

NorthMet Mining Project and Land Exchange

Preliminary Final Environmental Impact Statement

June 2015

Prepared by

**Minnesota Department of Natural Resources
United States Army Corps of Engineers
United States Forest Service**

This document is a working document. This document may change over time as a result of new information, further deliberation, or other factors not yet known to the Co-lead Agencies.

1 **TABLE OF CONTENTS – OVERVIEW**

2 **VOLUME I**

- 3 Table of Contents
- 4 List of Tables
- 5 List of Figures
- 6 List of Acronyms/Abbreviations
- 7 Glossary
- 8 Executive Summary
- 9 1.0 Introduction
- 10 2.0 EIS Development
- 11 3.0 Proposed Action and Alternatives
- 12 4.0 Affected Environment
- 13 List of Preparers
- 14 List of References

15 **VOLUME II**

- 16 Table of Contents
- 17 List of Tables
- 18 List of Figures
- 19 List of Acronyms/Abbreviations
- 20 Glossary
- 21 5.0 Environmental Consequences
- 22 6.0 Cumulative Effects
- 23 7.0 Comparison of Alternatives and Other Considerations
- 24 8.0 Major Differences of Opinion
- 25 List of Preparers
- 26 List of References

27 **VOLUME III**

- 28 Appendix A Response to Comments on the NorthMet Mining Project and Land Exchange
- 29 Draft and Supplemental Draft EIS

30 **VOLUME IV**

- 31 (Provided electronically with the PFEIS)
- 32 Appendix B Underground Mining Alternative Assessment for the NorthMet Mining Project
- 33 and Land Exchange Environmental Impact Statement
- 34 Appendix C Tribal Agency Position Supporting Materials
- 35 Appendix D Biological Assessment and Biological Evaluation (to be provided with the FEIS)

45 EXECUTIVE SUMMARY ES-1

46 1.0 INTRODUCTION 1-1

47 1.1 OVERVIEW 1-1

48 1.1.1 NorthMet Project 1-5

49 1.1.2 Land Exchange 1-9

50 1.2 EIS ROLES AND RESPONSIBILITIES 1-9

51 1.2.1 Co-lead Agencies 1-9

52 1.2.2 Cooperating Agencies 1-10

53 1.2.3 Other Agencies 1-10

54 1.3 PURPOSE AND NEED 1-11

55 1.3.1 Applicant’s Purpose and Need Statement 1-11

56 1.3.2 Co-lead Agencies’ Purpose and Need Statements 1-11

57 1.4 REGULATORY FRAMEWORK 1-13

58 1.4.1 National Environmental Policy Act 1-13

59 1.4.2 Minnesota Environmental Policy Act 1-14

60 1.4.3 Land Exchange Requirements 1-14

61 1.4.4 Other Permits and Requirements 1-16

62 1.4.5 Financial Assurance 1-18

63 1.5 PURPOSE OF THE FEIS 1-18

64 1.6 ORGANIZATION OF THE FEIS 1-18

65 1.7 CONSTITUENTS OF INTEREST 1-19

66 2.0 EIS DEVELOPMENT 2-1

67 2.1 INTRODUCTION 2-1

68 2.2 DEIS DEVELOPMENT 2-3

69	2.2.1	NorthMet Project Scoping	2-3
70	2.2.2	Identification of Issues.....	2-3
71	2.2.3	DEIS Proposed Action and Alternatives.....	2-4
72	2.2.4	Impact Analysis	2-4
73	2.2.5	DEIS Publication	2-4

1 GLOSSARY

2 **1854 Treaty Authority:** An inter-tribal natural
3 resource management agency that manages the off-
4 reservation hunting, fishing, and gathering rights of
5 the Grand Portage and Bois Forte Bands of the Lake
6 Superior Chippewa in the territory ceded under the
7 Treaty of 1854.

8 **1854 Treaty of La Pointe:** In 1854, the Chippewa of
9 Lake Superior entered into a treaty with the United
10 States whereby the Chippewa ceded to the United
11 States ownership of their lands in northeastern
12 Minnesota. These lands are generally known as the
13 “1854 ceded territory.” Article 11 of the 1854 Treaty
14 provides, “...*And such of them as reside in the*
15 *territory hereby ceded, shall have the right to hunt*
16 *and fish therein, until otherwise ordered by the*
17 *President.*” The Chippewa of Lake Superior who
18 reside in the ceded territory are the Fond du Lac,
19 Grand Portage, and Bois Forte Bands.

20 **Acid rock drainage:** Produced by the oxidation of
21 sulfide minerals, chiefly iron pyrite disulfide (FeS₂).
22 This is a natural chemical reaction which can proceed
23 when minerals are exposed to air and water. Acidic
24 drainage is found around the world, as a result of both
25 naturally occurring processes and activities associated
26 with land disturbances, such as highway construction
27 and mining where acid-forming minerals are exposed
28 to air. These acidic conditions can cause metals in
29 geologic materials to dissolve, which can lead to
30 impairment of water quality when acidic and metal-
31 laden discharges enter waters used by terrestrial and
32 aquatic organisms.

33 **Ad valorem tax:** A tax based on the value to real
34 estate or personal property. Municipal ad valorem
35 taxes are also known as “property taxes.”

36 **Adverse effect (for cultural resources):** A
37 significant alteration to the qualifying characteristics
38 of a historic property included in or eligible for
39 inclusion in the National Register.

40 **Adverse effect:** A harmful or undesired effect from
41 the proposed project on the environment.

42 **AERMOD air dispersion model:** The United States
43 Environmental Protection Agency (USEPA)-approved
44 model designed to predict short-range (up to 50
45 kilometers) dispersion of air pollutant emissions from
46 stationary industrial sources.

47 **Air dispersion model:** A computer program that
48 incorporates a series of mathematical equations used
49 to predict downwind concentrations in the ambient air
50 resulting from emissions of a pollutant. Inputs to a
51 dispersion model include the emission rate;
52 characteristics of the emission release such as stack
53 height, exhaust temperature, and flow rate; and
54 atmospheric dispersion parameters such as wind speed
55 and direction, air temperature, atmospheric stability,
56 and height of the mixed layer.

57 **Airblast overpressure:** A transient air pressure, such
58 as the shock wave from an explosion, that is greater
59 than the surrounding atmospheric pressure.

60 **Ambient air quality:** The quality of the portion of the
61 atmosphere, external to buildings, to which the public
62 has general access.

63 **Ammonium nitrate fuel oil (ANFO):** Primary
64 blasting agent used in open-pit mining; a mixture of
65 solid ammonium nitrate and liquid fuel oil.

66 **Amphibole:** A class of silicate minerals containing
67 iron and magnesium.

68 **Anthropogenic:** Relating to or resulting from the
69 influence of human beings on nature.

70 **Aquatic biota:** Collective term describing the
71 organisms living in or depending on the aquatic
72 environment.

73 **Aquifer:** A subsurface saturated rock unit or
74 formation of sufficient permeability to transmit
75 groundwater and yield usable quantities of water to
76 wells and springs.

77 **Archaeological site:** The physical remains of any area
78 of human activity, generally greater than 50 years of
79 age, for which a boundary can be established.
80 Examples of such resources could include
81 domestic/habitation sites, industrial sites, earthworks,
82 mounds, quarries, canals, roads, etc. Under the general
83 definition, a broad range of site types would qualify as
84 archaeological sites without the identification of any
85 artifacts.

86 **Archaic period:** A cultural period circa 9,000 to
87 3,000 years ago, or 7,000 to 1,000 B.C.; its
88 characteristic features included semi-permanent
89 seasonal camps, atlatls and bannerstones, deer
90 hunting, some copper tools, and the first long-distance
91 trade.

92 **Area of Potential Effect (APE):** The geographic
93 region in which a historic or cultural property may be
94 impacted as a result of the construction and operation
95 of the NorthMet Project Proposed Action or
96 alternatives.

97 **Attainment:** Air quality in the locality that meets the
98 established standards.

99 **Augmentation:** The act of adding treated water to
100 replace affected surface water flows.

101 **Autoclave:** A mineral processing pressure vessel for
102 conducting chemical reactions such as sulfide mineral
103 oxidation and leaching of metals.

104 **Batholith:** A large emplacement of igneous intrusive
105 rock that forms from cooled magma deep in the
106 earth's crust.

107 **Bedrock isopach map:** A map of the bedrock
108 thickness within a tabular unit or stratum, usually
109 illustrated with contour lines.

110 **Bedrock outcrop:** A visible exposure of bedrock on
111 the surface of the earth.

112 **Beneficiation:** Crushing and separating ore into
113 valuable substances or waste.

114 **Bentonite:** An absorptive and colloidal clay used
115 especially as a sealing agent or suspending agent.

116 **Best Available Control Technology (BACT):** An
117 emission limitation (including a visible emission
118 standard) based on the maximum degree of reduction
119 for each pollutant subject to regulation under the
120 Clean Air Act that would be emitted from any
121 proposed major stationary source or major
122 modification, taking into account energy,
123 environmental, and economic impacts and other costs.

124 **Best Management Practice (BMP):** The schedule of
125 activities, prohibition of practices, maintenance
126 procedures, and other management practices to avoid
127 or minimize pollution or habitat destruction to the
128 environment. BMPs can also include treatment
129 requirements, operating procedures and practices to
130 control runoff, spillage, or leaks; sludge or waste
131 disposal; or drainage from raw material storage.

132 **Bioaccumulation:** The accumulations of chemicals in
133 the tissue of organisms through any route, including
134 respiration, ingestion, or direct contact with
135 contaminated water or sediments.

136

137 **Bioassay:** A type of scientific experiment that is
138 typically conducted to measure the effects of a
139 substance on a living organism and is essential in
140 monitoring environmental pollutants.

141 **Biodiversity:** The degree of variation in lifeforms
142 within a given species, ecosystem, or biome. It is a
143 measure of the health of ecosystems.

144 **Biotic community:** A group of interdependent
145 organisms inhabiting the same region and interacting
146 with each other.

147 **Biwabik Iron Formation:** An approximately 1.9-
148 billion-year-old sequence of iron-rich sedimentary
149 rocks that was metamorphosed at its easternmost
150 extent by approximately 1.1-billion-year-old
151 intrusions of the Duluth Complex.

152 **Brownfield site:** Abandoned or underutilized
153 industrial or commercial property available for reuse
154 which may be contaminated by the presence or
155 potential presence of a hazardous substance or
156 pollutant.

157 **Buffer zone:** An area or region distinguished from
158 adjacent parts by a distinctive feature or characteristic.

159 **Calcareous fen:** Rare and distinctive wetlands
160 characterized by a substrate of non-acidic peat and
161 dependent on a constant supply of cold, oxygen-poor
162 groundwater rich in calcium and magnesium
163 bicarbonates.

164 **CALPUFF model:** The USEPA-approved non
165 steady-state puff dispersion model that simulates the
166 effects of time- and space-varying meteorological
167 conditions on pollution long-range transport,
168 transformation, and removal. CALPUFF can be
169 applied in complex terrain conditions.

170 **Class I area:** Under the Clean Air Act, a Class I area
171 is one in which some criteria pollutants, visibility, and
172 other air quality related values (AQRVs) are protected
173 more stringently than under the national ambient air
174 quality standards. Class I areas include national parks,
175 wilderness areas, monuments, and other areas of
176 special national and cultural significance.

177 **Class II area:** Under the Clean Air Act, Class II areas
178 are all areas that have been demonstrated to be in
179 attainment with the federal National Ambient Air
180 Quality Standards that are not designated as Class I
181 areas; modest increments of new pollution would be
182 allowed.

183

184 **Clean Air Act (CAA):** The Clean Air Act of 1970 is
185 a United States federal law intended to control air
186 pollution and protect air quality. The act—which
187 underwent major revisions in 1990 and 2003—deals
188 with ambient air pollution (that which is present in the
189 ambient air) as well as source-specific air pollution.
190 The Clean Air Act sets standards for air quality that
191 limit the amount of various pollutants to specified
192 levels. The Clean Air Act also sets deadlines for
193 governments and industries to meet the standards. The
194 federal USEPA is ultimately responsible for
195 establishing national standards and enforcing the
196 Clean Air Act. State and local authorities that have
197 approved plans to control air pollution are given local
198 authority by the USEPA to administer these
199 regulations.

200 **Clean Air Interstate Rule (CAIR):** The USEPA
201 issued the CAIR in March 2005. This rule provides
202 states with a solution to the problem of power plant
203 pollution that drifts from one state to another. The rule
204 uses a cap and trade system to reduce target
205 pollutants—sulfur dioxide (SO₂) and nitrogen oxides
206 (NO_x)—by 70 percent.

207 **Clean Water Act (CWA):** A federal act that
208 establishes the basic structure for regulating
209 discharges of pollutants into the waters of the United
210 States and regulating quality standards for surface
211 waters. The basis of the Act was enacted in 1948 and
212 was called the federal Water Pollution Control Act,
213 but the Act was significantly reorganized and
214 expanded in 1972. “Clean Water Act” became the
215 Act’s common name with amendments in 1972. Under
216 the Clean Water Act, the United States has
217 implemented pollution control programs including
218 industrial wastewater standards and water quality
219 standards for all contaminants in surface waters. The
220 Act has made it unlawful to discharge any pollutant
221 from a point source into navigable waters, unless a
222 permit is obtained.

223 **CWA Section 404 Permit:** Permit that authorizes the
224 discharge of dredged or fill material into waters of the
225 United States, including many wetlands.
226 Responsibility for implementing Section 404 is shared
227 by the United States Army Corps of Engineers
228 (USACE) and USEPA.

229 **Closure:** The process of terminating and completing
230 final steps in reclaiming any specific portion of a
231 mining operation. Closure begins when, as prescribed
232 in the Permit to Mine, there will be no renewed use or
233 activity by the permittee.

