputs. The probabilistic modeling approach used in GoldSim provides cumulative probability distributions for predicted concentrations that are far more useful for impacts assessment and project evaluation. Computing a “highest predicted concentration” is not useful if the probability of its occurrence is exceedingly small.</p> <p>Concentration caps are established at the highest expected concentrations of solutes in the various types of mine waste. Concentration caps incorporated into the GoldSim model are based upon the widely observed finding that the concentration of many solutes released by oxidation of sulfide metals in mine wastes can be limited by the precipitation of secondary minerals or adsorption to mineral surfaces. Because concentration caps vary with aqueous chemical conditions (i.e., most metals in mine waste pore waters have higher concentration caps in acidic conditions than neutral conditions), the GoldSim model applied different caps to water from acid-generating waste and non-acid generating waste. The selection of specific values for concentration caps was considered by the Co-lead Agencies (see Table 1 of MDNR, et. al. 2011, as cited in the FEIS); the specific ranges for concentration caps were estimated from mineral solubilities (for those solutes commonly found as secondary minerals in mine wastes) or observed in effluent from field-scale mine wastes (see Tables 1-15 and 1-30 through 1-33 in Barr 2012d, as cited in the FEIS). Concentration caps were based on field studies rather than laboratory studies so that the rock to</p> | PD 03<br>WR 056 |

|            | <p>disposed of at appropriate off-site facilities.” . . .Based on current GoldSimP90 model predictions, treatment activities could be required for a minimum of 200 years at the Mine Site” . . .Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements.”</p> <p>The tribal cooperating agencies have provided substantial evidence that the modeling for the NorthMet Project Proposed Action potentially underestimates those “highest predicted concentrations.” This will affect both volumes of water requiring treatment and duration of the need for mechanical treatment.</p> | <p>water ratios would be similar to conditions expected at the NorthMet Project Site, and thus would avoid the higher water to rock ratios in humidity cell tests that could under-estimate caps. The use of concentration caps is described in FEIS Section 5.2.2.2.3.</p> |                  |
| 19624      | <p>After refill, the West Pit water level would be controlled by pumping to the WWTF to prevent surface water overflow from the pit lake. However, release of pit lake water to the West Pit Surficial Flowpath would continue. The WWTF would also receive low flow rates from the Category 1 Stockpile groundwater containment system. The WWTF effluent would be discharged into a tributary channel that flows into the Partridge River at the location shown on Figure 5.2.2-15. Mine site: The WWTF would continue to operate during long-term closure, treating excess water from the West Pit and discharging the effluent to</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Section 5.2.2 of the FEIS says water quality modeling performed in support of the FEIS indicates that water treatment systems would be needed indefinitely at the Mine Site and Plant Site.</p>                                                                          | WR 035<br>WR 036 |

|            | <p>the small Partridge River tributary. The typical discharge rate from the WWTF is predicted to be 285 gpm. The water balance model predicts periodic temporary higher treatment/discharge rates to account for conditions when the freeboard in the pit becomes too small. By pumping pit lake water to the WWTF, the pit water level would be managed to always provides sufficient freeboard to absorb extreme precipitation events without overflowing. The estimated discharge for this condition is 570 gpm. In the water balance model, the occasional switch to the “high” treatment flow pushes the long-term average discharge rate to 290 gpm. Plant Site: During long-term closure, the WWTP would continue to treat water collected by the Tailings Bas in containment systems. Some of the treated effluent would be used for flow augmentation to Unnamed Creek, Mud Lake Creek, Trimble Creek, and Second Creek. It is predicted that Colby Lake water would no longer be needed for augmentation (Barr 2013a). Tailings seepage bypassing the containment system (approximately 19.4 gpm) would continue to enter the North, Northwest, and West Surficial flowpaths, and migrate slowly toward the Embarrass River. By year 200 in closure, which reflects when effects would have peaked and would be decreasing, the WWTF would be discharging and all groundwater contaminant loads would have reached the Partridge River (except negligible contributions from the bedrock flowpaths). Whatever the long-term goals to transition to non-mechanical treatment, this acknowledges a minimum of 200 years of operation of the WWTF. It is clear that the NorthMet Project Proposed Action would require long term treatment of water at both the Plant and Mine Sites. The minimum duration of this treatment is on the order of centuries, but the</p> |          |          |

|            | <p>SDEIS does not provide an estimate of when mechanical treatment would no longer be needed to meet MN WQS. Therefore, as provided in multiple comments on the preliminary SDEIS, Fond du Lac conservatively assumes that water treatment for the proposed PolyMet mine is perpetual and the SDEIS should be clear on this issue.</p>                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                            |
| 19625      | <p>However, instead of clarifying this factor, it appears that the co-lead agencies are attempting to minimize the significance of the necessity for long term/perpetual treatment by using vague and confusing language in the SDEIS. The specific language describing long term water treatment has changed during the development of the document, even though the model results have not. The co-lead agencies use creative wording to obscure the results of the modeling; this is misdirection at best and highly inappropriate for the co-lead agencies to present to the public.</p>                                                                                | <p>Water quality modeling performed in support of the FEIS indicates that water treatment systems in some form and at some scale would be needed at the Mine Site and Plant Site indefinitely. The water models constructed to assess the potential effects from the NorthMet Project Proposed Action were not designed to predict the duration of treatment nor do they capture all the factors that influence the duration of treatment, for example potential future regulatory and technological changes. Therefore, the models cannot be used to predict a year treatment would end. Actual treatment requirements would be assessed on a reoccurring basis throughout operations and closure based on results of ongoing discharges, performance and water resource monitoring ensuring continuous protection of ground and surface water quality and compliance with applicable water quality standards. This reassessment process would rely on measured monitoring results (evaluated through modeling) rather than the results of the predictive modeling included in the FEIS. Regardless of the precise duration of effects or water treatment at either the Mine Site or Plant Site, there are measures available to address impacts to natural resources.</p> | NEPA 09<br>WR 035          |
| 19626      | <p>In addition to water treatment, there will also need to be a substantial investment in long-term or perpetual operation, maintenance and replacement of other environmental controls for the Project, including seepage capture and pumping at multiple locations at both the mine site and plant site, repair and replacement of liners, managing appropriate stream augmentation and Tailings Basin pond elevation, and pumping, treating, and disposal of seepage from the HRF. The Tailings Basin pond would primarily receive solute loadings from the tailings, treated Mine Site process water (primarily during years 1 to 11, and possibly through year 20,</p> | <p>It is acknowledged that operation, maintenance and periodic replacement of environmental controls would be required during closure. Financial Assurance would be required under the State's Permit to Mine to perform these activities on a continuous and/or periodic basis for as long as these activities are needed.</p> <p>The FEIS Project description indicates that no Colby Lake water would be used for direct surface water augmentation. All water used for stream augmentation would be treated prior to being added to hydrologically affected waters. See the response to theme WR 035.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | PER 03<br>WR 035<br>WR 037 |

|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|----------|
|            | <p>depending on the NorthMet Project Proposed Action water budget), and captured seepage from the groundwater containment system. The Tailings Basin pond, in turn, would become a primary source of contaminants as its water seeps into the tailings. Therefore, the composition of the Tailings Basin pond, which would be a permanent feature of the Tailings Basin, would be an important component in the quality of water that would be discharged from the Tailings Basin. Thus, PolyMet proposes to use the WWTP to treat the pond water during reclamation, and as necessary during closure, to maintain the design water level and prevent overflow. The presence of the pond in closure would provide benefits as it would create a saturated layer that would permanently reduce the oxygen flux and associated solute release in the underlying tailings. The groundwater containment system would continue to operate during reclamation and closure, although in those phases, the seepage could not be reused as process water, but would be treated at the WWTP and used to accelerate filling of the West Pit (during reclamation) and for streamflow augmentation (during closure). Although it is designed to capture all of the Tailings Basin seepage, the groundwater containment system is assumed to capture 90 percent of the groundwater flow that approaches the system (PolyMet 2013g). During reclamation, all WWTP effluent would be used to help flood the West Pit; therefore, during this phase, all augmentation water would come from Colby Lake (approximately 1,600 gpm). In closure, it is expected that effluent from the WWTP alone (estimated at approximately 2,000 gpm) would be sufficient to meet the minimum flow augmentation requirements of the tributaries without requiring additional water from Colby Lake.</p> |          |          |

| 19627      | <p>The Tailings Basin pond would primarily receive solute loadings from the tailings, treated Mine Site process water (primarily during years 1 to 11, and possibly through year 20, depending on the NorthMet Project Proposed Action water budget), and captured seepage from the groundwater containment system. The Tailings Basin pond, in turn, would become a primary source of contaminants as its water seeps into the tailings. Therefore, the composition of the Tailings Basin pond, which would be a permanent feature of the Tailings Basin, would be an important component in the quality of water that would be discharged from the Tailings Basin. Thus, PolyMet proposes to use the WWTP to treat the pond water during reclamation, and as necessary during closure, to maintain the design water level and prevent overflow. The presence of the pond in closure would provide benefits as it would create a saturated layer that would permanently reduce the oxygen flux and associated solute release in the underlying tailings. The groundwater containment system would continue to operate during reclamation and closure, although in those phases, the seepage could not be reused as process water, but would be treated at the WWTP and used to accelerate filling of the West Pit (during reclamation) and for streamflow augmentation (during closure). Although it is designed to capture all of the Tailings Basin seepage, the groundwater containment system is assumed to capture 90 percent of the groundwater flow that approaches the system (PolyMet 2013g). During reclamation, all WWTP effluent would be used to help flood the West Pit; therefore, during this phase, all augmentation water would come from Colby Lake (approximately 1,600 gpm). In closure, it is expected that effluent from the WWTP alone (estimated at approximately 2,000 gpm) would be</p> | <p>It is acknowledged that operation, maintenance and periodic replacement of environmental controls would be required during closure. Financial Assurance would be required under the State's Permit to Mine to perform these activities on a continuous and/or periodic basis for as long as these activities are needed.</p> <p>The NorthMet Project Proposed Action has been modified since the SDEIS to address the issue of using Colby Lake water for augmentation. The FEIS Project description indicates that no Colby Lake water would be used for direct surface water augmentation. All water used for stream augmentation would be treated prior to being added to hydrologically affected waters. See the response to theme WR035. Section 5.2.2 of the FEIS says water quality modeling performed in support of the FEIS indicates that water treatment systems would be needed indefinitely at the Mine Site and Plant Site.</p> | <p>WR 035<br/>                     WR 037<br/>                     WR 124</p> |

|            | <p>sufficient to meet the minimum flow augmentation requirements of the tributaries without requiring additional water from Colby Lake. These statements indicate the need for perpetual WWTP operation, if for no other reason than needing clean water for stream augmentation, which will be required in perpetuity to compensate for the hydrologic impacts of the Tailings Basin.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                              |
| 19628      | <p>The rate of drainage would decrease over time as the pore water within the hydrometallurgical residue is collected and removed. Once the entire facility is closed, the volume of water from the drainage collection systems would decline. In the long term, the volume of water requiring treatment would decline to the point that the remaining reclamation activity may consist of periodic pumping of remaining drainage into tank trucks for transportation, treatment, and disposal, as appropriate, and of inspection of the closed cells to verify integrity of the reclamation systems...The water quality of both mine pits, however, is predicted to improve over time as the pits become flooded, thereby effectively eliminating oxidation of the pit walls, the primary source of solutes, except for the upper few feet where water levels may fluctuate. Figures 5.2.2-37, 5.2.2-38, and 5.2.2-39 show how the water quality in the West Pit is predicted to improve over time for three representative solutes: cobalt, nickel, and sulfate. It is expected that eventually the solute concentrations in the pits would stabilize to more or less steady-state values, although the timeframe for this would likely be greater than 200 years as indicated by Figures 5.2.2-37 to 5.2.2-39, which show solute concentrations continuing to decrease at year 200, although still above water quality standards. These predicted improvements in water quality suggest that the WWTF may not need to operate permanently, but that at some point, non-</p> | <p>The NorthMet Project Proposed Action relies on mechanical treatment for as long as necessary. FEIS Chapter 3 states that PolyMet has committed to conducting pilot and other feasibility studies on the use of non-mechanical treatment as an adaptive management measure if proven effective and cost efficient. The possible future use of non-mechanical treatment is stated as a long-term goal, but the details of how such systems would operate would be determined once operations begin and site specific data could be used for pilot/feasibility studies, and if eventually proposed would be addressed in future permitting.</p> | <p>PD 06<br/>                     WR 137</p> |

|            | mechanical treatment systems may be sufficient to meet water quality standards. The SDEIS frequently states the long-term goal is to transition to non-mechanical treatment, but there is little evidence to suggest that current treatment technologies can consistently treat large volumes of water to meet WQS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| 19629      | Furthermore, constructed wetlands would require substantial acreage to handle the volume of wastewater that will perpetually be collected, and do not function well in our cold climate for at least half of the year (when vegetation is not actively growing). They are not likely to be able to treat wastewater sufficiently to consistently meet water quality standards, including the wild rice sulfate criterion. But perhaps most the most significant factor to consider for the likelihood of successfully transitioning is that non-mechanical treatment, at least at the Mine Site, necessitates the seasonal application of the wild rice sulfate criterion: "...However, the non-mechanical system will be designed to discharge only during a portion of the year, to comply with the seasonal discharge criterion for wild rice downstream of the Mine Site. The design of the West Pit Overflow Non-Mechanical Treatment System is based on a discharge period of two months, September and October." | The NorthMet Project Proposed Action relies on mechanical treatment for as long as necessary. FEIS Chapter 3 states that PolyMet has committed to conducting pilot and other feasibility studies on the use of non-mechanical treatment as an adaptive management measure if proven effective and cost efficient. The possible future use of non-mechanical treatment is stated as a long-term goal, but the details of how such systems would operate would be determined once operations begin and site specific data could be used for pilot/feasibility studies, and if eventually proposed would be addresses in future permitting. Reference to a seasonal application of the wild rice standard has been removed from the description of these potential future non-mechanical treatments systems for the FEIS. | WR 137<br>WR 153 |
| 19630      | "However, the non-mechanical system will be designed to discharge only during a portion of the year, to comply with the seasonal discharge criterion for wild rice downstream of the Mine Site. The design of the West Pit Overflow Non-Mechanical Treatment System is based on a discharge period of two months, September and October." As described in the A WMP, this type of non-mechanical treatment system cannot meet the 10mg/l sulfate criterion. At this time, the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The NorthMet Project Proposed Action relies on mechanical treatment for as long as necessary. |            | <p>continued implementation of the seasonal application of that criterion is highly questionable as recent research conducted by the University of Minnesota on behalf of the MPCA indicates excess sulfate loading is detrimental to wild rice regardless of the time of year.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>non-mechanical treatments systems for the FEIS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                         |
| 19631      | <p>The SDEIS requires substantially more public transparency and less equivocation on what is arguably one of the most fundamental issues at stake for this project: how long will the company be required to flawlessly operate and maintain expensive mechanical treatment to comply with MN WQS? Clearly there are other engineering controls and management actions that will absolutely have to flawlessly operate and require maintenance in perpetuity (seepage collection, liners, pumps, waste rock stockpile cover systems, waste disposal, stream augmentation, Tailings Bas in pond elevation management). This singular issue has significant repercussions for the public interest determinations and the scale of required financial assurance.</p> | <p>Water quality modeling performed in support of the FEIS indicates that water treatment systems in some form and at some scale would be needed at the Mine Site and Plant Site indefinitely. The water models constructed to assess the potential effects from the NorthMet Project Proposed Action were not designed to predict the duration of treatment nor do they capture all the factors that influence the duration of treatment, for example potential future regulatory and technological changes. Therefore, the models cannot be used to predict a year treatment would end. Actual treatment requirements would be assessed on a reoccurring basis throughout operations and closure based on results of ongoing discharges, performance and water resource monitoring ensuring continuous protection of ground and surface water quality and compliance with applicable water quality standards. This reassessment process would rely on measured monitoring results (evaluated through modeling) rather than the results of the predictive modeling included in the FEIS. Regardless of the precise duration of effects or water treatment at either the Mine Site or Plant Site, there are measures available to address impacts to natural resources.</p> <p>Engineered systems can operate successfully over long periods of time if they are properly monitored and maintained. The FEIS provides a comprehensive description of proposed water treatment and seep collection systems including surface water and groundwater containment and synthetic liners and covers. This includes the types of monitoring used to assess performance. Detailed designs are provided in supporting documents, which are fully referenced in the FEIS. The FEIS also discusses long-term operation, maintenance, and periodic replacement of engineered systems. It is acknowledged that certain components of the engineered systems would need to be replaced when monitoring indicates that performance is marginal and not readily compensated for by adaptive mitigation measures.</p> <p>The financial assurance process would fully consider long-term monitoring and periodic replacement of equipment including, but not limited to, water treatment hardware and synthetic liners and covers. |            |                                                                                                                                                                                                                                                                                                                       | <p>Assurance package for the NorthMet Project Proposed Action would insure that future funding would be available if and when adaptive mitigation measures or component replacements are needed to achieve performance specifications.</p> <p>FEIS Section 3.2.2.4 includes available details regarding financial assurance. Additional details on the cost estimates and calculations that would be required for the project would be addressed during permitting. Specific infrastructure timelines and life expectancies of equipment would be accounted for during permitting as well. FEIS Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as for monitoring and mitigation costs. FEIS Section 3.2.2.4.1 discusses the activities that would be considered in cost estimates, and states that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |          |
| 19632      | <p>The SDEIS identifies 29 Areas of Concern (AOCs) that are now PolyMet's legal responsibility, but still does not provide the necessary clarity about the status of remedial investigations and/or actions necessary to clean up the contamination that occurred over decades of taconite mining and processing.</p> | <p>FEIS Table 4.2.1-2: NorthMet Project Proposed Action Area of Concern Summary List for Voluntary Investigation and Cleanup Program, has been updated in the FEIS to show the current status and additional information where available. Costs for assessment, investigation, and cleanup are not feasible to provide (Personal communication, Email from Jim Robin, MPCA, to ERM, October 27 &amp; 29, 2014).</p> <p>The April 6, 2010, Consent Decree is a court registered agreement between Cliffs Erie LLC and the MPCA to resolve alleged violations of Cliffs Erie's NPDES/SDS permits for its Hoyt Lakes and Dunka mining area facilities (State of Minnesota v. Cliffs Erie, L.L.C. 2010, as cited in the FEIS). Of particular relevance to the NorthMet project, the Consent Decree addresses issues at the current Cliffs Erie tailings basin (including outfall SD026) and discharges from the Cliffs Erie Area 5 mining area (SD033). The Tailings Basin is part of the NorthMet Project Proposed Action, whereas Area 5 is not; however, PolyMet has entered into an agreement with Cliffs Erie where both areas would be transferred to PolyMet upon issuance of project permits. Until that time, Cliffs Erie retains responsibilities for permit-related activities at the tailings basin and Area 5. While certain Consent Decree-related activities have been in progress or have been completed for these areas since the SDEIS, there has been no change in ownership or responsible parties since that time (Personal communication, Email from Jim Robin, MPCA, to ERM, October 27 &amp; 29, 2014).</p> | HAZ 05   |

|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 19633      | The SDEIS does not provide sufficient information for the public to understand whether the NorthMet Project Proposed Action will be required to remediate these and other AOCs before commencing project operations, or be allowed to defer remediation until closure. It is not clear in the SDEIS how the Voluntary Investigation and Cleanup (“VIC”) program requirements will be applied to PolyMet | <p>FEIS Table 4.2.1-2: NorthMet Project Proposed Action Area of Concern Summary List for Voluntary Investigation and Cleanup Program, has been updated in the FEIS to show the current status and additional information where available. Costs for assessment, investigation, and cleanup are not available.</p> <p>The April 6, 2010, Consent Decree is a court registered agreement between Cliffs Erie LLC and the MPCA to resolve alleged violations of Cliffs Erie’s NPDES/SDS permits for its Hoyt Lakes and Dunka mining area facilities. The Consent Decree addresses issues at the Tailings Bas in (including outfall SD026) and discharges from the Cliffs Erie Area 5 mining area (SD033). While the latter area is not part of the NorthMet Project Proposed Action, PolyMet has entered into an agreement with Cliffs Erie, whereby it would be transferred to PolyMet upon issuance of permits for the NorthMet Project Proposed Action. Until that time, Cliffs Erie retains responsibilities for permit-related activities at both the Tailings Bas in and Area 5. While certain Consent Decree-related activities have been in progress or have been completed for these areas since the SDEIS, there has been no change in ownership or responsible parties since that time.</p> | HAZ 05   |
| 19634      | Cliffs Erie (now Cliffs Natural Resources) was party to a Consent Decree and approved work plan(s) with MPCA regarding their remedial responsibilities, but there is little information in the SDEIS for the public to be assured regarding the need for PolyMet to enter into a legally binding agreement and develop approvable work plans to address their responsibilities.                         | The FEIS discusses in section 3.2.3.2 how the Consent Decree under the NorthMet Project No Action Alternative would require Cliffs Erie to complete closure and reclamation activities at the Plant Site. This would include completing activities for the localized affected areas under the Minnesota VIC Program, removal of the former Plant Site building, and management of seepage at the Tailings Bas in embankment. The FEIS identifies in Table 3.2-1 that under the NorthMet Project No Action Alternative, there would be no mining activities, and that existing management and land use of the federal lands would continue. The NorthMet Project No Action Alternative is also analyzed under each resource area in the FEIS Chapter 5, and summarized in the FEIS Table 7.2-1. FEIS Section 5.2.3.4 identifies that under the NorthMet Project No Action Alternative there would be no direct or indirect effects on wetlands. If the project progresses through permitting, MPCA and DNR would determine the responsible parties for clean up of legacy and other project related impacts managed under permit. See also response to 19636.                                                                                                                                        | ALT 14   |
| 19635      | It seems reasonable to expect PolyMet to clean up all legacy contamination as quickly as possible; in fact, remedial actions should be integrated with the                                                                                                                                                                                                                                              | These comments provide information on the legacy contamination sites at the NorthMet Mining project. No changes were made to the EIS as a result of these comments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | HAZ 05   |

|            | ‘refurbishing’ actions they plan to do to re-tool the taconite processing facilities to accommodate their processing needs.                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |          |
| 19636      | the public may not realize that the actual cleanup of LTV’s legacy contamination may be deferred until reclamation and closure of the NorthMet Project. This timeline is not acceptable, and the SDEIS should not be vague about the pace of fulfilling remedial requirements. | FEIS Table 4.2.1-2 includes the updated NorthMet Areas of Concern (AOCs) Summary List from the MPCA Voluntary Investigation and Clean-up Program. PolyMet has entered into an agreement with Cliffs Erie where the AOCs on the Mine Site would be transferred to PolyMet upon issuance of project permits. Until that time, Cliffs Erie retains responsibilities for permit-related activities at the AOCs. While certain Consent Decree related activities have been in progress or completed for these areas since the SDEIS, there has been no change in ownership or responsible parties since that time. Costs for assessment, investigation, and cleanup, are not feasible to provide. | HAZ 05   |

| 19637      | <p>Inadequate hydrologic and geochemical characterizations using all existing data; insufficient new data to support modeling and assumptions. Many of the deficiencies in site characterization and water modeling from the 2009 DEIS persist in the 2013 SDEIS despite some new data collection (not all of which was used) and new modeling (using unrealistic or unsupported assumptions and neglecting to consider critical features). As detailed in extensive comments submitted by tribal cooperating agencies to the co-lead agencies over the past seven years, water quality analyses for the Partridge and Embarrass Rivers are inadequate. Water modeling results, whether deterministic (DEIS) or in the form of probability distributions (SDEIS) are based on flawed understanding of hydrology at both the mine site and plant site. One example of this flawed understanding is the error in baseflow calculations, which is carried forward in the MODFLOW hydrologic modeling. At the mine site, MODFLOW under-predicts the amount of water that would flow into the mine pits and thus under-predicts the amount of water treatment needed for both short and long term closure. At the plant site, the MODFLOW model is constructed in a way that is not representative of the site's physical conditions and therefore yields results that are not logical.</p> | <p>In the FEIS Mine Site GoldSim model, bedrock flowpaths have been reconfigured with a bulk hydraulic conductivity that is approximately one order-of-magnitude higher than what was used in the SDEIS. In addition, the flowpaths are remodeled to be 15 meters thick to account for new information indicating that upper bedrock tends to have higher hydraulic conductivity, and this zone tends to control the overall groundwater flow within the bedrock. The model does consider the Virginia Formation as a separate hydrostratigraphic unit and assigns a higher hydraulic conductivity to this unit compared to the Duluth Complex. The presence of higher hydraulic conductivity Virginia Formation explains the higher pit in flows predicted for the East Pit, which is partially excavated into this bedrock unit. Note that Virginia Formation is not relevant to bedrock flowpaths in the Mine Site GoldSim model because the flowpaths only exist in Duluth Complex rock.</p> <p>The FEIS Plant Site MODFLOW model was modified and recalibrated for the FEIS as follows: 1) updated areal distribution of surficial deposits and bedrock outcrops, 2) established surficial deposits below and adjacent to the East Embankment, 3) used drain or river cells along the East Embankment to allow surface seepage of tailings water, 4) incorporated the hydrologic effects of the future swale to drain surface water from the East Embankment area, 5) recalibrated model material properties and boundary conditions using all available site data through 2013 (this is mostly new hydraulic head information), and 6) expanded the use of river and drain cells to provide a more accurate representation of wetlands outside the Tailings Basin. As a result of these changes, the FEIS Plant Site MODFLOW model no longer has no-flow boundary condition at the toe of the East Embankment, and river and/or drain cells in surficial deposits are in place to allow the potential for surface seepage ("upwelling") were added. The model was calibrated to insure that hydraulic heads in the tailings and adjacent surficial deposits were not well above ground surface. In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p> | <p>WR 011<br/>                 WR 058<br/>                 WR 060<br/>                 WR 071<br/>                 WR 093<br/>                 WR 103<br/>                 WR 176<br/>                 WR 179</p> |

| 19638      | <p>“Hard rock mining affects fresh water through heavy use of water in processing ore, and through water pollution from discharged mine effluent and seepage from tailings and waste rock impoundments.” Acid mine drainage (“AMD”) is one of the greatest environmental liabilities associated with mining, especially in pristine, water-rich environments like the Project mine site, that have economically and ecologically valuable natural resources. There are no hard rock surface mines that exist today that can demonstrate that AMD can be stopped once it occurs on a large scale. Inaccurate pre-mining characterization and interpretation often results in a failure to recognize or predict impacts to water quality and aquatic life. Evidence from literature and field observations suggests that permitting large scale surface mining in sulfide-hosted rock with the expectation that no degradation of surface water will result due to acid generation imparts a substantial and unquantifiable risk to water quality and fisheries. In a report comparing predicted and actual water quality at hard rock mines, two types of characterization failures were identified that led to differences between the predicted water quality in EIS documents and the actual water quality either during or after mining began. These included: (1) insufficient or inaccurate characterization of the hydrology. The authors reported primary causes of hydrologic characterization failures as overestimations of dilution, lack of hydrological characterization, overestimations of discharge volumes, and underestimations of storm size. (2) insufficient or inaccurate geochemical characterization of the proposed mine. The primary causes of geochemical characterization failures were identified as lack of adequate geochemical characterization, in terms of sample representativeness and sample adequacy. The</p> | <p>The Co-Lead Agencies have requested additional hydrologic and geochemical data and the incorporation of those data into EIS analyses periodically throughout the environmental review process by the Co-Lead Agencies. The criteria the Co-Leads used to determine what data is included in the FEIS are as follows.</p> <p>Is the updated data:</p> <ul style="list-style-type: none"> <li>• Significantly different than the data already used in the model?</li> <li>• An integral component of a calibrated variable?</li> <li>• Linked to other data such that updating one necessitates updating the other?</li> <li>• Considered background information important to assessing the project’s impacts?</li> <li>• Part of a greater dataset such that updating all of the dataset is necessary for consistency?</li> <li>• A type of input variable where GoldSim is sensitive?</li> <li>• Necessary for permitting-level analyses?</li> </ul> <p>Data collection and use in the FEIS are summarized in various data sufficiency documents.</p> <p>Nevertheless, a degree uncertainty in the predictions of environmental effects remains, as it would for any study of this type. The Co-Lead Agencies have addressed this uncertainty in several ways. Water quality modeling results (concentrations) are presented in terms of a probability, which communicates the likelihood actual concentrations could be higher or lower than what was modeled. Sensitivity analyses were performed on temperature and precipitation inputs, baseflows in the Partridge River and other inputs.</p> <p>The FEIS identifies monitoring and reliable mitigation measures that have been incorporated in the NorthMet Project Proposed Action, possible improvements to these measures and additional mitigation that could be implemented if effects to water quality are worse than predicted. Additionally, on-going monitoring would be used in modeling to help predict any issues before they occur.</p> <p>A detailed financial assurance analysis would be part of the permitting phase. The financial assurance process would fully consider long-term monitoring and periodic replacement of equipment including, but not limited to, water treatment hardware and synthetic liners/covers. The Financial Assurance package for the NorthMet Project Proposed Action would insure that future funding would be available if and when adaptive</p> | <p>PD 01<br/>                     WR 128</p> |

|            | <p>primary causes of mitigation failures were that mitigation measures were not identified, were inadequate, or were not implemented; waste rock mixing and segregation was not effective; liners leaked; tailings were spilled; or embankments failed, and land application discharge was not effective. The NorthMet Project Proposed Action, as defined in the SDEIS includes all of these characterization failures.</p>                                                                                                                                                                                             | <p>mitigation measures or component replacements are needed to achieve performance specifications.<br/>                     Taking the data, modeling, proposed monitoring, mitigation, adaptive management and financial assurance together, the NorthMet EIS sufficiently discloses and accurately predicts to the degree possible potential effects to water quality.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| 19639      | <p>The Project overestimates dilution of polluted water by underestimating baseflow in the bedrock surficial aquifer at both the mine and plant sites.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 streamgaging in the Partridge River at SW 006 that occurred when there were no discharges from Northshore and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTV tailings basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.<br/>                     The water quality predictions generated by the Mine and Plant Site GoldSim models reasonably consider the groundwater baseflow contributions in projecting potential contaminant levels within the Partridge River and Embarrass River during project operations, reclamation, and closure.</p> | WR 165           |
| 19640      | <p>A fundamental lack of hydrologic characterization enables PolyMet to reach a fictitious conclusion that there will be no water pollution resulting from the Project. No bedrock monitoring wells were installed near the tailings basin. The number of groundwater samples used to model the Mine Site included three or more samples from each of 23 monitoring wells in the surficial aquifer (a 24th well was dry after the first sampling, so it only provided a single sample). Of these, 12 were new monitoring wells installed in the surficial aquifer in 2012, yet data collected from them was not used</p> | <p>The SDEIS was based on data generally collected through October 2012. The FEIS relied on new data collected through the end of 2013, which included 12 new monitoring wells at the Mine Site. In addition, the FEIS made use of new geotechnical data collected in 2014 along the north, northwest, and west perimeter of the Tailings Basin; included geologic logs, ten new surficial aquifer piezometers, slug tests in the piezometers, and ten bedrock packer tests performed in five boreholes advanced into upper bedrock. Hydrogeologic site characterization was sufficient for purposes of environmental review.<br/>                     All publicly available and relevant studies were considered in developing the SDEIS and FEIS. These include technical reports prepared by the Proposer, reports from State and Federal agencies, technical papers in peer</p>                                                                                                                                                                                                                                                                                           | WR 071<br>WR 095 |

|            | <p>to model and predict potential impacts to water surrounding the Project. Storage coefficients used to model the entire Plant site area are not consistent with any peer reviewed scientific literature.</p> | <p>reviewed journals, and technical reports associated with other mine sites. The SDEIS and FEIS preparers drew on these information sources to the degree that they were reliable and relevant to the assessment of potential NorthMet Project Proposed Action impacts.</p> <p>The FEIS provided a description of data used to assess impacts. An explanation was provided regarding any data used and not used in finalizing the FEIS MODFLOW and GoldSim models.</p> <p>It is well known that unexplained sampling/laboratory issues can cause occasional chemical results to be incorrect and unusable for site characterization. This happens to some extent on all large projects where sampling is conducted at many locations and for long periods of time. When an occasional data value is clearly anomalous and does not fit in any reasonable way with the bulk of the related data, it is an acceptable practice to not use the anomalous value for characterization to develop a more accurate site characterization.</p> <p>During winter 2013-2014, an investigation of bedrock was conducted along the north, northwest, and west perimeter of the tailings basin. The investigation included five boreholes advanced into upper bedrock and 10 packer tests conducted in these holes. The investigation provided rock core, Rock Quality Designation data, and hydraulic conductivity of discrete intervals within the upper bedrock. The results of this investigation are reported in Barr 2014b (as cited in the FEIS) and in FEIS Section 4.2.2.3.1.</p> <p>It is correct there are currently no bedrock monitoring wells at the Plant Site. Installation of bedrock monitoring wells would be specified as part of the permitting process, with the results used to assess project performance on an ongoing basis.</p> <p>The MODFLOW and GoldSim models for the Mine and Plant Sites were modified and recalibrated using groundwater level and sampling data collected through the end of 2013. At the Mine Site, this included all 24 monitoring wells, including data from 12 newer wells that was not used in the SDEIS.</p> <p>Stream gaging data used in the SDEIS and FEIS is adequate to characterize groundwater baseflow, seasonal flow, and storm runoff in the Partridge and Embarrass Rivers.</p> <p>See the responses to themes WR011 and WR012 for additional discussions of fracture flow and hydrology.</p> <p>In the FEIS Plant Site MODFLOW model, storage coefficients for the</p> |          |

| 19641      | <p>The hydrology model that was applied used outdated data collected at a significant distance from the site. The Project XP-SWMM model is based on a stream gauging station for the Partridge River that is seventeen miles from the mine site and the data from that station are twenty years old; and stream gauging data for the Embarrass River that is based in data that is more than fifty years old from eleven miles downstream. Therefore, the results are highly unlikely to be representative of current conditions at the mine or plant site. This baseline hydrologic data deficiency has been carried forward from the 2009 DEIS, despite ample time and opportunity to collect sufficient new hydrologic data. The tribal cooperating agencies have long urged the co-lead agencies to require a more rigorous modeling effort before any confidence can be placed in predictions of Project impacts. From the March 2, 2012 Coleman memo to the co-lead agencies:</p> <p>“The calibration of the Modflow model to a Partridge River baseflow of 0.76 cfs predicted by XP-SWMM results in a model that moves very little water through the groundwater system. This can result in low predicted rates of inflow to the mine pit and slow movement of contaminants from sources (stockpiles or reflooded pits) to points of evaluation. More generally, an incorrect baseflow calibration target results in excessively low estimates of recharge and likely incorrect estimates of horizontal and vertical conductivity. These hydrologic parameters are interrelated and getting one wrong, as appears to be the case with baseflow, will almost certainly result in the other parameters being incorrectly estimated...Our long standing concern that the mine site hydrologic models incorporate incorrect assumptions about</p> | <p>surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p> <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 stream gaging in the Partridge River at SW 006 that occurred when there were no discharges from Northshore and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTVSMC tailings basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.</p> <p>The only other available gaging data is from a station installed during 2011 at SW003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore PMP pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.</p> <p>To better understand the relationship of groundwater baseflow to the GoldSim model’s water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted Project impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. It also reflected consideration of the flow data collected at SW 003 in requiring groundwater baseflows at all locations on the Partridge River be increased by a factor of 4 (e.g., 0.5 to 2.0 cfs at SW-003). The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action’s ability to meet groundwater</p> | <p>WR 003<br/>                 WR 071<br/>                 WR 086<br/>                 WR 091<br/>                 WR 175</p> |