234

235 **Coarse tailings:** 50% or more of waste byproducts of
236 mineral beneficiating processes other than heap and
237 dump leaching, is retained on a No. 200 sieve and
238 consists of rock particles, which have usually
239 undergone crushing and grinding, from which the
240 profitable mineralization has been separated.

241 **Comprehensive Environmental Response,
242 Compensation, and Liability Act (CERCLA):**
243 Commonly known as Superfund, legislation enacted
244 in 1980 which created a tax on the chemical and
245 petroleum industries and provided broad federal
246 authority to respond directly to releases or threatened
247 releases of hazardous substances that may endanger
248 public health or the environment.

249 **Comprehensive Land Use Plan:** A document
250 adopted by local elected officials that establishes
251 policies and guidance for land use, municipal growth,
252 public services, and infrastructure. Comprehensive
253 plans can provide the rationale and legislative basis
254 for local zoning and subdivision ordinances.

255 **Coniferous bog recharge:** The amount of
256 precipitation that maintains and refills coniferous
257 bogs, which are perched wetlands with generally no
258 groundwater connection.

259 **Connected action:** According to Council on
260 Environmental Quality (CEQ) regulations (40 CFR
261 Part 1508.25), actions are connected if they
262 automatically trigger other actions which may require
263 environmental impact statements, cannot or will not
264 proceed unless other actions are taken previously or
265 simultaneously, and/or are interdependent parts of a
266 larger action and depend on the larger action for their
267 justification.

268 **Consent decree:** Also referred to as a consent order,
269 this is a final, binding judicial decree or judgment
270 memorializing a voluntary agreement between parties
271 to a suit or dispute in return for withdrawal of a
272 criminal charge or an end to a civil litigation. In a
273 typical consent decree, the defendant has already
274 ceased or agrees to cease the conduct alleged by the
275 plaintiff to be illegal and consents to a court injunction
276 barring the conduct in the future.

277 **Consultation (for cultural resources):** The process
278 of seeking, discussing, and considering the views of
279 other participants, and, where feasible, seeking
280 agreement with them regarding matters arising in the
281 Section 106 process. The Secretary’s “Standards and
282 Guidelines for federal Agency Preservation Programs
283 pursuant to the National Historic Preservation Act”
284 provide further guidance on consultation.

285 **Contact period:** Relating to the period of initial
286 interaction between an indigenous people with an
287 outside culture. In the United States, the term refers to
288 an era of initial interaction between Native Americans
289 and Europeans.

290 **Cooperating Agency:** According to CEQ regulations
291 (40 CFR Part 1508.5), “Cooperating Agency” means
292 any federal agency other than a lead agency which has
293 jurisdiction by law or special expertise with respect to
294 any environmental impact involved in a proposal (or a
295 reasonable alternative) for legislation or other major
296 federal action significantly affecting the quality of the
297 human environment.

298 **Council on Environmental Quality (CEQ):** An
299 agency within the Executive Office of the President
300 that established the procedures to implement the
301 National Environmental Policy Act of 1970.
302 Regulations are found in 40 CFR 1500, et seq.

303 **Criteria air pollutant:** Seven common air pollutants
304 for which the USEPA has set primary (may harm
305 human health) or secondary (may affect the
306 environment and/or cause property damage) national
307 air quality standards. These pollutants are: particulate
308 matter less than or equal to 10 microns in size,
309 particulate matter less than or equal to 2.5 microns in
310 size, sulfur dioxide, nitrogen dioxide, carbon
311 monoxide, ozone, and lead.

312 **Cubic feet per second:** The rate of flow representing
313 a volume of 1 cubic foot passing a given point in 1
314 second.

315 **Culpability Analysis:** The relative contribution of
316 various contaminant sources to the overall
317 contaminant load at a specific evaluation location.

318 **Cultural resources:** Archaeological, traditional, and
319 built environment resources, including but not
320 necessarily limited to buildings, structures, objects,
321 districts, and sites.

322 **Cumulative effect:** The effects on the environment
323 that would result from the incremental effect of the
324 NorthMet Project Proposed Action when added to
325 other past, present, and reasonably foreseeable future
326 actions, regardless of who undertakes such actions.
327 Cumulative effects can result from individually minor
328 but collectively significant actions taking place over a
329 period of time.

330 **Cutoff trench:** A trench which is below the
331 foundation base line of a dam or other structure and is
332 filled with an impervious material, such as clay or
333 concrete.

334 **Cuyuna Range:** An iron range to the southwest of the
335 Mesabi Range, largely between Brainerd and Aitkin
336 within Crow Wing County, Minnesota.

337 **Density factor:** A pre-determined qualitative value
338 which is then assigned to wild rice stands based on the
339 density of wild rice present.

340 **Detection limit:** The lowest quantity of a material that
341 can be detected from the absence of that material
342 within a stated confidence.

343 **Direct effect (for cultural resources):** A physical
344 alteration to the qualifying characteristics of a historic
345 property included in or eligible for inclusion in the
346 National Register.

347 **Disseminated sulfide:** Deposits of sulfide minerals
348 which are distributed more or less uniformly within
349 the surrounding waste rock.

350 **Dissolved oxygen:** The amount of gaseous oxygen
351 dissolved into an aqueous solution, whether through
352 diffusion from the air, aeration by agitation, or as a
353 waste product of photosynthesis.

354 **Drawdown:** The lowering of the water level relative
355 to a background condition.

356 **Drift:** Material such as sand, clay, gravel, and rocks
357 transported and deposited by a glacier or glacial
358 process.

359 **Drilling log:** A record of events or features of the
360 formations penetrated or encountered during boring.
361 Also known as a boring log.

362 **Duluth Complex:** A mafic intrusive igneous
363 geological formation with quantities of copper, nickel,
364 cobalt, platinum, palladium, and gold. The Duluth
365 Complex lies at the eastern end of the Mesabi Iron
366 Range in northeastern Minnesota.

367 **Ecological land type:** A hierarchical level of the
368 National Hierarchical Framework of Ecological Units
369 and Ecological Classification System that is
370 determined based on differences in vegetation, soils,
371 climate, geology, and/or hydrology.

372 **Effect (for cultural resources):** Alteration to the
373 qualifying characteristics of a historic property
374 included in or eligible for inclusion in the National
375 Register.

376 **Effluent:** An outflow or discharge of a liquid.
377

378 **Eligible (for cultural resources):** Cultural properties
379 formally determined as such in accordance with the
380 regulations of the Secretary of the Interior and all
381 other properties that meet the National Register
382 criteria.

383 **Emergency Planning and Community Right-to-
384 Know Act (EPCRA):** A federal act enacted in 1986
385 to help communities plan for emergencies involving
386 hazardous substances. It establishes requirements for
387 federal, state, and local governments; Indian tribes;
388 and industry regarding emergency planning and
389 “Community Right-to-Know” reporting on hazardous
390 and toxic chemicals.

391 **Endangered Species:** The classification provided to
392 an animal or plant in danger of extinction within the
393 foreseeable future throughout all or a significant
394 portion of its range as defined in the Endangered
395 Species Act (ESA).

396 **Endangered Species Act:** A federal act enacted in
397 1973 to provide for the conservation of ecosystems
398 upon which threatened and endangered species of fish,
399 wildlife, and plants depend. The ESA authorizes the
400 determination and listing of species as endangered and
401 threatened, and prohibits unauthorized taking,
402 possession, sale, and transport of endangered species.
403 Section 7 of the ESA requires federal agencies to
404 ensure that any action authorized, funded, or carried
405 out by them is not likely to jeopardize the continued
406 existence of listed species or modify their critical
407 habitats.

408 **Environmental Justice:** The fair treatment and
409 meaningful involvement of all people regardless of
410 race, color, national origin, age, or income with
411 respect to the development, implementation, and
412 enforcement of environmental laws, regulations, and
413 policies. Fair treatment means that no group of
414 people—including racial, ethnic, age or
415 socioeconomic groups—should bear a
416 disproportionate share of the negative environmental
417 consequences resulting from industrial, municipal, and
418 commercial operations or the execution of federal,
419 state, local, and tribal programs and policies.
420 Executive Order 12898 directs federal agencies to
421 make achieving environmental justice part of their
422 missions by identifying and addressing
423 disproportionately high and adverse effects of agency
424 programs, policies, and activities on minority and low-
425 income populations.

426 **Ephemeral:** Lasting for a short time or a short-lived
427 organism. An ephemeral water body is a wetland,
428 stream, or pond that exists briefly during and
429 following a period of rainfall or snow melt.

430 **Evapotranspiration:** The amount of water removed
431 from a land area by the combination of direct
432 evaporation from the soil and plant transpiration.

433 **Factor of Safety:** Used to describe the ratio of
434 resisting forces to driving forces along a potential
435 failure surface, whereby a Factor of Safety of 1.0
436 represents equilibrium between the estimated resisting
437 shear strength to the applied shearing load. Systems
438 are often designed to a Factor of Safety above 1.0 to
439 allow for unexpected loads, unexpected operating
440 conditions, and variations in estimated material
441 properties.

442 **Fen:** Peat-forming wetlands that receive nutrients
443 from sources other than precipitation—usually from
444 upslope sources through drainage from surrounding
445 mineral soils and from groundwater movement. These
446 systems are often covered by grasses, sedges, rushes,
447 and wildflowers. Over time, peat may build up and
448 separate the fen from its groundwater supply. When
449 this happens, the fen receives fewer nutrients and may
450 become a bog.

451 **Final closure:** The period of time when ore-extracting
452 activities of a mine or ore-production activities of a
453 processing facility cease to continue, and
454 decommissioning and reclamation activities are being
455 completed.

456 **Fine tailings:** More than 50% of waste byproducts of
457 mineral beneficiating processes, other than heap and
458 dump leaching, passes the No. 200 sieve and consists
459 of rock particles, which have usually undergone
460 crushing and grinding, from which the profitable
461 mineralization has been separated.

462 **Fish assemblage:** The list of fish species that occupy
463 a given area, which is used as a sensitive indicator of
464 overall ecosystem health, habitat degradation, or
465 environmental contamination.

466 **Fish consumption advisory:** Federal, state, or local
467 government guideline restricting the amount of fish
468 consumption when certain species of fish are unsafe to
469 eat due to the presence of harmful chemicals in their
470 tissues.

471 **Floodplain:** The lowland areas adjacent to lakes,
472 wetlands, streams, and rivers that are prone to being
473 inundated by water during flood conditions.

474 **Flotation tailings:** Materials left over after valuable
475 minerals have been separated during a flotation
476 process.

477 **Footwall:** The mass of rock underlying a mineral
478 deposit or the bedrock located beneath a fault plane.

- 479 **Forb:** A flowering, herbaceous (non-woody) plant
480 other than a grass species.
- 481 **Fragmentation:** A decrease in the area of contiguous
482 habitat available to wildlife.
- 483 **Fugitive dust:** Particulate matter composed of soil
484 that is not emitted from a stack, vent, or hood; can
485 include emissions from haul roads, wind erosion or
486 exposed surfaces, and other activities in which soil is
487 removed and redistributed.
- 488 **GAP land cover:** A hierarchically organized
489 vegetation cover map developed as part of the U.S.
490 Geological Survey's Gap Analysis Program (GAP).
491 Units of analysis are Minnesota Ecological
492 Classification System subsections.
- 493 **General Land Office (GLO):** The GLO records
494 managed by U.S. Bureau of Land Management are the
495 repository for all Federal land title records issued
496 between 1820 and the present.
- 497 **Geographic Information System (GIS):** A system
498 designed to store, modify, analyze, or present various
499 types of geographical spatial data.
- 500 **Geosynthetic membrane cover system:** A process
501 designed to exclude certain waste rock materials from
502 oxidation, and which would include the installation of
503 limestone, overburden, a geomembrane material,
504 cover soil, and a vegetative soil layer.
- 505 **Geotechnical assessment:** An assessment of the
506 stability of a slope or ground surface under load; used
507 to identify risks or potential hazards of structural
508 failure.
- 509 **Giants Range:** The Giants Range batholith is a body
510 of granite in northeastern Minnesota that lies between
511 the Mesabi and Vermilion iron-mining ranges. It
512 outcrops as a narrow belt that strikes east-northeast
513 and occupies an area of about 1,000 square miles. The
514 Giants Range goes from just north of Hibbing (the
515 "Hill of Three Waters" is in the Hull-Rust Mine) to
516 Babbitt and rises from 200 to 400 feet above the
517 surrounding area.
- 518 **Glacial deposit:** A collection of various-sized rocks
519 and debris that is deposited by a glacier as it advances
520 or recedes across a landscape. There are many types of
521 deposits, including till, drift, erratics, and moraines.
- 522 **Glacial till:** Direct glacial deposits of rocks, gravel, or
523 boulders that are unsorted and unstratified.
- 524
- 525 **GoldSim:** A probabilistic simulation platform for
526 visualizing and simulating many types of physical,
527 financial, or organizational systems. Most GoldSim
528 applications fall into one of three categories:
529 environmental systems modeling, business and
530 economic modeling, or engineered systems modeling.
- 531 **Greenhouse gas:** Gases that trap heat in the
532 atmosphere. Some greenhouse gases, such as carbon
533 dioxide, occur naturally and are emitted to the
534 atmosphere through natural processes and human
535 activities. The principal greenhouse gases that enter
536 the atmosphere because of human activities are carbon
537 dioxide, methane, nitrous oxide, and fluorinated gases.
- 538 **Groundwater baseflow:** Groundwater discharge from
539 the surficial aquifer and bedrock unit into a perennial
540 stream.
- 541 **Groundwater Containment System:** An active or
542 passive measure (typically, either is engineered) put
543 into place to prevent or significantly reduce the
544 migration of contaminants or groundwater flow, in
545 groundwater or in the groundwater aquifer.
- 546 **Groundwater divide:** The boundary between two
547 adjacent groundwater basins represented by a high
548 point in the water table.
- 549 **Groundwater drawdown:** The lowering of the
550 groundwater level (water table) relative to a
551 background condition in a specific aquifer.
- 552 **Groundwater mound:** The increase or rise in height
553 of a water table due to concentrated recharge in a
554 given area.
- 555 **Groundwater plume:** The downgradient extension or
556 spread of contaminated groundwater within the pore
557 spaces or fractures of soil or rock.
- 558 **Groundwater:** The water located beneath the ground
559 surface in soil or rock pore spaces or fractures.
- 560 **Hardness:** A measure of the amount of minerals that
561 are dissolved in a water source; a higher mineral
562 content indicates harder water, while lower mineral
563 content indicates softer water. See Total dissolved
564 solids (TDS).
- 565 **Hazardous air pollutant:** Air pollutants that are not
566 covered by ambient air quality standards, but may
567 present a threat of adverse human health effects or
568 adverse environmental effects, and are specifically
569 listed on the federal list of 189 hazardous air
570 pollutants in 40 CFR 61.01 or in section 112(b) of the
571 CAA.

572 **Hazardous material:** Any item or agent (biological, 618
573 chemical, physical) that has the potential to cause 619
574 harm to humans, animals, or the environment, either 620
575 by itself or through interaction with other factors. The 621
576 term includes hazardous substances, hazardous waste, 622
577 marine pollutants, and elevated-temperature 623
578 materials—materials designated as hazardous under 624
579 the provisions of 49 CFR 172.101. Hazardous material 625
580 categories include: explosives, gases, flammable 626
581 liquids, flammable solids, spontaneous 627
582 combustibles/dangerous when wet, oxidizers and 628
583 organic peroxides, poisons and infectious substances, 629
584 and corrosives. 630

585 **Hazardous waste:** Defined in the *Minnesota Statutes*
586 as any refuse, sludge, or other waste material (or
587 combinations of materials) in solid, semi-solid, liquid,
588 or contained gaseous form which, because of its
589 quantity, concentration, or chemical, physical, or
590 infectious characteristics, may cause or significantly
591 contribute to an increase in mortality or an increase in
592 serious irreversible, or incapacitating reversible
593 illness, or pose a substantial present or potential
594 hazard to human health or the environment when
595 improperly treated, stored, transported, disposed of, or
596 otherwise managed.

597 **Hazardous Materials Response Team:** Personnel
598 specially trained to handle dangerous goods, which
599 include materials that are radioactive, flammable,
600 explosive, corrosive, oxidizing, asphyxiating,
601 biohazardous, toxic, pathogenic, or allergenic.

602 **Health Risk Limit (HRL):** A concentration of a
603 substance or chemical adopted by rule of the
604 Commissioner of Health that is a potential drinking
605 water contaminant because of a systemic or
606 carcinogenic toxicological result from consumption
607 (*Minnesota Statute 103H.005*).

608 **Herbaceous:** Plants with leaves and stems that die
609 down at the end of each growing season, and have no
610 woody or persistent stems above ground.

611 **Herbivore:** An organism that is anatomically and
612 physiologically adapted to survive by consuming only
613 plant-based foods.

614 **Hilsenhoff Biotic Index:** An index of organic
615 pollution that utilizes macroinvertebrate tolerances of
616 pollution to assess water quality in streams and rivers.

617

618 **Historic property:** Any prehistoric or historic district,
619 site, building, structure, or object included in, or
620 eligible for inclusion in, the National Register of
621 Historic Places maintained by the Secretary of the
622 Interior. This term includes artifacts, records, and
623 remains that are related to and located within such
624 properties. The term includes properties of traditional
625 religious and cultural importance to an Indian tribe or
626 Native Hawaiian organization and that meet the
627 National Register criteria.

628 **Humidity cell:** Geochemical kinetic tests designed to
629 mimic weathering at the laboratory or at bench scale
630 (controlled setting) to obtain bulk reaction rates. The
631 test determines the rate of acid generation and the
632 variation over time in leachate water quality.

633 **Hydraulic conductivity:** A measure of the ease with
634 which a medium transmits water, such as water
635 moving through pore spaces or fractures in soil or
636 rock.

637 **Hydrograph:** A graph showing the variation of
638 discharge with respect to time, with discharge
639 meaning the volume of water flowing past a specific
640 point versus the time it takes for it to do so, generally
641 cubic feet per second (cfs).

642 **Hydrology:** The science dealing with the origin,
643 distribution, and circulation of waters of the earth such
644 as rainfall, streamflow, infiltration, evaporation, and
645 groundwater storage.

646 **Hydrometallurgical residue:** Waste residues in the
647 form of sludges that contain concentrations of metals
648 as well as sulfur-bearing minerals in crystalline form.

649 **Hydrometallurgical:** Pertaining to hydrometallurgy;
650 involving the use of liquid reagents in obtaining
651 metals from their ores.

652 **Igneous rock:** Rock formed from cooling and
653 solidification of magma (molten rock).

654 **Impaired water:** As defined under Section 303(d) of
655 the Clean Water Act, waters that are too polluted or
656 degraded to meet the water quality standards set by
657 states, territories, or authorized tribes.

658 **IMPLAN:** Economic modeling software that analyzes
659 how local economies function and the economic
660 consequences for a particular project in a geographic
661 region.

662 **In-advance mitigation:** A form of mitigation that is
663 designed, permitted, and constructed in advance of a
664 permitted impact.

665	Indirect effect (for cultural resources): An	715	Leachate: Solution of product obtained by leaching,
666	alteration to the qualifying characteristics of a historic	716	in which a substance is dissolved by the action of a
667	property included in or eligible for inclusion in the	717	percolating liquid.
668	National Register that would not be considered a	718	Legacy contamination: Historic or existing pollution.
669	direct effect, which could include effects to a	719	Location quotient: The ratio between the local
670	property's use, setting, or feeling, or introduction of	720	economy and the economy of a reference unit.
671	incompatible visual, atmospheric, or audible elements.	721	Logging slash: The residue (e.g., treetops and
672	Infiltration: The process of water entering the soil at	722	branches) left on the ground after logging.
673	the ground surface and the ensuing movement	723	Long-term closure: An assessment of the
674	downward. Infiltration becomes percolation when	724	sustainability of the site "post-closure" and defining
675	water has moved below the depth at which it can	725	the need for long-term monitoring and maintenance
676	return to the atmosphere by evaporation or	726	required by the site (i.e., the "burden" placed on
677	evapotranspiration.	727	succeeding generations).
678	In-kind mitigation: The replacement of the impacted	728	Low solubility: Not easily dissolved in water.
679	aquatic site with one of the same hydrologic regime	729	Lynx analysis unit: Landscape-scale analysis areas
680	and plant community types (same species	730	used for lynx management.
681	composition).	731	Macroinvertebrate: An invertebrate (i.e., animal
682	In-place mitigation: The replacement of the impacted	732	without vertebrae or backbone) that is large enough to
683	aquatic site would take place in the same 8-digit	733	be seen without the use of a microscope. Freshwater
684	Hydrologic Unit Code (HUC) watershed as the	734	benthic macroinvertebrates comprise the following
685	proposed impacted resource. The USACE St. Paul	735	three animal phyla: Athropoda (crustaceans, insects,
686	District Policy uses the term "in-place" to include on	736	spiders), Annelida (segmented worms), and Mollusca
687	site, which is defined as an area located on the same	737	(mollusks).
688	parcel of land as the impact site, or on a parcel of land	738	Management Area: The framework that defines
689	contiguous to the impact site.	739	intended land and resource uses on national forest
690	In situ: This refers to actions happening "in place" or	740	lands, including timber harvesting regimes,
691	"in position" where they would naturally occur.	741	Recreational Opportunity Spectrum designations, and
692	Integrity (for cultural resources): The ability of a	742	other similar characteristics.
693	property to convey its significance based on its	743	Management Indicator Habitat (MIH): Categories
694	location, design, setting, materials, workmanship,	744	of forest types, including dominant species, stand age
695	feeling, and association.	745	class, and stand condition.
696	Invasive species: Organisms that cause, or are likely	746	Maximum Contaminant Level (MCL): The highest
697	to cause, harm to the economy, environment, or	747	level of a contaminant that is allowed in drinking
698	human health due to their tendency to out-compete	748	water under the Safe Drinking Water Act. MCLs are
699	other species.	749	enforceable standards.
700	Laurentian Divide: A geological formation that runs	750	Maximum Contaminant Level Goals (MCLGs):
701	along the crest of low, rocky hills and divides the Red	751	The level of a contaminant in drinking water below
702	River and Rainy River basins from the Minnesota	752	which there is no known or expected risk to health.
703	River and Lake Superior basins. The Laurentian	753	MCLGs allow for a margin of safety and are non-
704	Divide is part of the Northern Divide, a continental	754	enforceable public health goals.
705	divide that separates drainages to the Hudson Bay and	755	
706	Arctic Ocean from all other drainages in North		
707	America. Streams on the north slope of the divide		
708	flow through Canada to Hudson Bay. On the south		
709	side of the divide, streams flow south to either Lake		
710	Superior and the Atlantic Ocean, or the Mississippi		
711	River and the Gulf of Mexico.		
712	Laydown area: Material and equipment storage area		
713	during the construction phase of a project.		
714	L_{dn}: The day-night average sound level.		

756 **Mercury:** A highly toxic element that is found both
757 naturally and as an introduced contaminant in the
758 environment. Although concentrations in water are
759 very low, mercury accumulates through the aquatic
760 food chain, resulting in high concentrations in fish that
761 can threaten the health of people and wildlife.

762 **Mesabi Iron Range:** A vast deposit of iron ore and
763 the largest of four major iron ranges in the region
764 collectively known as the Iron Range of Minnesota,
765 Discovered in 1866, it is the chief deposit of iron ore
766 in the United States. The Mesabi Iron Range is a belt
767 of iron ore 110 miles long, averaging 1 to 3 miles
768 wide, and reaching a thickness as great as 500 feet. It
769 is located between Grand Rapids and Babbitt,
770 Minnesota. The Mesabi Range was known to the local
771 Ojibwe as *Mesabe Widjiu* which means “Giant’s
772 Mountain” or “Big-Man’s Mountain.”

773 **Mesic prairie:** A plant community dominated by
774 native grasses, with soil moisture content that is
775 between wet and dry.

776 **Mesotrophic:** Refers to a body of water having a
777 moderate amount of dissolved nutrients.

778 **Metamorphic rock:** Rock that has been changed
779 from an original form to a new form due to heat and
780 pressure.

781 **Meteoric water:** The water derived from precipitation
782 (snow and rain). This includes water from lakes,
783 rivers, and icemelts, which all originate from
784 precipitation indirectly.

785 **Methylmercury (MeHg):** A form of organic mercury
786 which can accumulate up the food chain in aquatic
787 systems and lead to high concentrations in predatory
788 fish, which, when consumed by humans, can result in
789 an increased risk of adverse effects in highly exposed
790 or sensitive populations.

791 **Mine pit dewatering:** Removal of water from the
792 mine pit(s).

793 **Mineland reclamation:** To reclaim, restore, enhance,
794 or develop areas that have been affected by mining.

795 **Mineral interest:** The ownership rights to exploit,
796 mine, and/or produce any or all of the minerals lying
797 below the surface of a property.

798 **Minerotrophic:** Soils and vegetation whose water
799 supply comes mainly from streams or springs,
800 resulting in high nutrient levels and reduced acidity.

801

802 **Minnesota Ambient Air Quality Standards**
803 **(MAAQS):** Air quality standards established under
804 authority of *Minnesota Rules*, Part 7009 that apply for
805 outdoor air to protect human health and public
806 welfare.

807 **Mitigation measure:** Actions to reduce, avoid, or
808 offset the potential adverse environmental
809 consequences of development activities.

810 **Modeling:** Predicting the probability of an outcome
811 given a set amount of input data.

812 **Monte Carlo simulation:** A computerized
813 mathematical technique that allows people to account
814 for risk in quantitative analysis and decision-making.
815 The simulation furnishes the decision-maker with a
816 range of possible outcomes and the probabilities they
817 will occur for any choice of action.

818 **MODFLOW:** A computer model used to simulate the
819 flow of groundwater through an aquifer.

820 **National Ambient Air Quality Standards**
821 **(NAAQS):** Air quality standards established under
822 authority of the Clean Air Act that apply for outdoor
823 air to protect human health and public welfare.

824 **National Environmental Policy Act (NEPA) of**
825 **1970:** Under NEPA, projects and activities that
826 require federal agency approvals or funding must
827 undergo an evaluation of their impacts. The CEQ
828 regulations (40 CFR 1500 et seq.) contain the
829 procedures for implementing NEPA.

830 **National Historic Preservation Act (NHPA):**
831 Legislation enacted in 1966 intended to preserve
832 historical and archaeological sites in the United States.
833 Among other things, the Act requires federal agencies
834 to evaluate the impact of all federally funded or
835 permitted projects on historic properties (buildings,
836 archaeological sites, etc.) through a process known as
837 Section 106 Review. The main purpose for the
838 establishment of the Section 106 Review process is to
839 minimize potential harm and damage to historic
840 properties. It allows interested parties an opportunity
841 to comment on the potential impact projects may have
842 on significant archaeological or historic sites.
843 Additionally, the Act established the Advisory
844 Council on Historic Preservation, State Historic
845 Preservation Offices, National Register of Historic
846 Places, and the list of National Historic Landmarks.

847

848 **National Pollutant Discharge Elimination System**
849 **(NPDES) Permits:** Permits issued to regulate
850 wastewater discharges to lakes, streams, wetlands, and
851 other surface waters. In Minnesota, these permits
852 establish specific limits and requirements to protect
853 surface and groundwater quality for a variety of uses,
854 including drinking water, fishing, and recreation. An
855 individual NPDES permit for an industrial facility
856 may cover a number of different waste types and
857 activities, including industrial process wastewater,
858 contact and non-contact cooling water, stormwater,
859 contaminated groundwater pumpouts, water supply
860 treatment backwash, and wastewater treatment
861 sludges.