|            | <p>recharge are supported by Fred Marinelli's comment on line 39 and elsewhere of: "Agency Responses MS and PS WP and Waste Characterization Data package V7 2-7-12.xls". His comment states that "A net infiltration (recharge) range of 0.3 to 1.5 in/yr represents 1.1 to 5.4 percent of mean annual precipitation (MAP). This range for local net infiltration is unrealistically low for this area of the US." These low recharge values and the low vertical K values are related to calibration of the Modflow model to low baseflow. Until Modflow, and by extension the other related models XP-SWIMM and GoldSim, are calibrated to data from the site (e.g. observed baseflow and an adequate number of observed heads) and incorporate reasonable recharge rates, the results from the models are unlikely to accurately simulate current or future conditions. . . The Modflow model, in particular, needs to be calibrated with targets based on observed baseflow and observed well water heads. Calibration to projections by XP-SWMM, that appear to be incorrect, means that the fundamental characterization of the site hydrology is likely to be faulty. . . . The focus on water quality parameters to the near exclusion of hydrologic flow parameters is reflected in the Groundwater IAP summary memo of June 2011. Groundwater flow modeling underpins contaminant transport modeling and is interrelated to surface flow models. Without adequate vetting of flow model parameters and predictions, it is impossible to have confidence in predictions of contaminant movement and water quality."</p> | <p>quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p> <p>The purpose of the groundwater baseflow analysis was to 1) evaluate natural characteristics of the surficial aquifer such as recharge and hydraulic conductivity and 2) estimate natural groundwater discharges into the rivers during low-flow conditions. Note that non-natural discharges into the rivers were estimated separately in the site models. Use of older data for evaluating natural hydrologic conditions was justified because it was not affected by artificial (non-natural) discharges into the stream channels by Northshore and LTVSMC operations.</p> |                          |

|            | <p>Storage and Layout Area (OSLA). Project estimates were based on one-hundred-year storm events. Before recognition of climate change impacts, this would have been a reasonable assumption. Now, storms severity and frequency suggest that what was previously considered a one-hundred-year storm event may occur once every ten years.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>distributions to capture the range of possible future conditions. While climate change may occur in the future, it cannot be stated at this time if in the long-term there would be more or less rainfall. Thus, the probabilistic approach to rainfall used in GoldSim represents a technically defensible method for dealing with this issue.</p> <p>Individual storm events and frequency are not incorporated into the GoldSim models. The effects of individual storms are considered by designing facilities to handle a 100 year - 24 hour storm event based on current data. If over time, climate change causes a gradual increase in annual rainfall, the 100 year storm event would be redefined to a larger precipitation value and mine facilities would be upgraded to handle a larger storm.</p> <p>For the Mine Site, a GoldSim sensitivity analysis was conducted to assess the possible effects of future climate change on groundwater and surface water impacts. It was concluded that reasonably foreseeable climate change would have little effect on pit inflows, pit lake water quality, groundwater chemical concentrations, and surface water chemical concentrations. These results are reported in the Water Modeling Data Package - Mine Site (Barr; December 2014). By analogy, the Plant Site is also expected to be minimally affected by possible future climate change.</p> <p>See the responses to themes WR 077 and WR 180.</p> |                                                                                |
| 19643      | <p>Many mitigation measures were not identified or evaluated using the required NEPA "hard look". Those mitigation measures that have been identified and carried forward as the Proposed Project are inadequate, especially the tailings basin seepage capture system. The tailings basin is unlined, and the seepage capture system has not been designed to collect any seepage from the east side of the tailings basin. This flow path for project pollutants to reach surface and ground water has not been addressed at all. The waste rock mixing and segregation has not been demonstrated to be effective at other similar projects. Liner leakage rates are very optimistically estimated using solid waste landfill average leakage rates (lined solid waste landfills are much smaller).</p> | <p>The FEIS Plant Site MODFLOW model was modified from the SDEIS to include: 1) the presence of surficial deposits below the East Embankment, 2) boundary conditions (drain and/or river cells) along the embankment toe to allow the potential for surface seepage, and 3) hydrologic inputs to account for the presence of the proposed drainage swale.</p> <p>Similar to other locations along the perimeter of the Tailings Basin, the project was modified to include installation of a containment system along the East Embankment where it is underlain by surficial deposits. Given the hydrogeology of the area east of the Tailings Basin and the proposed swale to be constructed there, this containment system would have higher hydraulic head on the east side compared to the west (tailings) side where a pumped trench would depress the groundwater level. This would create hydraulic gradients in the slurry wall and in shallow bedrock that would drive (low) flows from east to west across the containment system. This set of hydraulics would result in complete capture of all tailings water approaching the containment system from the Tailings Basin. Because the system would achieve complete capture of tailings water, an east side</p>                                                                                                                                                                                            | <p>NEPA 14<br/>                     WR 054<br/>                     WR 126</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>chemical transport flowpath is not needed in the Plant Site GoldSim model. There is no hydrologic reason to expect that impacted water from the Tailings Basin would migrate east of the containment system.</p> <p>There is a long history of rock segregation on the Iron Range and regulatory agencies annually review the placement of rock. Technology like GPS has improved segregation practices. See the responses to theme WR 134 for more information on waste rock segregation.</p> <p>The assumed liner leakage rates are based on a combination of literature values, experience at mine sites, experience at other types of industrial facilities, manufacturer documentation, and information provided in standard engineering guidance documents (Section 5.2.2.3 in the Mine Site Water Modeling Data Package [PolyMet 2015m]). Liner leakage rates were estimated using the USEPA-approved HELP model, where simulations combined NorthMet Project Proposed Action design values for slopes and subgrade design with the published values for average liner defects per acre. See response to theme WR 126 for more information.</p>                                                                                                                                                                                                                                                                                               |                                                                                                                                             |
| 19644      | <p>There are no predictions or contingency plans addressing the potential for tailings piped from the processing plant to the tailings basin could be spilled, or that tailings embankments may fail. The Hydrometallurgical Residue Facility (HRF) is proposed to be constructed in an area that is currently under water, and has a prominent historic drainage channel that has not been accounted for in project design or water modeling.</p> | <p>FEIS Section 5.2.14.2.2 (geotechnical stability of the Tailings Basin) and Section 3.2.2.3.5 (tailings management under the NorthMet Project Proposed Action) indicates that the Tailings Basin design would meet appropriate Factors of Safety and that Tailings Basin embankments would be monitored and inspected on a routine basis and repaired or strengthened on an as-needed basis (Geotechnical Data Package Volume 1 (PolyMet 2015l) as cited in the FEIS).</p> <p>The Hydrometallurgical Residue Facility would be constructed over the LTVSMC emergency basin. The design of the Hydrometallurgical Residue Facility acknowledges the presence of this seep by including a collection drain that would collect water from the seep below the proposed constructed embankment and liner systems to transmit the collected seep to the exterior of the facility. FEIS Section 5.2.2.3.3, and Section 5.2.14.2.3 discusses the design and construction of the Hydrometallurgical Residue Facility, and Geotechnical Data Package Volume 2 (PolyMet 2014c) as cited in the FEIS) indicates the design would meet all factors of safety as required.</p> <p>Management of hazardous materials (including piping and other means of transport) is addressed in section 5.2.13.</p> <p>Monitoring would allow potential failures to be recognized and corrected if and before there would be release of impacted water to the environment..</p> | <p>WR 066<br/>                     WR 131<br/>                     WR 132<br/>                     GT 01<br/>                     GT 11</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Financial assurance would be adequate to: 1) monitor and inspect the engineered systems, 2) repair or replace components as necessary, and 3) apply adaptive mitigation measures that are shown to be cost-effective which would also be required under the Permit to Mine. Financial assurance is described in FEIS Section 3.2.2.4.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |
| 19645      | <p>Project baseline data used for both the Mine Site and the Tailings Basin are still insufficient, even though this deficiency was highly criticized by many commenters on the 2009 DEIS. A comparison of hydrologic data that was collected for two other projects in the region demonstrates that the PolyMet project is data-poor in the area of basic hydrology, much less mitigation. Given the availability of the many existing studies of area hydrology, it is mystifying that the SDEIS preparers have continually neglected to use them, even as tribal cooperating agencies have repeatedly requested and recommended that they be used. A few examples of publicly available studies include: the Minnamax Project; the LTVSMC Dunka Pit, historic DNR fisheries documents; and data collected under the Cliffs Consent Decree.</p> | <p>Co-lead agencies rely upon the expertise and experience of their staff and consultants who bring to bear their knowledge of various studies and analyses performed on mine sites in Minnesota and elsewhere. This knowledge is applied in the review of documents prepared to evaluate the NorthMet Project Proposed Action potential effects. It should be noted that the NorthMet Project Proposed Action is different from other mining projects in this part of Minnesota in the following ways: different ore type, designs for groundwater containment systems, and use of long-term mechanical treatment. While experiences gained on other projects are informative, they do not necessarily apply to the NorthMet Project Proposed Action. This is particularly true for groundwater containment systems because the NorthMet Project Proposed Action uses a design that differs from those at other Iron Range mine sites.</p> <p>The mitigation designs of the NorthMet Project Proposed Action are unlike measures discussed in the Regional Copper-Nickel Study (MSPA 1979, as cited in the FEIS). The NorthMet Project Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater containment systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the NorthMet Project Proposed Action site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. In fact, the unique designs and high-quality construction measures proposed are a response to past events.</p> <p>The detailed and sophisticated modeling work performed to support the FEIS exceed those conducted for some existing mines in Minnesota. The models used for the NorthMet Project Proposed Action represent years of development, with input from the Proposer, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modifications were made to the models to improve FEIS impact</p> | WR 023<br>WR 071 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>evaluations. It is the Co-lead Agency position that incomplete or inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling to be used in the NorthMet FEIS.</p> <p>The EIS reflects consideration of information pertaining to the Dunka Pit that was directly relevant to the NorthMet Project Proposed Action. It is noteworthy that many aspects of operations at the Dunka Pit are dissimilar to the NorthMet Project Proposed Action in terms of hydrogeology and mine design.</p> <p>See the response to theme WR 071.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                   |
| 19646      | <p>there is no explanation for the failure to use pre-mining flow and sulfate data available through DNR fisheries reports to determine potential water quality and quantity impacts, or cumulative effects to flow and water quality in the Embarrass, Partridge, or St. Louis Rivers. In fact, decades-old flow data (1942 – 1964) was used instead of recently collected data in the Embarrass River watershed even though that historic flow data precedes any mining. Surface water and groundwater quality and quantity data collected for the Minnamax Project, LTVSMC Dunka Pit, and the VIC program were listed in SDEIS, but largely ignored in water quality and quantity predictions.</p> | <p>The Co-Lead Agencies have requested additional hydrologic and geochemical data and the incorporation of those data into EIS analyses periodically throughout the environmental review process by the Co-Lead Agencies. The criteria the Co-Leads used to determine what data is included in the FEIS are as follows.</p> <p>Is the updated data:</p> <ul style="list-style-type: none"> <li>• Significantly different than the data already used in the model?</li> <li>• An integral component of a calibrated variable?</li> <li>• Linked to other data such that updating one necessitates updating the other?</li> <li>• Considered background information important to assessing the project's impacts?</li> <li>• Part of a greater dataset such that updating all of the dataset is necessary for consistency?</li> <li>• A type of input variable where GoldSim is sensitive?</li> <li>• Necessary for permitting-level analyses?</li> </ul> <p>Data collection and use in the FEIS are summarized in various data sufficiency documents.</p> <p>To assess the incremental effects of the NorthMet Project Proposed Action on water resources in the Embarras River and Partridge River, the best information representative of existing conditions was used as the baseline. This method allows the proper assessment of the project on the environment. The assessment of cumulative effects does not require the tracing of water quality throughout time, but the aggregation of effects considering a proposed action. Water quality models were calibrated to existing conditions in and around the Plant Site and Mine Site. This allowed for the highest degree of model accuracy.</p> | <p>WR 003<br/>                 WR 023<br/>                 WR 071<br/>                 WR 175</p> |

| 19647      | <p>The cumulative body of data and public information regarding clear risks to area hydrology from mining at the PolyMet site cannot be ignored, with only new, favorable data be inserted into the SDEIS instead. Extensive experience from other hard rock mines and their faulty predictions of water quality impacts should compel the co-lead agencies to recognize the need for significant improvements to the modeling evaluations.</p>                                                                                                                                                                                                                                                                                        | <p>The detail and sophistication modeling work performed to support the FEIS far surpasses any analyses that have ever been performed at mines in Minnesota. The models used for the Proposed Action represent years of development, with input from the PolyMet, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modification were made to the models to improve FEIS impact evaluations. Inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling to be used in this FEIS.</p> <p>In addition, the mitigation designs of the Proposed Action differ from the many other hard rock mines. The Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater capture systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the Proposed Action site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. Some of the unique designs and high-quality construction measures proposed are in response to past mine site events.</p> <p>Also see the response to theme WR 071.</p> | <p>PD 26<br/>                     WR 023<br/>                     WR 071<br/>                     WR 189</p>                                                                                                  |
| 19648      | <p>Inadequate water quality impacts analysis. From SDEIS 5.2.2, Water Resources: with the proposed design modifications and engineering controls, the water quality model predicts that the NorthMet Project Proposed Action would not cause or increase the magnitude of an exceedance of the groundwater and surface water quality evaluation criteria at the P90 level for any of 28 solutes at 29 groundwater or surface water evaluation locations within the Partridge River and Embarrass River watersheds, with two exceptions: Aluminum...Lead...Evidently, the public is expected to uncritically accept the project proponent's assertion that a 700-ft deep open pit sulfide mine, a 526-acre permanent reactive waste</p> | <p>The FEIS discusses lead concentrations in the Embarrass River in Section 5.2.2.3.3, providing better discussion of results to avoid misinterpretation. According to the 2004 - 2012 surface water monitoring results, average lead concentrations on the Embarrass River do not exceed the water quality standard (3.2 ug/L) at 100 mg/L hardness.</p> <p>Under certain circumstances, water quality model results predict an exceedance of the lead surface water evaluation criterion in Unnamed Creek, north of the Tailings Basin. These exceedances would not be a direct effect but a side effect of the NorthMet Project Proposed Action and would be the result of the capture and removal of dissolved solids by the Plant Site WWTP and the associated decrease in the hardness-based lead evaluation criterion. The WWTP effluent would meet the water quality evaluation criteria, but exceedances could infrequently occur when non-project, noncontact surface runoff mixes with the WWTP effluent and lowers hardness more than it dilutes lead concentrations. Evaluation criteria</p>                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>WR 003<br/>                     WR 056<br/>                     WR 071<br/>                     WR 072<br/>                     WR 082<br/>                     WR 128<br/>                     WR 129</p> |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Theme(s)                                                                                                                                      |

|            | <p>rock stockpile, a pit lake requiring water treatment in perpetuity, a tailings basin that has already contaminated ground and surface water that now will host reactive sulfide tailings, and a permanent hazardous waste facility constructed within a wetland, will collectively result in only two exceedances of water quality standards – and they are not even directly attributable to the Project Proposed Action! This stunning conclusion is a result of flawed modeling assumptions (baseflow, hydraulic connectivity, etc.), dubious decisions on data usage (omitting ‘outliers’, concentration caps, etc.), fuzzy compliance thresholds, and inordinate reliance on engineering controls that must perform flawlessly, most of them in perpetuity.</p> | <p>can be found in Section 5.2.2.</p> <p>The FEIS discusses current aluminum concentrations in the Embarras River in Section 5.2.2.3.3, providing better discussion of results to avoid misinterpretation. According to the 2004- 2012 historic surface water monitoring results, average aluminum concentrations on the Embarras River do not exceed the water quality standard (125 ug/L). This is considered a NorthMet Project Proposed Action side effect.</p> <p>The NorthMet Project Proposed Action would not directly cause an exceedance of the groundwater and surface water quality evaluation criteria of aluminum. Additionally, the FEIS Project Description indicates that Colby Lake water, with higher aluminum concentrations, would not be used for direct surface water augmentation. However, the capture of Tailings Basin seepage with low aluminum concentrations (5 to 20 ug/L) by the groundwater containment system could result in exceedances of the aluminum evaluation criteria in tributary streams north of Tailings Basin. Capture of the seepage would result in less dilution, increasing the proportion of non-project, non-contact surface water runoff with higher natural aluminum concentrations (70 to 160 ug/L) reaching the streams. Elevated aluminum levels under the NorthMet Project Proposed Action modeling scenario are considered a side effect of the project.</p> |                                                                                                                                               |
| 19649      | <p>The NorthMet Project Proposed Action is also not predicted to result in any significant changes to groundwater and surface water flows when compared to existing conditions. Again, a remarkable conclusion grounded in the assumption that all seepage capture systems will operate at unrealistic performance rates in perpetuity, and dismissing the significant error in the baseflow value used to model project impacts. Surface water quality remains insufficiently characterized or left uncharacterized, and the defects in analysis are profound in this area.</p>                                                                                                                                                                                        | <p>The FEIS relies on revised cross-section models from the SDEIS to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the revised NorthMet Project Water Management Plan - Plant (PolyMet 2015i, as cited in the FEIS). These new models consider the presence of an upper more-permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed capture system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall groundwater capture efficiencies of the proposed Tailings Basin surface and groundwater seepage containment system would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater groundwater capture efficiency is justified.</p> <p>Based on a MODFLOW groundwater model specifically developed to assess capture efficiency of the Category 1 system, it was concluded that the system would achieve an overall efficiency between 90% and 94% for groundwater flowing in surficial deposits and bedrock. This analysis</p>                                                                                                 | <p>WR 003<br/>                     WR 017<br/>                     WR 018<br/>                     WR 021<br/>                     WR 115</p> |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Theme(s)                                                                                                      |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>supports the conclusion that the proposed Category 1 surface and groundwater seepage containment system has a high probability of meeting its performance specifications; thus, there was no need to consider a range of capture efficiency inputs in modeling.</p> <p>Groundwater baseflows used in the SDEIS are best-estimate values and were retained in the FEIS.</p> <p>The Co-Lead Agencies have requested additional hydrologic and geochemical data and the incorporation of those data into EIS analyses periodically throughout the environmental review process by the Co-Lead Agencies. The criteria the Co-Leads used to determine what data is included in the FEIS are as follows.</p> <p>Is the updated data:</p> <ul style="list-style-type: none"> <li>• Significantly different than the data already used in the model?</li> <li>• An integral component of a calibrated variable?</li> <li>• Linked to other data such that updating one necessitates updating the other?</li> <li>• Considered background information important to assessing the project's impacts?</li> <li>• Part of a greater dataset such that updating all of the dataset is necessary for consistency?</li> <li>• A type of input variable where GoldSim is sensitive?</li> <li>• Necessary for permitting-level analyses?</li> </ul> <p>Data collection and use in the FEIS are summarized in various data sufficiency documents.</p> |                                                                                                               |
| 19650      | <p>Contaminant transport modeling suggests that the Project will cause manganese, aluminum, and sulfate to exceed Minnesota Water Quality Standards ("MN WQS"). Mercury, sulfate, and specific conductance already exceed surface water criteria in surface water samples collected near the tailings basin at nearby Area Pit 5, and mercury and aluminum exceed surface water criteria in the Partridge River downstream of Colby Lake. Aluminum, iron, manganese, and mercury all exceed MN WQS in Colby Lake. Contaminants from the Project will likely contribute additional loading to these existing exceedances of MN WQS in the Embarrass River, Colby Lake, and the</p> | <p>The evaluation and decision of whether or not the NorthMet Project Proposed Action may or may not discharge into surface waters where water quality standards are exceeded is a permit decision. The FEIS identifies potential impacts to water resources and measures available to anticipate and control these same impacts.</p> <p>Water resources are considered not to be significantly impacted if evaluation criteria are met at evaluation locations. Evaluation criteria can be found in Section 5.2.2. If water quality criteria are not met under the CEC modeling scenario, the FEIS evaluates whether the NorthMet Project Proposed Action causes or increases concentrations.</p> <p>Surface water quality criteria apply in stream after the groundwater discharge has mixed with ambient surface water (independent of proximity to the project property boundary). Evaluation criteria are based on a</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>WR 064<br/>                     WR 075<br/>                     WR 109<br/>                     WR 197</p> |

|            | <p>Partridge River. There have not been any water samples collected from lakes in proximity to the tailings basin (Hiekkilla, Mud, Kaunonen, or Hay Lakes) to determine if the pollutants found in the surface and groundwater at the existing tailings basin have caused contamination of those waterbodies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>combination of health-based water quality standards for drinking water sources (such as groundwater and Colby Lake) and mercury in surface water (fish consumption) and on aquatic life-based standards for surface waters. Evaluation criteria can be found in Section 5.2.2.</p> <p>Groundwater evaluation criteria apply to groundwater at the project property boundary and the GoldSim models predicts that these criteria would be met. For the different flowpaths, groundwater travel times to groundwater evaluation locations and surface water discharge points are presented in the FEIS, including the times for initial change in chemical concentrations and the times to reach peak concentrations. Once chemicals are released from groundwater to surface water, it is assumed that migration is instantaneous to surface water evaluation locations.</p> <p>Sampling of the listed lakes would not have added substantially to the overall Plant Site characterization for the purpose of impacts assessment. It should be noted that Spring Mine Lake is located upstream of the east side of the Tailings Basin and has been sampled for water quality.</p>                                |                                                                              |
| 19651      | <p>Groundwater contamination from previous mining activities persists near the LTVSMC tailings basin, more than twelve years after operations ceased. Over the decades of operations at the LTVSMC tailings basin, thousands of gallons per minute of tailings basin water were discharged through the bottom of the basin into groundwater. This plume of contaminated water has been slowly moving down gradient into surrounding wetlands and the Embarrass River. The monitoring wells that do exist near the tailings basin have concentrations of pollutants including iron, sulfate, manganese, aluminum, and fluoride that exceeded drinking water standards. But because of the limited distribution of monitoring wells, the extent of the existing contaminant plume is not known. No bedrock monitoring wells have been drilled in the vicinity of the tailings basin. However, domestic wells near the northern property line show substantial contamination of the groundwater aquifer.</p> | <p>Section 4.2.2.3.1 has been revised to more clearly communicate groundwater quality at the existing LTVSMC Tailings Basin. The FEIS uses information from 27 domestic wells, Northeast Minnesota Baseline study and Regional Copper Nickel Study to characterize existing surficial groundwater quality.</p> <p>It is acknowledged that bedrock groundwater at the Plant Site has not been sampled for the FEIS. Effects to bedrock groundwater at the Plant Site are not anticipated. The characteristic hydraulic conductivity of upper bedrock is taken to be <math>4 \times 10^{-2}</math> m/day, which is two orders-of-magnitude lower than the hydraulic conductivity used in the GoldSim model for the overlying surficial deposits. Given this difference in hydraulic conductivities, the Co-Lead Agencies conclude that the GoldSim water quality model does not need to be revised to specifically include groundwater flow and transport in bedrock. The cross-section modeling indicates that in the presence of more permeable upper bedrock, the groundwater capture systems would still achieve substantially higher capture efficiencies than what was assumed in the SDEIS GoldSim model.</p> | <p>HU 03<br/>                     WR 008<br/>                     WR 064</p> |

| 19652      | Regardless, modeling of PolyMet contaminants at the tailings basin did not take existing pollutant concentrations into account, and pretends that existing contamination is an acceptable “baseline” from which only new contamination should be measured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | The FEIS does not consider the magnitude of change to water quality due to the NorthMet Project Proposed Action from a theoretical, “unimpacted” or “natural” background condition. Instead, the FEIS defines baseline for purposes of modeling as the CEC, be they impacted or unimpacted. The baseline water quality and predicted water quality with project are plotted against evaluation criteria for each water quality parameter so conclusions may be drawn about the baseline and project relative to the evaluation criteria and to one another. This approach was used because it discloses the actual changes expected to the environment from the Proposed Action. Evaluation criteria can be found in Section 5.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | WR 082<br>WR 109 |
| 19653      | The assumption that 93% of the seepage from the tailings basin can be captured is unrealistic. Tribes requested the co-lead agencies or their contractor to provide any references for the 90% or greater capture efficiency rate they were confident could be achieved; they were not able to provide a single example from anywhere in the world. The co-lead agencies provided a single citation from a USEPA guidance document (generally intended to inform solid waste sites) that revealed: • most barriers in the study have been in place for fewer than 10 years; therefore, long-term performance can only be extrapolated... • All sites included in the study were existing sites that had vertical barriers and, in many cases, caps. • None of the sites has an engineered bottom barrier. Therefore, the effect of leakage through aquitards was not evaluated in this study. | The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be directly compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and reinjection on the downgradient side to reverse hydraulic gradients across the slurry wall and in underlying bedrock. Relatively few containment systems have been built with this degree of pumping and reinjection to ensure effective capture. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture.<br><br>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed containment system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation data, and depth to top of bedrock. This information was used to develop revised MODFLOW cross-section models to evaluate containment system efficiencies on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the revised Plant Site Water Modeling Data Package (PolyMet 2015j, as cited in the FEIS).<br><br>These revised cross-sections and MODFLOW models considered the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin | WR 018           |

| 19654      | <p>Regardless of this study’s applicability (or lack thereof) to seepage capture systems proposed for the PolyMet project, the EPA found that</p> <ul style="list-style-type: none"> <li>• 10% of the reviewed containment systems failed to meet the desired performance objectives and required corrective action.</li> <li>• An additional 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not.</li> <li>• There is no information on the effectiveness of any of these facilities at timeframes remotely comparable to what will be required for PolyMet...</li> </ul> <p>A search for examples similar to the Project Proposed Action identified the Zortman-Landusky mine in Montana...the Molycorp, Inc., mine site in New Mexico...Examples of similar seepage capture systems installed and operating in northeastern Minnesota are at the US Steel-MINNTAC tailings basin, and the former LTV tailings basin seep SD0026 (the same tailings basin in PolyMet proposes to re-use), and demonstrate capture rates of less than 60%...The primary purpose of the seepage capture at the Proposed Project is to achieve compliance with MN WQS, but it is not likely to be successful, based upon limited but relevant regional experience.</p> | <p>containment systems would be substantially greater than 90%. It is the Co-lead Agency position that the assumption in the Plant Site GoldSim model of 90% or greater capture efficiency is justified by the analyses performed.</p> <p>The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be directly compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and reinjection on the downgradient side to reverse hydraulic gradients across the slurry wall and in underlying bedrock. Relatively few containment systems have been built with this degree of pumping and reinjection to ensure effective capture. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed containment system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation data, and depth to top of bedrock. This information was used to develop revised MODFLOW cross-section models to evaluate containment system efficiencies on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the revised Plant Site Water Modeling Data Package (PolyMet 2015j, as cited in the FEIS).</p> <p>These revised cross-sections and MODFLOW models considered the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. It is the Co-lead Agency position that the assumption in the Plant Site GoldSim model of 90% or greater capture efficiency is justified by the analyses performed.</p> | WR 018<br>WR 020 |
| 19655      | <p>The SDEIS acknowledges that seepage from the existing LTV tailings basin continues to drain south to Second Creek long after LTV operations have ceased (SDEIS p. 4-99). |            | <p>seepage will need to continue to be pumped back under the PolyMet Proposed Action, it “is not considered further in this discussion” (SDEIS p. 5-89). On pages 5-121 and 5-158, the SDEIS maintains that the seepage collection system installed at the south side of the existing tailings basin has “essentially eliminated the flow of Tailings Basin seepage into Second Creek”. This statement is clearly not supported by the facts. PolyMet and the state regulatory agencies are fully aware that this seepage pumpback system is not nearly as effective as claimed in the SDEIS. According to MPCA staff, the pumpback system has not resulted in the water quality improvements required under the Consent Decree, so there are two modifications currently proposed by Cliffs Natural Resources: 1) dewater the pond that is an additional source of water contributing to water quality concerns (pending a US EPA wetlands determination); or 2) create an additional barrier (dam) for seepage collection and pumpback between the existing dam and monitoring station SD026.</p> | <p>new systems to enhance capture. If 100% capture is not attained by the Cliffs Erie upgrades, the PolyMet has committed to installing additional systems in Second Creek to achieve this level of performance regardless of the types of measures required.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                              |
| 19656      | <p>There is simply no evidence to support the rosy scenario that PolyMet will be able to capture 97% of the shallow seepage and 90% of the deep seepage from an unlined, purposefully ‘leaky’ tailings basin, despite the co-lead agencies’ assurances. The SDEIS must be revised to accurately describe the ineffectiveness of the current seepage collection system, and the need for a redesigned system or additional mitigation must be clearly stated. The SDEIS must evaluate the impacts of polluted tailings basin seepage to Second Creek and the Partridge River.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>The FEIS relies on revised cross-section models from the SDEIS to evaluate containment systems on the north, northwest, and west sides of the Tailings Basin, which are documented in the revised Water Management Plan - Plant Site. These new models consider the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed capture system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin capture systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed capture system on the north, northwest, and west sides of the Tailings Basin in Section 4.2.2.3.1. This investigation</p> | <p>PD 08<br/>                     WR 018<br/>                     WR 117<br/>                     WR 118<br/>                     WR 133</p> |

|            |         | <p>provided field data on bedrock hydraulic conductivity, rock RQD, and depth to top of bedrock. This information was used to develop MODFLOW cross-section models at three locations on the alignment to assess capture efficiency. The models included bedrock below the slurry wall.</p> <p>The water quality modeling has been updated for the FEIS to include the potential for water to seep from the east side of the Tailings Basin. FEIS Section 3.2.2.3.10 describes that a containment system would be constructed around a portion of the east side of the Tailings Basin for seepage collection.</p> <p>Key design considerations for the containment systems include but are not limited to the local geologic and hydrogeologic characteristics of the site, the depth to bedrock or other confining unit from the ground surface, the presence and prevalence of cobbles and boulders in the glacial till, the ground surface topography along and adjacent to the containment system alignment, the soil types to be encountered along the alignment, and the constituents in the groundwater to be contained. The proposed containment system technology is not new nor unique; the slurry cutoff wall and collection trench approach has been used for many decades, beginning initially as a means to facilitate construction of deep foundations in locations of shallow groundwater and difficult soil conditions, and subsequently expanding to other uses such as the containment of contaminated groundwater emanating from unlined waste disposal facilities (e.g., landfills, stockpiles, etc.). There are many papers written about the use of groundwater containment systems and a number of contractors well-experienced and proficient in containment system construction. The groundwater collection component of the system and the hydraulic barrier (cutoff wall) work in tandem to control the direction of groundwater flow and the amount of groundwater collected. Maintenance of a lower hydraulic head on the upgradient side of the cutoff wall than on the downgradient side of the cutoff effectively captures any seepage that would otherwise leave the site, while limiting the effect that the system has on groundwater conditions downgradient from (away from) the system. This barrier to flow thereby minimizes the potential for water quality effects on the downgradient side of the containment system.</p> <p>PolyMet has committed to collecting all of the south seepage from the Tailings Basin that makes its way to Second Creek by implementing additional improvements to the existing seepage management system if necessary. Potential measures that could bring the capture efficiency of the</p> |          |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>system to 100% include improvements to the existing dam such as lining the upstream dam face with bentonite and injecting grout into the dam. If seepage is observed to bypass the existing dam, a second dam could be constructed approximately 500 feet downstream of the existing system, in an area where the Second Creek headwaters valley is more constricted and any remaining subsurface seepage will have to come to the surface. This potential second dam could be constructed as an earthen dam with a clay or concrete cutoff wall (extending to bedrock if necessary) in order to achieve 100% capture of the surface seepage. See FEIS Section 5.2.2.3.2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                          |
| 19658      | <p>The unsupported prediction of 90% or better seepage capture efficiency is unfortunately carried forward into other critical analyses. The SDEIS claims that construction of a groundwater containment system along the north, northwest and west sides of its unlined tailings basin “would capture virtually all of the Tailings Basin seepage presently flowing in those directions to restore water quality” (SDEIS p. 5-174). Without even a single bedrock monitoring well installed to confirm or deny this assumption, the SDEIS maintains that this prediction is “conservative”, because the modeling done by PolyMet assumes that bedrock hydraulic conductivity is “negligible” (SDEIS, pp. 5-68 - 5-69). Disturbingly, the tailings basin model uses storage coefficients that are not found anywhere in peer reviewed scientific literature.</p> | <p>It is acknowledged that the Plant Site MODFLOW model does not include bedrock below surficial deposits and thus does not consider flow towards the Embarras River in bedrock. This is because the bulk hydraulic conductivity of upper bedrock is estimated to be about two orders-of-magnitude lower than the hydraulic conductivity of the surficial aquifer, and it is interpreted that deeper bedrock has substantially lower hydraulic conductivity. Based on these assumptions, calculations show that chemical mass migration downgradient of Tailings Basin is dominated by flow in the surficial aquifer and for this reason only surficial flowpaths were modeled in MODFLOW and GoldSim; see FEIS Section 5.2.2.2.1 for greater detail. MODFLOW cross-section models of the Tailings Basin containment systems showed that groundwater capture substantially greater than 90% was achieved in both surficial deposits and the underlying zone of more “permeable” bedrock that was assumed to be 15 m thick. So even if there was chemical migration in upper bedrock, it would be effectively captured by the Tailings Basin containment systems. Absent predicted impacts there was no need for modeling of the underlying bedrock in MODFLOW or GoldSim to support the water resources impact assessment. See WR62 for additional information.</p> <p>The water quality modeling has been updated for the FEIS to include the potential for water to seep from the east side of the Tailings Basin. In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials. FEIS Section 3.2.2.3.10 states that a containment system would be constructed around a portion of the east side of the Tailings Basin for seepage collection.</p> <p>The proposed containment system technology is not new nor unique; the slurry cutoff wall and collection trench approach has been used for many decades, beginning initially as a means to facilitate construction of deep</p> | <p>PD 08<br/>                 WR 008<br/>                 WR 018<br/>                 WR 071<br/>                 WR 095<br/>                 WR 099</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>foundations in locations of shallow groundwater and difficult soil conditions, and subsequently expanding to other uses such as the containment of contaminated groundwater emanating from unlined waste disposal facilities (e.g., landfills, stockpiles, etc.). There are many papers written about the use of groundwater containment systems and a number of contractors well-experienced and proficient in containment system construction.</p> <p>Installation of paired monitoring wells on either side of the Tailings Basin containment systems would likely be identified during the permitting phase. Monitoring devices at these points would measure the head pressure differential, which would indicate the direction of groundwater flow through the containment system. The groundwater collection component of the system and the hydraulic barrier (cutoff wall) work in tandem to control the direction of groundwater flow and the amount of groundwater collected. Maintenance of a lower hydraulic head on the upgradient side of the cutoff wall than on the downgradient side of the cutoff effectively captures any seepage that would otherwise leave the site, while limiting the effect that the system has on groundwater conditions downgradient from (away from) the system. This barrier to flow thereby minimizes the potential for water quality effects on the downgradient side of the containment system.</p> |                  |
| 19659      | <p>These parameters are highly critical for establishing a reliable model, because the volume of groundwater that a geologic formation can contain (storativity or storage coefficient) and the rate of flow (hydraulic conductivity) are functions of the amount of open pore spaces or fractures/faults in rock, the quantity of water that infiltrates from the surface, and the groundwater gradient. The storage coefficient incorporated in the plant site model (including the tailings basin) for bedrock is 0.20, and for the surficial deposits 0.0002 (SDEIS p.5-41), suggesting that the bedrock contains several orders of magnitude more water than the surficial deposits.</p> | <p>In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | WR 095           |
| 19660      | <p>When questioned about these extraordinary storage coefficients, the co-lead agencies' explanation was that the model was "calibrated to match predicted and measured groundwater</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>The FEIS relies on revised cross-section models to evaluate containment systems on the north, northwest, and west sides of the Tailings Basin, which are documented in the revised Water Management Plan – Plant (PolyMet 2015i, as cited in the FEIS). |            | <p>levels.” Essentially, this model simulates a bedrock ‘storage tank’ where large volumes of water go in but virtually nothing comes out. Since this is not conceptually accurate, the modeled hydraulic conductivity and/or modeled storage coefficients cannot be relied upon to estimate the amount of seepage that will bypass the seepage capture system, or the amount of time before seepage upwells to surface waters in adjacent wetlands and the Embarrass River, where MN WQS must be met.</p> | <p>presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The new models explicitly consider groundwater flow in bedrock below the slurry wall and at the contact between the slurry wall and bedrock. The model results predicted that the overall capture efficiencies of the proposed Tailings Basin containment systems (with bedrock flow) would be substantially greater than 90%.</p> <p>FEIS Figure 3.2-28 has been revised to show that the slurry wall is keyed into bedrock.</p> <p>It is the Co-lead Agencies’ opinion that engineered systems can operate successfully over long periods of time if they are properly monitored and maintained. The FEIS provides a comprehensive description of proposed water treatment and seep collection systems including groundwater containment and synthetic liners and covers in Section 5.2.2. This includes conceptual designs and discussions of the types of monitoring used to assess performance. Detailed designs are provided in supporting documents, which are referenced in the FEIS. The FEIS also discusses long-term operation, maintenance, and periodic replacement of engineered systems. It is acknowledged that certain components of the engineered systems would need to be replaced when monitoring indicates that performance is marginal and not readily compensated for by adaptive mitigation measures.</p> <p>A detailed financial assurance analysis would be part of the permitting phase and is not a required component of the FEIS. The financial assurance process would fully consider long-term monitoring and periodic replacement of equipment including, but not limited to, water treatment hardware and synthetic liners/covers. The Financial Assurance package for the Project would ensure that future funding would be available if and when adaptive mitigation measures or component replacements are needed to achieve performance specifications.</p> |          |
| 19661      | <p>Another major deficiency in the plant site model is that seepage capture at the flotation tailings basin, as modeled with MODFLOW and GoldSim, does not account for any seepage out of the east side of the basin. SDEIS Figure 3.2-27, that indicates</p>                                                                                                                                                                                                                                              | <p>The FEIS Plant Site MODFLOW model was modified from the SDEIS to include: 1) the presence of surficial deposits below the East Embankment, 2) boundary conditions (drain and/or river cells) along the embankment toe to allow the potential for surface seepage, and 3) hydrologic inputs to account for the presence of the proposed drainage swale. See FEIS Section</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | WR 054   |