862 **National Register criteria:** The criteria established
863 by the Secretary of the Interior for use in evaluating
864 the eligibility of properties for inclusion on the
865 National Register (36 CFR part 60).

866 **National Register of Historic Places:** The official list
867 of the Nation's historic places worthy of preservation.
868 Authorized by the National Historic Preservation Act
869 of 1966, the National Park Service's National Register
870 of Historic Places is part of a national program to
871 coordinate and support public and private efforts to
872 identify, evaluate, and protect America's historic and
873 archeological resources.

874 **New Source Performance Standards:** Pollution
875 control standards issued by the USEPA and under
876 Section 111 of the Clean Air Act which dictate the
877 level of pollution that a new stationary source
878 (constructed on or after January 30, 2004) may emit.

879 **Noise-sensitive receptors:** Locations or areas where
880 dwelling units or other fixed, developed sites of
881 frequent human use occur.

882 **Non-contact Stormwater:** Stormwater that has not
883 been affected by sulfides and metal leachates from
884 oxidized rock exposed through mining.

885 **Non-degradation:** As applied under the Clean Water
886 Act and federal regulations, the term refers to both a
887 policy and a regulatory process for the preservation of
888 existing uses, preventing unnecessary degradation of
889 high water quality, and protecting and maintaining
890 specific waterbodies with outstanding characteristics.

891 **North American Industrial Classification System**
892 **(NAICS):** The standard used by federal statistical
893 agencies in classifying business establishments for the
894 purpose of collecting, analyzing, and publishing
895 statistical data related to the United States business
896 economy.

897 **Oligotrophic:** Lacking in plant nutrients such as
898 phosphates, nitrates, and organic matter, and
899 consequently having few plants and a large amount of
900 dissolved oxygen throughout.

901 **One Hundred Mile Swamp:** A large wetland located
902 between Babbitt and Hoyt Lakes, Minnesota that has
903 been rated high quality due to high watershed
904 integrity, large amount of interior forest, and high-
905 quality lowland coniferous forests.

906 **Open bog:** A carpet of living sphagnum moss
907 growing over a layer of acid peat.

908 **Ore stripping ratio:** Ratio of waste rock to ore.

909 **Ore Surge Pile:** A temporary ore storage pile located
910 near the Rail Transfer Hopper, which would help
911 maintain a steady delivery of ore to the Processing
912 Plant.

913 **Ore:** A type of rock that contains minerals with
914 important elements including metals that are
915 economically extracted through mining processes.

916 **Outcrop area:** A visible exposure of bedrock or
917 ancient superficial deposits on the surface of the
918 Earth.

919 **Outfall:** The discharge point of a waste stream into a
920 body of water; alternatively, it may be the outlet of a
921 river, drain, or a sewer where it discharges into a lake
922 or other body of water.

923 **Out-of-kind mitigation:** The replacement of an
924 impacted aquatic site with one of a different
925 hydrologic regime and plant community type
926 (different species composition).

927 **Out-of-place mitigation:** The replacement of the
928 impacted aquatic site would take place in a different
929 8-digit HUC watershed as the proposed impacted
930 resource.

931 **Outlier:** An observation that is numerically distant
932 from the rest of the data.

933 **Overburden:** Material of any nature, consolidated or
934 unconsolidated, that overlies a deposit of useful
935 materials, ores, or coal, especially those deposits that
936 are mined from the surface by open cuts.

937 **Overstory:** The larger, taller trees which occupy a
938 forest area and shade young trees, hardwoods, brush,
939 and other deciduous varieties that are growing beneath
940 the larger trees (i.e., understory).

941 **Oxidation:** A common chemical reaction involving
942 the combination of a substance such as sulfide
943 minerals with oxygen.

944	P90: 90 th percentile probability, which means that	989	Phase I Environmental Site Assessment (ESA): An
945	there is at least a 90 percent probability that a	990	environmental site assessment and report that identify
946	constituent would not exceed the evaluation criteria.	991	potential or existing environmental contamination
		992	liabilities associated with a specific property.
947	Paleoindian period: A cultural period circa 12,000 to	993	Phreatic: Term used to refer to groundwater (e.g.,
948	9,000 years ago, or 10,000 to 7,000 B.C.; the earliest	994	“The phreatic surface coincides with the water
949	North American archaeological epoch, characterized	995	table.”).
950	by retreating glaciers, mastodons and other large		
951	mammals, and small mobile groups of hunters.	996	Piezometer: A device that measures the pressure or
		997	level of groundwater at a specific point.
952	Particulate matter: Fine liquid or solid particles such		
953	as dust, smoke, mist, fumes, or smog, found in	998	Point source discharge: Discharge of wastewater or
954	ambient air or emissions.	999	other materials at a single location.
955	Paste or thickened tailings: Tailings that have been	1000	Porosity: A measure of the void (i.e., “empty”) spaces
956	significantly dewatered to a point where they will	1001	in a material.
957	form a homogeneous nonsegregated mass when		
958	deposited from the end of a pipe.	1002	Post-closure: Phase of activities (inspection,
		1003	maintenance, and reporting) that occur after the
959	Peat deposit: Deposits of partially decayed organic	1004	closure activities are complete.
960	material (vegetation) that typically forms in wetland		
961	bog areas.	1005	Post-contact period: Relating to the period of time
		1006	subsequent to the initial interaction of an indigenous
962	Perched: Contained by an underlying impervious	1007	people with an outside culture. In the United States,
963	layer, often used in reference to wetlands.	1008	the term refers to an era of significant European
		1009	influence for which a written record exists.
964	Perennial: Occurring or persisting for more than 2		
965	years, often in reference to plant species.	1010	Precipitation: Any product of the condensation of
		1011	atmospheric water vapor that falls under gravity. The
966	Perimeter dam: Outer constructed embankments of a	1012	main forms of precipitation include drizzle, rain, sleet,
967	tailings basin.	1013	snow, and hail.
968	Permeability: A measure of the ability of a material	1014	Pre-contact period: Relating to the period of time
969	(such as soil or rock) to transmit fluids.	1015	before contact of an indigenous people with an outside
		1016	culture. In the United States, the term refers to an era
970	Permeable reactive barrier: On-site method for	1017	before significant European influence for which a
971	remediating contaminated water that combines a	1018	written record does not exist.
972	passive chemical or biological treatment zone with		
973	subsurface fluid flow management.	1019	Prevention of Significant Deterioration: A federal
		1020	preconstruction permitting program that applies to
974	Permit to Mine: Pursuant to <i>Minnesota Rules</i> , Part	1021	areas that are not violating National Ambient Air
975	6132, a Permit to Mine means a legal approval issued	1022	Quality Standards.
976	by the commissioner of the Minnesota Department of		
977	Natural Resources to conduct a mining operation.	1023	Private mineral estate: The ownership of mineral
978	Under Wetlands Conservation Act provisions,	1024	rights on land, which allows the owner to mine or
979	wetlands must not be impacted as part of a project for	1025	produce any minerals lying below the surface of the
980	which a permit to mine is required, except as approved	1026	property.
981	by the commissioner (<i>Minnesota Rules</i> , Part		
982	8420.0930).	1027	Process water: Any water that, during manufacturing
		1028	or processing, comes into direct contact with or results
983	pH: A measure of relative acidity or alkalinity of a	1029	from the production or use of any raw material,
984	solution, expressed on a scale from 0 to 14, with the	1030	intermediate product, finished product, byproduct, or
985	neutral point at 7. Acid solutions have pH values	1031	waste product.
986	lower than 7, and basic (alkaline) solutions have pH		
987	values higher than 7.	1032	Progressive reclamation: Reclamation activities that
		1033	could occur while the mining project is still in
988		1034	operation, allowing for a portion of the disturbed areas
		1035	to be reclaimed prior to closure.

1036	Proposed Connected Actions: The Proposed	1083	Saturated overburden: That material unable to
1037	Connected Actions would involve both the NorthMet	1084	contain or hold more moisture of any nature,
1038	Project Proposed Action and the Land Exchange	1085	consolidated or unconsolidated, that overlies a deposit
1039	Proposed Action.	1086	of useful materials, ores, or coal, especially those
		1087	deposits that are mined from the surface by open cuts.
1040	Proposed Connected Actions Alternative B:		
1041	Proposed Connected Actions Alternative B would	1088	Scenic Integrity Objective (SIO): A statement of the
1042	involve the NorthMet Project Proposed Action and the	1089	intended visual conditions of national forest lands.
1043	Land Exchange Alternative B.	1090	Scenic Integrity Objectives are part of the United
		1091	States Forest Service Scenery Management System.
1044	Pumping test: Conducted to evaluate an aquifer by		
1045	“stimulating” the aquifer through constant pumping,	1092	Section 303(d) of the Clean Water Act: A portion of
1046	and observing the aquifer’s drawdown in observation	1093	the federal act that requires states, territories, and
1047	wells. It is a tool that hydrogeologists use to	1094	authorized tribes to develop lists of impaired waters.
1048	characterize a system of aquifers, aquitards, and flow	1095	These impaired waters do not meet water quality
1049	system boundaries.	1096	standards that the regulatory authorities have set for
		1097	them, even after point sources of pollution have
1050	Rail Transfer Hopper: A unit located at the Mine	1098	installed the minimum required levels of pollution
1051	Site and would consist of a raised platform from	1099	control technology. The law requires that these
1052	which haul trucks would dump ore into a hopper over	1100	jurisdictions establish priority rankings for waters on
1053	a pan feeder, which would discharge into a rail car	1101	the lists and develop total maximum daily loads for
1054	below it.	1102	these waters.
1055	Reclamation: Activities that successfully accomplish	1103	Section 404 of the Clean Water Act: see CWA
1056	the requirements of <i>Minnesota Rules</i> , Parts 6132.2000	1104	Section 404 Permit.
1057	to 6132.3200. Actions intended to return the land		
1058	surface to an equivalent undisturbed condition.	1105	Section 401 water quality certification: According
1059	Restoration of mined land to original contour, use, or	1106	to the Clean Water Act, anyone who wishes to obtain
1060	condition. Steps or operations integral to mining that	1107	a federal permit for any activity that may result in a
1061	prepare the land for post-mining use are called	1108	discharge to navigable waters of the United States
1062	reclamation. When the objective of reclamation is to	1109	must first obtain a state Section 401 water quality
1063	return the land to pre-mining conditions and uses, it is	1110	certification to ensure that the project will comply
1064	sometimes called restoration.	1111	with the state water quality standards. For example, if
		1112	someone proposes to discharge dredged or fill
1065	Recreation Opportunity Spectrum (ROS): The	1113	material into waters of the United States, including
1066	framework expressing the desired range of	1114	many wetlands, they generally must obtain a Section
1067	recreational activities that will be encouraged and	1115	404 permit from the USACE and, in Minnesota, a
1068	permitted on national forest lands.	1116	Section 401 water quality certification from the
		1117	Minnesota Pollution Control Agency.
1069	Reject concentrate: Process water or brine that		
1070	would result from the reverse osmosis process.	1118	Sedge meadow: An open, groundwater-influenced,
		1119	sedge- and grass-dominated wetland that typically
1071	Remediation: Actions taken to respond to a	1120	borders streams but is also found on pond and lake
1072	hazardous material release or threat of a release that	1121	margins and above beaver dams. Soils are nearly
1073	could affect human health and/or the environment.	1122	always sapric peat and range from strongly acid to
		1123	neutral in pH.
1074	Riparian: Relating to or located on the bank of a		
1075	natural watercourse (or a river or stream).	1124	Sedimentary rock: Rock formed from consolidation
		1125	of loose sediment that has accumulated in layers.
1076	Rock buttress: A rock aggregate structure built		
1077	against a slope for reinforcement and support.	1126	Severed mineral interest: Any whole or partial
		1127	interest in any or all minerals underlying land that has
1078	Rosgen geomorphic survey: A four-level hierarchy	1128	been separated from surface land ownership.
1079	survey designed to classify streams based on	1129	
1080	quantifiable field measurements to produce consistent		
1081	and reproducible descriptions of stream types and		
1082	conditions.		

1130	Significance (for cultural resources): The	1177	State Historic Preservation Office (SHPO): The
1131	importance of a cultural property for its historical,	1178	office and official appointed or designated pursuant to
1132	architectural, archeological, engineering, or cultural	1179	section 101(b)(1) of the National Historic Preservation
1133	values based upon the National Register criteria.	1180	Act to administer the State Historic Preservation
		1181	Program or a representative designated to act for the
1134	Significant effect: An effect that is predicted to be	1182	State Historic Preservation Officer.
1135	above an identified threshold and/or an effect that was		
1136	determined by the lead agencies to have a magnitude	1183	Stormwater: According to <i>Minnesota Rules</i> , Part
1137	that is large based on the context and intensity of that	1184	7090, stormwater is defined as storm water runoff,
1138	effect.	1185	snow melt runoff, and surface runoff and drainage.
1139	Slimes: The mixture of fine particles derived from	1186	Strahler Order: A stream order system used to
1140	ore, tailings, rock, or clay generally held in suspension	1187	classify stream segments based on the number of
1141	in water as generated during ore processing.	1188	tributaries upstream, with headwater streams being
		1189	first-order streams.
1142	Sludge: A semi-solid residue containing a mixture of		
1143	solid waste material and water from air or water	1190	Stream geomorphic monitoring: The monitoring of
1144	treatment processes.	1191	changes in stream geology or features over time.
1145	Slug test: A type of aquifer test where water is	1192	Streamflow: The flow of water in streams, rivers, and
1146	quickly added or removed from a groundwater well to	1193	other channels. A major element of the water cycle, it
1147	monitor and determine the hydraulic conductivity of	1194	is one component of the runoff of water from the land
1148	the material in which the well is located.	1195	to waterbodies, with the other component being
		1196	surface runoff.
1149	Slurry wall: An underground reinforced wall in areas		
1150	of soft earth or with a high water table typically made	1197	Structure (for cultural resources): Any human-built,
1151	of concrete or bentonite; often used to restrict flow of	1198	aboveground object, which may include, but is not
1152	groundwater from one area to another.	1199	limited to, a building, bridge, road, railroad, etc.
		1200	Although not exclusive, structures are generally
1153	Spigots: Devices used to discharge tailings for	1201	considered to be from contact and post-contact
1154	conventional storage. They are typically located along	1202	periods, as opposed to archaeological sites, which are
1155	the embankment(s) of a facility.	1203	generally considered to be associated with the pre-
		1204	contact period.
1156	Spill Prevention Control and Countermeasure		
1157	(SPCC) Plan: A written plan that includes	1205	Subaqueous: Existing or situated under water.
1158	requirements for oil spill prevention, preparedness,		
1159	and response to prevent oil discharges to navigable	1206	Subsistence: The source from which food and other
1160	waters and adjoining shorelines.	1207	items necessary to exist are obtained.
1161	Standard: A level of quality or attainment set by	1208	Substrate: The type of material that rests at the
1162	Minnesota water use classifications (<i>Minnesota Rules</i> ,	1209	bottom of a stream, river, lake, etc., which could
1163	Part 7060, 7050, and 7052), USEPA primary MCLs	1210	include sand, gravel, mud, or boulders.
1164	(pMCL), USEPA secondary MCLs (sMCL), and		
1165	MDH HRLs.	1211	Sulfate: A negatively charged ion that can be
		1212	produced when metal sulfides are oxidized, consisting
1166	Standard Industrial Classification (SIC) codes: A	1213	of one atom of sulfur and four atoms of oxygen, SO ₄ .
1167	system for categorizing businesses in the United		
1168	States, used by the United States government from	1214	Sulfide mineral: A class of minerals containing
1169	1937 to 1996. The Standard Industrial Classification	1215	sulfides, many of which contain metals.
1170	system was replaced by the North American Industry		
1171	Classification System in 1997.	1216	Sulfide: A form of sulfur that often is found in the
		1217	environment bound to metals.
1172	State Disposal System (SDS) permit: In Minnesota,	1218	Surface right: The landowner's rights to the upper
1173	this is a permit that establishes the terms and	1219	boundary (surface) of the land only, which does not
1174	conditions that must be met when a facility discharges	1220	include subsurface rights.
1175	wastewater to the ground surface or subsurface.		
		1221	Surface water divide: The boundary between two
1176		1222	adjacent surface water basins, often dictated by land
		1223	topography.

1224	Surficial aquifer: Shallow aquifers typically less than	1264	Total maximum daily load (TMDL): A calculation
1225	50 feet.	1265	of the maximum amount of a pollutant that a water
		1266	body can receive and still safely meet water quality
1226	Surficial glacial deposit: A collection of various	1267	standards.
1227	sized rocks and debris deposited by glacial activity		
1228	that is left on the earth's surface after the glacier	1268	Toxics Release Inventory (TRI): A USEPA
1229	recedes.	1269	maintained database containing data on disposal or
		1270	other releases of over 650 toxic chemicals from
1230	Surficial groundwater: Groundwater in surficial	1271	thousands of United States facilities and information
1231	aquifers, which continuously is unconfined and moves	1272	about how facilities manage those chemicals through
1232	along the hydraulic gradient from areas of recharge to	1273	recycling, energy recovery, and treatment.
1233	streams and other places of discharge.		
		1274	Traditional Cultural Property (TCP): A property
1234	Surrogate: A method to statistically analyze using	1275	that is eligible for inclusion in the National Register
1235	modified data.	1276	because of its association with cultural practices or
		1277	beliefs of a living community that are rooted in that
1236	Taconite: A low-grade iron ore, containing about 27	1278	community's history, and are important in maintaining
1237	percent iron and 51 percent silica found as a hard rock	1279	the continuing cultural identity of the community.
1238	formation in the Lake Superior region.		
		1280	Tribal Historic Preservation Officer (THPO): The
1239	Tailings: Waste byproducts of mineral beneficiating	1281	tribal office or official appointed by the tribe's chief
1240	processes other than heap and dump leaching,	1282	governing authority or designated by a tribal
1241	consisting of rock particles, which have usually	1283	ordinance or preservation program who has assumed
1242	undergone crushing and grinding, from which the	1284	the responsibilities of the State Historic Preservation
1243	profitable mineralization has been separated.	1285	Officer for purposes of Section 106 compliance on
		1286	tribal lands in accordance with section 101(d)(2) of
1244	Tailings basin: Land on which is deposited, by	1287	the Act.
1245	hydraulic or other means, the material that is separated		
1246	from the mineral product in the beneficiation or	1288	Trygg: John William Trygg was a land use
1247	treatment of ferrous minerals including any	1289	consultant, appraiser of natural resources, and early
1248	surrounding dikes constructed to contain the material.	1290	surveyor of Minnesota in the 1950s. He developed a
		1291	system used to make historical appraisals on behalf of
1249	Take: To harass, harm, pursue, hunt, shoot, wound,	1292	various Indian tribes in the Midwest. The Trygg

1261	amount of ions (minerals, salts, or metals) that are	1304	allocated to areas to preserve features with unique
1262	dissolved in a given volume of water. See Hardness.	1305	biological value within the Superior National Forest.
1263			
		1306	

- 1307 **United States Forest Service Regional Foresters** 1354
1308 **Sensitive Species (RFSS):** A list developed by the 1355
1309 Regional Forester that identifies sensitive species. 1356
1310 Sensitive species are defined as “*plant and animal* 1357
1311 *species identified by the Regional Forester for which* 1358
1312 *population viability is a concern as evidenced by: (a)* 1359
1313 *significant current or predicted downward trends in* 1360
1314 *population numbers or density, and/or (b) significant* 1361
1315 *current or predicted downward trends in habitat* 1362
1316 *capability that would reduce a species’ existing* 1363
1317 *distribution.”* Sensitive species are usually designated
1318 for an entire region, but independent “Forest
1319 Sensitive” lists are maintained by some individual
1320 National Forests.
- 1321 **United States Geological Survey (USGS) gaging**
1322 **station:** Facilities used by hydrologists to
1323 automatically monitor streams, wells, lakes, canals,
1324 reservoirs, and or other water bodies. Instruments at
1325 these stations collect information such as water height,
1326 discharge, water chemistry, and water temperature.
- 1327 **Unsaturated overburden:** All mineral overburden,
1328 including zones of soil formation, located above the
1329 water table.
- 1330 **Usufructuary:** Pertains to a person or group who has
1331 the legal right to use resources within a property that
1332 is not owned by them. Specific to the NorthMet
1333 Project Proposed Action, this pertains to the rights—
1334 derived from treaties, statutes, agreements, executive
1335 orders, and the like—of the Bands to hunt, fish, and
1336 gather 1854 Treaty resources on lands within the 1854
1337 Ceded Territory.
- 1338 **Virginia Formation:** Geological sedimentary rock
1339 formation located above the Biwabik Iron Formation.
- 1340 **Volatile organic compound:** Organic chemicals that
1341 have a high vapor pressure at ordinary, room-
1342 temperature conditions.
- 1343 **Voluntary Investigation and Cleanup (VIC)**
1344 **program:** The Minnesota Pollution Control Agency’s
1345 program to allow property transactions to move
1346 forward while promoting redevelopment of
1347 contaminated property and mitigating health or
1348 environmental risks. Program benefits to communities
1349 include new development, jobs, and an increased tax
1350 base in old industrial zones.
- 1351 **Waste rock:** Rock without economic value that
1352 surrounds ore.
- 1353
- Wastewater treatment facility (WWTF):** A facility
at which chemical, biological, or mechanical
procedures are applied to an industrial or municipal
discharge to remove, reduce, or neutralize
contaminants.
- Wastewater treatment plant (WWTP):** An
industrial structure designed to remove biological or
chemical waste products from water, thereby
permitting the treated water to be used for other
purposes.
- Water appropriation permit:** A permit from the
Minnesota Department of Natural Resources required
for all users withdrawing more than 10,000 gallons of
water per day or 1 million gallons per year.
- Water clarity:** A measure of how far light penetrates
through water. The deeper light penetrates, the clearer
the water. How far down light penetrates through
water depends on how many particles are suspended
in the water. Suspended particles reduce water clarity
by absorbing and scattering light.
- Water quality standard:** The foundation of the water
quality-based pollution control program mandated by
the Clean Water Act. Water quality standards define
the goals for a water body by designating its uses,
setting criteria to protect those uses, and establishing
provisions such as antidegradation policies to protect
waterbodies from pollutants.
- Watershed:** A geographic area from which water is
drained by a river and its tributaries to a common
outlet. A ridge or drainage divide separates a
watershed from adjacent watersheds.
- Wetland Conservation Act (WCA):** Minnesota
legislation, codified in *Minnesota Rules*, Part 8420,
designed to achieve no net loss in the quantity,
quality, and biological diversity of existing Minnesota
wetlands, by avoiding impacts to them or restoring
and enhancing diminished wetlands. This program is
administered by local governments with oversight by
the Board of Water and Soil Resources.
- Wetland delineation:** The act of establishing the
boundary between wetlands and uplands (or non-
wetlands) using soils, hydrology, and vegetation as
indicators.

1398 **Wetland:** Those areas that are inundated or saturated
1399 by surface water or groundwater at a frequency and
1400 duration sufficient to support, and that, under normal
1401 circumstances, do support a prevalence or vegetation
1402 typically adapted for life in saturated soil conditions.
1403 Wetlands generally include swamps, marshes, bogs,
1404 and similar areas.

1405 **Wild rice:** A tall aquatic annual grass (*Zizania*
1406 *palustris*) of North America, bearing edible grain that
1407 typically grows in shallow lakes or slow-moving
1408 rivers and streams.

1409 **Woodland period:** A cultural period circa 2,500 to
1410 850 years ago, or 500 B.C. to 1250 A.D.;
1411 characterized by the beginnings of modern tribes, clay
1412 pottery, agriculture, and ceremonial burial mounds.

1413 **XP-SWMM:** Comprehensive modeling software for
1414 surface water systems.

1415 **Zoning ordinance:** Locally adopted regulations that
1416 divide a town, city, village, or county into separate
1417 districts (e.g., residential, commercial, or industrial),
1418 define the permitted and prohibited land uses in those
1419 districts, and set forth specific development
1420 requirements (such as minimum lot size, height
1421 restrictions, etc).

DRAFT

NorthMet Mining Project and Land Exchange

Preliminary Final Environmental Impact Statement

June 2015

EXECUTIVE SUMMARY

Prepared by

55 INTRODUCTION

56 PolyMet Mining, Inc. (PolyMet) is
57 proposing to develop the NorthMet copper-
58 nickel-platinum group elements (PGE) mine
59 and associated processing facilities in
60 northeastern Minnesota. A land exchange is
61 also proposed with the United States Forest
62 Service (USFS) to eliminate a conflict
63 between PolyMet's desire to surface mine
64 and the United States' surface rights,
65 including USFS administration of National
66 Forest System (NFS) land.

67 • The mining proposal is known as the
68 *NorthMet Project Proposed Action*
69 consisting of the Mine Site,
70 Transportation and Utility Corridor, and
71 Plant Site. The NorthMet Project
72 Proposed Action would represent the
73 first copper-nickel-PGE mine in
74 Minnesota. Figure 1 shows the general
75 location of the NorthMet Project area
76 and its geographic relationship within
77 the northeast Minnesota region.

78 • The land exchange proposal is known as
79 the *Land Exchange Proposed Action*
80 consisting of USFS conveyance of
81 Superior National Forest lands
82 encompassing the Mine Site and
83 surrounding lands to PolyMet, and
84 USFS acquisition from PolyMet of up to
85 five tracts of private land within the
86 Superior National Forest proclamation
87 boundary. Figure 1 shows the general
88 location of the Land Exchange area and
89 its geographic relationship within the
90 northeast Minnesota region.

91 This Executive Summary provides an
92 overview of the Final Environmental Impact
93 Statement (FEIS). The purpose of the FEIS
94 is to describe the process undertaken to
95 evaluate the issues related to and predicted
96 effects of the NorthMet Project Proposed
97 Action and Land Exchange Proposed Action

98 and alternatives. For complete discussions
99 and analyses related to the potential effects
100 on environmental, cultural, and
101 socioeconomic resources, please refer to
102 their respective sections in the FEIS.

103 As Co-lead Agencies, the Minnesota
104 Department of Natural Resources (MDNR),
105 United States Army Corps of Engineers
106 (USACE), and USFS have jointly prepared
107 this FEIS under the National Environmental
108 Policy Act (NEPA) for the two federal
109 agencies and under the Minnesota
110 Environmental Policy Act (MEPA) for the
111 MDNR. The FEIS describes the process the
112 Co-lead Agencies undertook to evaluate the
113 effects of the NorthMet Project Proposed
114 Action, the Land Exchange Proposed
115 Action, and alternatives developed during
116 the process.