|            | continuous bedrock on the east side of the tailings basin, is incorrect and must be corrected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 5.2.2.2.1.<br>Similar to other locations along the perimeter of the Tailings Basin, the project was modified to include installation of a containment system along the East Embankment where it is underlain by surficial deposits. Given the hydrogeology of the area east of the Tailings Basin and the proposed s/wale to be constructed there, this containment system would have higher hydraulic head on the east side compared to the west (tailings) side where a pumped trench would depress the groundwater level. This would create hydraulic gradients in the slurry wall and in shallow bedrock that would drive (low) flows from east to west across the containment system. This set of hydraulics would result in complete capture of all tailings water approaching the containment system from the Tailings Basin. Because the system would achieve complete capture of tailings water, an east side chemical transport flowpath is not needed in the Plant Site GoldSim model. There is no hydrologic reason to expect that impacted water from the Tailings Basin would migrate east of the containment system. |                  |
| 19662      | Baseline groundwater elevations, depths to bedrock, and surface water drainage locations have been used to identify four flowpaths (West, Northwest, North, and South) that represent the most direct paths between Tailings Basin facilities and evaluation locations (i.e., property boundaries and surface waters of the state) (MDNR 2011L [as cited in the submission]). The modeling approach used by PolyMet has placed an artificial and unrealistic no-flow boundary on the east side of the tailings basin, when a critical evaluation of hydraulic head clearly shows the potential for substantial groundwater movement to east. Because of this this flawed assumption, there has been no contaminant transport modeling or water quality impacts analysis for seepage leaving the east side of the tailings basin. | The Plant Site MODFLOW model was modified for the FEIS to better represent natural and Project-related conditions. These include: 1) more accurate representation of surficial deposits and bedrock outcrops around the perimeter of the Tailings Basin, 2) more extensive distribution of drain and/or river cells to provide for potential surface seepage and distribution of wetlands, 3) more appropriate storage coefficients, and 4) steady-state and transient calibrations using new data extending through the end of 2013. Many of the improvements pertained to the East Embankment area of the Tailings Basin, where it is acknowledged that tailings water seepage would be likely to occur and model changes were made to simulate this seepage more accurately. These changes in response to the Theme improve the SDEIS MODFLOW model that limited tailings seepage on the east side of the Tailings Basin.                                                                                                                                                                                                        | WR 054<br>WR 102 |
| 19663      | Also, according to the plant site surficial geology and depth to bedrock figures, the thickest layer of glacial till for the entire Proposed Project occurs around the tailings basin, representing, essentially, the biggest "pipe" for conducting contaminated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The Plant Site MODFLOW model was modified for the FEIS to better represent natural and project-related conditions. These include: 1) more accurate representation of surficial deposits and bedrock outcrops around the perimeter of the Tailings Basin, 2) more extensive distribution of drain and/or river cells to provide for potential surface seepage and distribution                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WR 093           |

|            | tailings basin seepage to downgradient wetlands and eventually the Embarrass River. Tribal agency re-analysis using MODFLOW for the east side of the tailings basin reveals that this is likely the most significant discharge area for the entire tailings basin.                                                                                                                                                                                                                                                                                                                                                                  | of wetlands, 3) more appropriate storage coefficients, and 4) steady-state and transient calibrations using new data extending through the end of 2013. Many of the improvements pertained to the East Embankment area of the Tailings Basin, where it is acknowledged that tailings water seepage would be likely to occur and model changes were made to simulate this seepage more accurately. These changes correct deficiencies in the SDEIS MODFLOW model that limited tailings seepage on the east side of the Tailings Basin. With the modifications described above, the FEIS Plant Site MODFLOW model has provided reliable flow directions in this area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                            |
| 19664      | The SDEIS maintains that mine pit dewatering impacts will be very limited or non-existent based on an assumption carried forward from the DEIS that there is little or no connection between the bedrock and surficial aquifers. This assumption is based solely on an unsupported "professional opinion," when in fact there is ample evidence that there may be substantial connection between the bedrock and surficial aquifers. Such a connection indicates that dewatering the mine pits could cause significant drawdown of the water table in the surficial aquifer, potentially dewatering wetlands and ephemeral streams. | Impact assessment modeling relies on site characterization data that indicate the bulk hydraulic conductivity of upper bedrock is two to three orders-of-magnitude lower than the hydraulic conductivity of the surficial aquifer. Thus, groundwater flow and transport at both the Mine Site and Plant Site are dominated by the hydraulics of the surficial aquifer. Bedrock plays a negligible role in transporting water.<br><br>However, it is acknowledge that there could be some negligible hydraulic connections between bedrock and the surficial aquifer. Therefore, the approach in the FEIS was to not consider this possible connection in the NorthMet Project Proposed Action water quality models, but to recommend extensive monitoring during operations and closure to assess if interactions occur and if they would raise concerns for permitting agencies. If monitoring data indicate trends toward permit non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate what is expected to be a small transport-related bedrock impact relative to surficial flows. See FEIS Section 5.2.2.3.5 for information on adaptive mitigation measures and Section 5.2.2.3.6 for information on monitoring.<br><br>The FEIS further evaluated the possibility of fractures and faults at the Mine Site and Plant Site to determine what (if any) changes need to be made to model assumptions to accurately predict potential environmental effects for purposes of environmental review. Although no change was made to the Plant Site GoldSim model, the FEIS Mine Site GoldSim model was modified to include a flow/transport zone 15 meters thick from that present in the SDEIS. The results of the analysis are included in FEIS Section 5.2.2.3.2. The response to theme WR169 also contains additional information. | WR 010<br>WR 012<br>WR 013 |
| 19665      | Tritium and unionized ammonia nitrogen were found in water samples collected from two deep boreholes in the area where the Project mine pits                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Tritium and non-ionized ammonia can be indicators of relatively young water. However, when these constituents are identified in water extracted from a borehole, the overriding question is whether or not foreign (young)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | NEPA 09<br>WR 010          |

|              | <p>will be located. Both tritium and unionized ammonia are classic indicators for a strong connection with surface water. Tritium indicates water found in the deep boreholes was surface water that originated post-1952, during or after nuclear testing. The boreholes are approximately one mile southwest of the Peter Mitchell Pit, which is the closest and most likely source of this pollution. Production at the Northshore mine started in 1955. Review of the Peter Mitchell Pit discharge monitoring data for SD001 from 2006 and 2008 shows the average concentration of unionized ammonia exceeded their 0.04 mg/l NPDES permit limit. Unionized ammonia and tritium in the deep boreholes suggest that travel time of contaminants through bedrock fractures will be on the order of decades, not the hundreds or thousands of years that are assumed in the SDEIS. Impacts to surface waters, groundwater, and wetlands for a project of this size and complexity demand a scientific, data-driven approach rather than one based on opinion and scant, selectively used data.</p> | <p>water was introduced during the drilling process. There are many documented cases where tritium in borehole water could be traced to makeup water introduced during the drilling process to help maintain circulation. Experience indicates that conclusions about the age of groundwater based on tritium and non-ionized ammonia are unreliable unless it can be absolutely verified that no foreign (makeup) water was introduced during the drilling process. Given the isolated occurrences additional verification is not warranted for the EIS.</p> <p>It is acknowledged that there could be some hydraulic connections between bedrock and the surficial aquifer where transport is expected to be negligible. Given these factors, the approach was to not consider this possible connection in the NorthMet Project Proposed Action water quality models, but to recommend extensive monitoring during operations and closure to assess if interactions occur and if they would raise concerns for permitting agencies. If monitoring data indicate trends toward permit non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate what is expected to be a small transport-related bedrock impact relative to surficial flows. See FEIS Section 5.2.2.3.5 for information on adaptive mitigation measures and Section 5.2.2.3.6 for information on monitoring.</p> <p>The Co-lead Agencies believe that the EIS contains adequate information and analyses consistent with the NEPA and MEPA guidance and best practices. Also refer to the response to theme NEPA 09 for more detail.</p> | <p>WR 013</p>                                                                                                 |
| <p>19667</p> | <p>The lack of fracture and fault analysis is a major deficiency of this SDEIS. The map provided by GLIFWC in their SDEIS comments, Geologic Faults at the PolyMet Mine and Plant Site, indicates: 1. There are several faults extending from Northshore pits to the PolyMet mine site. This may explain why there is ammonia and tritium in the deep borehole samples. 2. There is an inferred fault running right through the area of the Hydrometallurgical Residue Facility. (Not only is the HRF proposed to be constructed within wetland, with a buried stream and springs, but it will also be receiving seepage from the tailings basin and it could be geologically predisposed to facilitate groundwater movement. 3. There is a</p>                                                                                                                                                                                                                                                                                                                                                     | <p>Regarding tritium and non-ionized ammonia, these can be indicators of relatively young water. |            | <p>fault system right where water would exit the tailings basin on the east side. Notice that the inferred fault may connect to other fault systems running east-west to the south of the facility.</p>                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>of the Iron Range do show the existence of fault lines, but hydrogeologic studies have not provided evidence that any faults that may be present behave as conduits for groundwater flow. In addition, case histories at similar Iron Range mine sites indicate that groundwater movement is dominated by flow in surficial materials (where present) and not bedrock, regardless of the presence of fractures and faults.</p> <p>At the Plant Site, there is no field evidence to suggest that bedrock faults or fracture zones provide enhanced groundwater flow to the Partridge and Embarras Rivers. It is possible that structural features with enhanced groundwater flow exist, but the Co-lead Agencies believe they are improbable given the body of evidence for the Project Site and other mines sites in the Iron Range with similar geology. Further, if such features do exist, it is highly unlikely that they could be intercepted and characterized by any reasonable field program of exploratory boreholes.</p> <p>The management approach is to require robust groundwater monitoring during operations and closure to identify if structurally controlled groundwater flow actually occurs at the site, and if this proves to be the case, require the implementation of adaptive management measures. Monitoring would include observations from paired piezometers to be installed on opposite sides of the containment systems to verify reversal of hydraulic gradients and thus, essentially complete capture of affected groundwater. If reversed gradients are not indicated, adaptive mitigation measures would be implemented to modify the groundwater hydraulics so that essentially complete capture is established.</p> |                  |
| 19668      | <p>The potential for water quality impacts from prospecting and mining operations that have contacted the Duluth Complex have long been known to the MNDNR and MPCA. The State of Minnesota spent \$4.3 million over three years in the late 1970s to produce the Regional Copper-Nickel Study, a 5-volume compilation of technical information regarding the potential impacts of copper-nickel mining in the Duluth Complex. Nevertheless, predicted water quality impacts and ineffective mitigation methods referenced in the Study were ignored when the technical documents and SDEIS were drafted for PolyMet.</p> | <p>The Co-lead Agencies rely upon the expertise and experience of their staff and consultants who bring to bear their knowledge of various studies and analyses performed on mine sites in Minnesota and elsewhere. This knowledge is applied in the review of documents prepared to evaluate the NorthMet Project Proposed Action potential effects.</p> <p>It should be noted that the NorthMet Project Proposed Action is different from other mining projects in this part of Minnesota in the following ways: different ore type, designs for groundwater containment systems, and use of long-term mechanical treatment. While experiences gained on other projects are informative, they do not necessarily apply to the NorthMet Project Proposed Action. This is particularly true for groundwater containment systems because the NorthMet Project Proposed Action uses a design that differs from those at other Iron Range mine sites.</p> <p>The mitigation designs of the NorthMet Project Proposed Action are unlike</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | WR 023<br>WR 203 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>measures discussed in the Regional Copper-Nickel Study. The NorthMet Project Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater containment systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the NorthMet Project Proposed Action site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. In fact, the unique designs and high-quality construction measures proposed are a response to past events.</p> <p>The detailed and sophisticated modeling work performed to support the FEIS exceed those conducted for some existing mines in Minnesota. The models used for the NorthMet Project Proposed Action represent years of development, with input from the Proposer, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modifications were made to the models to improve FEIS impact evaluations. It is the Co-lead Agency position that incomplete or inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling to be used in the NorthMet FEIS.</p> <p>The EIS reflects consideration of information pertaining to the Dunka Pit that was directly relevant to the NorthMet Project Proposed Action. It is noteworthy that many aspects of operations at the Dunka Pit are dissimilar to the NorthMet Project Proposed Action in terms of hydrogeology and mine design.</p> |          |
| 19669      | <p>The SDEIS also diminishes the lessons learned from the Dunka Pit, located on the former LTVSMC site approximately five miles north and east of the PolyMet Project mine site. Within the Dunka Pit, LTVSMC contacted the Duluth Complex and the Virginia Formation while mining for taconite in the Biwabik Iron Formation. By 1991, LTVSMC had removed about 50 million tons of Duluth Complex material from the Dunka pit and placed it in “gabbro” stockpiles. Monitoring of the drainage from these stockpiles</p> | <p>The Co-lead Agencies rely upon the expertise and experience of their staff and consultants who bring to bear their knowledge of various studies and analyses performed on mine sites in Minnesota and elsewhere. This knowledge is applied in the review of documents prepared to evaluate the NorthMet Project Proposed Action potential effects. It should be noted that the NorthMet Project Proposed Action is different from other mining projects in this part of Minnesota in the following ways: different ore type, designs for groundwater containment systems, and use of long-term mechanical treatment. While experiences gained on other projects are informative, they do not necessarily apply to the Proposed Action. This is particularly true for groundwater containment systems because the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WR 023   |

|            | <p>beginning in 1976 revealed a decrease in pH and an increase in trace metals. Copper and nickel concentrations as high as 1.7 and 40 mg/l respectively were observed in seepage/run-off from the Duluth Complex waste rock stockpiles and pH was observed as low as 5.0 at seep 1 between 1976 and 1980. Most of the seepage from waste rock piles at the Dunka site was discharged to Bob's Bay in Birch Lake via Unnamed Creek. A 1976-1977 study of trace metals in Bob's Bay found that concentrations of copper, nickel, cobalt, and zinc in the water of the Bay were higher than regional average concentrations and decreased with distance from the mouth of Unnamed Creek. Additionally, it was determined that Unnamed Creek contributed more than 90% of the trace metals load to Bob's Bay. The NPDES permit for this discharge expired in 2005 and another variance request is expected. A WWTF located at the site has been inactive because Cliffs Erie, LLC, the owner who acquired the property from LTVSMC, declared bankruptcy and claims it is simply too expensive to continue running. Unfortunately, the passive wetland treatment system did not function well enough to remove nickel and copper in waters still discharging from the mine pit and stockpiles to a concentration that complies with MN WQS.</p> | <p>NorthMet Project Proposed Action uses a design that differs from those at other Iron Range mine sites.</p> <p>The mitigation designs of the Proposed Action are unlike measures discussed in the Regional Copper-Nickel Study (MSPA 1979). The Proposed Action measures include: long-term mechanical water treatment, uniquely designed groundwater containment systems, subaqueous disposal of reactive waste rock, and synthetic covers and under-liners used at waste rock stockpiles and treatment ponds. In addition, the level of construction QA/QC proposed at the NorthMet site would be much higher than what has historically occurred at older mine sites in the Iron Range. It is erroneous to conclude that operation and closure of the NorthMet Project Proposed Action Site would necessarily entail the same types of failures that have occurred at some historical Iron Range mines. In fact, the unique designs and high-quality construction measures proposed are a response to past events.</p> <p>The detailed and sophisticated modeling work performed to support the FEIS exceed those conducted for some existing mines in Minnesota. The models used for the NorthMet Project Proposed Action represent years of development, with input from PolyMet, Co-lead Agencies and Cooperating Agencies. Based on comments received on the SDEIS, modifications were made to the models to improve FEIS impact evaluations. It is the Co-lead Agencies' position that incomplete or inaccurate predictions made in the past at historical mining operations do not provide a basis for judging the quality of modeling to be used in the NorthMet FEIS.</p> <p>The FEIS reflects consideration of information pertaining to the Dunka Pit that was directly relevant to the NorthMet Project Proposed Action. It is noteworthy that many aspects of operations at the Dunka Pit are dissimilar to the NorthMet Project Proposed Action in terms of hydrogeology and mine design.</p> |                                                                                                               |
| 19670      | <p>The Mining Simulation Project (funded in part by a Minnesota Legislative appropriation of \$185,000 to the MNDNR and MPCA) was a cooperative study to identify and resolve environmental issues associated with non-ferrous mining and to anticipate industry and government data needs to address those issues before commercial development occurred in Minnesota. The study clearly identified those state ground and surface</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Evaluation criteria are based on applicable water quality standards. Where a waterbody is classified as Domestic Consumption (1B) or for groundwater, USEPA primary drinking water standards apply. The USEPA primary drinking water standards set mandatory maximum contaminant levels for drinking water to protect the public from consuming water that presents a risk to human health. Evaluation criteria can be found in Section 5.2.2.</p> <p>For purposes of the FEIS, the MPCA has provided guidance as to what waters in the Embarrass and Partridge rivers are waters used for production of wild rice to which the current 10 mg/L wild rice sulfate standard applies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>WR 041<br/>                     WR 042<br/>                     WR 110<br/>                     WR 154</p> |

|            | <p>water quality regulations that would apply to copper-nickel mining operations in Minnesota, including applying the 10 mg/l sulfate criterion to effluent discharges where wild rice is present; it prioritized nondegradation of both surface and groundwater and protection of groundwater as a drinking water source; and it rejected using natural wetlands for mine effluent treatment (“as a toxic metals dumping ground”). The tribal cooperating agencies have also consistently elevated our concerns for the Proposed Project’s potential to adversely impact groundwater quality and quantity. “Groundwater maintains stream flows and wetlands during dry periods, supporting significant ecosystem functions. Groundwater is an important source of drinking water in the Great Lakes Basin, where 8.2 million people, or 82% of the rural population, rely on groundwater for their drinking water.” In Minnesota, all groundwater is protected for drinking water supplies, “constituting the highest priority use, and as such, to provide maximum protection to all underground waters.” When considering water allocations, drinking water is supposed to be considered the highest priority by the MN DNR. According to MPCA’s groundwater profile for Northeastern MN including the Project area: “Glacial aquifers are commonly thin and limited in their extent and yield. Bedrock aquifers have limited yield, generally from fractures; groundwater movement is difficult to define. There are no large-scale regional aquifers. The Biwabik Iron Formation is the only source of groundwater for many Iron Range cities.” The SDEIS has not adequately evaluated the potential for impacting drinking water sources, and it is clear from the state regulatory agencies’ uncertainties about the frequency, volume, and water quality of other mine discharges (i.e., the Peter Mitchell Pit) even</p> | <p>The MPCA reviewed all available relevant information in making their recommendation; however, that recommendation in itself is a policy decision of the MPCA that is not part of the EIS process.</p> <p>Water treatment using natural wetlands is not included in the Project Description. The NorthMet Project Proposed Action would rely upon mechanical treatment for as long as necessary. During operations and closure, the use wetland treatment may be considered as an adaptive management measure if pilot and other studies indicate that this method has potential utility and is cost-effective.</p> <p>Groundwater and surface water flow model predict that the NorthMet Project Proposed Action would have a minimal effect on drinking water standard-based evaluation criteria in the groundwater at the project boundaries or in Colby Lake (the locations at which drinking water standards apply). Based on this, it is therefore expected that the NorthMet Project Proposed Action would not have any significant impacts on water quality downstream of the Project area or significantly contribute to any cumulative effects on drinking water resources.</p> |          |

| 19671      | <p>while regulated under permits, that this issue remains a significant deficiency in the SDEIS analysis.</p> <p>The tribal cooperating agencies have consistently raised concerns about reactive dust and ore fines along the Transportation and Utility Corridor, and potential for water quality impacts to the three streams and wetlands that are crossed within the corridor. Yet these concerns have been repeatedly kicked back and forth between the Air IAP and Water Quality IAP work groups, with neither group ultimately resolving the information and risk analysis gap. The end result of this ‘oversight’ in the SDEIS is that no consideration, discussion, or proposed management of this potential water and wetland quality impact is provided for the public to review.</p> | <p>The Project Description in the FEIS includes routine inspections of the Transportation and Utility Corridor to identify accumulations of dust or ore spillage.</p> <p>Regarding dust, given the majority of the dust that could leave the NorthMet Project area could be characterized as low sulfide/low metal, potential impacts would be controlled by: 1) the commitment to treat all runoff from disturbed areas as process wastewater, and 2) the facilities would be subject to an air quality Fugitive Emissions Plan. Significant impact on water resources or historic properties is not expected.</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6, and 4.3.9, in PolyMet 2015a, as cited in the FEIS).</p> <p>Regarding potential spillage, any significant accumulations would be removed by a combination of machines and hand work. Ore transport would be by special railcars that minimize dust and spillage, where, since the SDEIS, the Proposer has committed to retrofit the railcars to better control spillage and develop an ore management/transport plan for monitoring site conditions. It is unlikely that there would be sufficient spillage to affect the quality of surface water or groundwater. See FEIS Section 5.2.2.3.2. See FEIS Section 3.2.2.4 for more information on the railcars, and Sections 5.2.3 and 5.2.7 for impacts of railcar spillage and dust on wetlands and air quality, respectively. The effect of dust falling on the disturbed portions of the Mine Site would be controlled by the perimeter dike and ditch system, which would route runoff to the WWTF (Section 4.1.5.3 and Large Figures 19 through 21 of PolyMet 2015a, as cited in the FEIS).</p> <p>Please refer to the responses to themes WET 11 and WR 151.</p> | WET 11<br>WR 151           |

|            | <p>be no surface stockpiles of waste rock, ore, or other potential solute sources in these areas. There is the potential, however, for ore spillage from rail cars in transport from the Mine Site to the processing plant during operations. Based on observations at other mining operations using similar side-dump rail cars, it is assumed that spillage could occur along the first 1,000 meters of rail from the Rail Transfer Hopper (PolyMet 2013l). It is estimated that 55.7 kg ore per m<sup>2</sup> track could spill from rail cars within the first 1,000 meters of the Transportation and Utility Corridor over the 20-year life of the NorthMet Project Proposed Action. This is equivalent to 1.25 inches of spilled material over a 2,000-m<sup>2</sup> area. Rainfall contacting the spilled ore material has the potential to release solutes, but with the small volume of ore and dilution from other sources, water quality is expected to meet the evaluation criteria (PolyMet 2013l). This is not a trifling mass of ore, nor is it an insignificant quantity of reactive dust and fines, deposited directly into the watershed. It is unacceptable to dismiss the likely water quality impacts of twenty years of ore spillage and dust/fine deposition with a casual statement and zero analysis. It is especially disheartening to the tribal cooperating agencies that have attempted to elevate this issue for so many years, that the co-leads have been completely unwilling to consider giving it the analysis it requires, or to even provide examples from other sulfide mines where this has not proven to be a concern.</p> | <p>NorthMet Project area could be characterized as low sulfide/low metal, potential impacts would be controlled by: 1) the commitment to treat all runoff from disturbed areas as process wastewater, and 2) the facilities would be subject to an air quality Fugitive Emissions Plan. Significant impact on water resources or historic properties is not expected.</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6, and 4.3.9, in PolyMet 2015a, as cited in the FEIS).</p> <p>Regarding potential spillage, any significant accumulations would be removed by a combination of machines and hand work. Ore transport would be by special railcars that minimize dust and spillage, where, since the SDEIS, the Proposer has committed to retrofit the railcars to better control spillage and develop an ore management/transport plan for monitoring site conditions. It is unlikely that there would be sufficient spillage to affect the quality of surface water or groundwater. See FEIS Section 5.2.2.3.2. See FEIS Section 3.2.2.4 for more information on the railcars, and Sections 5.2.3 and 5.2.7 for impacts of railcar spillage and dust on wetlands and air quality, respectively. The effect of dust falling on the disturbed portions of the Mine Site would be controlled by the perimeter dike and ditch system, which would route runoff to the WWTF (Section 4.1.5.3 and Large Figures 19 through 21 of PolyMet 2015a, as cited in the FEIS).</p> |          |
| 19673      | <p>Regardless of the “footprint” of the equalization basins, the liner leakage estimate of 5 gallons per acre per day (gpad) is not consistent with what we have found in the literature for the maximum allowable, or “Action Leak Rate”, above which a</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>The assumed liner leakage rates are based on a combination of literature values, experience at mine sites, experience at other types of industrial facilities, manufacturer documentation, and information provided in standard engineering guidance documents (Section 5.2.2.3 in PolyMet 2015m, as cited in the FEIS). Liner leakage rates were estimated using the USEPA-approved HELP model, where simulations combined NorthMet</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | WR 126   |

|            | leak must be found and repaired.                                                                                                                                                                                                                                                                        | <p>Project design values for slopes and subgrade design with the published values for average liner defects per acre.</p> <p>It is acknowledged that there have been historical instances where poor-quality liner installations have failed or leaked at relatively high rates. However, for the high-quality liner installations to be used for the NorthMet Project Proposed Action, the assumed liner leakage rates are reasonable and consistent with industry standards. While solid waste landfills may typically be smaller than the NorthMet facilities, the liner leakage rates are expressed on a unit area basis, so the results can be scaled to larger facilities. Further, the waste rock stockpiles where liners would be used are only temporary and monitoring would give early warning if they are not functioning properly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |          |
| 19674      | The Band has consistently raised concerns for the NorthMet Project potential to increase mercury concentrations in fish within the St. Louis River watershed, where we exercise water quality jurisdiction, and within the 1854 Ceded Territory where Band members can exercise treaty fishing rights.  | <p>The change in mercury concentration in fish is thought to be ultimately proportional to the percent increase in mercury load (MPCA 2006a, as cited in the FEIS). The current MPCA-estimated mercury deposition rate is 12.5 µg/m<sup>2</sup>/yr for northeast Minnesota (MPCA 2007, as cited in the FEIS), which translates into about 250 pounds per year of mercury currently being deposited onto the St. Louis River Watershed (3,600 square miles) due to background deposition. The potential total annual deposition in the watershed from the NorthMet Project Proposed Action is estimated to be about 0.17 pounds per year (Barr 2012b), which is less than 0.1% of the background deposition levels described above. Discharges from the WWTF and WWP are expected to meet the 1.3 ng/L standard for mercury, and overall the NorthMet Project Proposed Action is predicted to result in a net decrease in mercury loading. Therefore, mercury concentrations are not likely to result in an appreciable change in the mercury concentration in fish in waterbodies of the St. Louis River watershed or in the St. Louis River itself (Barr 2015f, as cited in the FEIS). Per FEIS Section 6.2.6, the NorthMet Project Proposed Action would not have any direct effects on aquatic habitat in the St. Louis River, and would not have any appreciable indirect effects on fish or aquatic invertebrates as a result in changes in flow or water quality.</p> | AQ05     |
| 19675      | There has not been significant “ground-truthing” of mercury deposition rates that were used in the modeling assessment. Tribal cooperating agencies note that no studies have been conducted within this region of active mining to determine why fish tissue mercury concentrations are so high if the | <p>The assessment of potential local mercury deposition and resulting changes in fish mercury conducted for the NorthMet Project Proposed Action are consistent with the assessments conducted for other recent mining projects requiring environmental review. Such information in reference to mercury deposition has been summarized in Barr 2006g (as cited in the FEIS).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | AQ28     |

|            | local sources mainly emit 'non-locally polluting' forms of mercury.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                         |
| 19676      | The Band concurs with the letter recently signed by 19 Duluth health care professionals expressing concerns that the SDEIS fails to define the human health effects of increased mercury emissions, exposure to asbestos-like mineral fibers, and arsenic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>The AERA contains toxicological information for various emissions, including mercury and airborne fibers, as well as an analysis of the potential health effects of those chemicals. The toxicological information was included in the AERA summary in FEIS Section 7.3.4.</p> <p>The AERA includes an evaluation of the most sensitive health endpoint for each chemical (e.g., neurological morbidity from manganese, reproductive toxicity of methyl mercury, and the carcinogenic potential of diesel, nickel, and arsenic). Arsenic releases to groundwater and surface water were evaluated in FEIS Section 5.2.2.3.2, and modelled concentrations were compared to drinking water standards. Drinking water standards would not be exceeded for arsenic.</p> <p>FEIS Section 5.2.7.5 contains a discussion of various types of fibers, as well as the health effects found in the scientific literature, including a summary of toxicity information from a scientific literature review conducted in 2009. FEIS Section 5.2.7.5 concludes with a finding of "an uncertain level of potential public health risk" being present due to airborne fibers in the area, and provides a summary of the dust suppression practices that would be used to minimize fiber generation. This information is referenced in the human health section of Chapter 7 (FEIS Section 7.3.4).</p> | HU 01<br>HU 02<br>HU 07 |
| 19677      | The SDEIS states that the current fish tissue concentrations in the five local lakes that were studied result in Hazard Quotients (HQs) that exceed 1 (page 6-63), but gives no further information. The Cumulative Impacts Analysis, Local Mercury Deposition and Bioaccumulation in Fish (July 2012) (Barr report) showed modeled contributions from both the Mesabi Nugget LDSP and PolyMet; this information should be included in the SDEIS for public review. The Barr report provides the actual HQs, rather than just saying "they exceed 1". The SDEIS should state clearly that in one case, the existing HQ equals 46.2, which is 46 times as high as the number where action is recommended. This is an unacceptable situation. | 'Information pertaining to the specific Hazard Quotients summarized in Barr 2012b (as cited in the FEIS) have been included in FEIS Section 6.2.6, summarizing the cumulative effects assessment for mercury deposition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | AQ 03                   |

| 19678      | The SDEIS does not provide any rationale for more mercury to be added to a system that is already so high in mercury, but rather only suggests that the TMDL should take care of this.                                                                                                                                             | <p>This comment was originally presented as part of the Tribal Position Summary included in MDO #2, which was previously addressed in SDEIS Table 8-1. Further explanation is provided below.</p> <p>MPCA's goal is to protect high-quality waters and improve the quality of impaired waters, so water quality standards are met and beneficial uses are maintained and restored, where these uses are attainable. As summarized in FEIS Section 5.2.7.2.5, widespread contamination of fish from atmospheric pollution is why Minnesota established a statewide mercury TMDL. The TMDL seeks to reduce atmospheric deposition everywhere in the state, in order to make the state's lakes and streams fishable, as required by federal regulations, and is intended to provide the long-term framework to reduce mercury in fish. The MPCA published Guidelines for New and Modified Mercury Air Emission Sources, and revised those guidelines in 2012 (MPCA 2012h, as cited in the FEIS). The guidelines were developed to limit the mercury emissions from new and expanding sources in order to meet the TMDL goal of total statewide mercury emissions of 789 lbs/year by 2025. The MPCA has conducted a review of the NorthMet Project Proposed Action mercury emissions, and has determined that it would not impede the reduction goals (MPCA 2013b, as cited in the FEIS).</p> <p>The MPCA has provided guidance to the Co-lead Agencies that a discharge to a water body impaired for fish tissue mercury is not prohibited, provided that the discharge can meet the applicable water quality standard without benefit of mixing or dilution (i.e., does not cause or contribute to the impairment). The FEIS has evaluated mercury concentrations from the Plant Site WWTW and Mine Site WWTF, and has concluded that effluent from both facilities can meet the applicable mercury water quality standard of 1.3 ng/L. Overall the NorthMet Project Proposed Action is predicted to result in a net decrease of mercury-loading.</p> | MERC 22  |
| 19679      | The background site-specific analyses and data presented in the SDEIS for total mercury and methylmercury in surface and groundwater is not sufficient to adequately describe existing conditions or evaluate the potential for impact due to changes in hydrology and water quality as a result of the NorthMet Proposed Project. | <p>The comments in this theme correctly recognize that impact assessment requires collection of background information to establish baseline conditions. For assessing mercury impacts, the SDEIS relied on monitoring data for total mercury and methylmercury collected through August 2012 at both the Mine Site and Plant Site. Because collection of baseline data is ongoing, data used for the impact assessment was expanded for the FEIS by using data collected through December 2013.</p> <p>Selected surface waters where water quality samples have been taken include, but are not limited to, the LTVSMC Tailings Basin, Unnamed Creek, Trimble Creek, Spring Mine Creek, Second Creek, Embarrass</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | MERC 02  |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>River, Sabin Lake, Wynne Lake, Esquagama Lake, Embarrass Lake, Heikkila Lake, Partridge River, Colby Lake, and the St. Louis River. FEIS Table 4.2.2-4 summarizes total mercury concentrations in the Partridge River and Embarrass River watersheds in the NorthMet Project area.</p> <p>Groundwater monitoring has also been conducted at the Mine Site and Plant Site. For surficial groundwater resources, 24 wells collected data at the Mine Site, while 8 wells were used at the Plant Site. Bedrock monitoring for the Mine Site includes 4 deep monitoring wells and 5 shallower bedrock wells. FEIS Table 4.2.2-6 summarizes total mercury concentrations sampled from these wells at the Mine Site. No bedrock water quality sampling has been required at the Plant Site.</p> <p>All of these data were subject to statistical analysis to estimate baseline mercury concentrations for surface water and groundwater resources at the Mine Site and Plant Site. This baseline estimate was subsequently used as input into the respective GoldSim water quality models, with the results reported in the FEIS. See FEIS Section 4.2.2.</p> <p>This data collection and subsequent analyses are documented in (all as cited in the FEIS): PolyMet 2015j, PolyMet 2015m, PolyMet 2015q, and Barr 2015f. Additional relevant documentation includes (all as cited in the FEIS): Barr 2010c, Barr 2012b, and Barr 2015g, as well as PolyMet 2011 (not cited in the FEIS). These analyses are considered adequate for FEIS impact evaluations.</p> |          |
| 19680      | <p>There is very little methylmercury data included in the analysis for any waterbodies, and there is no sediment mercury or methylmercury data used to evaluate and understand existing conditions. For the data that is presented, there are numerous inconsistencies in reporting limits and method detection limits, casting doubt on data quality and its utility for critical analysis of project impacts.</p> | <p>Additional baseline monitoring was performed in 2009 and additional data was included in the SDEIS to evaluate the Embarrass River and tributary streams and assess relationships between sulfate and methylmercury. This data are summarized in FEIS Section 4.2.2.3.1 and 4.2.2.3.2.</p> <p>Data presented in the FEIS were gathered from various sources thereby leading to inconsistencies in the way the results are reported. The data presented in tables in the FEIS have been reviewed for consistency and updated as necessary. The quality assurance process is documented in the FEIS.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | MERC 04  |
| 19681      | <p>The SDEIS also fails to evaluate other scientifically documented factors that affect mercury methylation and bioaccumulation. The SDEIS approach to evaluating mercury impacts of the Proposed Project avoids addressing complex but well-studied environmental processes by</p>                                                                                                                                  | <p>The FEIS assesses NorthMet Project Proposed Action-related mercury contributions using a mass-balance methodology. This approach was identified as the appropriate analytic tool for predicting mercury concentrations during scoping of this EIS, and is a common and reliable analytical tool used by agencies to assess mercury impacts in impact assessments. This estimation method is preferred over a detailed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | MERC 13  |

|            | <p>modeling, and instead relies upon an incomplete mercury mass balance to predict future conditions. It superficially references some of the large body of literature related to sulfate, pH, dissolved organic carbon, iron, and microbial activity, but in some cases erroneously interprets it.</p>                                                                                                                                                                                                                                           | <p>mechanistic model because it incorporates the important input and removal processes for mercury, it is transparent with regard to data inputs, it typically provides conservative estimates of aqueous mercury concentrations, and it allows for easy assessment of the effect of changing parameter values on mercury concentrations. Further, the NorthMet Project Proposed Action is not anticipated to be a major discharger of mercury into the environment. The RO treatment is expected to discharge mercury at or below the mercury standard of 1.3 ng/L, which includes all surface water that would be discharged at the Plant Site, including water used for flow augmentation. Mercury at the Mine Site is projected to decrease due to the NorthMet Project Proposed Action and the combined contributions from the Embarras River and Partridge River are unchanged when modeled at the St. Louis River at the Fond du Lac reservation boundary. Therefore, the potential effects are expected to be less than significant, and the mass balance approach is appropriate to provide a reasonable estimate of potential contributions for purposes of environmental review given these circumstances.</p> <p>Regarding mercury concentrations in fish, the scientific community's understanding of the relationship between total mercury, sulfate, methylmercury, etc., is evolving, and the science is complex. That said, changes in mercury concentration in fish is thought to be ultimately proportional to the % increase in mercury load (MPCA 2006a); therefore, sophisticated modeling of methylation and bioaccumulation may not lead to more accurate results, but instead could lead to erroneous conclusions.</p> |                                                                              |
| 19682      | <p>The SDEIS assumes that existing tailings in the LTV Tailings Basin will indefinitely adsorb mercury. However, Table 4.2.2-34 Summary of Surface Water Quality Monitoring Data for the Tailings Basin Surface Seeps clearly demonstrates that existing seepage exceed the GLI standard, and are higher than many of the data shown for most of the tributary streams. Given the lack of confidence in predicted seepage capture rates, Tailings Basin seepage is another source that has been greatly underestimated in the SDEIS analysis.</p> | <p>The MDNR has found that taconite tailings appear to be a sink for mercury in full-scale actual tailings basins in northern Minnesota, at least similar to other media like soils, as evidenced by lower mercury concentrations in waters seeping from tailings basins (specifically at U.S. Steel's Minntac Mine and Northshore Mining's Northshore Mine) than in either precipitation input or pond water in the tailings basin. The loss of mercury through adsorption to solids in the tailings basin and subsequent burial in the sediments results in an overall permanent retention of mercury within the basin and decreases the mercury load released to receiving waters. MDNR research demonstrates that mercury released to surface waters during taconite processing is insignificant with respect to mercury concentrations found in local precipitation and existing background surface waters.</p> <p>The FEIS relies on revised cross-section models from the SDEIS to</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>PD 08<br/>                     WR 018<br/>                     WR 021</p> |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>evaluate containment systems on the north, northwest, and west sides of the Tailings Basin, which are documented in PolyMet 2015i (as cited in the FEIS). These new models consider the presence of an upper more-permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>Water captured by the containment system would be treated by the WWTP thereby lowering mercury levels once again before water is discharged to the environment. The target mercury WWTP effluent concentration is 1.3 ng/L which would meet the GLI standard.</p> |                  |
| 19683      | <p>The SDEIS evaluation of mercury impacts is deficient, and the conclusion of no mercury impacts downstream in the St. Louis River watershed is not supported by the information presented. This issue remains a significant impact to reservation and treaty resources.</p>                                                                                                                                                                                                                                                                                                                                                                                                          | <p>As summarized in FEIS Section 6.2.3.3.4, the NorthMet Project Proposed Action is predicted to result in a net overall decrease of mercury loadings of approximately 1.0 grams per year (i.e., a net decrease of 1.2 grams per year in the Partridge River and a net increase of 0.2 grams per year in the Embarrass River), which is indistinguishable from natural background variability. Therefore, the NorthMet Project Proposed Action would not contribute to cumulative effects on mercury loading to the St. Louis River. Supporting information is provided in FEIS Section 6.2.3.3.4.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | MERC 19          |
| 19684      | <p>Project's effect on wild rice waters sulfate loadings, compliance points, seasonal discharge. The Band has consistently challenged the conclusion that the NorthMet Project will not result in damage to wild rice waters in the Partridge and Embarrass Rivers and their watersheds. Our skepticism arises from growing knowledge of the extent to which state and federal regulatory agencies have consistently failed to enforce standards and regulations on the mining industry that are intended to protect wild rice. We have exhaustively commented on the specific threats of this project from the very beginning of our involvement as a cooperating agency, and our</p> | <p>Neither seasonal application of the wild rice standard nor non-mechanical treatment systems are part of the NorthMet Project Proposed Action, which relies solely on mechanical treatment and year-round application of the sulfate standard. Non-mechanical treatment may be considered during operations and closure if pilot studies demonstrate their utility and cost-effectiveness for water treatment and water disposal. For purposes of the FEIS, the MPCA has provided guidance as to what waters in the Embarrass and Partridge rivers are waters used for production of wild rice to which the current 10 mg/L wild rice sulfate standard applies. The MPCA reviewed all available relevant information in making their recommendation; however, that recommendation in itself is a policy decision of the MPCA that is not part of the EIS process.</p>                                                                                                                                                                                                                                 | WR 153<br>WR 154 |

|            | <p>previous concerns are carried forward to the SDEIS, despite new engineering controls and water treatment. It is commendable that PolyMet has committed to constructing wastewater treatment plants that include reverse osmosis, which has the potential to meet the low sulfate effluent limit if designed and operated properly, including at the Mine Site at year 1. But the damage to wild rice will be just as real and just as permanent if it results from inadequate regulatory controls, as if it results from inadequate engineering controls. In order to effectively apply the standard, the period when wild rice may be susceptible to high sulfate needed to be determined. MPCA produced draft staff recommendations (MPCA 2012b; MPCA 2012a) that included reviews of supporting research findings and related information. The MPCA's recommendations were that the 10 mg/L sulfate standard is applicable for portions of the Partridge River and Embarrass River used for the production of wild rice and that in the portions of the Partridge River, the 10 mg/L sulfate standard is applicable from April 1 through August 31. As stated in earlier comments, recent research does not support seasonal-only restrictions on sulfate loading. There is no time of year when high sulfate discharges do not result in the generation of highly toxic sulfide in the sediments, and consequently, no time of year when wild rice is not susceptible to high sulfate.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                        |          |
| 19685      | <p>The results over the 4 years of surveys indicate some variability in the location and density of observed wild rice and in associated water column sulfate concentrations between survey years. The 2012 survey showed generally fewer and less dense stands of wild rice than were observed in the 2009 to 2011 surveys...No wild rice was observed in Spring Mine Creek, Trimble Creek, or</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>For purposes of the FEIS, the MPCA has provided guidance as to what waters in the Embarrass and Partridge rivers are waters used for production of wild rice to which the current 10 mg/L wild rice sulfate standard applies. The MPCA reviewed all available relevant information in making their recommendation; however, that recommendation in itself is a policy decision of the MPCA that is not part of the EIS process.</p> | WR 154   |

|            | <p>Unnamed Creek near the Plant Site and they are not recommended as waters used for production of wild rice (Barr 2009b; Barr 2011a; Barr 2012a; MPCA 2012b). Section 4.2.2 provides a discussion on wild rice survey results and water quality standards (see Figure 4.2.2-3). . . . The co-lead and cooperating agencies are all well aware of the historic flood event this region experienced in June 2012; tribal and state rice harvesters reported widespread resource losses (thousands of acres) across many of the region's wild rice lakes and flowages. It is not surprising that the 2012 surveys of wild rice waters impacted by mine discharges showed fewer, less dense stands of wild rice than in previous years. . . . Minnesota tribes have engaged in consultation with the MPCA on this culturally vital issue and provided recommendations for better protection of the wild rice that remains across a much-diminished range. The tribal cooperating agencies have engaged in consultation with the federal co-lead agencies under Section 106 of the National Historic Preservation Act, continually elevating the need for protection of all remaining wild rice in the 1854 Ceded Territory. During consultation the Bands have provided information about tribal wild rice harvest in the Embarrass River far upstream of where the MPCA has recommended as "waters used for the production of wild rice." The wild rice sulfate standard must apply throughout the Embarrass River watershed.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                               |
| 19686      | <p>The scant remaining stands [of wild rice] in the upper reaches [of the Embarrass River] have already been severely impacted by previous mining disturbances and continued releases of high-sulfate water, and are in need of restoration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>In 1973, Minnesota adopted a water quality standard of 10 mg/L applicable to "water used for production of wild rice during periods when the rice may be susceptible to damage by high sulfate levels."<br/>                     Water quality and quantity modeling predictions for SW-005 and PM-13 indicate that the project would not result in adverse impacts to wild rice. Impacts on wild rice further downstream in these waters, or on wild rice resources regionally throughout the treaty areas, would not be expected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                            |
| 19687      | In MPCA-recommended wild rice waters along the Partridge and Embarrass rivers, the sulfate concentration already exceeds 10 mg/L, so it must be demonstrated that the NorthMet Project Proposed Action would have an acceptably high probability of not increasing sulfate concentrations in these areas. This contorted interpretation of compliance under the Clean Water Act is not defensible. The NorthMet Project Proposed Action must meet MN WQS, including the sulfate criterion to protect wild rice.    | Federal Regulations 40 CFR 122.4(i) and 40 CFR 122.44(d)1 have the primary purpose of ensuring that impaired waters are not further degraded before a TMDL is complete. Enacted in the early 1980s, these regulations fulfill the Clean Water Act objective to restore and maintain the chemical, physical, and biological integrity of the nation's waters. 40 CFR. § 122.4(i) prohibits the net increase of any pollutant that will cause or contribute to a numeric or narrative water quality standard violation. 40 CFR. § 122.44(d) requires effluent limits in permits to ensure discharges do not cause, have a reasonable potential to cause, or contribute to the violation of a numeric or narrative water quality standard. | PER 10<br>WR 153<br>WR 154 |
| 19688      | As stated previously, our concerns for protecting wild rice within this region of the 1854 Ceded Territory is based as much upon inadequate implementation of MN WQS protections, as upon the high likelihood that surface and groundwater discharges from the project will exceed MN WQS. We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact. | Water quality and quantity modeling predictions for SW-005 and PM-13 indicate that the project would not result in adverse impacts to wild rice. These locations are the nearest downstream locations in the Partridge and Embarrass Rivers respectively and are recommended by MPCA to be considered as waters used for the production of wild rice. Impacts on wild rice further downstream in these waters, or on wild rice resources regionally throughout the treaty areas, would not be expected.                                                                                                                                                                                                                                 | PER 10<br>WR 156<br>WR 157 |
| 19689      | The SDEIS does not adequately discuss impacts to traditional uses such as hunting and trapping, nor does it adequately discuss impacts to traditional game and furbearer populations. This is a major discrepancy in these documents as healthy wildlife populations, particularly game and furbearer species, and access to them is critical for the exercise of treaty rights for tribal members.                                                                                                                | Potential effects from the NorthMet Project Proposed Action on game species are discussed in FEIS Section 5.2.5. The potential cultural effects on the Bands from the NorthMet Project Proposed Action on game species are discussed in FEIS Section 5.2.9.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | CR 01                      |
| 19690      | Fond du Lac's comments on the DEIS regarding the existing wildlife corridors are still applicable: they are fundamentally inadequate to maintain habitat connectivity across the heavily disturbed                                                                                                                                                                                                                                                                                                                 | The FEIS wildlife sections include an analysis of the wildlife corridors, including their use by various species.<br><i>Minnesota Rules</i> 6132.2700 require that a project site be reclaimed once mining has ceased. The goals of such reclamation are to "control erosion, to                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WI 02 WI 03                |

| 19693      | from the Band's perspective, perhaps the most significant deficiency in the SDEIS analysis of wildlife impacts is its failure to critically analyze potential impacts to moose.                                                                                                                                                                                                                                                                                          | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement.                                                                     | WI 01                      |
| 19694      | The tribal cooperating agencies have consistently raised impacts to moose as an issue of critical importance throughout the DEIS, SDEIS, Section 106 consultation, and 'sieve list' meeting processes. It is not acceptable to defer full consideration of this culturally significant species until the FEIS. We have valid concerns about the project's impact on moose habitat at a time when their population is crashing, and they should be addressed immediately. | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state ETSC status listings from August 19, 2013, as well as new federal status listing changes. | 19695      | the Band's concern for project impacts to moose is not simply potential effects to hunting zones and seasons; we are gravely concerned about protecting sustainable moose populations for future generations                                                                                                                                                                                                                                                             | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement.                                                                     | WI 03                      |
| 19696      | This discussion [in the SDEIS] contains substantially outdated information regarding sturgeon reintroduction, both in the St. Louis River estuary and upstream of the Minnesota Power dams on the Fond du Lac Reservation.                                                                                                                                                                                                                                               | FEIS Section 4.2.6.1.4 has been edited to state that lake sturgeon have been documented near Floodwood, MN, per 2012 - 2014 FDL sturgeon data.                                                                                                                                                                                                                                                                   | AQ 02                      |
| 19697      | Uncontrolled contaminant loading from existing mine facilities, along with elevated constituents from the Proposed Project, have the potential to affect the successful establishment of a sustainable lake sturgeon fishery throughout the St. Louis River. This potential impact should be fully evaluated in the SDEIS.                                                                                                                                               | Existing data review indicates recruitment and a viable population of lake sturgeon do exist in the St. Louis River Watershed. The NorthMet Project Proposed Action is not considered to have the potential for cumulative effects on hydrology and water quality in the St. Louis River Watershed. As a result, no effects to lake sturgeon population within the St. Louis River Watershed system would occur. | AQ 02                      |
| 19698      | The SDEIS states that the property boundaries at both the Plant Site and Mine Site are used to define the maximum extent of NorthMet air impacts that would have the potential to affect historic properties, because the project is predicted                                                                                                                                                                                                                           | The NorthMet project would have fugitive dust emissions. To evaluate the impact of those fugitive dust emissions, air quality modeling was conducted to assess impacts from those emissions. The modeled results determined impacts to be below applicable air quality standards. The FEIS used the evaluation criteria available to determine impacts. |            | <p>to meet ambient air quality standards at those boundaries. The Band asserts that these property boundaries cannot arbitrarily be used for acid dust and metal deposition boundaries because there are no ambient air quality standards for these pollutants.</p> <p>While secondary ambient air quality standards do exist for vegetation, these are not to be used for deposition. It doesn't make sense to use or reference an ambient air quality standard for purposes of studying deposition because "ambient air quality" is a concentration of a pollutant found in a unit of air. "Deposition" is a concentration of a pollutant that settles out of the air onto a surface. Therefore, compliance with traditional ambient air quality modeling and the range where such compliance occurs cannot be used with regard to the deposition of these pollutants on the ground, water surfaces, and vegetation.</p> | <p>quality standards are used to provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.</p> <p>Significant impact on environmental resources or historic properties from dust is not expected because areas with the potential to generate dust would be controlled by a Fugitive Dust Control Plan and any dust leaving the site would most likely come from sources that would be characterized as having low sulfide/low metal content.</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project Proposed Action area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6 and 4.3.9 of PolyMet 2015a, as cited in the FEIS).</p> <p>FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 includes a discussion on the potential indirect deposition effects on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The FEIS has been revised to clarify the assessment results. The deposition modeling results for dust, metals, and sulfur would likely not have an adverse effect on wetlands; however, the modeling only indicated those areas that had deposition rates greater than 100 percent of background deposition. These specific wetlands areas would be identified for consideration in any future monitoring to be conducted for the NorthMet Project Proposed Action. Please refer to theme WET 11 for more information.</p> |                  |
| 19700      | <p>The SDEIS also states that "Within the property boundary, modeling shows where fugitive dust from the Plant Site, Tailings Basin, and Mine Site stockpiles is predicted to settle. Outside of these areas, modeling does not indicate potential effects on historic properties from dust deposition." Again, it is inappropriate to use areas that show compliance with ambient air quality standards to show "no effects from dust and metal deposition", because ambient air quality and impacts caused by deposition are two separate concepts.</p>                                                                                                                                                                                                                                                                                                                                                                  | <p>The NorthMet project would have fugitive dust emissions. To evaluate the impact of those fugitive dust emissions, air quality modeling was conducted to assess impacts from those emissions. The modeled results determined impacts to be below applicable air quality standards. The FEIS used the evaluation criteria available to determine impacts. Secondary ambient air quality standards are used to provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.</p> <p>Significant impact on environmental resources or historic properties from dust is not expected because areas with the potential to generate dust would be controlled by a Fugitive Dust Control Plan and any dust leaving the site would most likely come from sources that would be characterized as having</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | AIR 05<br>WR 151 |

|            |                                                                                                                                                                                                                                                                                               | <p>low sulfide/low metal content,</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project Proposed Action area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6 and 4.3.9 of PolyMet 2015a, as cited in the FEIS).</p> <p>FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 includes a discussion on the potential indirect deposition effects on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The FEIS has been revised to clarify the assessment results. The deposition modeling results for dust, metals, and sulfur would likely not have an adverse effect on wetlands; however, the modeling only indicated those areas that had deposition rates greater than 100 percent of background deposition. These specific wetlands areas would be identified for consideration in any future monitoring to be conducted for the NorthMet Project Proposed Action. Please refer to theme WET 11 for more information.</p> |                            |
| 19701      | <p>Second, and more importantly, it is simply not true that “modeling does not indicate potential effects on historic properties from dust deposition”.</p> <p>Figure 4.2.9-4 shows areas where the Fugitive Dust Area of Potential Effect extends outside both the Plant and Mine Sites.</p> | <p>Significant dust related impact on environmental resources or historic properties located out of the project boundary is not expected because project areas with the potential to generate dust would be controlled by a Fugitive Dust Control Plan and any dust leaving the site would most likely come from sources that would be characterized as having low sulfide/low metal content,</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project Proposed Action area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6 and 4.3.9 of PolyMet 2015a, as cited in the FEIS).</p>                                                                                                                                                                                                                                                                                                                                                                                                | AIR 05<br>WR 151           |
| 19702      | <p>The SDEIS states that modeled annual dust deposition rates were compared to an “annual effects-level deposition rate” (background) of 365 g/m<sup>2</sup>/yr. This same “annual effects-level</p>                                                                                          | <p>The assessment approach for deposition of dust, metals, and sulfur to wetlands presented in FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 was a summary from the <i>NorthMet Project Wetlands Data Package</i> (PolyMet 2015b, as cited in the FEIS) which includes a citation of the 365 g/m<sup>2</sup>/yr.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | AIR 05<br>WR 151<br>WET 11 |

|            | deposition rate” was given in the PSDEIS in May of 2013, but without providing a reference for how this number was derived.                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                  |
| 19703      | direct physical effects of mineral dusts on vegetation can be seen at a surface load of 7 g/m <sup>2</sup> and chemical effects of reactive materials can be seen at 2 g/m <sup>2</sup> . These levels indicate that the proposed “impact” level of 365 g/m <sup>2</sup> /yr may be too high. | <p>Minnesota’s acid deposition standard recognized that aquatic systems were more sensitive to sulfur inputs and that a wet sulfate deposition standard of 11 kilogram/hectare/year (kg/ha/yr) (3.6 kg/ha/yr wet sulfur) was considered protective of chemistry and biota (MPCA 1985). Others identified that a wet sulfate deposition standard of 15 kg/ha/yr (approximately 5 kg/ha/yr wet sulfur) would be protective of the aquatic systems (MPCA 1985). Sulfate dosing of wetlands in the Marcell Experimental Forest near Grand Rapids that was more than four times background (approximately 28 kg/ha/yr wet sulfate; approximately 9 kg/ha/yr as wet sulfur) did not identify any vegetation-related affects due to the additional sulfur (Jeremiason et al. 2006). At 100 percent of background, the “total” potential sulfur deposition (wet + dry) estimated for the NorthMet Project Proposed Action would be approximately 3.2 kg/ha/yr (background+ NorthMet Project Proposed Action). Given that higher doses of sulfur are considered protective of aquatic chemistry and biota, and/or did not show any toxic effects to wetland vegetation, the potential particle-bound sulfur that may be contributed to wetlands by the NorthMet Project Proposed Action would not be expected to result in any adverse effects to vegetation.</p> <p>The fugitive dust would not be reasonably expected to be toxic to the touch and would not be reasonably expected to be directly toxic to vegetation, as it is typically part of road construction materials and/or tailings. The wetland dust deposition analysis identified that metals are expected to be particle-bound, within the mineral matrix of the rock particle. Therefore, the mineral particle must undergo physical or chemical weathering to release the metals. This is typically a slow release over time, measured in years. Metals deposited or applied to mineral and wetland soils have been shown to be sequestered in the upper soil layers and not be available to vegetation. Because of the potential small amounts of metals from fugitive dust that may be available in surface soils for uptake by plants, and the sequestering of most of the metals in soils should they be weathered out of the dust over time, the potential for the metals to be toxic to vegetation is very low. Monitoring of the areas estimated to have metal deposition greater than 100 percent of background would occur as part of the wetland monitoring program which would assess if potential indirect effects occur</p> | AIR 04<br>WET 11 |

| 19704      | Further, as the Band commented on the PSDEIS, the modeled deposition rates do not include the effects of contamination from other sources, such as pit leaks and seepage, nor are cumulative impacts from all of these sources included in Chapter 6.                                                                                                                                                                                                                                                                                                                                                                                                                | The Co-lead Agencies considered the information included in the Tribal Cooperating Agencies' cumulative effects assessment and found no compelling information or analysis to change the original approach or conclusions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | CU 12    |
| 19705      | The SDEIS statement that "all of the receptor nodes with the highest model-estimated deposition rates were located within the ambient air boundary" is incorrect, especially given that the following paragraph contradicts this statement by saying "of the 234 acres of wetlands, (that could be potentially indirectly affected) 228 acres would be located within the Mine Site ambient air boundary". While only 3% of the affected acres are outside of the boundary, these two statements should be reconciled. This same comment was made by the Band previously while reviewing the PSDEIS. The inaccuracy serves to diminish consideration of any impacts. | FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 includes a discussion on the potential indirect deposition effects on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The FEIS has been revised to clarify the assessment results. The deposition modeling results for dust, metals, and sulfur would likely not have an adverse effect on wetlands; however, the modeling only indicated those areas that had deposition rates greater than 100 percent of background deposition. These specific wetlands areas would be identified for consideration in any future monitoring to be conducted for the NorthMet Project Proposed Action. | WET 11   |
| 19706      | SDEIS Figure 5.2.3-22 depicts receptors outside the plant site that are predicted to receive dust deposition rates higher than 50% of background. Since the SDEIS asserts that only those areas receiving deposition greater than 100% of background will be affected, it is unclear why Figure 5.2.3-22 shows areas receiving more than 50% of this value.                                                                                                                                                                                                                                                                                                          | The FEIS indicates that dust deposition was highest in three locations: southwest corner, north west of the Plant Site; southeast corner; and the northeast corner, towards Area 5. The FEIS also states that all receptors have model-estimated dust deposition of 50% or less of the effects-level background. FEIS Figure 5.2.3-22 depicts those three locations that would receive dust deposition of 50% or less and is not intended to depict areas receiving deposition greater than 100% of background.                                                                                                                                                                                  | WET 11   |
| 19707      | SDEIS Figure 5.2.3-23 depicts receptors outside the plant site that are predicted to receive metal deposition rates higher than 100% of background, but there is no discussion regarding monitoring or management actions to quantify or mitigate affects. Other SDEIS text is confusing or contradictory; from SDEIS 5-302: "all receptors have model-estimated dust deposition of 50% or                                                                                                                                                                                                                                                                           | FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 includes a discussion on the potential indirect deposition effects on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The FEIS has been revised to clarify the assessment results. |            | less of the effects-level background of 365 g/m <sup>2</sup> /yr”, but the very next sentence states “At the Plant Site, there would be two locations showing model-estimated deposition rates greater than 100% of background deposition”. Later in the same paragraph “...the modeling only indicated those areas that had deposition rates greater than 100% of background deposition”. It appears as though one statement may address dust deposition and the other metals deposition, but this is unclear. | consideration in any future monitoring to be conducted for the NorthMet Project Proposed Action.<br>Please refer to theme WET 11 for more information on deposition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |          |
| 19708      | The SDEIS discussion on fugitive dust is quite often confusing. There should be clarification between when the text is referring to sulfide dust and when it is talking about metallic dust. The text apparently switches between the two without explanation. Also, the text is not clear which air emissions sources were modeled with regard to fugitive dust.                                                                                                                                               | FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 includes a discussion on the potential indirect deposition effects on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The discussions is divided into a discussion on 1) fugitive dust and 2) metals and sulfide dust emissions. The deposition modeling results for dust, metals, and sulfur would likely not have an adverse effect on wetlands; however, the modeling only indicated those areas that had deposition rates greater than 100 percent of background deposition. These specific wetlands areas would be identified for consideration in any future monitoring to be conducted for the NorthMet Project Proposed Action.<br>Please refer to theme WET 11 for more information on deposition. | WET 11   |
| 19709      | From the SDEIS, “90% of the receptor nodes with the highest model-estimated deposition rates are located within the ambient air quality boundary”. As the Band has commented before, this is impossible to verify, as no map of the location of the receptor nodes has been included. Also, 90% of the area predicted to be impacted does not lie within the ambient air quality boundary; it appears to be only about 60% contained to the ambient air quality boundary (SDEIS Figure 5.2.3-22).               | FEIS Sections 5.2.3.2.2 and 5.2.3.2.4 show the deposition impacts on wetlands from particulate emissions from the Mine Site, Transportation and Utility Corridor, and the Plant Site. The receptor nodes are depicted on Large Figure 15 and 16 of the <i>NorthMet Project Wetlands Data Package</i> (PolyMet 2015b, as cited in the FEIS).                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WET 11   |
| 19710      | the co-lead’s only ‘mitigation’ for fugitive sulfide dust is recommending future wetlands monitoring.                                                                                                                                                                                                                                                                                                                                                                                                           | The indirect effects analyses performed for the FEIS were not performed to characterize impacts but were done to inform where monitoring should take place for those areas that were identified as having a potential for indirect wetland effects. As a result of these analyses performed to determine where monitoring should occur, quantification of wetland types and acres of potential indirect wetland effects were also generated. FEIS Section 5.2.3                                                                                                                                                                                                                                                                                                                                                    | WET 11   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>provides these quantitative values of potential indirect wetland effects. FEIS Section 5.2.3.3 (wetland mitigation and monitoring), has been revised to include additional details on the proposed monitoring and wetland adaptive plan. The wetland mitigation and monitoring would be reviewed and approved by the appropriate regulatory agencies responsible for authorizing the permit application during the permitting process. Monitoring is proposed within all wetlands containing a potential indirect wetland impact factor rating of 3 to 5 and a sampling of those wetlands with factor ratings of 1 or 2 as described in FEIS Section 5.2.3.3 (see Figures 5.3.2-31 and 5.2.3-32).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| 19711      | <p>the Proposed Project suggests water spraying for areas of fugitive dust release during dry periods as mitigation. In the case of dust that may have high acidic content, this would be a poor choice for management action, as the addition of water to the dust would likely create or accelerate toxic run-off.</p>                                                                                                                                               | <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan (FDCP) approved by the MPCA, which would discuss dust mitigation beyond water spray as a control technique for mitigating impacts from dust with acidic content. Reducing vehicle travel speeds, limiting blasting on days with low wind speed, and including chemical dust suppressants would also be in the FDCP. The FDCP would be part of the air quality permit public notice documents. (see Sections 4.1.6, and 4.3.9, in PolyMet 2015a, as cited in the FEIS).</p> <p>Fugitive dust from the project could generally be characterized as low sulfide/low metal. Using water spray on unvegetated surfaces would be appropriate because this would reduce the potential for dust generation and transport off site where it would not be managed. Water that contacts dust falling on disturbed areas within the Project Site would be treated before discharged.</p> <p>The effect of dust falling on the disturbed portions of the Mine Site would be controlled by the perimeter dike and ditch system, which would route runoff to the WWTF (Section 4.1.5.3 and Large Figures 19 through 21 of PolyMet 2015a, as cited in the FEIS).</p> <p>Please refer to theme WET 11 for more information.</p> | WET 11<br>WR 151 |
| 19712      | <p>The Band does not agree with the statement that “no significant reactive airborne fugitive dust from the rail transport is expected”. The SDEIS minimizes the potential adverse impacts from constant rail corridor spillage during the life of the mine project by claiming “Any spillage of the ore fines is expected to be within 2 meters of the rail line, along the path”. The Band is concerned with the effect of any spillage on water run-off, as has</p> | <p>The NorthMet Project Proposed Action description in the FEIS includes routine inspections of the Transportation and Utility Corridor to identify accumulations of dust or ore spillage.</p> <p>Regarding dust, given the majority of the dust that could leave the NorthMet Project area could be characterized as low sulfide/low metal, potential impacts would be controlled by: 1) the commitment to treat all runoff from disturbed areas as process wastewater, and 2) the facilities would be subject to an air quality Fugitive Emissions Plan. Significant</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | WR 151           |