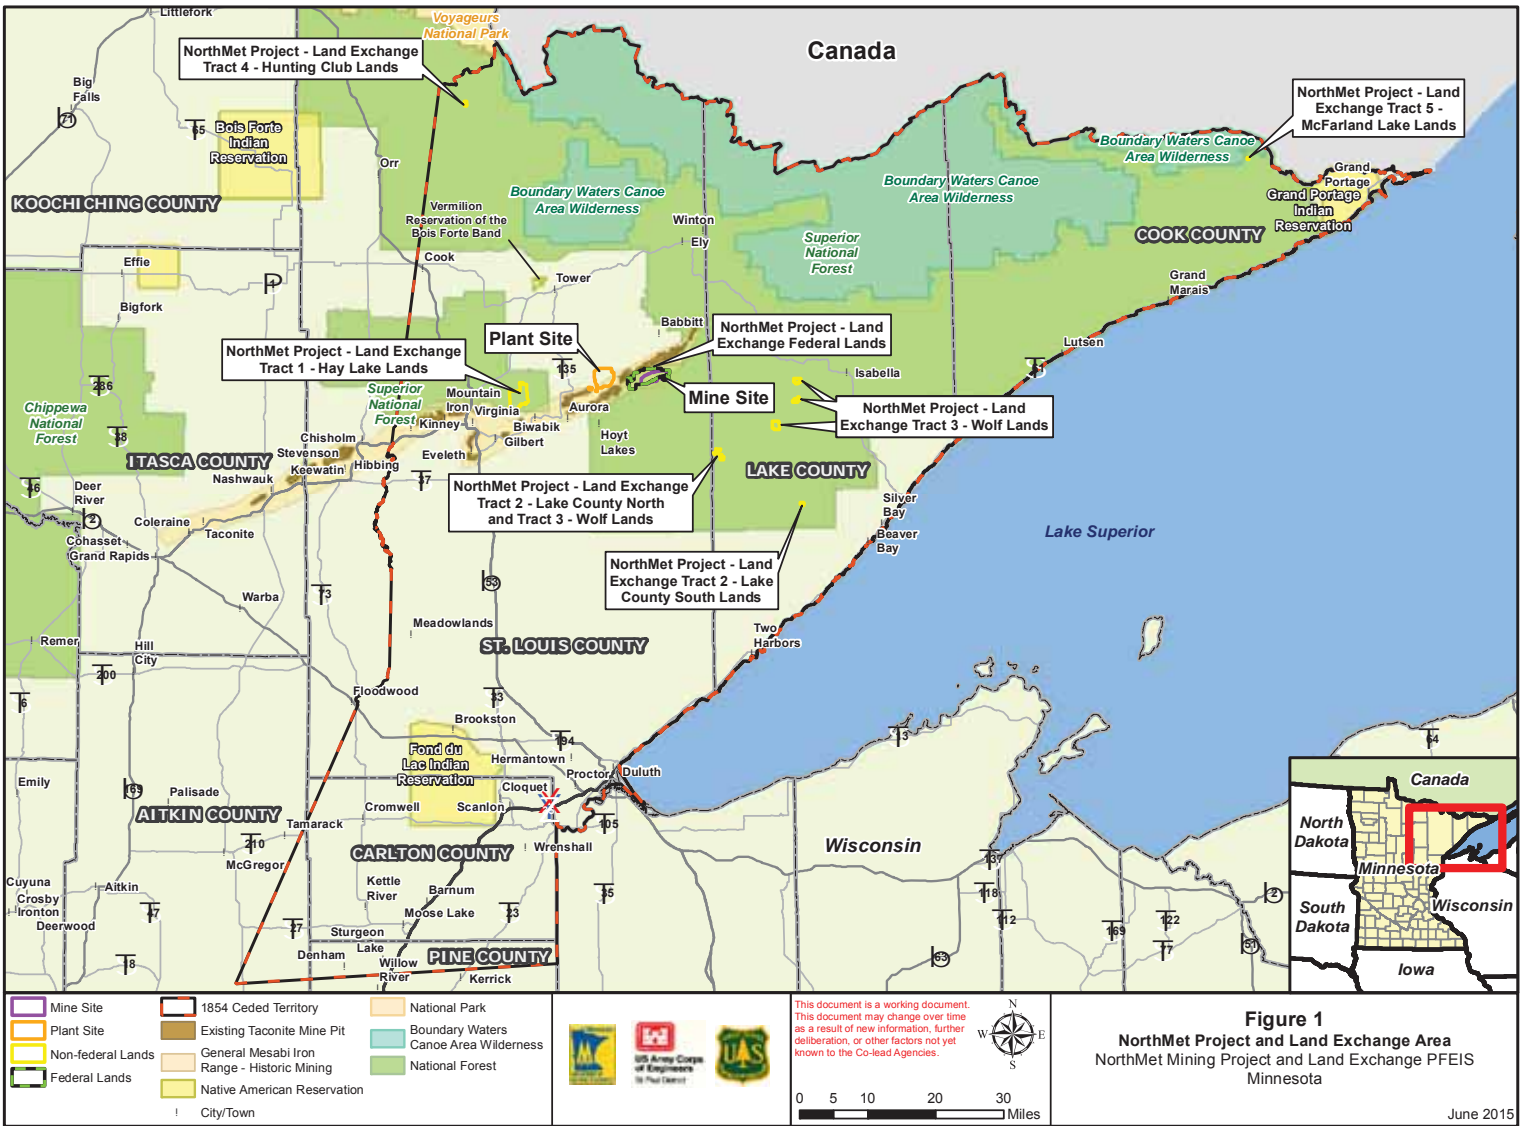

117 The NorthMet Project Proposed Action
118 would require a number of federal, state, and
119 local permits, including a Department of the
120 Army (DA) permit pursuant to Section 404
121 of the Clean Water Act (CWA) for the
122 discharge of dredged or fill materials into
123 waters of the United States. The USACE has
124 determined that issuance of a DA permit for
125 this project would be a major federal action
126 that has the potential to significantly affect
127 the quality of the human environment and,
128 therefore, pursuant to NEPA, requires
129 preparation of an EIS.

130 In addition, the NorthMet Project Proposed
131 Action would require a Permit to Mine from
132 the MDNR, which requires the preparation
133 of a state EIS, with the MDNR as the
134 Responsible Governmental Unit pursuant to
135 MEPA. The State of Minnesota's
136 environmental review process and ultimately
137 the EIS are intended to inform the
138 subsequent permitting and approval
139 processes and describe mitigation measures

140 that may be available.

141 NFS lands are owned by the United States of
142 America and administered by the U.S.
143 Department of Agriculture, Forest Service.
144 The NorthMet Deposit containing copper-
145 nickel-PGE minerals is located on NFS
146 lands within the Superior National Forest.
147 These mineral rights were reserved by the
148 original private owner when the United
149 States purchased the land for National Forest
150 purposes under the authority of the Weeks
151 Act. Those mineral interests remain
152 privately owned and are now controlled by
153 PolyMet. The USFS does not believe that
154 the mineral reservation gives PolyMet a
155 right to surface mine NFS land to access the
156 minerals. In addition, allowing private
157 surface mining would be inconsistent with
158 USFS legal mandates for acquiring and
159 managing these lands.

160 To eliminate this conflict between
161 PolyMet's desire to surface mine and the
162 United States' rights, including USFS
163 administration of the NFS land, PolyMet
164 proposed a land exchange with the USFS
165 where it would acquire the NFS land
166 (surface estate) in exchange for currently
167 privately owned lands that would become
168 part of the NFS. The Land Exchange
169 Proposed Action would reunify the severed
170 mineral and surface estates of the NorthMet
171 Deposit (see Figure 1). Without this
172 exchange, under the described conditions,
173 the surface mining operation desired by
174 PolyMet would not take place. For this
175 reason, the Land Exchange Proposed Action
176 is a connected action to the NorthMet
177 Project Proposed Action and has been
178 analyzed in this FEIS.

DRAFT

181 NEPA AND MEPA PROCESS

182 **Development of the FEIS**

183 As a major federal action and a project that
184 meets or exceeds a state mandatory EIS
185 threshold, the NorthMet Project Proposed
186 Action and Land Exchange Proposed Action
187 trigger the need for an EIS under NEPA and
188 MEPA. The purpose of the EIS is to inform
189 the public and decision-makers of the
190 proposed actions, assess potential
191 environmental consequences, identify
192 potential mitigation measures and
193 reasonable and feasible alternatives, and to
194 address the no-action alternative. The
195 NEPA/MEPA process provides for
196 consultation and/or solicitation of comments
197 from federal and state agencies, Native
198 American Tribes, and the general public.

199 The Co-lead Agencies (the MDNR,
200 USACE, and, as of 2010, USFS) have
201 engaged in a joint federal-state process to
202 consider PolyMet's project proposals as they
203 have evolved over time based on external
204 input and agency reviews of draft designs
205 (see Figure 2).

206 Between 2005 and 2009, the USACE and
207 MDNR evaluated PolyMet's original mining
208 proposal. This process culminated in
209 October 2009 with the publication of the
210 NorthMet Project Draft EIS (DEIS) that
211 analyzed the project as it was then proposed
212 by PolyMet. After issuing the DEIS, the Co-
213 lead Agencies—responding to public, other
214 state and federal agencies' (including the
215 United States Environmental Protection
216 Agency [USEPA]), and tribal comments and
217 concerns—developed an alternative in
218 consultation with PolyMet that sought to
219 resolve several major environmental
220 concerns and permitting barriers raised
221 during the DEIS process. This alternative
222 was subsequently adopted by PolyMet and

223 became the current NorthMet Project
224 Proposed Action.

225 In 2010, the USFS joined as a third Co-lead
226 Agency for the purpose of analyzing the
227 Land Exchange Proposed Action as a
228 connected action. Under state and federal
229 regulations, multiple actions or projects that
230 are connected actions must be considered in
231 total in preparing an EIS. Coincident review
232 of these connected actions prompted the Co-
233 lead Agencies' decision to prepare a
234 Supplemental Draft Environmental Impact
235 Statement (SDEIS). The SDEIS included
236 updated analysis of environmental impacts
237 based on the revised NorthMet Project
238 Proposed Action and added the Land
239 Exchange. It was published in December
240 2013 and public comments were solicited
241 during a 90-day comment period ending in
242 March 2014.

243 This FEIS is being published to address
244 public comments received on the SDEIS and
245 to inform the completion of the Co-lead
246 Agencies' EIS process under NEPA and
247 MEPA.

248 **Structure of the FEIS**

249 This Executive Summary provides an
250 overview of the FEIS, which includes a full
251 description and analysis of the proposed
252 NorthMet Mining Project and Land
253 Exchange and alternatives, as outlined
254 below:

- 255 • Chapter 1.0 (Introduction) provides an
256 overview and descriptions of the purpose
257 of and need for the NorthMet Project
258 Proposed Action and the Land Exchange
259 Proposed Action, the regulatory
260 framework, agency roles and
261 responsibilities, and the organization of
262 the FEIS.

263	• Chapter 2.0 (EIS Development)	306	• Chapter 6.0 (Cumulative Effects)
264	describes the process undertaken by the	307	describes the cumulative effects of the
265	Co-lead Agencies for the NorthMet	308	NorthMet Project Proposed Action and
266	Project Proposed Action and Land	309	Land Exchange Proposed Action when
267	Exchange Proposed Action. It includes	310	considered along with other past,
268	discussion on the scoping process;	311	present, and reasonably foreseeable
269	identification of issues; development of	312	future actions in the region.
270	the NorthMet Project Proposed Action	313	• Chapter 7.0 (Comparison of Alternatives
271	and Land Exchange Proposed Action	314	and Other Considerations) contains a
272	and alternatives; public and agency	315	comparison of the Proposed Connected
273	participation; consultation and	316	Actions and alternatives, conclusions of
274	coordination undertaken to prepare the	317	the impacts (including human health),
275	DEIS, SDEIS, and this FEIS;	318	and Land Exchange Proposed Action
276	incorporation of the Land Exchange	319	public interest considerations, and also
277	Proposed Action; reevaluation of DEIS	320	addresses other NEPA considerations
278	alternatives; and impact analysis	321	including a discussion of agency-
279	approach.	322	preferred alternatives.
280	• Chapter 3.0 (Proposed Action and	323	• Chapter 8.0 (Major Differences of
281	Alternatives) describes the NorthMet	324	Opinion) describes the Tribal
282	Project Proposed Action and Land	325	Cooperating Agencies' major
283	Exchange Proposed Action and	326	differences of opinion with aspects of
284	alternatives including the No Action	327	the EIS.
285	Alternative, Land Exchange Alternative	328	• Appendix A (Response to Comments on
286	B, as well as alternatives considered but	329	the NorthMet Mining Project and Land
287	eliminated from detailed consideration in	330	Exchange Draft and Supplemental Draft
288	the EIS.	331	EIS) identifies the process for public
289	• Chapter 4.0 (Affected Environment)	332	engagement throughout the EIS and
290	summarizes the existing conditions of	333	provides responses to comments
291	the NorthMet Project area and the	334	received on the DEIS and SDEIS.
292	surrounding environment, as well as the	335	• Appendix B (Underground Mining
293	proposed Land Exchange parcels,	336	Alternative Assessment for the
294	including the land and its physical,	337	NorthMet Mining Project and Land
295	biological, cultural, socioeconomic, and	338	Exchange Environmental Impact
296	recreational resources.	339	Statement) describes the analysis that the
297	• Chapter 5.0 (Environmental	340	Co-lead Agencies undertook in
298	Consequences) presents the direct and	341	consideration of a potential Underground
299	indirect environmental effects of the	342	Mining Alternative.
300	NorthMet Project Proposed Action and	343	• Appendix C (Tribal Agency Position
301	alternatives and the direct and indirect	344	Supporting Materials) includes verbatim
302	environmental effects of the Land	345	comments and supporting
303	Exchange Proposed Action and	346	documentation provided by the Tribal
304	associated alternatives.	347	Cooperating Agencies.
305			

348 • Appendix D (Biological Assessment and 352 Exchange Proposed Action may affect
349 Biological Evaluation) identifies 353 listed or proposed species and critical
350 whether activities related to the 354 habitat as required under the Endangered
351 NorthMet Proposed Action and Land 355 Species Act.