|            | <p>been seen with other mines in the US: “The Fugitive Dust Risk Management Plan (FDRMP) for Red Dog Operations, Alaska (August 2008, draft) states: “Elevated metal concentrations have been identified in tundra in areas surrounding the DMTS, primarily as a result of deposition of fugitive dust originating from the DMTS corridor, which is used to transport zinc and lead ore concentrates from the Red Dog Mine, operated by Teck Cominco Alaska Incorporated (Teck Cominco).”</p>                                      | <p>impact on water resources or historic properties is not expected.</p> <p>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6, and 4.3.9, in PolyMet 2015a, as cited in the FEIS).</p> <p>Regarding potential spillage, any significant accumulations would be removed by a combination of machines and hand work. Ore transport would be by special railcars that minimize dust and spillage, where, since the SDEIS, PolyMet has committed to retrofit the railcars to better control spillage and develop an ore management/transport plan for monitoring site conditions. It is unlikely that there would be sufficient spillage to affect the quality of surface water or groundwater. See FEIS Section 5.2.2.3.2. See FEIS Section 3.2.2.4 for more information on the railcars, and Sections 5.2.3 and 5.2.7 for impacts of railcar spillage and dust on wetlands and air quality, respectively. The effect of dust falling on the disturbed portions of the Mine Site would be controlled by the perimeter dike and ditch system, which would route runoff to the WWTF (Section 4.1.5.3 and Large Figures 19 through 21 of PolyMet 2015a, as cited in the FEIS).</p> |          |
| 19713      | <p>There are other invalid and/or inconsistent statements throughout the SDEIS related to air quality. The SDEIS states “The NorthMet Project area has been designated by the USEPA as attainment for all air quality pollutants”. To be clear, attainment designations for the new short-term standards for NOx and SO2 have not yet been completed for the State of Minnesota. Also, 90% control efficiency is assumed for haul roads at the Mine Site, but only 80% control is assumed for unpaved roads at the Plant Site.</p> | <p>In FEIS Section 5.2.7.1.1, the statement, “The NorthMet Project area has been designated by the USEPA as attainment for all air quality pollutants” has been revised to read, “The NorthMet Project area has been designated by the USEPA as attainment or unclassified for all air quality pollutants.”</p> <p>The proposed project can have multiple control efficiencies for the various road segments located at the site. The MPCA approved Fugitive Dust Control Plan (FDCP) would have the control efficiencies and the required dust suppression details outlined within the document. The FDCP would be part of the air quality permit public notice documents.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | AIR 12   |
| 19714      | <p>The Band has continually questioned the Page 5-411 states that “The modeling results for the Mine Site receptors... indicate that the highest modeled 24-hour H2H PM-10 concentration was 27 ug/m3 for the year 8 operating scenario and 29 ug/m3 for the year 13 operating scenario”. Yet the 29 ug/m3 result not shown in Table 5.2.7-11, even though</p>                                                                                                                                                                     | <ul style="list-style-type: none"> <li>The H2H PM10 concentration of 29 ug/m3 for the year 13 operating scenario was added in FEIS Table 5.2.7.11.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | AIR 12   |

|            | this value is nearly the PM-10 24-hour increment limit (30 ug/m3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| 19716      | From Table 6.2-22, cumulative inhalation risks for cancer are four times greater than the guideline of 1E-05. Although much of this risk comes from existing facilities, this number indicates that the area cannot sustain pollution that adds to what is already there without compromising health.                                                                                                                                                                                                                                                                                   | Please also see Response to Comment ID 2879.<br><br>The commenter is correct that the estimated inhalation cancer risk from the combination of background air data and modeled facility data are above the facility risk guideline for cancer risk. This is consistent with estimates for air data across the state of Minnesota, with levels generally higher in urban areas and lower in rural areas. The estimation of cancer risk from air concentrations is a mathematical exercise and is not equal to actual increases in cancer. Also, these estimates based on environmental hazards must be considered against the background cancer risk in Minnesota from all causes (genetics, tobacco, nutrition, etc.). For example, the background incidence in males is about 1 in a population of 2 ( <a href="http://www.health.state.mn.us/divs/eh/risk/rules/air/hrvsonar.pdf">http://www.health.state.mn.us/divs/eh/risk/rules/air/hrvsonar.pdf</a> ). | HU 05            |
| 19717      | The Band has also continued to raise concerns for amphibole fibers, and what we perceive as insufficient analysis in the SDEIS. According to the SDEIS, the BACT-like fine particulate controls will control the release of more than “99.9% of amphibole fibers that are emitted from controlled sources”, not “99.9% of fibers in the ore”. The second statement is incorrect, because some sources of fibers from the ore are uncontrolled, like blasting operations, or are unable to be controlled up to 99.9%, like haul roads, tailings, crushing and screening, and stockpiles. | FEIS Section 5.2.7.1 has been revised to incorporate additional information about limiting fugitive dust as a surrogate to limit potential fiber emissions.<br><br>All active areas at the Mine Site and Plant Site would be subject to a Fugitive Dust Control Plan approved by the MPCA, which describes management of fugitive dust generated from unpaved roads across the NorthMet Project area, rock dumping and loading locations on the Mine Site, and areas potentially subject to wind erosion on the Plant Site (see Sections 4.1.6, and 4.3.9, in PolyMet 2015a, as cited in the FEIS).<br><br>Compliance with the requirements for blasting, found in <i>Minnesota Rules</i> , Chapter 6132, will minimize fugitive dust from blasting operations.                                                                                                                                                                                              | AIR 03           |
| 19718      | The SDEIS states that the Biwabik Iron Formation (which has been found to contain amphibole fibers) slopes under the Duluth Complex at the Mine Site, coming within 100 feet of the area that is planned to be mined. The Band’s previous comments regarding unexamined hydrological connections between geologic layers or formations are also applicable in this instance. With fractured bedrock present, that could establish a hydrological connection, and 100 feet would be an insufficient barrier. Additionally, these types of                                                | The NorthMet Project Proposed Action would mine ore from the Duluth Complex, which has been shown to contain amphibole mineral fibers, though to a lesser extent than found in the Biwabik iron formation. The Duluth complex may contain geologic heterogeneities near the proposed project site, which could result in variability in both the concentrations of and type of fiber contained within the ore. The results of the analysis for quantification and identification of fibers collected from samples taken from PolyMet’s various floatation tests (SGS 2004, Barr 2007) were used only to confirm the presence of amphibole minerals in the ore and should not be used as a predictor of potential facility emissions. It is not possible to quantify the amount of fibers that may be emitted from the facility with any                                                                                                                      | WR 012<br>WR 107 |

|            | <p>formations are characteristically not homogeneously distributed, meaning that pockets of fibers could be found unexpectedly. While it is true that some information on the occurrence of amphibole fibers has been gathered from the site, the drill locations were chosen with regard to studying minerals of economic interest, and did not specifically target locations where fibers may be expected to occur.</p>                                                 | <p>predictive accuracy. Any decisions as to the stringency of ambient air quality monitoring for fibers would be made during the air permitting process, during which there will be an opportunity for public participation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |          |
| 19719      | <p>The SDEIS maintains that the Minnesota Department of Health has reported that males within the area of the taconite mining and milling industry had more than two times the mesothelioma rate than the rest of the state. Actually, the report from the epidemiologic study of Minnesota iron mine workers states that it is three times the rate found in the rest of the state.</p>                                                                                  | <p>Both the MDH's study of cancer incidence rates in Northeastern Minnesota and the U of M's Taconite Miners Health Study found an increased risk of certain respiratory cancers in iron range mine workers when compared to incidence experienced in Minnesota as a whole. However, neither study was able to definitively link the exposure to occupational amphibole mineral fibers with this observed increase in risk. The design limitations of these epidemiologic studies did not allow for the development of data that could address the potential toxicity that amphibole mineral fibers may present to either those that work directly with mining operations or who live within the surrounding communities.</p> | HU 05    |
| 19720      | <p>Page 5-443 The SDEIS assures that ambient air monitoring for amphibole fibers would be conducted following facility start-up. While no schedule of frequency or duration for amphibole fibers monitoring has been proposed in the SDEIS, the Band continues to assert, as we have throughout the environmental review process, that monitoring will need to continue over the life of the mine, as no one can predict when fibers might be contacted and released.</p> | <p>Decisions on ambient air quality monitoring for fibers would be made during air permitting and there would be an opportunity for public participation via that process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | AIR 03   |
| 19722      | <p>The tribal cooperating agencies were not permitted to participate in the Geotechnical Stability IAP workgroup, so we are at a disadvantage for understanding how some of the profound geotechnical stability risks identified for the PolyMet project as defined in the 2009 DEIS were resolved for the 2013 SDEIS.</p>                                                                                                                                                | <p>The proposed design and management of the proposed waste management facilities has evolved throughout the EIS. These modifications have resulted in improved expected stability as well as enhanced environmental outcomes (such as water impacts). Notable enhancements to the design of the proposed waste management facilities since the DEIS include:</p> <ul style="list-style-type: none"> <li>- improving stability at the Tailings Basin by adding rock buttressing along the northern edge, and adding cement deep soil mixing in the fines and slimes layers along the northern sections of the LTVSMC tailings basin;</li> </ul>                                                                               | GT 14    |

Details of the current NorthMet Project Proposed Action are provided in Section 3.2. Section 5.2.14 provides details of the design factors, management, and modeling results pertaining to geotechnical stability of the waste material storage facilities.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |
| 19723      | <p>we do not share PolyMet's confidence in being able to virtually eliminate leakage to groundwater from any type of containment system. Some leakage must always be assumed, and given the site-specific conditions for the proposed location of the HRF, the risk for highly contaminated seepage to exit the HRF and flow to wetlands in the Embarrass River watershed.</p> | <p>The Hydrometallurgical Residue Facility would be double-lined to minimize release of water that has contacted the hydrometallurgical residue. The double liner would consist of a composite liner system utilizing a geomembrane liner above a geosynthetic clay liner with a second liner placed above the first, separated by a leakage collection system. This would substantially remove all hydraulic head from the lower liner and thereby virtually eliminate leakage from the Hydrometallurgical Residue Facility. It is expected that no water would be released directly from the Hydrometallurgical Residue Facility, so, appropriately, leakage from the Hydrometallurgical Residue Facility is not included in modeling.</p> <p>PolyMet initiated laboratory testing to consider the chemical compatibility of the potential geosynthetic liner to be used with leakage from residue (PolyMet 2014r, as cited in the FEIS). Results indicated that a polymer-treated geosynthetic liner should be used that is manufactured specifically in anticipation of the chemical characteristics of the liquid and the pore water that would be contained within the facility. The hydraulic conductivity of the soil leakage collection system is not expected to degrade over time. Typical liner performance assumes a 500-year service life of the geomembrane; therefore, hydraulic conductivity of the liner is not expected to degrade over that time. Specific attributes would be determined during the geosynthetic clay layer development to achieve the desired performance before final installation. Findings of studies on geosynthetic liners indicate that performance is minimally affected by</p> | WET 12   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | freeze-thaw cycles (PolyMet 2014c). At the Hydrometallurgical Residue Facility, the majority of the geosynthetic liner system would be below the water elevation, and therefore not exposed to freeze-thaw cycles.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                 |
| 19724      | [A] 'natural low point in the topography' is an open water wetland (as prominently displayed in the left photograph on the cover of the SDEIS) with distinct natural drainage channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | This comment has been received and acknowledged by the Co-lead Agencies. The Co-Lead Agencies believe the identification of wetlands at the NorthMet Project area are accurately and adequately depicted in Section 4.2.3 for the purpose of the EIS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | WET 17          |
| 19725      | A 0.03-acre area of sedge/wet meadow within the Tailings Basin and a 28.6 acre area of shallow marsh within the Hydrometallurgical Residue Facility are exempt from state and federal wetland regulations as they are both located within the Cliffs Erie Permit to Mine Ultimate Tailings Basin Limit Boundary. The significance of the site topography and natural drainage features is more relevant to our concerns than the regulatory status of the wetlands. The SDEIS simply does not address the potential lack of integrity or risk of failure when constructing a hazardous waste facility within a wetland. Assumptions about hydraulic head being removed from the lower liner are not reassuring when the lower liner (geosynthetic clay) has been installed within a wetland and natural drainage ravine. | <p>The Hydrometallurgical Residue Facility would be constructed over the LTVSMC emergency basin. This site is known to have suitable subsurface conditions, and would minimize impacts to ecosystems and water resources as compared to a new site, since it is already disturbed. The two liner layers on the Hydrometallurgical Residue Facility would be separated by a leakage collection system, which is designed to collect any potential leakage from the bottom of the cell. Each liner layer would consist of a geomembrane layer above a geosynthetic clay layer. A drainage collection system would also be installed during reclamation to collect drainage above the upper liner. The cap would consist of a geotextile fabric, overlain by a clay barrier layer, and a 40-mil low-density polyethylene layer. This would be covered with additional LTVSMC coarse tailings or common borrow and cover soils to sustain a vegetated cover. During reclamation and long-term closure, leakage would be routed and cycled through the Plant Site WWTP. The FEIS includes details from the updated Residue Management Plan.</p> <p>The liner system components have been selected specifically to perform well given the characteristics of the residue, which consists primarily of gypsum. The liner system components selected for the Hydrometallurgical Residue Facility are routinely used for similar facilities in other industries and have demonstrated the expected levels of performance. The design produces a liner system with virtually no leakage due to the system's ability to maintain a very low hydraulic head on the composite liner portion of the overall liner system.</p> <p>In order to install liners, the existing ground would be cleared and either dewatered or built up with fill material. It is not possible to install liners on saturated ground or in standing water. If needed to address foundation conditions, wick drains, including a granular drainage layer and geogrid reinforcement as needed, will be incorporated during construction. If after installation and placement of waste material, there is some head buildup below the liner (unlikely), the direction of leakage would be upward</p> | PD 18<br>WR 126 |

|            |                                                                                                                                                                                        | <p>through the liner and into the facility collection system, not downward into groundwater.</p> <p>The Residue Management Plan presents the planned Hydrometallurgical Residue Facility monitoring and maintenance plan. Additional monitoring and maintenance requirements would be outlined by the responsible regulatory agency as part of facility permitting.</p> <p>Two submittals titled “PolyMet Information on HRF Residues” were provided to the Co-lead Agencies on August 5, 2014. The documentation summarized the results of two rounds of testing conducted in 2005 and 2009 respectively on the residue that is to be discharged to the Hydrometallurgical Residue Facility. It also reviewed the testing results against the regulations under the federal Resource Conservation and Recovery Act (RCRA). Mining wastes associated with extraction, beneficiation, and processing of ores and minerals are typically excluded from the RCRA definition of hazardous waste (40 CFR 261.4(b)(7)).</p> <p>PolyMet has conducted environmental testing to compare the properties of the hydrometallurgical residue with the RCRA hazardous waste thresholds. Comparison of the results from this testing with the RCRA hazardous waste thresholds shows that the hydrometallurgical residue does not have any toxicity characteristics of a hazardous waste. The MPCA concurs with this assessment.</p> |                 |
| 19726      | <p>The potential for substantial volumes of seepage flowing from the Tailings Basin to the HRF has not been addressed in the SDEIS; this represents a potential structural hazard.</p> | <p>Seeps have been observed along the southern edge of the LTVSMC Tailings Basin in Cell 2W. These seeps have diminished since the termination of the LTVSMC operations and are expected to remain minimal as Cell 2W is not proposed for use as part of the NorthMet Project Proposed Action.</p> <p>The design of the Hydrometallurgical Residue Facility acknowledges the presence of this seep by including a collection drain that would collect water from the seep below the proposed constructed embankment and liner systems to transmit the collected seep to the exterior of the facility. This seepage collection system would include a layer of free-draining soil which would reduce the potential for phreatic build-up below the liner.</p> <p>Details on this design consideration are provided in Section 5.1 of the Geotechnical Data Package, Volume 2 (PolyMet 2014c, as cited in the FEIS). Geotechnical stability of the Hydrometallurgical Residue Facility is summarized in FEIS Section 5.2.14.2.3. Details are provided in the Geotechnical Data Package, Volume 2 (PolyMet 2014c, as cited in the FEIS). Design, construction, monitoring, maintenance, and adaptive management are addressed in the Residue Management Plan (PolyMet</p>                                                                                                                                                | GT 11<br>WR 066 |

| 19727      | But we have no assurance that the HRF is designed to structurally withstand thousands of gallons per day of Tailings Basin seepage along the dikes that do not have seepage capture features installed. | <p>2014r, as cited in the FEIS).</p> <p>The current Hydrometallurgical Residue Facility design acknowledges the presence of an active seep in the proposed area of construction. As such, a collection drain has been designed to collect water from the active seep below the proposed constructed embankment and liner systems, and to transmit the collected seep to the exterior of the facility. This seepage collection system would include a layer of free-draining soil which would reduce the potential for phreatic build-up below the liner. Details on this design consideration are provided in Section 5.1 of the Geotechnical Data Package, Volume 2 (PolyMet 2014c).</p> <p>FEIS Section 4.2.14.3 describes the details of the existing conditions at the location of the proposed Hydrometallurgical Residue Facility, including the fact that it is proposed to be constructed at the location of the LTVSMC Emergency Basin. FEIS Section FEIS 3.2.2.3.7 broadly describes the Hydrometallurgical Residue Facility, while Section 5.2.14.2.3 provides details on the construction, operation, monitoring, and maintenance for geotechnical stability, including potential liquefaction. Additional technical details on design and construction, factors of safety analysis, operation and management, and reclamation and closure are found in the Geotechnical Data Package, Volume 2 (PolyMet 2014c) the Residue Management Plan (PolyMet 2014r).</p> | GT 11    |
| 19728      | the co-lead agencies' approach to predicting indirect impacts to wetlands and their resulting conclusions, [is] an overly simplistic method based upon a flawed concept of hydrology at the mine site.  | <p>When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an EIS and there is incomplete or unavailable information because the overall costs of obtaining it are exorbitant or the means to obtain it are not known, NEPA directs the agency to make it clear that such information is lacking, discuss the relevance of the lacking information, and discuss any information relevant to evaluation of the future impacts. In these cases, NEPA also directs the agency to evaluate these impacts based upon theoretical approaches or research methods generally accepted in the scientific community provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason.</p> <p>The Co-lead Agencies believe this is the case for evaluating indirect wetland effects. The Co-lead Agencies have thoroughly considered throughout the development of the EIS and through the wetland Impact Assessment Planning Work Group how to assess potential indirect wetland effects. As a result, strengths and weaknesses of the approach used, as well as other suggested approaches, have been carefully considered. The Co-</p>                                                                                                                                                                                                  | WET 08   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate. Further, the FEIS has been revised to address concerns raised by the Bands regarding the assertion that ombrotrophic bogs would not be impacted by mine dewatering. FEIS Section 5.2.3.2.2 applies a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-ft analog zone. Specifically, ombrotrophic bogs were reclassified from the “no effect” category to the “low likelihood” category, the same status as that assigned to minerotrophic bogs. The complex mixes of bedrock, surficial deposits, and wetland soils at the Mine Site impede the ability to reasonably model (e.g., using MODFLOW) and accurately assess the potential effect of pit dewatering on wetlands. In light of this modeling limitation, wetlands were divided into zones based on distance from the open pit. The closer a wetland was to the pit during dewatering, the greater the water table drawdown would be and the greater potential there would be for hydrologic effects on overlying wetlands. These impact assessment methodologies are presented in FEIS Sections 5.2.2.3.2 and 5.2.3.1.2.</p> <p>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but are monitoring wetlands for potential indirect effects. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions would likely include a plan for adaptive management practices to be implemented. Additional compensatory mitigation would be required if indirect wetland impacts are identified during monitoring and annual reporting.</p> |                          |
| 19729      | <p>The purpose of an EIS is to be “forward looking” by predicting potential impacts and adequate mitigation for those impacts; this SDEIS is deficient in that respect. The USA CE has not yet developed a monitoring plan to assess after-the-fact Project impacts to wetlands, but maintains that will be the way to best determine and mitigate indirect wetland impacts. The Band is not aware of any previous instance for which the USA CE St. Paul District Office has required reasonably foreseeable indirect wetland impacts to be later mitigated as direct effects based upon monitoring.</p> | <p>FEIS Section 5.2.3.3 has been revised to include more information on the monitoring and mitigation plan for the potential indirect wetland effects.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>COE 02<br/>WET 02</p> |

|            | <p>cooperating agencies, the Band specifically requests that financial assurance for potential indirect wetland effects and monitoring be secured.</p>                                                                                                                                                                                                                                                             | <p>constructed in advance of any authorized direct wetland impacts and would therefore not require financial assurance. If issued, USAACE permits would require mitigation for indirect wetland effects. Guidance for USAACE permits that are conditioned to include any type of financial assurance to ensure that required compensatory mitigation is completed can be found in FEIS Section 5.2.3.3.2, or at:</p> <ul style="list-style-type: none"> <li>• 33 CFR Parts 325 and 332, Compensatory Mitigation for Losses of Aquatic Resources; Final Rule, dated April 10, 2008. Financial assurances are specifically discussed at 33 CFR 332.3(n).</li> <li>• Regulatory Guidance Letter No. 05-1 Date: 14 February 2005 titled: Guidance on the Use of Financial Assurances, and Suggested language for Special Conditions for Department of the Army [i.e., USAACE] Permits Requiring Performance Bonds, provides additional guidance on the use of financial assurances.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |          |
| 19731      | <p>Nearly 2,000 acres of coniferous bog wetlands will be directly impacted by mine pit(s) and stockpiles, or indirectly impacted due to drawdown and/or pollution. This is particularly significant to the Band because many tribally harvested resources are only available in coniferous bogs, and restoration of coniferous bogs is a very difficult and long process that has extremely low success rates.</p> | <p>The Co-lead Agencies/ obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and that the Bands' usufructuary rights to collect resources are not impaired. The Land Exchange Proposed Action was analyzed to understand the potential effect posed to usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the GLIFWC and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands Through consultation, the Co-lead Agencies understand that the Bands' principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing and gathering, cultural or religious resources, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 Ceded Territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by</p> | WET 13   |

Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |          |
| 19732      | The proposed mitigation plan is inadequate; it allows for the vast majority of mitigation and/or restoration credits to come from outside the Partridge, Embarrass, and St. Louis River watersheds. There is no justifiable reason to permit out-of-watershed mitigation when in-watershed opportunities still exist... | FEIS Section 5.2.3.3.2 includes a discussion on the wetland mitigation study limits and the site selection process. The compensatory wetland mitigation site selection for the NorthMet Project Proposed Action began in 2005 and has gone through a rigorous site selection evaluation. Prior to the 2008 Federal Mitigation Rule, the Aitkin and Hinckley sites were selected, initial approvals by the USA CE were received, and substantial investments were made by PolyMet to develop both sites for compensatory mitigation. The USA CE guidance prior to the implementation of the 2008 Federal Mitigation Rule was to look for mitigation sites that could provide the following: restoration of historical wetlands, high probability of success, achieve at least partial in-kind mitigation and sites that had ditched and/or tiled peatlands to provide for restoration. When the 2008 Final Mitigation Rule went into effect, the USA CE informed PolyMet of the priority for siting any future compensatory mitigation within the St. Louis River/ Great Lakes Basin. The Zim Site was subsequently proposed as a third site. Please refer to the response to theme WET 03. | WET 03   |
| 19733      | The Band objects to the approval of any further out-of-watershed mitigation credits or restoration for impacts to irreplaceable high quality aquatic resources of national importance, which include all remaining unimpacted wetlands within the St. Louis River watershed/Lake Superior Basin.                        | FEIS Section 5.2.3.3.2 includes a discussion on the wetland mitigation study limits and the site selection process. | 19734      | Tribal cooperating agencies believe the CEA for land use should encompass the 1854 Ceded Territory, as the signatory Bands have lost access to substantial portions of the 1854 CT and the resources within.                                                                                                                                                                                                                                                                                                                                  | The cumulative effects section in the FEIS (Section 6.1.1.1) describes the rationale how the cumulative effects assessment areas (CEAAs) were identified. The CEAAs for individual resource areas vary based on the potential for cumulative effects and not on a single overall assessment area. Table 6.1.1-2 of the FEIS summarizes the spatial areas utilized for each resource area. Please also refer to the response to themes CR 02 and CR 03. The federal Co-lead Agencies considered an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands including use of a portion of the 1854 Ceded Territory as the CEA. By evaluating the effects of the NorthMet Project Proposed Action along with other past, present, and reasonably foreseeable future projects in the context of a much larger area with a much larger number of resources similar to those affected by the NorthMet Project Proposed Action, the effect of the NorthMet Project Proposed Action on those resources is diminished. The cumulative effects analysis focuses on the specific resources, or types of resources, affected by the NorthMet Project Proposed Action within an area that is geographically meaningful considering the project under review. The Cultural Resources section of FEIS Chapter 6 addresses the Co-lead Agencies' determination of the NorthMet Project Proposed Action's cumulative areas of potential effect. | CU 01<br>CR 01<br>CR 03 |
| 19735      | The tribal cooperating agencies believe the water quality and hydrologic cumulative effects analysis should incorporate the entire St. Louis River watershed. This watershed has experienced substantial historic, current and proposed expanded mining activities, as well as other industrial, agricultural and urban development. In addition to the direct surface water and wetland impacts (loss and/or degradation) from these activities, nearly half of the watershed has experienced hydrologic alteration from extensive ditching. | The cumulative effects section in the FEIS (Section 6.1.1.1) describes the rationale how the cumulative effects assessment areas (CEAAs) were identified. The CEAAs for individual resource areas vary based on the potential for cumulative effects and not on a single overall assessment area. Table 6.1.1-2 of FEIS summarizes the spatial areas utilized for each resource area. Please also refer to Section 8.3, MDO 12 for the Co-lead Agencies' rationale for the CEA identified for water resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | CU 01                   |
| 19736      | Tribal cooperating agencies consider a 216,300 acre area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of                                                                                                                                                                                                                                                                                                     | The historic district proposed by the Grand Portage Band in a June 27, 2013 letter was addressed. The federal Co-lead Agencies have considered an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the CEA. Use of the 1854 Ceded Territory as the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | CR 03<br>CR 04          |

|            | cumulative effects to cultural resources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>CEAA for cultural resources would actually diminish the significance of any cumulative effects. By evaluating the effects of the NorthMet Project Proposed Action along with other past, present, and reasonably foreseeable future projects in the context of a much larger area with a much larger number of resources similar to those affected by the NorthMet Project Proposed Action, the effect of the NorthMet Project Proposed Action on those resources is diminished. The cumulative effects analysis focuses on the specific resources, or types of resources, affected by the NorthMet Project Proposed Action within an area that is geographically meaningful considering the project under review.</p> <p>Cumulative effects are discussed and addressed differently based on the affected resource. Discussions related to socioeconomics, for instance, use an expanded analysis area compared to other resources. Such expanded analysis areas are used as appropriate. The Cultural Resources sections in FEIS Chapters 4, 5, and 6 address the Co-lead Agencies' determination of the NorthMet Project Proposed Action's direct, indirect, and cumulative areas of potential effect.</p>                                                                                                                              |                            |
| 19737      | <p>Inadequate cumulative effects analysis, across all resource categories. Cumulative effects result in a relentless, unmitigated diminishment of treaty resources and access to those resources. Yet across virtually all resource categories, the SDEIS predicts that there will be no adverse impacts as a result of the NorthMet Project Proposed Action; this conclusion then enables the co-leads to determine 'no cumulative effects' from the project and the land exchange. But those initial no-impact predictions are contingent upon assumptions that all best management practices, engineering controls and mitigation measures discussed throughout the SDEIS will be successfully and flawlessly implemented, and that the NorthMet Project will comply with all applicable federal state and local regulations and permit requirements, particularly water quality standards. The tribal cooperating agencies have provided extensive comments and analyses over the course of the DEIS and SDEIS processes that support our misgivings for this circular logic. We presented a</p> | <p>The FEIS does not conclude there would be no adverse impacts or there would be no cumulative effects from the NorthMet Project Proposed Action of Land Exchange. The rationale for the geographic and temporal scope of the cumulative effects analysis is well documented in Chapter 6.</p> <p>Table 6.2-1 has been updated to include additional projects that have been identified since publication of the SDEIS. In addition, FEIS Section 6.1.1.2.1 has expanded descriptions regarding the actions included the cumulative effects assessment. FEIS Section 6.2.9 describes specific cumulative effects for cultural resources, including effects to treaty-protected resources and access to those resources.</p> <p>The FEIS's estimates of predicted water quality impacts represent years of study and deliberation and are expected to be reasonable estimates of actual impacts in the event the project is constructed. The NorthMet Project Proposed Action has undergone substantial changes throughout this time to improve predicted water quality, most notably the addition on reverse osmosis treatment plants and water capture systems, liners and covers. The FEIS discloses the probability of water quality impacts and identifies mitigation measures that can be implemented in the event they are needed.</p> | WR 044<br>WR 045<br>WR 049 |

|            | <p>substantial alternative analysis of cumulative effects from the NorthMet Project Proposed Action as part of our commenting during the preliminary SDEIS review. Key concepts from our tribal CEA include: The tribal cooperating agencies' review of the water modeling data packages for the NorthMet Project Proposed Action led to our conclusion that GoldSim did not accurately predict existing conditions, and cannot be relied upon to accurately predict future project conditions.</p> | <p>The FEIS Mine Site GoldSim model was recalibrated to provide a better correspondence between predicted and observed water chemistry data in the Partridge River for existing conditions. This calibration considered new surface water chemistry data collected through the end of 2013. For Colby Lake, a new chemical source term was added to the Mine Site GoldSim model and calibrated to measured concentrations in the lake to ensure there was an adequate basis for assessing Proposed Action potential impacts</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |          |
| 19738      | <p>While any individual mine may not have significant impacts on plants, wildlife or the landscape, the cumulative impacts of thousands of acres of habitat loss and degradation correspond to a legitimate, significant concern for treaty-protected resources and access to them.</p>                                                                                                                                                                                                             | <p>Table 6.2-1 has been updated to include additional projects that have been identified since publication of the SDEIS. In addition, FEIS Section 6.1.1.2.1 has expanded descriptions regarding the actions included the cumulative effects assessment.</p> <p>FEIS Section 6.2.9 describes specific cumulative effects for cultural resources, including effects to treaty-protected resources. Please also refer to the responses to themes CR 02, VEG 08, and W109.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | CU 11    |
| 19739      | <p>General reluctance to share information with non-Band members is often prevalent [at NorthMet Project meetings] as well as cultural restrictions on who (inside and outside the Band) can legitimately and safely be trusted with sensitive information.</p>                                                                                                                                                                                                                                     | <p>Refer to FEIS section 1.2 for roles and responsibilities of the agencies, and Chapter 2 for an overview of the EIS process undertaken.</p> <p>The federal Co-lead Agencies have made a reasonable and good-faith effort to identify cultural resources potentially affected by the NorthMet Project Proposed Action. The federal Co-lead Agencies have actively consulted with the federally recognized Bands that have expressed an interest in consulting on the NorthMet Project Proposed Action. Historic properties affected by the NorthMet Project Proposed Action have been identified and the impacts to those properties have been assessed through the traditional Section 106 methods/process. This also includes an assessment of actual use of those historic properties, as well as other resources in the APE, by tribal members. In addition to traditional methods, elder interviews were conducted in 2010 and 2011 with members of the Bois Forte, Fond du Lac, and Grand Portage. Elders recalled that some Band members had utilized the general NorthMet Project area for hunting, fishing, and plant gathering of wild rice, maple-sugar, berries, and birch bark; however, they could not provide specific locations or uses within the NorthMet Project area. The federal Co-lead Agencies also conducted reconnaissance of trail corridors with participation from the Bands. The purpose of the traditional research and survey was to provide historic documentation and context for and to</p> | NEPA 14  |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | identify places important to the Bands. The elder interviews were to be used to further identify and understand tribal use areas and places of importance. The field investigation component was informed by the results of those efforts.                                                                                                                                                                                                                                                                                                                                                                                 |                         |
| 19740      | The Area of Potential Effect (APE) for cultural resources surrounding the proposed mine site and the proposed plant site should be revised. "Figure 4.2.9-1, Cultural Resource Analysis-Area of Potential Effect" needs only to have the two areas joined to compose an APE that reflects an undertaking as defined in Section 106 of the National Historic Preservation Act of 1966...)." An APE that encompasses the Mine and Plant sites and surrounding area affected by operations would better describe the undertaking for cultural resource investigations. | The APE is based on extensive modeling and other analysis completed for the NorthMet Mining Project and Land Exchange, and includes an area much broader than the Plant Site and Mine Site. Since the SDEIS, the APE has been modified to encompass the proposed Mine Site and Plant Site, the Dunka Road corridor, several federal parcels included in the Land Exchange Proposed Action, and the Colby Lake Pumphouse and pipeline.                                                                                                                                                                                      | CR 02                   |
| 19741      | The Beaver Bay to Lake Vermilion Trail requires further clarification... There has been no rigorous attempt to research the BBLVT by the Bands or Lead Agencies, although the Superior National Forest Heritage Program reviewed the GLO plats and conducted field investigations on SNF land. Additional fieldwork should be conducted in the spring or fall when ephemeral features such as foot trails are less easily concealed by vegetation and more easily discerned.                                                                                        | The federal Co-lead Agencies believe that the work to justify consideration of the BBLV Trail Segment as an historic property is complete. There has been sufficient background research and fieldwork completed to date as discussed in FEIS Section 4.2.9.2.3. Additional research and fieldwork may be part of any resolution of adverse effect.                                                                                                                                                                                                                                                                        | CR 04                   |
| 19742      | The proximity of the plant site to the Sugarbush and the cumulative effects of dust on leaves, trees and understory flora have not been examined in detail and their long term effects may well be detrimental to vegetation, other than maples, that comprise the Sugarbush."                                                                                                                                                                                                                                                                                      | As discussed in FEIS Section 5.2.9.2.1, the federal Co-lead Agencies have determined that the NorthMet Project Proposed Action would adversely affect the Spring Mine Lake Sugarbush. As part of an MOA, the federal Co-lead Agencies would ensure the avoidance, minimization, and/or mitigation of impacts to cultural resources that may be encountered, such as unauthorized collection, during construction or operation of the NorthMet Project Proposed Action. The federal Co-lead Agencies, in consultation with the Bands, SHPO, and PolyMet, are currently working to resolve adverse effects on this property. | CR 02<br>CR 03<br>CR 05 |
| 19743      | The SDEIS must be revised to fully evaluate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Neither Minnesota Rules nor CEQ regulations require the Co-lead                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | ALT 20                  |

|              | <p>reasonable alternatives in the SDEIS, including identifying the federal agency preferred alternative and the LEDPA.</p>                                                                                                                                                                            | <p>Agencies to identify a preferred alternative in the SDEIS (40 CFR 1502.14(e)). The FEIS includes available details regarding the identification of an Agency Preferred Alternative. The FEIS contains sufficient information to identify and substantiate the Least Environmentally Damaging Preferred Alternative (LEDPA). The LEDPA is the only alternative that is permissible pursuant to the Clean Water Act (CWA) Section 404(b)(1) Guidelines. The applicant must clearly demonstrate that the preferred alternative in the FEIS is the LEDPA, in that there is not a practicable alternative that would have less adverse impact on the aquatic ecosystem and no other significant adverse environmental consequences. An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics. The USACE is not required to identify a LEDPA in the FEIS; the final determination on the LEDPA would be made in the ROD for the USACE which serves as the USACE's decision document and the basis for the Department of the Army permit decision. FEIS Section 7.5 includes additional information about the Area of Potential Effect (APE) and LEDPA.</p> <p>The USFS would utilize the FEIS to show the factors relating to how the public interest would be served by the Land Exchange, and the ROD for the USFS would incorporate the findings of those factors and identify the preferred alternative. The MDNR is not required to identify a preferred alternative under MEPA. The FEIS Sections 3.2 and 3.3 further detail this process.</p> <p>The agency preferred alternative and LEDPA process are described in FEIS Sections 7.4 and 7.5. The ROD for the USACE would include the Section 404(b)(1) analysis and the public interest review, and would determine the LEDPA. Furthermore, the ROD for the USACE cannot be finalized until 30 days after release of an FEIS. Any comments received during the 30 day period may be considered in the ROD for the USACE. The ROD for the USACE would recommend issuance, issuance with conditions, or denial of the Project.</p> | <p>COE 04</p>           |
| <p>19744</p> | <p>No mitigation has been identified in the SDEIS for this permanent loss of lands and resources (natural and cultural) to the 1854 Ceded Territory. The public interest determination must include a specific finding that "The intended use of the conveyed Federal land will not substantially</p> | <p>The Cultural Resources sections of FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6, also address effects on, and any proposed mitigation for effects on cultural resources and culturally significant natural resources. Mitigation/compensation for effects on</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>CR 01<br/>LAN 05</p> |

|            | <p>conflict with established management objectives on adjacent Federal lands, including Indian Trust lands” (36 C.F.R. 254.3(b)(2)(ii)). This threshold has not been met, and the Fond du Lac Band objects to the implementation of the Land Exchange Proposed Action.</p> | <p>cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations providing the federal authorities for the NorthMet project review</p> <p>The federal Co-lead Agencies’ obligation is to ensure that Band members have ample opportunity to exercise their treaty-reserved usufructuary rights; that federal lands are managed to maintain both the diversity and abundance of natural resources; and to ensure that the Bands’ usufructuary rights to treaty resources are not impaired. The Cultural Resources sections of FEIS Chapters 4 and 5 address these federal tribal trust responsibilities under the 1854 Treaty.</p> <p>The Land Exchange Proposed Action was analyzed to understand the potential effects on usufructuary rights. The Co-lead Agencies have consulted, and continue to consult with the Bois Forte Band of Chippewa, the Grand Portage Band of Lake Superior Chippewa, and the Fond du Lac Band of Lake Superior Chippewa, the three principle Bands that retain usufructuary rights in the proposed project area. In addition, the Co-lead Agencies have consulted with the Great Lakes Indian Fish and Wildlife Commission and the 1854 Treaty Authority, the principal natural resource agencies representing the aforementioned Bands.</p> <p>Through consultation, the Co-lead Agencies understand that the Bands’ principle interest with regards to the Land Exchange Proposed Action are the following: to retain or increase the amount of public land within the 1854 Treaty Ceded Territory, shoreline wetlands, culturally important natural resources used in exercising treaty rights of hunting, fishing, and gathering, cultural or religious properties, and access to culturally important natural resources and cultural or religious properties. The Co-lead Agencies have a fiduciary obligation to understand and consider the effects that the Land Exchange Proposed Action would have on Band members exercising their Treaty rights in the 1854 ceded territory. While the Land Exchange Proposed Action would remove certain lands from federal ownership, this loss is potentially offset by incoming private lands that would become part of the federal estate within the 1854 Ceded Territory. Outside of the Land Exchange Proposed Action, the Co-lead Agencies have also analyzed the potential effects posed by the Proposed Connected Actions. The potential affects posed to natural resources and cultural resources of importance to the Bands have been disclosed and would be considered during the Co-lead Agency decision process.</p> <p>Land exchanges do not include mitigation; instead, the resource values and</p> |          |

|            |                                                                                                                                                                                                                                                   | <p>public objectives of the non-federal lands must equal or exceed the resource values and public objectives of the federal lands. See FEIS Section 1.4.3. Mitigation for cultural resources as a result of the NorthMet Project Proposed Action is discussed in Section 5.2.9 of the FEIS. The NorthMet Project Proposed Action mining activities would result in a loss of bogs; however, as part of the NorthMet Proposed Action, the Applicant is required to provide compensatory mitigation for wetland impacts in accordance with state and federal permits. One of the proposed mitigation sites for wetland impacts (Zim Site) would be a compensation site for the loss of bogs, and would be located within the 1854 Ceded Territory.</p> <p>The Lake County lands were tax forfeit lands that were offered for sale by the County through a public auction. The Lake County lands would still be accessible to the Bands for their use if the exchange took place, because the lands would become part of the SNF managed lands.</p> <p>No heritage surveys were conducted on the non-federal lands. If any cultural resources are located on the non-federal lands, those cultural resources would be transferred to federal ownership. Such transfer would not adversely affect the heritage resource, but would provide greater preservation protection under federal law.</p> <p>The non-federal lands that contain wild rice beds would not be affected as a result of the Land Exchange Proposed Action or Land Exchange Alternative B, because no activities are proposed on these lands and the proposed mining activities would not affect these lands. As noted in the FEIS, the Land Exchange Proposed Action and Land Exchange Alternative B would increase wild rice stands within the federal estate. FEIS Sections 5.3.2 and 5.3.4 clarify that, although the Land Exchange would result in an increase in wild rice stands within the federal estate boundaries, there would be no change to the existing public access to Tract 1 wild rice stands via the Pike River. Consequently, there would be no increase in wild rice harvest opportunities for the public. No wild rice stands are known to occur on the federal lands, and suitable habitat is limited.</p> <p>Please refer to the response to theme LAN 01 for more information on the public interest determination.</p> |                                                                                                               |
| 19745      | <p>Summary: Based upon our extensive evaluation of the SDEIS and supporting technical documents, we conclude that there will undoubtedly be significant and unmitigated impacts to natural and cultural resources that the tribal cooperating</p> | <p>FEIS Section 4.2.9.2.3 provides a detailed discussion and analysis of the area in which cultural resources may be affected by the undertaking. The APE takes into account both direct and indirect effects using a geographically expansive area that accounts for direct effects as well as</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>FIN 06<br/>                     PER 03<br/>                     WR 035<br/>                     WR 037</p> |

|            | <p>agencies have consistently elevated to the attention of the co-lead agencies. There will be significant and unmitigated tribal resource losses within the 1854 Ceded Territory and the Lake Superior basin, including the St. Louis River watershed. The NorthMet Project Proposed Action and Land Exchange Proposed Action would decrease the amount of land available for public access and use, and would decrease portions of the 1854 Ceded Territory available for use by the Bands. The SDEIS must be revised, with significant additional study, to appropriately evaluate closure, mitigation, reclamation, and perpetual treatment cost estimates. The SDEIS requires substantially more public transparency and less equivocation on what is arguably one of the most fundamental issues at stake for this project: perpetual treatment.</p> | <p>visual, audible, atmospheric, hydrological, and water quality effects. The APE is based on extensive modeling and other analysis completed for the NorthMet Mining Project and Land Exchange, and includes an area much broader than the Plant Site and Mine Site. Since the SDEIS, the APE has been revised slightly to include the Dunka Road corridor, several federal parcels included in the Land Exchange Proposed Action, and the Colby Lake Pumphouse and pipeline.</p> <p>It is acknowledged that operation, maintenance and periodic replacement of environmental controls would be required during closure. Financial Assurance would be required under the State's Permit to Mine to perform these activities on a continuous and/or periodic basis for as long as these activities are needed. The FEIS includes available details regarding financial assurance (Section 3.2.2.4). Final details on the cost estimates, timeframes, contingency plan amounts, and calculations that would be required for the project would be addressed during permitting. In addition, see the response to theme WR035.</p>                                                                                                                                                                    | CR03     |
| 19746      | <p>The SDEIS does not provide sufficient information for the public to understand whether the NorthMet Project Proposed Action will be required to remediate these and other AOCs before commencing project operations, or be allowed to defer remediation until closure.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>FEIS Table 4.2.1-2: NorthMet Project Proposed Action Area of Concern Summary List for Voluntary Investigation and Cleanup Program, has been updated in the FEIS to show the current status and additional information where available. Costs for assessment, investigation, and cleanup are not available.</p> <p>The April 6, 2010, Consent Decree is a court registered agreement between Cliffs Erie LLC and the MPCA to resolve alleged violations of Cliffs Erie's NPDES/SDS permits for its Hoyt Lakes and Dunka mining area facilities. The Consent Decree addresses issues at the Tailings Basin (including outfall SD026) and discharges from the Cliffs Erie Area 5 mining area (SD033). While the latter area is not part of the NorthMet Project Proposed Action, PolyMet has entered into an agreement with Cliffs Erie, whereby it would be transferred to PolyMet upon issuance of permits for the NorthMet Project Proposed Action. Until that time, Cliffs Erie retains responsibilities for permit-related activities at both the Tailings Basin and Area 5. While certain Consent Decree-related activities have been in progress or have been completed for these areas since the SDEIS, there has been no change in ownership or responsible parties since that time.</p> | HAZ 05   |
| 19747      | <p>Based upon our extensive evaluation of the SDEIS and supporting technical documents, we conclude that there will undoubtedly be significant and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>The Co-lead Agencies acknowledge that bedrock is variably fractured. The effects of fracturing are incorporated into the bulk hydraulic conductivity values used to characterize bedrock. This is common practice in large-scale</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | WR012    |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Theme(s)         |

|            | <p>unmitigated impacts to natural and cultural resources that the tribal cooperating agencies have consistently elevated to the attention of the co-lead agencies. There will be significant and unmitigated tribal resource losses within the 1854 Ceded Territory and the Lake Superior basin, including the St. Louis River watershed. The NorthMet Project Proposed Action and Land Exchange Proposed Action would decrease the amount of land available for public access and use, and would decrease portions of the 1854 Ceded Territory available for use by the Bands... There is a demonstrated need for significant improvements to the modeling evaluations. The lack of fracture and fault analysis is also major deficiency of this SDEIS.</p>                                                                                                                                                                                                                                                                           | <p>evaluations of bedrock hydraulics.<br/>                     The Co-lead Agencies acknowledge that structural faults may exist between mine facilities and perennial streams that receive groundwater discharge. Because the landscape is covered with surficial deposits and there few bedrock outcrops, the existence of faults is conjectural and locations at best can only be inferred. It is unknown if faults (if and where they exist) behave as conduits or barriers to groundwater flow. Given these uncertainties, it is unlikely that any reasonable field program would be able to identify the existence, location, and hydraulic characteristics of faults that may or may not be present at the site. The Co-lead Agency approach is to set up a robust monitoring program during operations and closure to provide direct or indirect evidence on the existence of hydrologically significant faults. If significant faults are identified (that is, faults which could lead to violation of water quality standards), then adaptive measures would be employed to mitigate the fault-related effects.</p> |                  |
| 19748      | <p>Based upon our extensive evaluation of the SDEIS and supporting technical documents, we conclude that there will undoubtedly be significant and unmitigated impacts to natural and cultural resources that the tribal cooperating agencies have consistently elevated to the attention of the co-lead agencies. There will be significant and unmitigated tribal resource losses within the 1854 Ceded Territory and the Lake Superior basin, including the St. Louis River watershed. The NorthMet Project Proposed Action and Land Exchange Proposed Action would decrease the amount of land available for public access and use, and would decrease portions of the 1854 Ceded Territory available for use by the Bands. We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarras River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact... The water quality analysis is fundamentally inadequate; it must be redone</p> | <p>Water quality modeling predictions for SW-005 and PM-13 indicate that the NorthMet Project Proposed Action would not result in significant adverse impacts to water quality. These evaluation locations are the nearest downstream locations from the NorthMet Project Proposed Action in the Partridge and Embarras Rivers respectively that are recommended by MPCA staff to be considered as waters used for the production of wild rice for purposes of the FEIS. Impacts on wild rice further downstream in these waters, or on wild rice resources regionally throughout the treaty areas, would not be expected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | WR 115<br>WR 157 |

|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 19749      | The SDEIS evaluation of mercury impacts is deficient, and the conclusion of no mercury impacts downstream in the St. Louis River watershed is not supported by the information presented.                                                                                                                                                  | As summarized in FEIS Section 6.2.3.3.4, the NorthMet Project Proposed Action is predicted to result in a net overall decrease of mercury loadings of approximately 1.0 grams per year (i.e., a net decrease of 1.2 grams per year in the Partridge River and a net increase of 0.2 grams per year in the Embarrass River), which is indistinguishable from natural background variability. Therefore, the NorthMet Project Proposed Action would not contribute to cumulative effects on mercury loading to the St. Louis River. Supporting information is provided in FEIS Section 6.2.3.3.4.                                                                                                                                                                                                                                     | MERC 19          |
| 19750      | We consider the high probability of continued degradation of remaining wild rice stands in the Partridge and Embarrass River watersheds as a result of the NorthMet Project to be an unacceptable environmental impact.                                                                                                                    | This comment states that the continued degradation of wild rice stands in the Partridge and Embarrass Rivers will result from the NorthMet Mining project. Since no specific information was provided, no changes were made to the EIS. See also response to comment 19748.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | PER 10<br>VEG 04 |
| 19751      | The most significant deficiency in the SDEIS analysis of wildlife impacts is its failure to critically analyze potential impacts to moose.                                                                                                                                                                                                 | FEIS Sections 4.2.5, 4.3.5, 5.2.5, and 5.3.5 (Wildlife) have been updated to include the new state endangered, threatened, and special concern (ETSC) status listings from August 19, 2013, as well as new federal status listing changes. The FEIS includes a more robust analysis on effects to moose, including habitat and displacement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WI01             |
| 19752      | Uncontrolled contaminant loading from existing mine facilities, along with elevated constituents from the Proposed Project, have the potential to affect the successful establishment of a sustainable lake sturgeon fishery throughout the St. Louis River. This potential impact should be fully evaluated in the SDEIS.                 | Existing data review indicates recruitment and a viable population of lake sturgeon do exist in the St. Louis River Watershed. The NorthMet Project Proposed Action is not considered to have the potential for cumulative effects on hydrology and water quality in the St. Louis River Watershed. As a result, no effects to lake sturgeon population within the St. Louis River Watershed system would occur.                                                                                                                                                                                                                                                                                                                                                                                                                    | AQ02             |
| 19753      | A cumulative analysis of fibers expected from the site along with fibers currently being emitted from other sources should be performed. Human health risk assessments should be expanded to include scenarios of worker exposure to amphibole fibers. Fugitive dust impacts must be evaluated for human health and environmental impacts. | FEIS Section 5.2.7.5.3 contains information on amphibole mineral fibers resulting from mining activities. The exact human health risk of amphibole mineral fiber exposure is not known, and it is not possible to quantify amphibole mineral fiber emissions. Section 5.2.7.5.3 includes information on activities that can minimize fiber emissions, ongoing ambient monitoring to collect baseline mineral fiber data, and information on the commitment to continue fiber emission monitoring after start-up of the NorthMet Project Proposed Action for comparison to the baseline. Amphibole mineral fiber emissions would also be addressed during air permitting.<br>Off-site worker exposure is discussed in the air section of FEIS Chapter 5, specifically in sections 5.2.7.5.2 and 5.2.7.5.3. On-site worker health and | AIR 03<br>HU 04  |

| 19754      | The SDEIS simply does not address the potential lack of integrity or risk of failure when constructing a hazardous waste facility within a wetland. | <p>safety is regulated by other agencies such as the MSHA, NIOSH, and the OSHA.</p> <p>Based on MPCA preliminary analysis of the material being placed in the Hydrometallurgical Residue Facility, it is not expected to be classified as a hazardous waste facility subject to RCRA. Samples would be collected routinely to confirm that physical and chemical characteristics of residue and materials disposed of in the Hydrometallurgical Residue Facility are not characteristically hazardous, subject to RCRA, and are in compliance with the Permit to Mine and NPDES/SDS permits.</p> <p>FEIS Section 4.2.14.3 describes the details of the existing conditions at the location of the proposed Hydrometallurgical Residue Facility, including the fact that it is proposed to be constructed at the location of the LTVSMC Emergency Basin. The LTVSMC emergency tailings would be consolidated and compacted prior to the construction of the proposed facility. New dams would be located beyond the extent of the emergency basin and founded on existing silty sand, gravel glacial till, and Giants Range granite. The Hydrometallurgical Residue Facility would be constructed using the downstream method and stability modeling indicates that the Hydrometallurgical Residue Facility would meet the required factors of safety.</p> <p>Construction monitoring and mitigation plans would require further detail during permitting to evaluate consolidation of the LTVSMC tailings, settlement for the Hydrometallurgical Residue Facility, and performance of the wick drains. For more information, see the responses to themes GT 11 and GT 15.</p> <p>Geotechnical stability of the Hydrometallurgical Residue Facility is summarized in FEIS Section 5.2.14.2.3. Details are provided in the Geotechnical Data Package, Volume 2 (PolyMet 2014c). Design, construction, monitoring, maintenance, and adaptive management are addressed in the Residue Management Plan (PolyMet 2014r).</p> | GT 07<br>GT 15 |
| 19756      | The Band specifically requests that financial assurance for potential indirect wetland effects and monitoring be secured.                           | <p>FEIS Section 3.2.2.4 states that compensatory wetland mitigation for the NorthMet Project Proposed Action is expected to be approved and constructed in advance of any authorized direct wetland impacts and would therefore not require financial assurance. If issued, USACE permits would require mitigation for indirect wetland effects. Guidance for USACE permits that are conditioned to include any type of financial assurance to ensure that required compensatory mitigation is completed can be found in</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | FIN 03         |

| 19757      | <p>The Band objects to the approval of any further out-of-watershed mitigation credits or restoration for impacts to irreplaceable high quality aquatic resources of national importance, which include all remaining unimpacted wetlands within the St. Louis River watershed/Lake Superior Basin.</p> | <p>FEIS Section 5.2.3.3.2 includes a discussion on the wetland mitigation study limits and the site selection process. The compensatory wetland mitigation site selection for the NorthMet Project Proposed Action began in 2005 and has gone through a rigorous site selection evaluation. Prior to the 2008 Federal Mitigation Rule, the Aitkin and Hinckley sites were selected, initial approvals by the USACE were received, and substantial investments were made by PolyMet to develop both sites for compensatory mitigation. The USACE guidance prior to the implementation of the 2008 Federal Mitigation Rule was to look for mitigation sites that could provide the following: restoration of historical wetlands, high probability of success, achieve at least partial in-kind mitigation and sites that had ditched and/or tiled peatlands to provide for restoration. When the 2008 Final Mitigation Rule went into effect, the USACE informed PolyMet of the priority for siting any future compensatory mitigation within the St. Louis River/ Great Lakes Basin. The Zim Site was subsequently proposed as a third site. Please refer to the response to theme WET 03.</p> | <p>WET 03<br/>WET 14</p> |
| 19758      | <p>Tribal cooperating agencies believe the CEAA for land use should encompass the 1854 Ceded Territory, as the signatory Bands have lost access to substantial portions of the 1854 CT and the resources within.</p>                                                                                    | <p>The cumulative effects section in the FEIS (Section 6.1.1.1) describes the rationale for the identification of CEAA's. The CEAA's for individual resource areas vary based on the potential for cumulative effects, and not on a single overall assessment area. | 19760      | Tribal cooperating agencies consider a 216,300 acre area bounded by the St Louis River, Lake Superior, Lake Vermilion and the Beaver Bay to Vermilion Trail to be a Tribal Historic District, and the pertinent area for consideration of cumulative effects to cultural resources. | <p>water resources.</p> <p>The historic district proposed by the Grand Portage Band in a June 27, 2013 letter was addressed. The federal Co-lead Agencies do not believe that this area meets the definition of a district, nor does it have sufficient integrity as a district to qualify for inclusion in the NRHP. The federal Co-lead Agencies have considered an expanded area for analysis of cumulative effects on cultural resources and natural resources of significance to the Bands, including use of the 1854 Ceded Territory as the CEA. Use of the 1854 Ceded Territory as the CEA for cultural resources would actually diminish the significance of any cumulative effects. By evaluating the effects of the NorthMet Project Proposed Action along with other past, present, and reasonably foreseeable future projects in the context of a much larger area with a much larger number of resources similar to those affected by the NorthMet Project Proposed Action, the effect of the NorthMet Project Proposed Action on those resources is diminished. The cumulative effects analysis focuses on the specific resources, or types of resources, affected by the NorthMet Project Proposed Action within an area that is geographically meaningful considering the project under review.</p> <p>Cumulative effects are discussed and addressed differently based on the affected resource. Discussions related to socioeconomics, for instance, use an expanded analysis area compared to other resources. Such expanded analysis areas are used as appropriate. The Cultural Resources sections in FEIS Chapters 4, 5, and 6 address the Co-lead Agencies' determination of the NorthMet Project Proposed Action's direct, indirect, and cumulative areas of potential effect.</p> | CR 03<br>CR 04 |

| <i>Comments from GLIFWC (Submission ID 42952)</i> |                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| 2924                                              | In the SDEIS or supporting documents, there is no discussion of tailings pond water exiting the basin into this topographically closed area. There is no accounting for contaminants moving eastward, and there is no description of their possible impact on receiving ground or surface waters. | <p>The FEIS contains new text describing pond leakage and how the chemistry of this leakage would affect chemical concentrations at the Tailings Bas in toes. In general, the chemistry of water at the Tailings Bas in toes results from a combination of chemical-loading from pond leakage, meteoric infiltration, chemical release from currently existing LTVSMC tailings, and chemical release from future NorthMet Project Proposed Action-related tailings. See FEIS Section 5.2.2.2.1 for additional information.</p> <p>The 6.5-inches-per-year pond leakage flux is not computed, but is a stated engineering performance specification. The hydraulic conductivity that achieves this leakage flux is computed using a Darcy's law calculation.</p> <p>The GoldSim model contains algorithms that can allow the pond to overflow during periods of high rainfall, so the model does in fact evaluate pond overflow. The pond size and design are such that the GoldSim model predicts that the pond never overflows during the 200-year simulation period.</p> <p>The FEIS acknowledges that there would be future leakage from the tailings pond and the GoldSim model performs calculations to estimate this flow rate. The FEIS Plant Site MODFLOW model was modified from the SDEIS to include: 1) the presence of surficial deposits below the East Embankment, 2) boundary conditions (drain and/or river cells) along the embankment toe to allow the potential for surface seepage, and 3) hydrologic inputs to account for the presence of the proposed drainage swale. See FEIS Section 5.2.2.3.3 and PolyMet 2015j and PolyMet 2015i (both as cited in the FEIS) for more information.</p> | WR 054<br>WR 057 |
| 2925                                              | Because of the no-flow boundaries, the model output files (NorthMet Model Files DVD, BARR July 2012) show extremely unrealistic groundwater heads in the aquifer surrounding the east side of the FTB.                                                                                            | <p>In response to these issues, the Plant Site MODFLOW model was modified and recalibrated as follows:</p> <ol style="list-style-type: none"> <li>1) Updated areal distribution of surficial deposits and bedrock outcrops,</li> <li>2) established surficial deposits below and adjacent to the East Embankment,</li> <li>3) used drain or river cells along the East Embankment to allow surface seepage of tailings water,</li> <li>4) incorporated the hydrologic effects of the future swale to drain surface water from the East Embankment area,</li> <li>5) recalibrated model material properties and boundary conditions using all available data through 2013 (this is mostly new hydraulic head information), and</li> <li>6) expanded the use of river and drain cells to provide a more accurate representation of wetlands outside the Tailings Bas in.</li> </ol> <p>As a result of these changes, the FEIS Plant Site MODFLOW model no</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WR 093<br>WR 097 |

|            |                                                                                                                                                                                                                                                                                                                      | <p>longer has a no-flow boundary condition at the toe of the East Embankment, and river and/or drain cells in surficial deposits are in place to allow the potential for surface seepage along the embankment toes (See Attachment A, Plant Site Water Modeling Data Package [PolyMet 2015], as cited in the FEIS]). The model was checked to ensure that hydraulic heads in the tailings and adjacent surficial deposits were not well above ground surface. In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p>                                   |                          |
| 2950       | <p>Staff continue to believe that the underground mine and west pit backfill alternatives have not been properly explored given the environmental benefits they could bring to the project. Our comments stand as detailed in Appendix C.</p>                                                                        | <p>The Co-lead agencies considered the information provided by the Tribal Cooperating Agencies in SDEIS Appendix C, and considered both Underground Mining and Backfilling the West Pit as potential alternatives; however, they did not pass screening analysis and were therefore eliminated from detailed analysis in the EIS. The screening process and results for these potential alternatives is described in FEIS Section 3.2.3. See the response to theme ALT 01 for more details on the Underground Mining Alternative and ALT 03 for more details on the West Pit Backfill Alternative.</p>                                                                                                                 | <p>ALT 01<br/>ALT 03</p> |
| 2951       | <p>In addition, there are a number of alternatives that the SDEIS fails to explore. These include paste backfill, immediate operation of the RO treatment facility at the mine site, etc. Additional details are found in the comments submitted by the Fond du Lac Band.</p>                                        | <p>The Co-lead Agencies considered many potential alternatives and mitigation measures including several options for tailings and water management throughout the development of the EIS. As described in Chapter 2 of the FEIS, consideration of these alternatives and mitigation measures influenced the development of the NorthMet Project Proposed Action. Section 3.2.3 of the FEIS describes the alternatives considered and either adopted or eliminated (with reason) from detailed analysis in the EIS. See the response to themes ALT 06 and ALT 13 for more details on several other alternatives, including paste tailings, RO treatment, etc.</p>                                                       | <p>ALT 06<br/>ALT 13</p> |
| 2952       | <p>Unfortunately the SDEIS has no serious analysis of a No Action Alternative. Section 5.2.2.4 is less than 1 page long and gives a very general and hypothetical discussion. It in no way represents a serious analysis of a No Action Alternative. The SDEIS needs to have modeling of a No Action Alternative</p> | <p>FEIS Section 3.2.3.2 discusses how the Consent Decree under the NorthMet Project No Action Alternative would require Cliffs Erie to complete closure and reclamation activities at the Plant Site. This would include completing activities for the localized affected areas under the Minnesota Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building, and management of seepage at the Tailings Basin embankment. FEIS Table 3.2-1 shows that under the NorthMet Project No Action Alternative, there would be no mining activities, and that existing management and land use of the federal lands would continue. The NorthMet Project No Action Alternative is also</p> | <p>ALT 14</p>            |

| 2953       | The concerns regarding the cumulative effects analysis have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.                                                                                                                                                                                                                                                                                                                                                                                                                                 | The Co-lead Agencies considered the information included in the Tribal Cooperating Agencies' cumulative effects assessment and found no compelling information or analysis to change the original approach or conclusions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | CU 12                      |
| 2959       | The ACOE and Forest Service's position in the SDEIS is that these items can be addressed at a later time by the Minnesota Department of Natural Resources in the review of future mining permits. This action is an ill-conceived attempt to abdicate their federal trust responsibility to protect the habitats that support treaty harvests. Despite their attempts, the ACOE and Forest Service cannot delegate their federal trust responsibility to protect habitats that sustain treaty harvests to the state of Minnesota when it undertakes the process of permitting the mine. | The Cultural Resources sections in FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6, also address effects on and any proposed mitigation for cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations pertaining to the federal authorities for the NorthMet Project Proposed Action review. Effects on historic properties would be fully considered prior to the issuance of any permit or land exchange, pursuant to the NHPA and its implementing regulations. Effects on cultural resources and culturally significant natural resources are addressed in the Cultural Resources sections in FEIS Chapters 4, 5, and 6. | CR 01                      |
| 2961       | The superficial estimate of financial assurance provides inadequate detail as to how any of the cost estimates were developed. The DEIS provided a discussion about the options for financial assurance instruments however any substantial discussion of costs and assumptions on the metrics were not provided and instead postponed until the permitting phase of this Project.                                                                                                                                                                                                      | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. Section 3.2.2.4.2 discusses the types of financial assurance instruments that could be used in combination to assure the project. Additional details on the cost estimates, methods, and instruments that would be required for the project, and how the instruments would be updated and dedicated to the project would be addressed during permitting.                                                                | FIN 05<br>FIN 08           |
| 2963       | The Executive Summary fails to provide: 1) an estimated cost for reclamation, 2) an estimated cost for post-closure maintenance and water treatment, 3) any realistic estimate as to the length of time that post-closure maintenance and water                                                                                                                                                                                                                                                                                                                                         | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | FIN 05<br>FIN 06<br>FIN 08 |

At this time, PolyMet estimates that based on preliminary information that will need to be confirmed by pilot/feasibility studies, they can transition from mechanical to non-mechanical water treatment at the Tailings Basin upon mine closure, and at the Mine Site within 30 years after mine closure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| 2966       | The SDEIS provides a listing of items for which costs must be included in the financial assurance instrument (i.e. demolition of all structures and remediation of sites [fencing the perimeters, sloping and seeding the overburden, constructing outlet structures, removing culverts, etc]) yet fails to provide any estimated costs or the basis for these costs.                                                                                                                                                                                                                                         | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine.                                                                                                                                                                                                                                                                                                                                                          | FIN 05           |
| 2967       | The SDEIS notes, PolyMet would ensure that the financial assurance amount is established as a function of at least three main variables: 1) extent of surface disturbance and potential releases from waste storage facilities, 2) reclamation and long-term care standards (including mechanical water treatment), and 3) reasonable assessment of the costs to execute the Contingency Reclamation Plan. The SDEIS provides no discussion as to how these variables are likely to impact overall costs of the financial assurance instrument and how large the variance of cost estimates are likely to be. | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, timeframes, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. Section 3.2.2.4.2 discusses the types of financial assurance instruments that could be used in combination to assure the project. Additional details on the cost estimates, methods, and instruments that would be required for the project, and how the instruments would be updated and dedicated to the project would be addressed during permitting. | FIN 05<br>FIN 08 |
| 2968       | The costs provided in Table 3.2-15 provide no basis for their estimation or other assumptions. The SDEIS failed to provide detailed costs for the physical closure and reclamation of the mine site that will need to be covered by Financial Assurance Instruments – a detailed discussion as to how much money will be needed from financial assurance instruments and when.                                                                                                                                                                                                                                | FEIS Section 3.2.2.4 provides available details regarding financial assurance. Section 3.2.2.4.2 discusses the types of financial assurance instruments that could be used in combination to assure the project. Additional details on the cost estimates, methods, and instruments that would be required for the project, and how the instruments would be updated and dedicated to the project would be addressed during permitting. | FIN 05<br>FIN 08 |
| 2973       | The SDEIS notes, PolyMet may cancel financial assurance only upon approval by the MDNR after it is replaced by an alternative mechanism or after being released (in whole or in part) from financial assurance. The SDEIS fails to discuss any federal oversight of this process and how the federal government will meet its trust responsibility in protecting habitats that support off-reservation treaty harvests.                                                                                                                                                                                                    | Section 3.2.2.4 discusses financial assurance requirements of the Project, and the response to Theme FIN15 addresses federal requirements for financial assurance. The Cultural Resources sections in FEIS Chapters 4 and 5 address the federal Co-lead Agencies' federal tribal trust responsibilities under the 1854 Treaty. These sections, along with other relevant natural resources sections of FEIS Chapters 4, 5, and 6, also address effects on and any proposed mitigation for cultural resources and culturally significant natural resources. Mitigation/compensation for effects on cultural resources and culturally significant natural resources is considered to the extent possible within the parameters of the statutes and regulations pertaining to the federal authorities for the NorthMet Project Proposed Action review.                                                                                               | CR 01            |
| 3049       | Depending on the exact placement of the drain cells, the modified modeling [GLIFWC conducted] resulted in an estimate of 588 to 847 gpm of flow through the east berm of the basin. This flow is on a scale similar to the flow predicted for the south berm discharge at SD026 (570 gpm, RS13B Draft-01; or 540 gpm, Polymet 2013j). That the predicted discharges at the south berm and at the east berm are similar is logical because both areas are underlain by bedrock valleys filled with high conductivity surficial deposits. In the context of the predicted total discharge from the FTB at year 20 (3340 gpm, | The Plant Site MODFLOW model was modified for the FEIS to better represent natural and NorthMet Project Proposed Action-related conditions. These include: 1) more accurate representation of surficial deposits and bedrock outcrops around the perimeter of the Tailings Basin, 2) more extensive distribution of drain and/or river cells to provide for potential surface seepage and distribution of wetlands, 3) more appropriate storage coefficients, and 4) steady-state and transient calibrations using new data extending through the end of 2013. Many of the improvements pertained to the East Embankment area of the Tailings Basin, where it is acknowledged that tailings water seepage would be likely to occur and model changes were made to simulate this seepage more accurately.                                                                                                                                          | WR 102           |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                 | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Theme(s) |

|            | RS13B; or 3230 gpm, Polymet 2013j) the 588-847 gpm prediction suggests that approximately 1/5 of the FTB water would exit through the east berm.                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |          |
| 3054       | NorthMet water management plan version 2 states that the south side seepage capture facility is already operational. The SDEIS further states that the system is operating effectively and capturing all seepage out of the south end of the facility. This statement is factually incorrect.                                                                                                                           | FEIS text has been changed to acknowledge that the south side Tailings Basin containment system is not capturing all seepage from the southern end of the Tailings Basin. Cliffs Erie is currently addressing this issue by upgrading the performance of the existing capture system and, if necessary, constructing new systems to enhance capture. If 100% capture is not attained by the Cliffs Erie upgrades, PolyMet has committed to installing additional systems in Second Creek to achieve this level of performance regardless of the types of measures required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | WR 117   |
| 3055       | The SDEIS discusses Cliffs Erie site, identifies 62 Areas of Concern (AOC's), and discusses PolyMet's role in site remediation. The SDEIS failed to provide any information as to cost estimates for addressing the legal requirements for mitigating the AOC's as identified. This information is needed to ascertain if the proposed project would further contaminant AOC's and increase clean-up/remediation costs. | FEIS Table 4.2.1-2: NorthMet Project Proposed Action Area of Concern Summary List for Voluntary Investigation and Cleanup Program, has been updated in the FEIS to show the current status and additional information where available. Costs for assessment, investigation, and cleanup are not feasible to provide (Personal communication, Email from Jim Robin, MPCA, to ERM, October 27 & 29, 2014).<br><br>The April 6, 2010, Consent Decree is a court registered agreement between Cliffs Erie LLC and the MPCA to resolve alleged violations of Cliffs Erie's NPDES/SDS permits for its Hoyt Lakes and Dunka mining area facilities (State of Minnesota v. Cliffs Erie, L.L.C. 2010, as cited in the FEIS). Of particular relevance to the NorthMet project, the Consent Decree addresses issues at the current Cliffs Erie tailings basin (including outfall SD026) and discharges from the Cliffs Erie Area 5 mining area (SD033). The tailings basin is part of the NorthMet Project Proposed Action whereas Area 5 is not; however, PolyMet has entered into an agreement with Cliffs Erie where both areas would be transferred to PolyMet upon issuance of project permits. Until that time, Cliffs Erie retains responsibilities for permit-related activities at the tailings basin and Area 5. While certain Consent Decree-related activities have been in progress or have been completed for these areas since the SDEIS, there has been no change in ownership or responsible parties since that time (Personal communication, Email from Jim Robin, MPCA, to ERM, October 27 & 29, 2014). | HAZ 05   |
| 12501      | The importance of baseflow in understanding site hydrogeology is hard to overstate. Unfortunately, the quality of flow data collected at the Polymet site is poor and fraught with uncertainty. Because there has not been a Polymet streamgaging at the                                                                                                                                                                | Groundwater baseflows used in the SDEIS are best-estimate values and are retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 streamgaging in the Partridge River at SW-006 that occurred when there were no discharges from Northshore and 2) 1942 to 1963 gaging data in the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WR 003   |