356

DRAFT

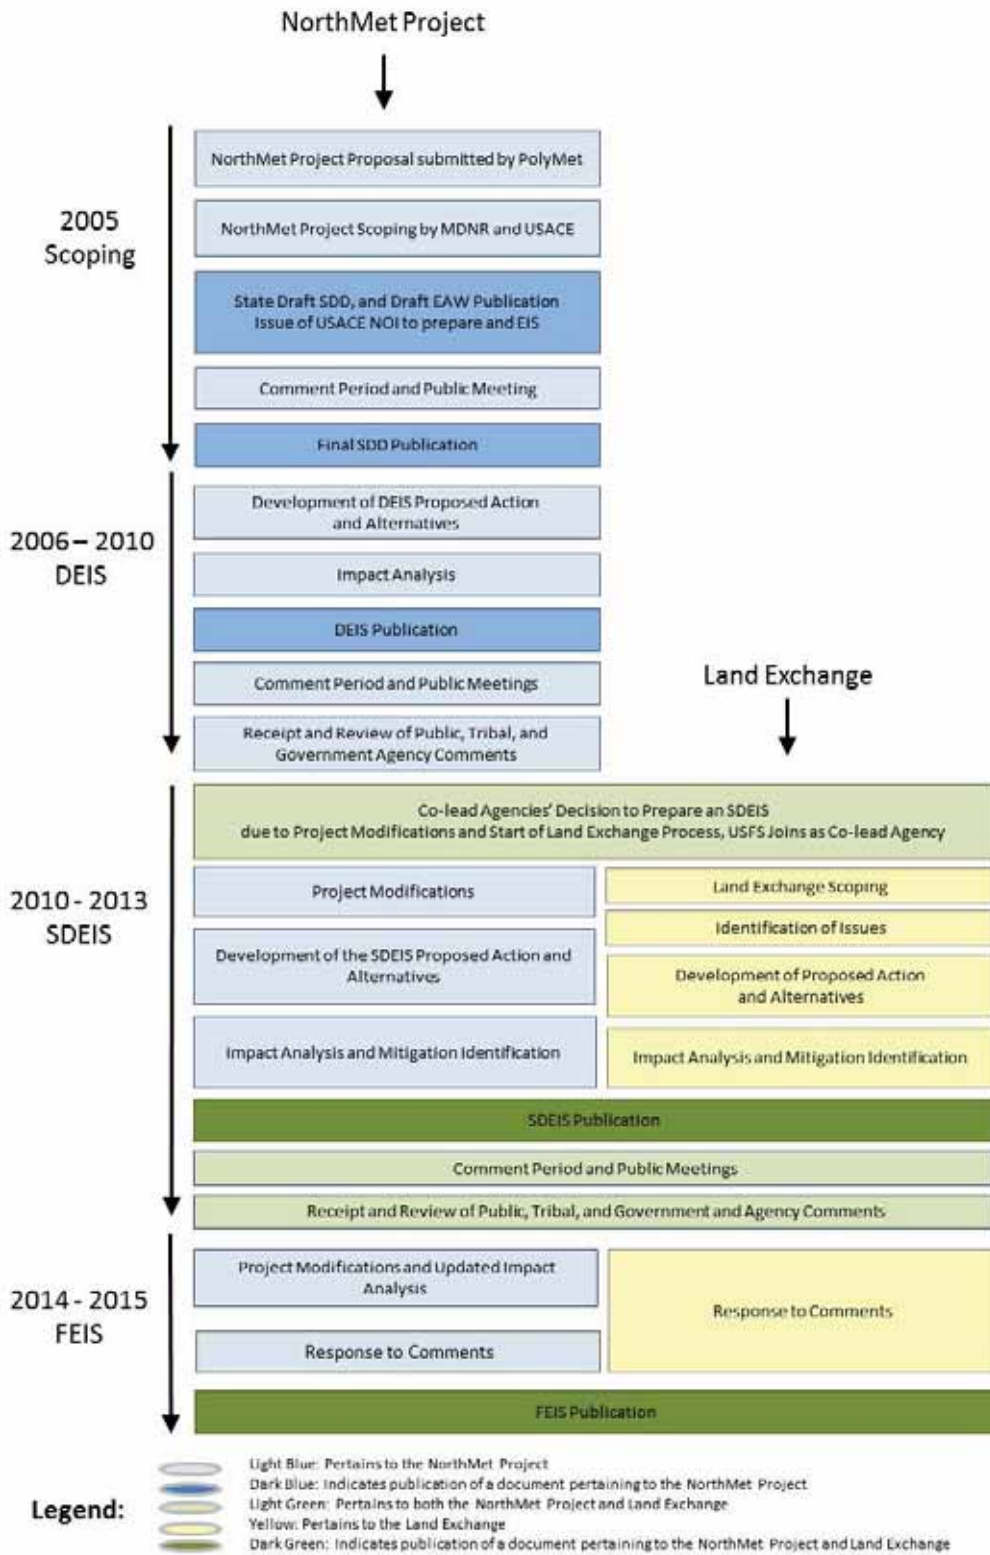

Figure 2 NEPA/MEPA Process, 2005 to Present

357
358

359 **Agency Roles in the FEIS**

360 ***Co-lead Agencies***

361 The MDNR, USACE, and USFS are Co-
362 lead Agencies for the joint state-federal EIS
363 and, therefore, are responsible for the
364 content of the FEIS and have final authority
365 over the language used in the document.

366 ***Cooperating Agencies***

367 The USEPA, under Section 309 of the Clean
368 Air Act, is required to review and publicly
369 comment on all federal EIS documents and
370 publish its review in the public record.

371 Along with the USEPA, the Bois Forte Band
372 of Chippewa, Grand Portage Band of Lake
373 Superior Chippewa, and the Fond du Lac
374 Band of Lake Superior Chippewa (the
375 Bands) have been invited by the Co-lead
376 Agencies to participate in the EIS process
377 and agreed to participate as formal
378 Cooperating Agencies under NEPA. The
379 NorthMet Project area and Land Exchange
380 parcels are located within the 1854 Ceded
381 Territory, within which the Bands reserve
382 hunting, fishing, and gathering
383 (usufructuary) rights. The Great Lakes
384 Indian Fish and Wildlife Commission and
385 the 1854 Treaty Authority have assisted the
386 Bands in addressing issues with the
387 NorthMet Mining Project and Land
388 Exchange.

389

390 ***Other Agencies***

391 Other federal and state agencies
392 participating in development of the FEIS
393 include, but are not limited to, the
394 Minnesota Pollution Control Agency
395 (MPCA), the Minnesota Department of
396 Health, and the United States Fish and
397 Wildlife Service.

398 **PURPOSE OF THE NORTHMET PROJECT AND**
399 **LAND EXCHANGE**

400 The purpose of the NorthMet Project and
401 Land Exchange is multifaceted:

- 402 • PolyMet: The NorthMet Project and
403 Land Exchange would allow the
404 company to exercise its mineral lease
405 rights to mine the NorthMet Deposit.
- 406 • USACE and MDNR: The NorthMet
407 Project Proposed Action would produce
408 base and precious metal precipitates and
409 flotation concentrates from ore mined at
410 the NorthMet Deposit by uninterrupted
411 operation of the former LTV Steel
412 Mining Company (LTVSMC)
413 processing plant. The processed
414 resources would help meet domestic and
415 global demand by sale of these products
416 to domestic and world markets.
- 417 • USFS: The Land Exchange Proposed
418 Action is intended to resolve the conflict
419 between the surface estate owned by the
420 United States and the private mineral
421 estate.

422 **PROPOSED CONNECTED ACTIONS**

423 The Proposed Connected Actions includes
424 the NorthMet Project Proposed Action and
425 the Land Exchange Proposed Action as
426 described below.

427 **NorthMet Project Proposed Action**

428 Located on the eastern flank of the Mesabi
429 Iron Range, the proposed NorthMet Mine
430 would be located 6 miles south of the City
431 of Babbitt and the processing plant would be
432 6 miles north of the City of Hoyt Lakes in
433 St. Louis County, Minnesota. The Mesabi
434 Iron Range region has been mined for iron
435 ore and lower-grade iron ore called taconite
436 for over 100 years (see Figure 3). The entire
437 mine is within the municipal boundaries of
438 the City of Babbitt and the processing plant
439 is mostly located within the municipal
440 boundaries of the City of Hoyt Lakes (see
441 Figure 4). Several other communities,
442 including Aurora, Virginia, Ely, Hibbing,
443 Eveleth, and Biwabik that are located within
444 St. Louis and Lake counties, are within 50
445 miles of the NorthMet Project area. In
446 addition, the project is about 50 miles
447 southeast of Voyageurs National Park and
448 20 miles south of the Boundary Waters
449 Canoe Area Wilderness (BWCAW).

450 A substantial portion of the land required by
451 the NorthMet Project Proposed Action
452 would reuse a former mining plant site
453 (LTVSMC processing plant) for mineral
454 processing, and use the existing Tailings
455 Basin for tailings disposal.

456 Mining would occur on what is referred to
457 as the Mine Site, which is relatively
458 undisturbed land; however, there is
459 previously logged land nearby. The Mine
460 Site would be connected to the processing
461 facilities and tailings basin (Plant Site) by an
462 existing (upgraded) rail line, the Dunka

463 Road, and a water line, collectively referred
464 to as the Transportation and Utility Corridor.
465 The active Northshore Mine (taconite iron
466 ore mine) is located about a mile north of
467 the Mine Site.

468 There would be three distinct phases to the
469 NorthMet Project Proposed Action:

- 470 • Construction would last for
471 approximately 18 months and would
472 include land clearing, building
473 renovation and construction, stockpile
474 preparation, and utility upgrades.
- 475 • Operations would last approximately 20
476 years, and would include ore mining and
477 processing, continued construction, and
478 progressive reclamation.
- 479 • Final land reclamation, closure, and
480 post-closure maintenance would occur
481 after mining and would include
482 infrastructure removal, maintenance, and
483 monitoring.

484 An overview of the NorthMet Project
485 Proposed Action construction, operations,
486 closure, and post-closure maintenance is
487 provided below.

DRAFT

493 **Construction**

494 Construction would begin after permitting
495 and about 18 months before mining and
496 processing. Geochemical characterization
497 has identified four types of waste rock that
498 would be managed based on their potential
499 to oxidize and release various solutes
500 (Category 1 being the lowest potential and
501 Category 4 being the highest). In preparation
502 for mining at the Mine Site, existing
503 vegetation would be cleared and overburden
504 (i.e., soils and rock) would be removed.
505 Additionally, a Mine Site Wastewater
506 Treatment Facility (WWTF), Category 1
507 Stockpile groundwater containment system,
508 and liner systems for the Category 2/3
509 Stockpile and Category 4 Stockpile would
510 be constructed. At the Transportation and
511 Utility Corridor, an existing road, railroad,
512 and utilities would receive minor upgrades.
513 These transportation routes and utilities
514 would connect the Mine Site to the Plant
515 Site, which are about 8 miles apart.

516 At the Plant Site, existing buildings would
517 be refurbished and new buildings would be
518 constructed. A portion of the existing
519 LTVSMC Tailings Basin would be used as
520 the base for a new NorthMet Project
521 Tailings Basin. A surface and groundwater
522 containment system would be installed
523 around the northern, western and eastern
524 sides of the Tailings Basin to collect surface
525 and groundwater coming from the Tailings
526 Basin. The existing containment system
527 along the southern side of Tailings Basin
528 would be improved as necessary to meet
529 performance requirements. The stability of
530 the Tailings Basin would be enhanced by the
531 addition of rock buttressing, and weaker
532 material in the existing facility would be
533 strengthened using cement deep soil mixing.
534 A separate double-lined facility would be
535 constructed to contain residue from the
536 hydrometallurgical process. A mechanical
537 Wastewater Treatment Plant (WWTP)
538 (using reverse osmosis [RO]) or