|            | <p>site and Northshore pit dewatering has occurred into the Partridge at varying and uncertain times, all flow data from the site is suspect. Simple upstream, at-site, and downstream flow measurement would have provided higher quality data but was never collected by the applicant nor required by the state.</p>                                           | <p>Embarras River, which includes years prior to the LTVSMC Tailings Basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.</p> <p>The only other available gaging data is from a station installed during 2011 at SW-003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore Pit pumped discharges, seepage from the Northshore Western Pond, and complex storage and release mechanisms in the wetlands that receive these flows.</p> <p>More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.</p> <p>To better understand the relationship of groundwater baseflow to the GoldSim model's water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p> |          |
| 12502      | <p>The mine site water modeling data package very clearly states (SDEIS reference Polymet 2013i, pg 123 &amp; 133) that the 1 cfs added to Goldsim modeling was to account for constituents added to the Partridge by pit dewatering from Northshore; it is not relevant to baseflow calculations nor is it relevant to determination of aquifer conductivity</p> | <p>The 1 cfs added to GoldSim modeling was to account for constituents added to the Partridge River by pit dewatering and other discharges from the Northshore Mine. It is not part of groundwater baseflow as defined in the Mine Site GoldSim model and is therefore not relevant to determination of aquifer hydraulic conductivity, areal recharge, or groundwater travel times. This variable was updated to be 2.6 cfs at a sulfate concentration of 28 mg/l in the FEIS Mine Site GoldSim model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | WR 005   |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Theme(s) |

|            | or groundwater travel times.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |          |
| 12504      | <p>Polymet Modeling of Flow from the Basin: Polymet modeling with MODFLOW (RS13 Attachment A-6 2007; RS13B Attachment A-6 2008; Polymet 2013j Attachment A 2011), for the FTB has prevented any discharge of basin water to the east by erecting a no-flow boundary at the surface of the berm and at the ground surface. This no-flow boundary is an artificial construct that has no basis in reality. In reality, flow to the east will be controlled by the relative head pressures and the conductivity of the materials in the FTB, beneath the FTB and in the berms.</p>                                                                                                                                                                | <p>In response to these issues, the Plant Site MODFLOW model was modified and recalibrated as follows:</p> <p>1) Updated areal distribution of surficial deposits and bedrock outcrops, 2) established surficial deposits below and adjacent to the East Embankment, 3) used drain or river cells along the East Embankment to allow surface seepage of tailings water, 4) incorporated the hydrologic effects of the future swale to drain surface water from the East Embankment area, 5) recalibrated model material properties and boundary conditions using all available data through 2013 (this is mostly new hydraulic head information), and 6) expanded the use of river and drain cells to provide a more accurate representation of wetlands outside the Tailings Basin.</p> <p>As a result of these changes, the FEIS Plant Site MODFLOW model no longer has a no-flow boundary condition at the toe of the East Embankment, and river and/or drain cells in surficial deposits are in place to allow the potential for surface seepage along the embankment toes (See Attachment A, Plant Site Water Modeling Data Package [PolyMet 2015], as cited in the FEIS)). The model was checked to ensure that hydraulic heads in the tailings and adjacent surficial deposits were not well above ground surface. In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p> | WR 093   |
| 12510      | <p>Geology Beneath the East Berm: Examination of the geologic data for the site indicates that the east berm of the FTB sits on a bedrock valley filled with surficial material that is 25 to 50 feet deep. The bedrock valley under the east berm is the historical stream channel for Trimble Creek prior to the creation of the current tailings basins (Figure 1). The thickness of the surficial material under the east berm is indicated as 25 to 50 feet in the depth to bedrock map of the SDEIS Figure 4.2.2.-12 (Figure 2) and in the depth to bedrock map MN Geological Survey M-126.</p> <p>The distribution of bedrock under the FTB has been represented in 2 ways during Polymet MODFLOW modeling. Technical document RS13</p> | <p>The Tailings Basin design and footprint used in the FEIS Plant Site MODFLOW model was updated from the version used in the SDEIS to address this comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | WR 094   |

|            | <p>of Nov. 16, 2007 Attachment A-6 Fig. 4-2 showed bedrock in the 2007 MODFLOW model as extending under the eastern quarter of the tailings basin. In technical document RS13b of Sept. 8, 2008 Attachment A-6 Fig. 4-7h, bedrock in the 2008 model did not extend under the basin but rather showed the basin to be underlain with surficial material. The text of RS13b, section 4.6.1 of Attachment A-6 states: “The location of the bedrock hills that flank the Tailings Basin to the east and south were updated. The location of the bedrock hills is used in the model to define the extent of the low hydraulic conductivity zone that represents the bedrock. Because the footprint of the Tailings Basin – Mitigation Design is closer to these hills on the southeast side of the footprint than was the footprint for the proposed design, it was important to get the location of these hills as accurate as possible. The location of the bedrock hills was defined using information from the Minnesota Geological Survey’s map M-164. The resulting zones of hydraulic conductivity can be seen on Figure 4-7.”</p> <p>The extent of the tailings basin footprint represented in RS13b is the same extent as currently proposed in the SDEIS. However, evaluation of flow from the basin using MODFLOW and Goldsim appears to have fallen back to the 2007 representation of the basin footprint and of the underlying bedrock (see GLIFWC comment re: SDEIS modeling and mitigation basin design).</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                               |

|            | <p>(1700 ft; RS13b, 2008), and the head pressure at the toe of the basin (1660 ft) will push water toward the toe of the east berm. The 25-50 feet of surficial deposits in the bedrock valley under the east berm will conduct water under the east berm and beyond.</p> <p>Revised MODFLOW Modeling of Discharge from East Berm: In order to investigate the approximate magnitude of discharge that would exit the east berm of the FTB, we conducted modified MODFLOW modeling of basin flows in year 20 of the project. To simulate the basin but without the no-flow boundary imposed in previous Polymet modeling, we used the 2008 Polymet MODFLOW model (RS13B Draft-01), with the sole modification being the placement of model drain cells at the east berm.</p> <p>The original 2008 model predicted flows of 3340 gpm from the basins, 570 of which was predicted to flow to the seepage barrier on the south side of the basins (SD026) but no flow to the east because of the no-flow boundary instituted in that model (RS13B Draft-01). Our placement of drain cells in the east berm area of the MODFLOW model enabled water to move east from the berm, rather than reverse flow to the north, west and south as was dictated by the no-flow boundary. The use of drain cells at the east berm to allow eastward movement of water is an identical approach as that implemented by Polymet for the south berm of the tailings basin where the discharge to SD026 is modeled by drain cells.</p> <p>Depending on the exact placement of the drain cells, the modified modeling resulted in an estimate of 588 to 847 gpm of flow through the east berm of the basin. This flow is on a scale similar to the flow predicted for the south berm discharge at SD026 (570 gpm, RS13B Draft-01; or</p> | <p>coefficients, and 4) steady-state and transient calibrations using new data extending through the end of 2013. Many of the improvements pertained to the East Embankment area of the Tailings Basin, where it is acknowledged that tailings water seepage would be likely to occur and model changes were made to simulate this seepage more accurately. These changes in response to the comment improve the SDEIS MODFLOW model that limited tailings seepage on the east side of the Tailings Basin.</p> |          |

|            | <p>540 gpm, Polymet 2013j). That the predicted discharges at the south berm and at the east berm are similar is logical because both areas are underlain by bedrock valleys filled with high conductivity surficial deposits. In the context of the predicted total discharge from the FTB at year 20 (3340 gpm, RS13B; or 3230 gpm, Polymet 2013j) the 588-847 gpm prediction suggests that approximately 1/5 of the FTB water would exit through the east berm.</p> <p>Implication of Faulty Modeling of Discharge to the East:</p> <p>At least three problems arise from the current situation of SDEIS modeling of the FTB with a no-flow boundary on the east and inaccurate representation of bedrock: 1) There is no contaminant transport modeling or evaluation of the water leaving the east side of the basin. Without substantial engineering to remove the water, a lake toward the 1680 foot contour would form (Figure 4) until water spilled toward Spring Mine Lake. The Flotation Tailings Management Plan (Polymet 2013m, page 16) discusses the need for a drainage swale to release stormwater from the topographically closed area to the east of cell 1E. In the SDEIS or supporting documents, there is no discussion of tailings pond water exiting the basin into this topographically closed area. There is no accounting for contaminants moving eastward, and there is no description of their possible impact on receiving ground or surface waters. 2) There are potential receiving surface waters near to the east berm; wetlands at the toe of the east berm, Spring Mine Lake &amp; Spring Mine Creek to the east, and wetlands and an unnamed creek to the north of the proposed drainage swale. 3) The Polymet MODFLOW modeling was designed to prevent any water from leaving the east side of the basin by establishing no-flow</p> |          |          |

|            | <p>boundaries on that side of the model. Because of the no flow boundaries, the model output files (NorthMet Model Files DVD, BARR July 2012) show extremely unrealistic groundwater heads in the aquifers surrounding the east side of the FTB. For example, the Polymet MODFLOW 2011 model predicts groundwater head to be over 1800 ft in elevation where the ground elevation is 1660 ft on the east side of the tailings basin. A model with such distorted groundwater head predictions is unlikely to produce accurate flow information, rendering the flowpaths to the north, west and south and flow quantities used by Goldsim in the SDEIS unreliable.</p> <p>Realistic flow modeling of the proposed FTB must be conducted to determine flow directions, flow quantities and travel rates for environmental impact prediction. Information on water flow direction and quantity is also needed so that water management plans can be formulated.</p> |                                                                                                                                                                  |                          |
| 12525      | <p>SDEIS MODFLOW Modeling Appears to be of Fatally Flawed and Discarded Tailings Basin Design. Modeling in the SDEIS appears to be of a Flotation Tailings Basin (FTB) design that was discarded several years ago and does not model the currently proposed basin design. The 2007 FTB design, that is modeled in Attachment A (2011) of Polymet 2013], was deemed to be “fatally flawed” by the MNDNR (Mitigation Table, Arkley email of 2008/12/09) and was replaced by the “mitigation” design developed in 2008. GLIFWC staff have posed a series of questions to the lead agencies regarding the modeling for water quantity and flow direction at the FTB. ERM has provided a series of written responses to those questions. The 2014-03-10 Response 4 from ERM re: the Plant Site MODFLOW modeling identified Attachment A of the Water Modeling Data package of March 2013 (SDEIS reference Polymet</p>                                                | <p>The Tailings Basin design and footprint used in the FEIS Plant Site MODFLOW model was updated from the version used in the SDEIS to address this comment.</p> | <p>WR 094<br/>WR 098</p> |

|            | <p>2013) as the documentation of the tailings basin flow modeling for the SDEIS. Careful examination of the scant information in the above referenced Attachment A (2011) indicates that the modeling done in 2011 for that attachment was not of the FTB as currently proposed. The footprint modeled for attachment A is the footprint of an early FTB proposal from 2007 (Figure 5) that was supplanted by the FTB design developed during the “Mitigation Options” process of 2008. The 2008 mitigation FTB design (Figure 6) is the current design footprint assumed in the text of the SDEIS (SDEIS Fig. 3.2-23). In addition to using a discarded FTB design footprint, the modeling in Attachment A also used a crude representation of bedrock that was supplanted by a more refined bedrock representation during the modeling of the 2008 mitigation design (RS13B Draft-01, 2008). The diagrams and model files supporting Appendix A (2011) further demonstrate that the modeled footprint is of the 2007 fatally flawed FTB design (see footprints in layer 1 of 2007 (Figure 7) and 2011 (Figure 8) models, attached), instead of the mitigation basin design (see footprint in layer 1 of 2008 model, (Figure 9)). The rejected basin design had a smaller footprint and did not extend as far to the south and south-east. Unlike the current design, the rejected design did not cover the ash disposal site in the south-east end of the FTB. It appears that the SDEIS Goldsim (water quality) modeling is based on MODFLOW (water quantity) modeling of an old FTB design that was deemed fatally flawed and is not modeling the currently proposed FTB design.</p> |                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                               |

|            | <p>applicant provide an estimate of when treatment would no longer be needed. Therefore, as articulated in Chapter C, GLIFWC staff maintain that water treatment for the proposed Polymet mine is perpetual.</p> <p>GLIFWC staff are gravely concerned that the lead agencies are attempting to minimize the issue of perpetual/long term treatment by using vague and confusing language in the SDEIS. In addition, the language the lead agencies have used has changed during the development of the document even though the model results have not.</p> <p>The SDEIS states on page 5-7: “Mechanical water treatment is part of the modeled NorthMet Project Proposed Action for the duration of the simulations (200 years at the Mine Site, and 500 years at the Plant Site). The duration of the simulations was determined based on capturing the highest predicted concentrations of the modeled NorthMet Project Proposed Action. It is uncertain how long the NorthMet Project Proposed Action would require water treatment, but it is expected to be long term; actual treatment requirements would be based on measured, rather than modeled, NorthMet Project water quality performance, as determined through monitoring requirements.” (Emphasis added)</p> <p>In response to comments on the PSDEIS (Comment GLIFWC1) the Co-Lead agency disposition states: “Modeling predicts that treatment activities will be a minimum 200 years at the Mine Site and a minimum of 500 years at the Plant Site. While long-term, these time frames are not necessarily perpetual. The owning company would be held accountable to maintenance and monitoring required under permit and would not be released until all conditions are met” (Appendix C SDEIS) (Emphasis added)</p> | <p>Plant Site.</p> <p>It is acknowledged that operation, maintenance and periodic replacement of environmental controls would be required during closure. Financial Assurance would be required under Minnesota’s Permit to Mine to perform these activities on a continuous and/or periodic basis for as long as these activities are needed.</p> <p>FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, time frames, contingency plan amounts for unforeseen challenges, and calculations that would be required for the project would be addressed during permitting. Specific infrastructure timelines and life expectancies of equipment would be accounted for during permitting as well. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. FEIS Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate. The liner and cover systems selected for waste containment are selected on the basis of numerous factors discussed in the Rock and Overburden Management Plan and FEIS Sections 3.2.2.1.8 and 3.2.2.3.10. The WWTP and WWTF would undergo continued inspection and maintenance during operations, long-term treatment, and in closure. The WWTP and WWTF replacement costs would be included in long-term financial assurance estimates. The USEPA guidance on utilization of adaptive management defines it as a decision making process that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. <i>Minnesota Rules</i> 6132.1200, Subparts 4 and 5, require the MDNR to evaluate financial assurance cost estimates, terms, and conditions using individuals with documented experience in the relevant field. Those individuals would consider all relevant information in making their evaluations.</p> <p>In addition, see the response to theme WR 035.</p> |          |

|            | <p>It is impossible to reconcile these 2 statements. We agree that the duration of simulations were based on capturing the highest predicted concentrations of the modeled action. However, those concentrations require water treatment to avoid violating water quality standards. This treatment is at minimum 200 years at the mine site and 500 years at the plant site. As the lead agencies indicate, these time estimates are only minimums and there is no information that points to a time when water treatment would not be needed. Finally, while the maximum contaminant plume is predicted to occur at the 200 and 500 year mark for the mine and plant sites respectively, this does not mean that contaminants immediately drop to zero. The reduction would be gradual and perhaps last for another few centuries. In addition the SDEIS states on page 5-56: "The attenuation effect resulting from sorption is significant enough that arsenic, copper, and nickel are not predicted to travel from source areas to any evaluation locations or the Partridge River within the 200 year model simulation period (Barr 2013f). Analytical calculations suggest that the travel times for these solutes would be in the order of thousands of years."</p> <p>This statement suggests that water treatment activities would be required far beyond the 200 year time frame at the mine site and would be on the order of thousands of years. Therefore, the only logical conclusion is that water treatment is perpetual at this project.</p> <p>It is also important to note that, in the response to GLIFWC comments on the PSDEIS, the lead agencies acknowledge monitoring and maintenance requirements during the same 200 (mine site) and 500 (plant site) year timeframe. The SDEIS requires substantially more transparency on one of the most fundamental</p> |          |          |

|            | <p>issues at stake for this project. The fundamental question is: how long will the company be required to operate and maintain expensive mechanical treatment to meet water quality standards? This singular issue has significant repercussions for the public interest determination</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                            |
| 12544      | <p>Indirect Wetland Impacts.<br/>                     The methods used in the analysis of indirect wetland impacts in the SDEIS are essentially the same as the 2009 DEIS. GLIFWC staff reiterate the comments we have provided in the past that the method is overly simplistic, based on a flawed conceptual understanding of hydrology at the mine site and inadequate for the NEPA process of a large scale sulfide mine.<br/>                     The SDEIS has underestimated baseflow at the mine site. The entire conceptual model of perched wetlands with hydrology that is completely decoupled from groundwater was supported by the use of unrealistically low baseflow numbers. Now that the applicants XP-SWMM model has been discredited and that it is obvious that the movement of groundwater at the mine site is 3 times greater than the SDEIS indicates, the assumption that wetlands will not be impacted by groundwater drawdowns should be abandoned. The higher baseflow numbers support the independent analysis of indirect wetland impacts provided by the tribal cooperating agencies in Appendix C. The lead agencies have also based their analysis on the Bog Memo prepared by the Army Corps of Engineers (Eggers, Steve (2011) MEMORANDUM SUBJECT: Distinguishing Between Bogs That Are Entirely Precipitation Driven Versus Those with Some Degree of Mineral Inputs from Groundwater and/or Surface Water Runoff). This memo uses plant community information to determine the degree of hydrologic connectivity between a wetland and groundwater.</p> | <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 stream gaging in the Partridge River at SW-006 that occurred when there were no discharges from the Northshore Mine and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTVSMC Tailings Basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.<br/>                     The only other available gaging data is from a station installed during 2011 at SW-003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore Mine probable maximum precipitation pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.<br/>                     More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.<br/>                     To better understand the relationship of groundwater baseflow to the GoldSim model's water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. It also reflected consideration of</p> | WET 08<br>WR 003<br>WR 175 |

|            | <p>The conclusions in the memo are appropriate for a system that is not experiencing depressurization of the aquifer (drawdown). However, when mine induced drawdown occurs, new downward pressure gradients are created. Whittington and Price documented that these downward hydrologic gradients can in fact dewater wetlands that are entirely surface water dependent under normal conditions (Whittington, PN and JS Price, The effects of water table drawdown (as a surrogate for climate change) on the hydrology of a fen peatland, Canada.) HYDROLOGICAL PROCESSES, 20(17), 3589-3600. 2006). The bog memo is not an assessment of the hydrologic conditions of wetlands in a dewatered state but rather an assessment of surface hydrology under normal conditions. The indirect wetland impact analysis should be performed using realistic hydrologic assumptions and appropriate mitigation should be required.</p> | <p>the flow data collected at SW -003 in requiring groundwater baseflows at all locations on the Partridge River be increased by a factor of 4 (e.g., 0.5 to 2.0 cfs at SW -003). The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p> <p>The Co-lead Agencies are responsible for determining the requirements and adequacy of data used for the EIS. Where field measurements were not available, model assumptions were reviewed and approved for use in impact analyses. The Co-lead Agencies believe that the FEIS contains the best available data and analyses consistent with the National Environmental Policy Act and Minnesota Environmental Policy Act guidance and best practices.</p> <p>While the Co-lead Agencies believe that the analog method used in the SDEIS to assess potential indirect effects from mine dewatering is adequate, the FEIS has been updated with a more conservative approach to address concerns raised by the Bands. FEIS Section 5.2.3.2.2 has been updated to make a more conservative assumption of the potential indirect effects for all bog communities within the 0-1,000-foot analog zone such that all bogs are reclassified from the "no effect" category to "low likelihood" category of wetland hydrology effects.</p> <p>The Co-lead Agencies are not relying solely on the potential impact zones determined in the analog method for the FEIS but are monitoring wetlands for potential indirect effects. In the event that the required wetland monitoring identifies additional indirect effects, permit conditions could include a plan for adaptive management practices to be implemented. A additional compensatory mitigation will be required if indirect wetland impacts are identified during monitoring and annual reporting.</p> |                                                                                                                                                                                                                                               |
| 12566      | <p>Seepage Capture Efficiency. As detailed in comments submitted to the lead agencies for the 2009 DEIS and for the current SDEIS, water quality analyses for the Partridge and Embarrass Rivers are inadequate. The results, be they deterministic (DEIS) or in the form of probability distributions (SDEIS) are based on a flawed understanding of hydrology at both mine site and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Although relatively few containment systems have been built with this degree of pumping, the conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture. The FEIS relies on revised cross-section models from the FEIS to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in PolyMet 2015j (as cited in the FEIS). These new models consider the presence of an upper more-permeable bedrock zone directly below the slurry wall, with</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>WR 003<br/>                     WR 009<br/>                     WR 010<br/>                     WR 013<br/>                     WR 018<br/>                     WR 019<br/>                     WR 020<br/>                     WR 099</p> |

|            | <p>plant site. This flawed understanding, reflected most prominently in the errors in baseflow calculations, is carried forward to the MODFLOW hydrologic modeling. At the mine site MODFLOW under-predicts the amount of water that would flow into the mine pits and thus under-predicts the amount of water treatment needed for both short and long term closure. At the plant site, the MODFLOW model is constructed in a way that is not representative of reality and therefore yields results that are not logical. The lead agencies appear to disregard these problems because there is faith that the seepage capture and treatment systems will work at over 90% effectiveness for centuries. The SDEIS claims of long term compliance with applicable water quality standards depend entirely on this leap of faith. On conference calls scheduled to discuss these issues, the lead agency consultants have stated that the effectiveness of the capture systems have not been questioned and the lead agencies have not been able to provide any references that would support their position. We suggest that there are substantial reasons for skepticism regarding capture efficiency for the flotation tailings basin, hydrometallurgical tailings basin, and category 1 stockpile seepage capture systems. This skepticism is based on available literature and the performance of other facilities in the immediate vicinity. The EPA conducted an analysis of the effectiveness of seepage capture systems (Evaluation of Subsurface Engineered Barriers at Waste Sites, United States Environmental Protection Agency (EPA), 1998). This analysis looked at capture systems at 36 facilities and evaluated their effectiveness based on the performance requirements at each site. It is difficult to extrapolate the results of this analysis to the Polymet setting because a) the required</p> | <p>hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses have included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. This analysis supports the conclusion that the assumption of 90% or greater capture efficiency is justified.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed containment system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 5.2.2.2.3. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation, and depth to top of bedrock. This information was used to develop MODFLOW cross-section models at three locations on the alignment to assess capture efficiency. The models included bedrock below the slurry wall.</p> <p>The FEIS has been changed to recognize that currently not all water is being pumped back to the Tailings Basin, and therefore it is being released into Second Creek.</p> <p>Impact assessment modeling relies on site 19649 data that indicate the bulk hydraulic conductivity of upper bedrock is two to three orders-of-magnitude lower than the hydraulic conductivity of the surficial aquifer. Thus, groundwater flow and transport at both the Mine Site and Plant Site are dominated by the hydraulics of the surficial aquifer. Bedrock plays a negligible role in transporting NorthMet Project Proposed Action Site-derived chemicals to the Partridge River and Embarras River.</p> <p>It is acknowledged that there could be some hydraulic connections between bedrock and the surficial aquifer where transport is expected to be negligible. Given these factors, the approach was to not consider this possible connection in the NorthMet Project Proposed Action water quality models, but to recommend extensive monitoring during operations and closure to assess if interactions occur and if they would raise concerns for permitting agencies. If monitoring data indicate trends toward non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate what is expected to be a small transport-related bedrock impact relative to surficial flows. See FEIS Section 5.2.2.3.5 for more information on adaptive mitigation measures and FEIS Section 5.2.2.3.6 for more information on monitoring.</p> | <p>WR 117<br/>                     WR 123</p> |

| Comment ID | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Theme(s) |

|            | <p>effectiveness varied from facility to facility; b) the way in which effectiveness was measured was different (i.e. water quality improvements downstream versus change in hydrologic head pressure) and c) data collection varied between facilities. Despite these difficulties, the report indicates that 10% of the reviewed containment systems failed to meet the desired performance objectives and required corrective action. An additional 19% of the evaluated facilities did not have sufficient data to conclude whether the containment system was operating successfully or not. Furthermore, there is no information on the effectiveness of any of these facilities at timeframes remotely comparable to the needs at Polymet. In the EPA report, long term is considered 30 years whereas the water capture needs at Polymet are perpetual for the flotation tailings basin, category 1 stockpile and hydrometallurgical tailings basin. Finally, none of the facilities in the study are as large as the one proposed at Polymet. At the tailings basin, Polymet has proposed to install a seepage collection system around the north and west sides of the facility. The scale of this engineering control is extensive. It would be approximately 5 miles long and would have to be keyed to bedrock that is 25 to 50 feet below ground surface. The most likely pathway for leakage at this barrier will be in the vicinity of the key with bedrock (EPA 1998). This feature, and the similar containment system at the Category 1 waste rock stockpile are assumed to capture 93% of water leaving the facilities for an indeterminate period of time. As previously stated, there is no scientific justification for this number. The only examples we are able to identify at this time suggest capture rates that are lower. In t</p> | <p>The Hydrometallurgical Residue Facility would be double-lined to minimize release of water that has contacted the hydrometallurgical residue. The double liner would consist of a composite liner system utilizing a geomembrane liner above a geosynthetic clay liner with a second liner placed above the first, separated by a leakage collection system. This would substantially remove all hydraulic head from the lower liner and thereby virtually eliminate leakage from the Hydrometallurgical Residue Facility. It is expected that no water would be released directly from the Hydrometallurgical Residue Facility.</p> <p>PolyMet initiated laboratory testing to consider the chemical compatibility of the potential geosynthetic liner to be used with leakage from residue (Residue Management Plan (PolyMet 2015r, as cited in the FEIS)). Results indicated that a polymer-treated geosynthetic liner should be used that is manufactured specifically in anticipation of the chemical characteristics of the liquid and the pore water that would be contained within the facility. The hydraulic conductivity of the soil leakage collection system is not expected to degrade over time. Typical liner performance assumes a 500-year service life of the geomembrane; therefore, hydraulic conductivity of the liner is not expected to degrade over that time. Specific attributes would be determined during the geosynthetic clay layer development to achieve the desired performance before final installation. Findings of studies on geosynthetic liners indicate that performance is minimally affected by freeze-thaw cycles (PolyMet 2014c). At the Hydrometallurgical Residue Facility, the majority of the geosynthetic liner system would be below the water elevation, and therefore not exposed to freeze-thaw cycles.</p> <p>Based on a MODFLOW groundwater model specifically developed to assess capture efficiency of the Category 1 system, it was concluded that the system would achieve an overall efficiency between 90% and 94% for groundwater flowing in surficial deposits and bedrock.</p> <p>The FEIS further evaluated the possibility of fractures and faults at the Mine Site and Plant Site to determine what (if any) changes need to be made to model assumptions to accurately predict potential environmental effects for purposes of environmental review. Although no change was made to the Plant Site GoldSim model, the FEIS Mine Site GoldSim model was modified to include a flow/transport zone 15 meters thick from that present in the SDEIS. The results of the analysis are included in FEIS Section 5.2.2.3.2.</p> |          |

|            | <p>The prediction of water quality standard compliance for this proposed project hinges on the perfect operation of the water capture systems. The reliance on this engineered containment system that uses overly optimistic capture rates and must function in perpetuity is not scientifically supported and therefore is not appropriate for the SDEIS. The water quality and quantity impacts at both plant site and mine site should be remodeled by using a range of capture efficiencies. We suggest 60%, 70%, 80% capture rates be modeled for the tailings basin and category 1 stockpile. Water quality values for each of these capture rates should be reported. This will allow the public and decision makers to have a realistic picture of the risk and uncertainty for this project. Seepage capture at the flotation tailings basin does not account for seepage out of the east side of the basin. The seepage capture system should be expanded to account for this expected discharge. A MODFLOW model was developed to assess the amount of seepage that would flow out of the basin. As detailed in GLIFWC comments, that model is designed in a way that does not conform to reality and therefore the results are unreliable.</p> | <p>keyed into bedrock, 2) a collection trench on the tailings side, 3) permanent pumping of the collection trench to depress the groundwater level on the tailings side, and 4) a discharge pipe on the opposite side to raise groundwater levels to near ground surface. As shown by the cross-section MODFLOW models, this design insures a reversal of hydraulic gradients across the slurry wall (complete capture in surficial deposits) and complete or very high capture efficiency in bedrock below the slurry wall. The examples cited in the comment for northeastern Minnesota are very different designs and cannot be compared to the proposed design for the Tailings Basin. Modeling performed for the NorthMet Project Proposed Action capture system indicates that the overall capture efficiency would be substantially greater than 90%.</p> <p>The proposed capture system for the Category 1 Stockpile is a unique design that uses a slurry wall keyed into bedrock and a pumped collection trench that maintains depressed groundwater levels on the inside (Category 1 Stockpile side) of the system. It is acknowledged that there are existing capture systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be directly compared to the system proposed for the Category 1 Stockpile. Based on a MODFLOW groundwater model specifically developed to assess capture efficiency of the Category 1 Stockpile system, it was concluded that the system would achieve an overall efficiency between 90% and 93% for groundwater flowing in surficial deposits and bedrock. This analysis supports the conclusion that the proposed Category 1 capture system has a high probability of meeting its performance specifications.</p> | <p>WR 018<br/>                     WR 022<br/>                     WR 035<br/>                     WR 093<br/>                     WR 129<br/>                     WR 133</p> |
| 12573      | <p>Ability of GoldSim to Accurately Predict Contaminant Concentrations:<br/>                     We remain concerned about the inability of GoldSim to accurately predict current and future contaminant concentrations. This is particularly troubling in the lower Partridge River (e.g. SW005) and in Colby Lake where GoldSim predictions of current conditions appear to be inaccurate. In recent conversations with the lead agencies and ERM, there has been agreement that the modeling in the SDEIS does not accurately capture the environmental conditions at Colby Lake. Additional modeling of this waterbody is needed to assess impacts of the proposed project</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>The Mine Site GoldSim model used for the SDEIS (Barr 2013f, as cited in the FEIS) was modified for the FEIS (Mine Site GoldSim model) (PolyMet 2014v, as cited in the FEIS) to include a new chemical loading source in Colby Lake and was calibrated to the measured chemical concentrations in Colby Lake. This calibration considered new surface water chemistry data collected through the end of 2013. The same chemical loading source was applied to both the Continuation of Existing Conditions model and NorthMet Project Proposed Action model (PolyMet 2014v, as cited in the FEIS). The chemical loading source was constant and did not exhibit seasonal or long-term variations for future conditions. Incorporation of the loading source addressed the issue by providing predicted chemical concentrations in Colby Lake for existing conditions that are similar to currently measured concentrations. The average arsenic concentration based on 33 samples in Colby Lake is 0.95 µg/L. The GoldSim</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>WR 049</p>                                                                                                                                                                 |

|            | and to evaluate the suitability of Colby Lake water for use in augmenting the flow of other waterbodies. In addition, the discrepancies between modeled and observed data at SW 005 should be addressed in detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Continuation of Existing Conditions (PolyMet 2014v, as cited in the FEIS) modeling scenario predicts an average concentration of 0.80 µg/L at P50 over the 200 year modeling period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                            |
| 12575      | The SDEIS does not adequately address mercury concerns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | This comment has been received and acknowledged by the Co-lead Agencies. An index of information on mercury associated with the NorthMet Project Proposed Action can be found in FEIS Section 1.7.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | MERC 01                    |
| 12580      | Wild Rice Standard. The concerns over the MPCA's interpretations and recommendations regarding the wild rice sulfate standard have not been resolved. The information provided in Appendix C is still applicable to the SDEIS. In addition, staff believe that water quality modeling underestimates the amount of sulfate at points of compliance. Even with this problem, contaminant modeling suggests that the sulfate standard will be violated in the Partridge River points of compliance approximately 10% of the time. While this may meet the lead agencies arbitrary evaluation criteria (standard met 90% of the time) it certainly is not enough to warrant the issuance of an NPDES permit. At the Embarrass River the standard is already exceeded at the point of compliance because of historic contamination from the tailings basin and the area 5 pits. It is not clear if the capture system around the tailings basin will function well enough to allow the standard to be met. | The GoldSim model results predict that for all situations where a potential impact could be attributed to the NorthMet Project Proposed Action, the expected increase in sulfate concentration at SW-005 (and SW-006) would be less than or equal to 0.1 mg/L, and this would be added to the typical annual fluctuations of sulfate concentrations of several mg/L. A practical consequence of this result is that the effects of the NorthMet Project Proposed Action would not be identifiable by even the most robust field monitoring program.<br><br>The small modeled sulfate increases associated with the NorthMet Project Proposed Action are explained by the small amounts of impacted and untreated water leaving the Mine Site in the model, which only occurs as groundwater migration. For P50 best-estimate predictions of the model during all phases of the NorthMet Project Proposed Action, the maximum amount of impacted and untreated groundwater leaving the NorthMet Project Proposed Action Site is 0.031 cfs (14 gpm). The maximum impact to the Partridge River would occur when this affected groundwater is released to the Partridge River during low-flow conditions. At SW-005, the average annual 1-day low flow is estimated to be 6.9 cfs (3,100 gpm) when Northshore Mine is discharging (up to year 55) and 5.0 cfs (2,240 cfs) when only the wastewater treatment facility discharges to the Partridge River (after year 55). Given the difference between groundwater and river flows, it is apparent that the mass loading associated with groundwater flow from the Mine Site is far too small to impart a noticeable impact on sulfate concentrations in the Partridge River. | WR 152<br>WR 153<br>WR 154 |
| 12601      | Impacts from Rail Car Spillage. The concerns regarding the hydrologic impacts of sulfide ore dust spillage along the rail corridor have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | The potential for rail car spillage and dust has been minimized since the SDEIS by PolyMet committing to (PolyMet 2015a):<br><ul style="list-style-type: none"><li>- additional rail car refurbishments as part of the NorthMet Project Proposed Action (FEIS Section 3.2.2.2.4 and PolyMet 2014a as cited in the FEIS).</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | PD 07<br>WR 151<br>AIR 05  |

|            |                                                                                                                                                                                                                                                                                                             | <p>- Developing and implementing monitoring and mitigation activities with the DNR and MPCA in the permit process (including surface water quality sampling in the streams traversed by the rail line).</p> <p>The FEIS includes available information from the updated Project Description document.</p> <p>Routine inspections would be undertaken along the Transportation and Utility Corridor to identify accumulations of dust or ore spillage. Any significant accumulations would be removed by a combination of machines and hand work. It is unlikely that there would be sufficient spillage to affect the quality of surface water or groundwater.</p> <p>Facilities and activities with the potential to generate fugitive dust would be subject to an air quality Fugitive Dust Control Plan which would be (regulated by the MPCA) (see Section 4.1.6 and Section 4.3.9 of PolyMet 2015a, as cited in the FEIS).</p> <p>See FEIS Sections 5.2.2.3.2, 5.2.3 and 5.2.7 for impacts of railcar spillage and dust on wetlands and air quality, respectively. See also the response to comment 19698.</p>                                                                                                                                                                                                                                |                                                                                                          |
| 12602      | <p>Loss of High Biodiversity Significance Values Sites. The concerns regarding the loss of high biodiversity sites such as the 100 mile swamp, Lynx and Moose habitat and remaining wildlife corridors have not been resolved. The information provided in Appendix C is still applicable to the SDEIS.</p> | <p>The USGS National Atlas shows a single wetland complex (referred to as the One Hundred Mile Swamp) as straddling the major watershed divide separating the Superior Basin from the Rainy River Basin, which suggests that this wetland complex creates a conduit for water originating from the Mine Site to reach the Dunka River, and ultimately, the BWCAW.</p> <p>Wetlands are delineated using many factors in addition to hydrology; the delineation of the One Hundred Mile Swamp as continuous across this boundary does not equate to a hydrologic connection. There are two hydrologic barriers between the Mine Site and the Rainy River Basin, including: 1) High ground north of the Partridge River creates a watershed divide separating the Superior and Rainy River Basins, and prevents surface water from passing between the two. This major watershed divide is included in the National Atlas, as well as USGS and MDNR data sets. This divide is accurately presented in the FEIS. 2) Yelp Creek and the Partridge River encircle the north, east, and south sides of the Mine Site. These streams create a hydrologic "sink" for sources of water originating at the Mine Site. Surface runoff and groundwater in surficial deposits leaving the Mine Site would follow a gradient into Yelp Creek or the Partridge</p> | <p>VEG 02<br/>                     WI02<br/>                     WI03<br/>                     WR080</p> |

|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
|            |                                                                                                                                                                                                                                                                             | <p>River, as opposed to continuing uphill towards the watershed divide. Yelp Creek and the Partridge River extend further west (i.e., more fully encompassing the Mine Site) than is shown on the map in question.</p> <p>The FEIS wildlife sections include information about NorthMet Project Proposed Action impacts to wildlife habitat types and Minnesota Biological Survey (MBS) Sites of Biodiversity Significance. FEIS Sections 4.2.4 and 4.3.4 provide maps of the MBS Sites (Figures 4.2.4-1, 4.2.4-4, 4.3.4-1, 4.3.4-2). The WCA rules (including those parts applicable to mining projects under <i>Minnesota Rules</i> 8420.0930) include a special consideration for wetlands that are rare natural communities (<i>Minnesota Rules</i> 8420.0515, Subpart 3). The Permit to Mine would address special consideration of wetlands that include rare natural communities. Additional information on rare natural communities would be included in the wetland permit application as part of the Permit to Mine process for further refinement of site-specific conditions.</p> <p><i>Minnesota Rules</i> 6132.2700 require that a project site be reclaimed once mining has ceased. The goals of such reclamation are to “control erosion, to screen mining areas from non-compatible uses, and to provide for subsequent land uses such as wildlife habitat or timber production.” The rules also include requirements about the characteristics and planting schedule for vegetation used in reclamation. Mitigation measures for wildlife species would be considered during the Endangered Species Act Section 7 consultation process.</p> |          |
| 12604      | <p>The Supplemental Draft Environmental Impact Statement (SDEIS) NorthMet Mining Project and Land Exchange failed to adequately address closure and maintenance costs and length of time for post-closure treatment in the context of financial assurance requirements.</p> | <p>FEIS Sections 3.2.2.1.10, 3.2.2.3.12, and 5.2.2.3.1 include available information regarding long-term water treatment and maintenance. Temporal aspects of financial assurance can be managed through <i>Minnesota Rules</i> 6132.3200 Subpart 2, item E, which state that financial assurance is required for all areas that require continued maintenance following closure, and that no release from the Permit to Mine would be granted for portions of mining areas that require post-closure maintenance until the maintenance activities are no longer necessary. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | FIN 05   |
| 12605      | <p>Within the 54 pages of Executive Summary only a single paragraph addresses the issue of financial assurance as noted below:</p>                                                                                                                                          | <p>FEIS Section 3.2.2.4 provides available details regarding financial assurance. Additional details on the cost estimates, time frames, contingency plan amounts for unforeseen challenges, and calculations that</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | FIN 08   |

Specific infrastructure timelines and life expectancies of equipment would be accounted for during permitting as well. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3 states that cost estimates shall be annually adjusted, using current dollar value at the time of the estimate. Neither NEPA nor MEPA rules require that all financial assurance mechanisms be in place before the EIS is finalized.</p>                                                                                                                                                                                                                                                                                                                                                    |          |
| 12607      | <p>The SDEIS failed to clearly state how the State of Minnesota will determine the maximum bond requirements,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>FEIS Section 3.2.2.4 provides available details regarding financial assurance. A additional details on the cost estimates and calculations that would be required for the project would be addressed during permitting. Table 3.2-15 provides financial assurance cost estimates for various years of closure, as well as monitoring and mitigation costs. Section 3.2.2.4.1 discusses what activities would be considered in cost estimates, and that cost estimates would be updated annually under the Permit to Mine. <i>Minnesota Rules</i> 6132.1200, Subpart 3, states that cost estimates shall be annually adjusted using current dollar value at the time of the estimate. Financial assurance is required upfront and would be updated throughout the project under the Permit to Mine, which would be required prior to the start of mining. <i>Minnesota Rules</i> 6132.1200 Subpart 4 also dictate that the Commissioner shall evaluate all financial assurance cost estimates and adjustments to cost estimates using individuals with documented experience in material handling and construction and mining costs.</p> | FIN 05   |
| 15020      | <p>In determination of baseflow, all GLIFWC's calculations have excluded Northshore pumping from the calculation. The Dec. 17th MNDNR memo (Attachment A) also picked a period when pumping for Northshore pit dewatering was not occurring so as to calculate true baseflow. The 1 cfs added to GoldSim modeling of the Partridge, mentioned in various DNR documents, is irrelevant to the calculation of baseflow and does not solve the modeling problems in XP-SWMM, MODFLOW and by extension GoldSim. Some of the implications of incorrect baseflow are</p> | <p>The FEIS reflects Co-lead Agencies' reconsideration of the appropriate groundwater baseflow rate to employ in the water impact assessment modeling. Information considered included: 1) definition of groundwater baseflow; 2) potential Northshore Peter Mitchell Pit contributions to flow; 3) available data from SW-006 gage versus SW-003 gage; and 4) confounding factors. The Co-lead Agencies continued to rely on the USGS-collected data at SW-006 as the basis for determining groundwater baseflow for the water impact assessment in the EIS.</p> <p>To better understand how groundwater baseflow affected water quality projections, a detailed GoldSim sensitivity analysis was conducted using groundwater baseflows four times larger than the best-estimate values. As part of the sensitivity analysis, appropriate modifications were made to</p>                                                                                                                                                                                                                                                                  | WR 052   |

|            | <p>highlighted on page 114 of the water modeling data package (March 2013), in our memo of 2012-03-02, and in GLIFWC's baseflow summary of 2014-02-13 (Attachments B, C, and D respectively).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>surficial aquifer hydraulic conductivities and aerial recharge based on a recalibration of the Mine Site MODFLOW model. In addition, a recalibration was performed for surface water runoff concentrations. Results of the high groundwater baseflow rate scenario were compared with the best-estimate scenario to evaluate the degree to which predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow and related inputs. The FEIS reports the results of the sensitivity analysis in FEIS Section 5.2.2.3.2. The Mine Site sensitivity analysis indicate that modeled groundwater and surface water concentrations are sensitive to changes in baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |          |
| 15021      | <p>Because the implications of baseflow are substantial when it comes to a basic understanding of the mine site hydrogeology, all modeling of flow and by extension contaminant transport must be re-calibrated to the higher baseflow numbers indicated by GLIFWC's analysis of 2013-07-02 (Attachment E) and DNR's 2013-12-17 analysis (Attachment A). Page 114 of the mine site Water Modeling Data Package makes it clear that recalibration of the MODFLOW model generates new conductivity values that are then fed into Goldsim. It states: "The revised model calibration resulted in different optimized values for the horizontal hydraulic conductivity of the surficial aquifer and bedrock, which are used to establish the distribution of values used for the probabilistic groundwater flow path modeling (Section 5.2.3.1)." It is also clear that higher hydraulic conductivities for the aquifers result in faster contaminant transport to points of evaluation.</p> | <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 stream gaging in the Partridge River at SW-006 that occurred when there were no discharges from Northshore Mine and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTV tailings basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.</p> <p>The only other available gaging data is from a station installed during 2011 at SW-003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore Mine probable maximum precipitation pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.</p> | WR 003   |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>To better understand the relationship of groundwater baseflow to the GoldSim model's water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                           |
| 15022      | <p>Although baseflow assumptions have significant effects on GoldSim modeling, the implication of re-calibrating the MODFLOW model go beyond the conductivities used in the GoldSim modeling. Higher baseflows imply higher conductivities that imply faster and greater groundwater flow rates. This affects:</p> <ol style="list-style-type: none"> <li>1) The amount of water expected to flow into the mine pit as it is excavated.</li> <li>2) The amount of drawdown of Partridge River flow that can be expected due to pit dewatering.</li> <li>3) The amount of wetland dewatering that can be expected due to pit dewatering.</li> </ol> <p>Given the uncertainty in baseflow numbers due to the poor quality flow data, it is reasonable to re-calibrate the MODFLOW model to a range of values that included the previously assumed baseflow and the newer, higher baseflow numbers.</p> | <p>Mine Site groundwater baseflows used in the SDEIS and FEIS are reliable. This is because the SDEIS and FEIS groundwater baseflow values were based on winter 1986-77 and winter 1987-88 streamgaging in the Partridge River that occurred when there were no discharges from the Northshore Mine. When expressed as a groundwater baseflow yield per unit area, the similar results for both the Partridge and Embarras River watersheds (approximately 0.05 cfs per square mile) lends credibility to the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota.</p> <p>Interpretation of groundwater baseflow derived from new data collection at SW-003 is not reliable due to the complicating effects of Northshore Pit pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>The Mine Site MODFLOW model was re-calibrated based on new groundwater level data collected through the end of 2013; however, calibrations performed for the FEIS used the same Partridge River baseflows as were used in SDEIS. Revised hydraulic conductivities and recharge values that come from MODFLOW recalibration informed the FEIS Mine Site GoldSim model.</p> <p>Groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms that groundwater baseflows used in the Mine Site GoldSim model are reliable and appropriate for FEIS impact evaluation.</p> | <p>WR 003<br/>                 WR 086<br/>                 WR 094<br/>                 WR 098<br/>                 WR 165<br/>                 WR 166</p> |

The sensitivity analysis fully considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. See FEIS Section 5.2.2.3.2 regarding the results of the sensitivity analysis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |          |
| 15023      | <p>Discharge From East Berm of Flotation Tailings Basin:<br/>                     Significance:<br/>                     The contaminant transport analysis at the Flotation Tailings Basin (FTB) does not include any accounting for discharge through the east berm of the basin. There are 3 reasons why discharge through the east berm will be enough to cause environmental concern:<br/>                     1) the flow distance between the final FTB pond in cell 1E and the exterior of the east berm is relatively short compared to flow distances from the pond to the north and west berms (SDEIS Figure 3.2-29).<br/>                     2) the east berm is underlain with 25-50 feet of conductive surficial material (SDEIS Figure 4.2.2-12 and Figure 2 below).<br/>                     3) the basin pond level is 1720 ft, the land elevation east of the basin is 1660 ft (Lidar data: <a href="http://www.mngeo.state.mn.us/chouse/elevation/lidar.html">http://www.mngeo.state.mn.us/chouse/elevation/lidar.html</a>). The elevation difference between the pond and the adjacent land surface is substantial; 1720 ft - 1660 ft = 60 ft.</p> | <p>It is acknowledged that there would likely be subsurface flow below the East Embankment from west to east and that surface seepage may occur at the toe. The FEIS Plant Site MODFLOW model was modified from the SDEIS to include: 1) the presence of surficial deposits below the East Embankment, 2) boundary conditions (drain and/or river cells) along the East Embankment toe to allow the potential for surface seepage, and 3) hydrologic inputs to account for the presence of the proposed drainage swale. See PolyMet 2015j (as cited in the FEIS) for more information.</p> <p>Similar to other locations along the perimeter of the Tailings Basin, the NorthMet Project Proposed Action was modified to include installation of a containment system along the East Embankment where it is underlain by surficial deposits. Given the hydrogeology of the area east of the Tailings Basin and the proposed swale to be constructed there, this containment system would have higher hydraulic head on the east side compared to the west (tailings) side where a pumped trench would depress the groundwater level. This would create hydraulic gradients in the slurry wall and in shallow bedrock that would drive (low) flows from east to west across the containment system. This set of hydraulics would result in complete capture of all tailings water approaching the containment system from the Tailings Basin. Because the system would achieve complete capture of tailings water, an east side chemical transport flowpath is not needed in the Plant Site GoldSim model. There is no hydrologic reason to expect that impacted water from the Tailings Basin would migrate east of the containment system.</p> | WR 054   |
| 15024      | <p>Discharge From East Berm of Flotation Tailings Basin:<br/>                     Significance:<br/>                     Because there has been no prediction of discharge from the east side of the FTB, there was no flow path established or contaminant transport analyzed in the easterly direction. The SDEIS is completely</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>The FEIS Plant Site MODFLOW model was modified from the SDEIS to include: 1) the presence of surficial deposits below the East Embankment, 2) boundary conditions (drain and/or river cells) along the embankment toe to allow the potential for surface seepage, and 3) hydrologic inputs to account for the presence of the proposed drainage swale.</p> <p>Similar to other locations along the perimeter of the Tailings Basin, the project was modified to include installation of a containment system along</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | WR 054   |

|            | <p>devoid of any mention or analysis of flow from the basin toward the east. Receiving waters for the contaminated discharge would be wetlands adjacent to the basin, Spring Mine Lake, Spring Mine Creek and wetlands to the north if a proposed stormwater drainage swale is constructed.</p> | <p>the East Embankment where it is underlain by surficial deposits. Given the hydrogeology of the area east of the Tailings Basin and the proposed swale to be constructed there, this containment system would have higher hydraulic head on the east side compared to the west (tailings) side where a pumped trench would depress the groundwater level. This would create hydraulic gradients in the slurry wall and in shallow bedrock that would drive (low) flows from east to west across the containment system. This set of hydraulics would result in complete capture of all tailings water approaching the containment system from the Tailings Basin. Because the system would achieve complete capture of tailings water, an east side chemical transport flowpath is not needed in the Plant Site GoldSim model. There is no hydrologic reason to expect that impacted water from the Tailings Basin would migrate east of the containment system.</p> |          |

| <i>Comments from the 1854 Treaty Authority (Submission ID 42968)</i> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                         |
| 3111                                                                 | <p>Under the proposed project, it appears that long term (perhaps perpetual) water treatment, site maintenance, and monitoring will be needed after closure to protect the environment and meet water quality standards. We don't believe that this meets the goal of a maintenance free closure, which is required under MN Rule 6132.3200. . . Regardless of how this issue is described or strategically worded in the document, it is our understanding that the project will require long term/perpetual monitoring, maintenance, and treatment. We would argue that a timeframe of potentially hundreds of years should be considered perpetual rather than long term. This will not constitute a site that is maintenance free at closure.</p> | <p><i>Minnesota Rules</i> 6132.3200, Closure and Postclosure Maintenance, identifies several goals for non-ferrous mining areas, including sites be closed so that they are maintenance-free. A maintenance-free site is the goal of the MDNR for the NorthMet Project Proposed Action, as it is for every mining site. The NorthMet Project Proposed Action includes piloting of non-mechanical treatment system to move in the direction of achieving the goal. PolyMet would include funds in its reclamation cost estimate and financial assurance package to fund mechanical water treatment for as long as necessary. Any Permit to Mine would also require PolyMet to present a plan for eventual transition from mechanical water treatment to non-mechanical treatment. PolyMet cannot be released from its responsibilities, including financial assurance requirements, until there is no longer a need for closure/post-closure treatment/maintenance. Financial assurance is a component of any Permit to Mine, to ensure necessary maintenance can be provided for as long as it necessary.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | PER 04                                                  |
| 3113                                                                 | <p>Effectiveness of the proposed water treatment and seep collection methods are vital to the project meeting water quality standards. Analysis and design detail are lacking in the SDEIS as a whole. More detail is needed on water treatment and seep collection, including long-term operation and maintenance, since they are essential components of the project meeting environmental standards.</p>                                                                                                                                                                                                                                                                                                                                           | <p>The FEIS relies on revised cross-section models to evaluate containment systems on the northern, northwestern, and western sides of the Tailings Basin, which are documented in PolyMet 2015j (as cited in the FEIS). These new models considered the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The new models explicitly consider groundwater flow in bedrock below the slurry wall and at the contact between the slurry wall and bedrock. The model results predicted that the overall capture efficiencies of the proposed Tailings Basin containment systems (with bedrock flow) would be substantially greater than 90%.</p> <p>FEIS Figure 3.2-28 has been revised to show that the slurry wall is keyed into bedrock.</p> <p>Engineered systems can operate successfully over long periods of time if they are properly monitored and maintained. FEIS Section 5.2.2 provides a comprehensive description of proposed water treatment and seep collection systems including groundwater containment and synthetic liners/covers. This includes conceptual designs and discussions of the types of monitoring used to assess performance. Detailed designs are provided in supporting documents, which are fully referenced in the FEIS. The FEIS also discusses</p> | PD 35<br>WR 019<br>WR 128<br>WR 143<br>WR 144<br>WR 148 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>long-term operation, maintenance, and periodic replacement of engineered systems. It is acknowledged that certain components of the engineered systems would need to be replaced when monitoring indicates that performance is marginal and not readily compensated for by adaptive mitigation measures.</p> <p>A detailed financial assurance analysis would be part of the permitting phase and is not a required component of the FEIS. The financial assurance process would fully consider long-term monitoring and periodic replacement of equipment including, but not limited to, water treatment hardware and synthetic liners and covers. The Financial Assurance package for the NorthMet Project Proposed Action would ensure that future funding would be available if and when adaptive mitigation measures or component replacements are needed to achieve performance specifications.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                  |
| 3114       | <p>The seep collection system is modeled to have a capture efficiency of 90%. Description is needed on how this efficiency rate was determined. We question if such a high capture rate can be achieved, and it would be helpful to include examples and citations of other projects operating seep collections at that efficiency rate. Further, if such capture rates are not achieved, impacts to water quality and quantity should be described in the SDEIS.</p> | <p>The Co-lead Agencies acknowledge that there are existing water containment systems at other mine sites that do not operate with a high degree of capture, but these are different designs and cannot be directly compared to the system proposed for the NorthMet Project Proposed Action. The proposed containment system uses pumping on the tailings side and reinjection after treatment on the downgradient side to reverse hydraulic gradients across the slurry wall and in underlying bedrock. Relatively few containment systems have been built with this degree of pumping and reinjection to ensure effective capture. The conceptual hydraulics of this type of system provides evidence that it would achieve complete or nearly complete capture.</p> <p>The FEIS describes a 2014 field program that investigated bedrock along the alignment of the proposed containment system on the northern, northwestern, and western sides of the Tailings Basin in FEIS Section 4.2.2.3.1. This investigation provided field data on bedrock hydraulic conductivity, Rock Quality Designation, and depth to top of bedrock. This information was used to develop revised MODFLOW cross-section models to evaluate containment system efficiencies on the northern, northwestern, and western sides of the Tailings Basin, which are documented in the revised Plant Site Water Modeling Data Package (PolyMet 2015), as cited in the FEIS).</p> <p>These revised cross section models considered the presence of an upper more permeable bedrock zone directly below the slurry wall, with hydraulic properties based on 2014 packer tests conducted in five boreholes along the proposed containment system alignment. Sensitivity analyses included</p> | WR 018<br>WR 020 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | variable bedrock hydraulic conductivity and different upper bedrock zone thicknesses up to 100 feet. The model results predict that the overall capture efficiencies of the proposed Tailings Basin containment systems would be substantially greater than 90%. It is the position of the Co-lead Agencies that the assumption in the Plant Site GoldSim model of 90% or greater capture efficiency is justified by the analyses performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| 3115       | <p>Concern also exists over the methods used to estimate Partridge River baseflow (Section 5.2.2.2.2). XP-SWMM model estimates of Partridge River baseflow presented in the SDEIS have been found to be three times lower than observed values. The XP-SWMM projections, which are based on data from 17 miles away collected from 1978 to 1987, do not align with the rating curve from recent Minnesota Department of Natural Resources (MDNR) winter monitoring data, or the results of the Great Lakes Indian Fish and Wildlife (GLIFWC) projections taken from two years of recent data from the Dunka Road gage in the XP-SWMM model. Co-Lead Agencies have been working with Cooperating Agencies on this issue, but it needs to be addressed in the SDEIS regarding how it may affect modeling results. The models may be under-predicting the amount of water and contaminant load that will need to be treated and contained at the Mine Site. Questions have also arisen on data use, including if new data is being utilized and how existing data was selected (or not selected) for use.</p> | <p>Groundwater baseflows used in the SDEIS are best-estimate values and should be retained in the FEIS. This is because the SDEIS groundwater baseflow values were based on 1) winter 1986-87 and winter 1987-88 stream gaging in the Partridge River at SW-006 that occurred when there were no discharges from the Northshore Mine and 2) 1942 to 1963 gaging data in the Embarrass River, which includes years prior to the LTV tailings basin startup (1957). When expressed as a groundwater baseflow yield per unit area, the similar results for both watersheds (approximately 0.05 cfs per square mile) supports the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota. Studies have shown that streamflow characteristics in this part of Minnesota have not changed systematically over the last 50 years.</p> <p>The only other available gaging data is from a station installed during 2011 at SW-003 on the Partridge River. Interpretation of groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater baseflow due to the complicating effects of Northshore Mine pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>More broadly, groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms continued reliance on the 1986-87 USGS data for the FEIS is reliable.</p> <p>To better understand the relationship of groundwater baseflow to the GoldSim model's water quality impact projections, a sensitivity analysis for the Mine Site was conducted to evaluate if predicted NorthMet Project Proposed Action impacts are sensitive to groundwater baseflow values. The sensitivity analysis considered the relationship of various model inputs to groundwater baseflow including hydraulic conductivity, recharge, and surface runoff chemical concentrations. It also reflected consideration of the flow data collected at SW-003 in requiring groundwater baseflows at all</p> | WR 003<br>WR 175 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                           | locations on the Partridge River be increased by a factor of 4 (e.g., 0.5 to 2 cfs at SW-003). The results indicate that modeled groundwater and surface water concentrations are sensitive to changes in groundwater baseflow. However, the NorthMet Project Proposed Action's ability to meet groundwater quality and surface water quality evaluation criteria is not sensitive to changes in baseflow. Evaluation criteria can be found in Section 5.2.2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                            |
| 3116       | Questions have also arisen on data use, including if new data is being utilized and how existing data was selected (or not selected) for use. Additional analyses should be performed and included in the SDEIS that investigate how the XP-SWMM model predictions may change with using the new baseflow measurements for the Partridge River to calibrate the model, and how that may affect the MODFLOW and GoldSIM model predictions. | <p>Mine Site groundwater baseflows used in the SDEIS and FEIS are reliable. This is because the SDEIS and FEIS groundwater baseflow values were based on winter 1986-77 and winter 1987-88 stream gaging in the Partridge River that occurred when there were no discharges from the Northshore Mine. When expressed as a groundwater baseflow yield per unit area, the similar results for both the Partridge and Embarrass River watersheds (approximately 0.05 cfs per square mile) lends credibility to the approach used. The yield per unit area is similar to other watersheds in Northern Minnesota.</p> <p>Interpretation of groundwater baseflow derived from new data collection at SW003 is not reliable due to the complicating effects of Northshore Pit pumped discharges, seepage from the Northshore Western Pond, and complex storage/release mechanisms in the wetlands that receive these flows.</p> <p>The Mine Site MODFLOW model was re-calibrated based on new groundwater level data collected through the end of 2013; however, calibrations performed for the FEIS used the same Partridge River baseflows as were used in SDEIS. Revised hydraulic conductivities and recharge values that come from MODFLOW recalibration informed the FEIS Mine Site GoldSim model.</p> <p>Groundwater baseflow discharge varies with time and is a reflection of longer-term weather and climatic conditions. The variability of groundwater baseflow discharge is demonstrated by the examination of estimated values for several years using different methods. Evaluation of these values affirms that groundwater baseflows used in the Mine Site GoldSim model are reliable and appropriate for FEIS impact evaluation.</p> | WR 003<br>WR 091<br>WR 165 |
| 3118       | It is our understanding that MODFLOW modeling does not account for any water to move east from the tailings basin. The head differential between the tailings basin and surrounding elevation may push water through the east side of the basin,                                                                                                                                                                                          | <p>In response to these issues, the Plant Site MODFLOW model was modified and recalibrated as follows:</p> <p>1) Updated areal distribution of surficial deposits and bedrock outcrops, 2) established surficial deposits below and adjacent to the East Embankment,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | WR 093                     |

|            | potentially forming a lake. Significant uncertainties exist with groundwater flows and related contaminated water transport.                                                                                                                                                                                              | <p>3) used drain or river cells along the East Embankment to allow surface seepage of tailings water, 4) incorporated the hydrologic effects of the future swale to drain surface water from the East Embankment area, 5) recalibrated model material properties and boundary conditions using all available data through 2013 (this is mostly new hydraulic head information), and 6) expanded the use of river and drain cells to provide a more accurate representation of wetlands outside the Tailings Basin.</p> <p>As a result of these changes, the FEIS Plant Site MODFLOW model no longer has a no-flow boundary condition at the toe of the East Embankment, and river and/or drain cells in surficial deposits are in place to allow the potential for surface seepage along the embankment toes (See Attachment A, Plant Site Water Modeling Data Package [PolyMet 2015], as cited in the FEIS)). The model was checked to ensure that hydraulic heads in the tailings and adjacent surficial deposits were not well above ground surface. In the FEIS Plant Site MODFLOW model, storage coefficients for the surficial deposits and bedrock outcrops were assigned and/or calibrated to be more in line with literature values for these types of materials.</p> |                  |
| 3119       | <p>We disagree with the conclusion in the SDEIS that the PolyMet project will not have any impacts on surface or ground water hydrology in the Partridge and Embarrass Rivers (Section 5.2.2, page 5-8). Augmenting stream flow to tributaries with treated and Colby Lake water will impact surface water hydrology.</p> | <p>The FEIS assesses the potential for the NorthMet Project Proposed Action to affect surface and groundwater hydrology for the Partridge and Embarrass Rivers. The FEIS updates this analysis in FEIS Sections 5.2.2.3.2 and 5.2.2.3.3 respectively.</p> <p>The FEIS acknowledges that the NorthMet Project Proposed Action would alter stream flows relative to existing conditions. However, the flows would be similar to existing conditions. Where and when necessary, surface streams would receive treated augmentation water to maintain stream flow to within +/- 20% of existing flows. The augmentation water would generally consist of water obtained from the containment systems or mine pits, and treated at the WWTF or WWTP prior to discharge.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | WR 107<br>WR 183 |
| 3121       | <p>We believe that the interaction of the project's impacts with natural variability in precipitation would be more adverse than reported in the SDEIS. This is because effects of climatic variability are additive to the project-related change, which would be especially true for drier periods.</p>                 | <p>Estimates of monthly and annual rainfall amounts were based on best available data obtained from weather stations near the NorthMet Project Proposed Action site. In the GoldSim models, these parameters were treated as uncertain inputs and assigned probability distributions to capture the range of possible future conditions. While climate change may occur in the future, it cannot be stated at this time if in the long-term there would be more or less rainfall. Thus, the probabilistic approach to rainfall used in GoldSim represents a technically defensible method for dealing with this issue.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | WR 077<br>WR 180 |

|            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Individual storm events and frequency are not incorporated into the GoldSim models. Rainfall inputs are monthly and annual. The effects of individual storms are considered by designing facilities to handle a 100-year, 24-hour storm event based on current data. If over time, climate change causes a gradual increase in annual rainfall, the 100-year storm event would be redefined to a larger precipitation value and mine facilities would be upgraded to handle a larger storm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                      |
| 3123       | It is also noted in section 5.2.3 (Wetlands) that indirect effects on wetlands are expected due to groundwater drawdown. Groundwater drawdown will impact groundwater hydrology and its connectivity to the surficial aquifer, which will likely impact surface water hydrology.                                                                                                                                                                                                                                                                | Using an observational approach based on data from similar nearby mine sites (i.e., analog method), the Co-lead Agencies concluded that drawdowns in the surficial aquifer would not be expected to extend very far from the mine pits. This is explained by the following factors: 1) the surficial aquifer is thin and moderately permeable, 2) the surficial aquifer is subject to aerial recharge, and 3) the surficial aquifer is underlain by low-permeability bedrock that limits downward leakage from the surficial unit. These factors support the conclusion that wetland drawdown did not need to be included in the Mine Site GoldSim model. See FEIS Section 5.2.2.3.2 for more information on the analog method.<br><br>It is acknowledged that there is some degree of hydraulic interaction between wetlands and the surficial aquifer at the Mine Site. However, attempts to quantitatively model the effects of these interactions on drawdown and water quality would be highly uncertain and potentially misleading. The FEIS approach was to not model hydraulic connections between wetlands and the surficial aquifer in the Mine Site GoldSim model, but rely on future monitoring and adaptive mitigation measures in the event that some wetlands are affected by the NorthMet Project Proposed Action. See FEIS Sections 5.2.2.3.6 and 5.2.2.3.5 for more information on closure monitoring and adaptive mitigation. | WET 15<br>WR 053<br>WR 086<br>WR 166 |
| 3124       | Disagreement exists over application of the 10 mg/L wild rice sulfate standard (Section 5.2.2.1.2, page 5-21). Although some of these comments relate more to Minnesota Pollution Control Agency (MPCA) determinations and permitting issues, they are important considerations for the project to meet water quality standards and should be clearly addressed in the SDEIS. It is arbitrary to define how much rice presence is required for an area to be defined as a water used for the production of wild rice, especially given the lack | The FEIS recognizes the MPCA is overseeing a variety of studies on wild rice beds. At applicable surface water locations, the FEIS evaluated impacts using an impact criteria based on the current MPCA 10 mg/L standard for sulfate concentration in waters used for the production of wild rice. This impact assessment metric is keyed to the current regulation.<br><br>It is recognized that the MPCA is currently evaluating the current wild rice sulfate water quality standard and, as part of that process, new information on potential contributing factors on the growth of wild rice beds has been generated. However, that information has not yet been holistically reviewed in the context of its possible influence on the wild rice bed standard. Future change to the wild rice sulfate standard, if any, is speculative and outside                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | PER 10<br>WR 152<br>WR 154           |

|            | <p>of long-term monitoring data in the receiving waters of this project. Application of this standard may be evolving/changing as research has been completed and the standard is currently being evaluated by the MPCA. Wild rice exists upstream in the Embarras River from the draft MPCA staff recommended definitions of water used for production of wild rice (compliance points). In the Partridge River, the 2009 survey identified rice near SW-004b, also upstream of the proposed compliance point. Barr Engineering conducted the survey and has indicated a possible error in the 2009 survey, bringing into question the accuracy of these upstream wild rice locations in the Partridge River. Currently, the wild rice water quality standard is not being met in portions of the Embarras and Partridge river systems. The SDEIS states that the wild rice sulfate standard would be met for the Embarras River, assuming the containment and seepage collection system would capture seepage presently going to the Embarras tributaries. However, the Partridge River will exceed the standard during low-flow conditions. We question how this will be handled in permitting.</p> | <p>the scope of the FEIS; applying research findings outside the basis of the current rule is not appropriate.</p> <p>The FEIS includes descriptions of the Plant Site WWTP and Mine Site WWTF, both of which would be capable of discharging treated wastewater at concentrations at or below 10 mg/L as demonstrated by pilot-testing already conducted. More detailed information on these treatment systems would be available as part of the permitting process. However, should a more stringent standard be developed in the future, operation of the reverse osmosis treatment systems could be adjusted to meet a more stringent effluent limit.</p> <p>During permitting, the MPCA would evaluate the latest water quality modeling results at the MPCA staff-recommended wild rice production water closest to the mine site, to ensure that surface water uses are being protected. Appropriate mitigation and monitoring would be required if and when a permit is drafted.</p> |          |
| 3125       | <p>Disagreement also exists over the current MPCA staff recommendation of seasonal application of the wild rice sulfate standard from April 1 through August 31 (page 5-25). Application of this standard may be evolving/changing as research has been completed and the standard is currently being evaluated. According to SDEIS, PolyMet is seeking seasonal application [April 1 through August 31] of the standard during non-mechanical water treatment after closure. If seep collection and water treatment do not work as planned (substantial assumptions without a lot of detail), the seasonal discharge may become a larger issue. The SDEIS states that this is beyond the scope of</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>PolyMet is not seeking a seasonal application of the wild rice sulfate standard. Neither seasonal application of the wild rice standard nor non-mechanical treatment systems are part of the NorthMet Project Proposed Action, which relies solely on mechanical treatment and year-round application of the sulfate standard. Non-mechanical treatment may be considered during operations and closure if pilot studies demonstrate their utility and cost-effectiveness for water treatment and water disposal.</p> <p>The NorthMet Project Proposed Action, as proposed, relies on well-tested mitigation and mechanical treatment technologies. Non-mechanical treatment effectiveness in decreasing the concentration of sulfate and other parameters would need to be proven through bench and pilot testing before it would be relied upon to meet water quality standards.</p>                                                                                                    | WR 153   |