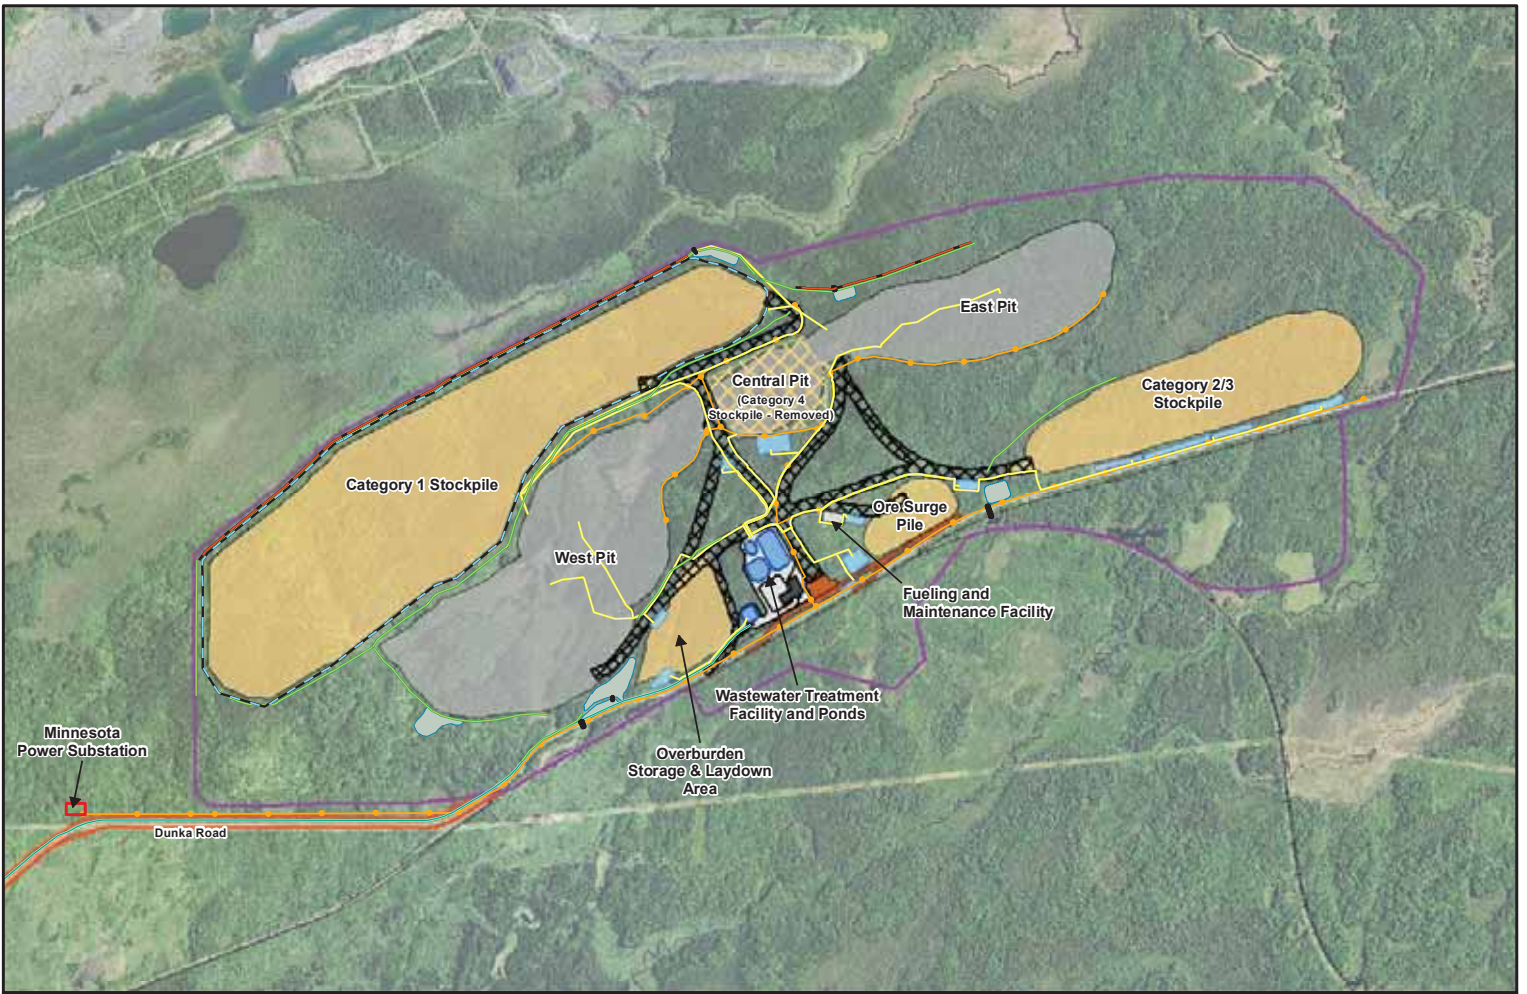

539 equivalently performing technology would
540 be constructed.

541 **Mining Operations**

542 The mining operations would involve the
543 use of conventional open-pit surface mining
544 methods such as blasting and the excavation
545 of rock from the NorthMet Deposit. The
546 NorthMet Deposit is a low- to medium-
547 quality copper-nickel-PGE deposit with low
548 sulfide content. The Life of Mine (i.e., the
549 duration of mining operations) would be 20
550 years, over which time approximately
551 533 million tons of waste rock and ore
552 would be removed from the NorthMet
553 Deposit. This includes a total of 225 million
554 tons of ore and 308 million tons of waste
555 rock. The average ore processing rate would
556 be up to 32,000 tons per day.

557 Mining would be conducted in three open
558 pits. The East Pit and West Pit would be
559 mined simultaneously through the first 11
560 years of the mine life (see Figure 5). Mining
561 would cease at the East Pit at approximately
562 year 11 and continue at the West Pit until
563 year 20 (see Figure 6). The Central Pit
564 would be mined between years 11 and 16
565 and would ultimately be combined with the
566 East Pit. The maximum depths of the pits
567 below the original surface level would be
568 696 feet (ft) for the East Pit (at year 11), 356
569 ft for the Central Pit (at year 16), and 630 ft
570 for the West Pit (at year 20).

Mine Site Plan - Year 20
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

June 2015

DRAFT

577 Until the completion of mining in the East
578 Pit (approximately year 11), waste rock
579 would be hauled to one of the following
580 stockpiles at the Mine Site:

- 581 • Permanent Category 1 Stockpile
582 (surrounded by a water containment
583 system and covered at closure);
- 584 • Temporary Category 2/3 Stockpile
585 (lined); or
- 586 • Temporary Category 4 Stockpile (lined).

587 After mining planned at the East Pit ends by
588 year 11, the waste rock in the temporary
589 Category 2/3 and 4 stockpiles would be
590 moved into the East Pit for subaqueous
591 disposal. This option is the preferred method
592 of disposal for the more reactive waste rock.
593 Waste rock generated from ongoing mining
594 in the West Pit and Central Pit after year 11
595 would be directly disposed of in the East Pit.
596 Some Category 1 waste rock would continue
597 to be placed on the Category 1 Stockpile
598 until year 13. Mining operations would
599 continue in the West Pit until year 20, while
600 backfilling the combined East Central Pit
601 with waste rock.

602 Water control systems would be constructed
603 to capture water that has contacted surfaces
604 disturbed by mining operations, water
605 collected on stockpile liners, and water
606 collected by the Category 1 Stockpile
607 containment system (i.e., collectively
608 referred to as process water). Process water
609 would be treated at a mechanical WWTF
610 located at the Mine Site and either pumped
611 to the Plant Site Tailings Basin for use as
612 process make-up water or to supplement
613 flooding of the East Pit after backfilling with
614 waste rock. No surface water would be
615 discharged off site.

616 ***Processing Operations***

617 Ore would be transported to the Plant Site
618 (see Figure 7) by rail, for crushing and
619 processing. Processing would involve

620 concentration using a flotation method to
621 separate metallic sulfide minerals (ore
622 concentrate) from feldspar and other non-ore
623 minerals (tailings).

624 Ore concentrate would either be dewatered
625 and shipped off site as copper concentrate
626 and nickel concentrate final products, or the
627 nickel concentrate would be processed in an
628 autoclave (oxidation and leaching method)
629 at the Hydrometallurgical Plant and
630 base/precious metal precipitates would be
631 produced. These precipitates would be
632 shipped off site and sold as final products.
633 Based on the anticipated rate of mining,
634 mineral processing of up to 32,000 tons per
635 day of ore would yield annual production of
636 about 113,000 tons of copper concentrate,
637 18,000 tons of mixed (nickel/copper)
638 hydroxide, and 500 tons of PGE precipitate.

639 After passing through a secondary flotation
640 cycle to remove as many sulfide minerals as
641 possible, the tailings would be transferred as
642 slurry to the Tailings Basin. Bentonite clay
643 would be incorporated into the exposed
644 outer side-slopes of the Tailings Basin as it
645 is built up to create a barrier that would limit
646 oxidation of sulfide minerals. This limiting
647 of oxygen transfer would reduce pollutants
648 generated from the Tailings Basin.

649 Water seepage from the Tailings Basin
650 would be collected by the containment
651 system and sent to either the Tailings Basin
652 pond or the Plant Site WWTP for treatment.
653 Treated water would be used to maintain
654 flows (augmentation) in the streams that
655 would otherwise receive reduced flows
656 because of the Tailings Basin containment
657 system.

658 ***Closure and Post-closure Maintenance***

659 In general, the Mine Site area has been
660 designed and would be operated to allow for
661 progressive reclamation. After mining is
662 completed, the West Pit would be filled with
663 groundwater and surface water to become a

664 pit lake (see Figure 8). The Mine Site
665 mechanical WWTF would be upgraded to
666 include RO or equivalently performing
667 technology and would be maintained to treat
668 pit lake water quality for as long as
669 necessary. Other unnecessary buildings and
670 infrastructure would be removed and
671 reclaimed. The Plant Site would be closed
672 by removing unnecessary buildings and
673 infrastructure, capping the
674 Hydrometallurgical Residue Facility
675 (double-lined), and adding bentonite
676 amendment and vegetation to the beaches
677 and pond at the Tailings Basin. The Tailings
678 Basin collection system and Plant Site
679 WWTP (RO or equivalently performing
680 technology) would be maintained to treat
681 Tailings Basin seepage for as long as
682 necessary.

683 Water quality modeling performed in
684 support of the FEIS indicates that water
685 treatment systems would be needed at the
686 Mine Site and Plant Site indefinitely. The
687 water objective of closure is to provide
688 water treatment for as long as necessary to
689 meet regulatory standards at applicable
690 groundwater and surface water compliance
691 points. The NorthMet Project Proposed
692 Action includes long-term mechanical
693 treatment (RO or equivalently performing
694 technology) at both the Mine Site and Plant
695 Site with a goal of transitioning to a non-
696 mechanical water treatment technology
697 requiring less maintenance over the long
698 term. Pilot studies for non-mechanical
699 treatment would be conducted during
700 operations (and post-closure as necessary) to
701 demonstrate the ability to transition to non-
702 mechanical water treatment. Both
703 mechanical and non-mechanical treatment
704 would require periodic maintenance and
705 monitoring activities for as long as treatment
706 is required (indefinitely).

707 The water models constructed to assess the
708 potential effects from the NorthMet Project
709 Proposed Action were not designed to

710 predict the duration of treatment nor do they
711 capture all the factors that influence the
712 duration of treatment. Therefore, the models
713 cannot be used to predict when treatment
714 would end. Actual treatment requirements
715 would be assessed on a recurring basis
716 throughout operations and closure based on
717 results of ongoing discharges, performance,
718 and water resource monitoring, ensuring
719 continuous protection of groundwater and
720 surface water quality and compliance with
721 applicable water quality standards. This
722 reassessment process would rely on
723 measured monitoring results (evaluated
724 through modeling) rather than the results of
725 the predictive modeling included in the
726 FEIS. Regardless of the precise duration of
727 effects or water treatment at either the Mine
728 Site or Plant Site, there are measures
729 available to address impacts to natural
730 resources.

731 *Monitoring, Adaptive Management, and* 732 *Mitigation*

733 The monitoring and maintenance of
734 geotechnical stability, water, wetland,
735 vegetation, and other resources would
736 continue for as long as necessary.

737 One of the key elements of the NorthMet
738 Project Proposed Action is the inclusion of
739 several management plans that detail how
740 PolyMet would monitor environmental
741 conditions to ensure that they would meet all
742 applicable environmental goals set in the
743 permits. Key among these plans is the
744 Adaptive Water Management Plan, which
745 describes how Mine Site and Plant Site
746 water management would be managed and
747 under what circumstances design changes to
748 the following NorthMet Project Proposed
749 Action facilities would be triggered:

- 750 • Category 1 Stockpile Cover System –
751 PolyMet proposes to install a
752 geomembrane cover system to reduce
753 the load of constituents that reach the

754 West Pit via drainage from the Category 798 of the NorthMet Project Proposed Action.
755 1 Stockpile. It is considered an adaptive 799 Monitoring and modeling would be used to
756 engineering control as the cover system 800 determine the performance of the proposed
757 could be enhanced if monitoring 801 measures and identify any needed revisions.
758 identified the cover system was 802
759 underperforming.

- 760 • Mine Site WWTF – the WWTF is
761 considered adaptive engineering control
762 as it would be upgraded to a RO or
763 equivalently performing technology
764 during closure and adjusted as needed to
765 manage sulfate concentrations in the
766 effluent.
- 767 • Plant Site WWTP – the WWTP would
768 treat Plant Site process water. It is
769 considered an adaptive engineering
770 control because the operating
771 configuration and requirements of the
772 process units within the WWTP or the
773 capacity of the WWTP could be
774 modified to accommodate varying
775 influent streams and discharge
776 requirements.
- 777 • Tailings Basin Pond Bottom Cover
778 System – PolyMet proposes to install a
779 Tailings Basin pond bottom cover
780 system during reclamation in order to
781 reduce the diffusion of oxygen into the
782 tailings. It is considered adaptive
783 engineering control as additional
784 bentonite could be added if the pond
785 bottom cover system were under-
786 performing.

787 Other proposed mitigation measures are also
788 included in the FEIS and would be a part of
789 the NorthMet Project Proposed Action.
790 These may include measures to ensure
791 geotechnical dam stability, reduce fugitive
792 dust and noise, and effects on water quality,
793 wetlands, cultural resources or historic
794 properties, and other resources.

795 The FEIS describes these proposed
796 measures and when they would be employed
797 during construction, operations, and closure

 Minnesota

DRAFT

808 **Land Exchange Proposed Action**

809 The Land Exchange Proposed Action would
810 involve the transfer of 6,650.2 acres
811 (General Land Office [GLO]) of federal
812 lands from public to private ownership, and
813 up to 6,722.5 acres (GLO) of land from
814 private to public ownership (see Figure 9),
815 depending upon the results of the
816 environmental analysis and real estate
817 appraisals. This information will be
818 presented in the USFS Record of Decision
819 (ROD). The ROD will require a current
820 appraisal, approved by the USFS, to verify
821 equal value.

822 ***Federal Lands***

823 The federal lands proposed to transfer to
824 PolyMet include a large black spruce,
825 tamarack, and cedar wetland, and also
826 contain Mud Lake. Yelp Creek and the
827 Partridge River also flow through the
828 property. These federal lands lie
829 immediately south of the Superior National
830 Forest proclamation boundary and are
831 bounded on the south by the former
832 LTVSMC railroad and Dunka Road, which
833 are features of the NorthMet Project
834 Proposed Action. Legal access to the federal
835 lands is primarily via Dunka Road, which is
836 privately owned and would require an
837 approval for ingress and egress, and the
838 former LTVSMC railroad.

839 The area includes other privately owned
840 properties to the north and west of the
841 federal lands, which have been surface
842 mined over the years. There are mine pits,
843 waste rock stockpiles, tailings basins,
844 processing facilities, railroad grades, and
845 other general mining facilities throughout
846 the area. A 115-acre, privately owned in-
847 holding within the exterior boundaries of the
848 northwestern portion of the federal lands is
849 not included in the Land Exchange Proposed
850 Action.

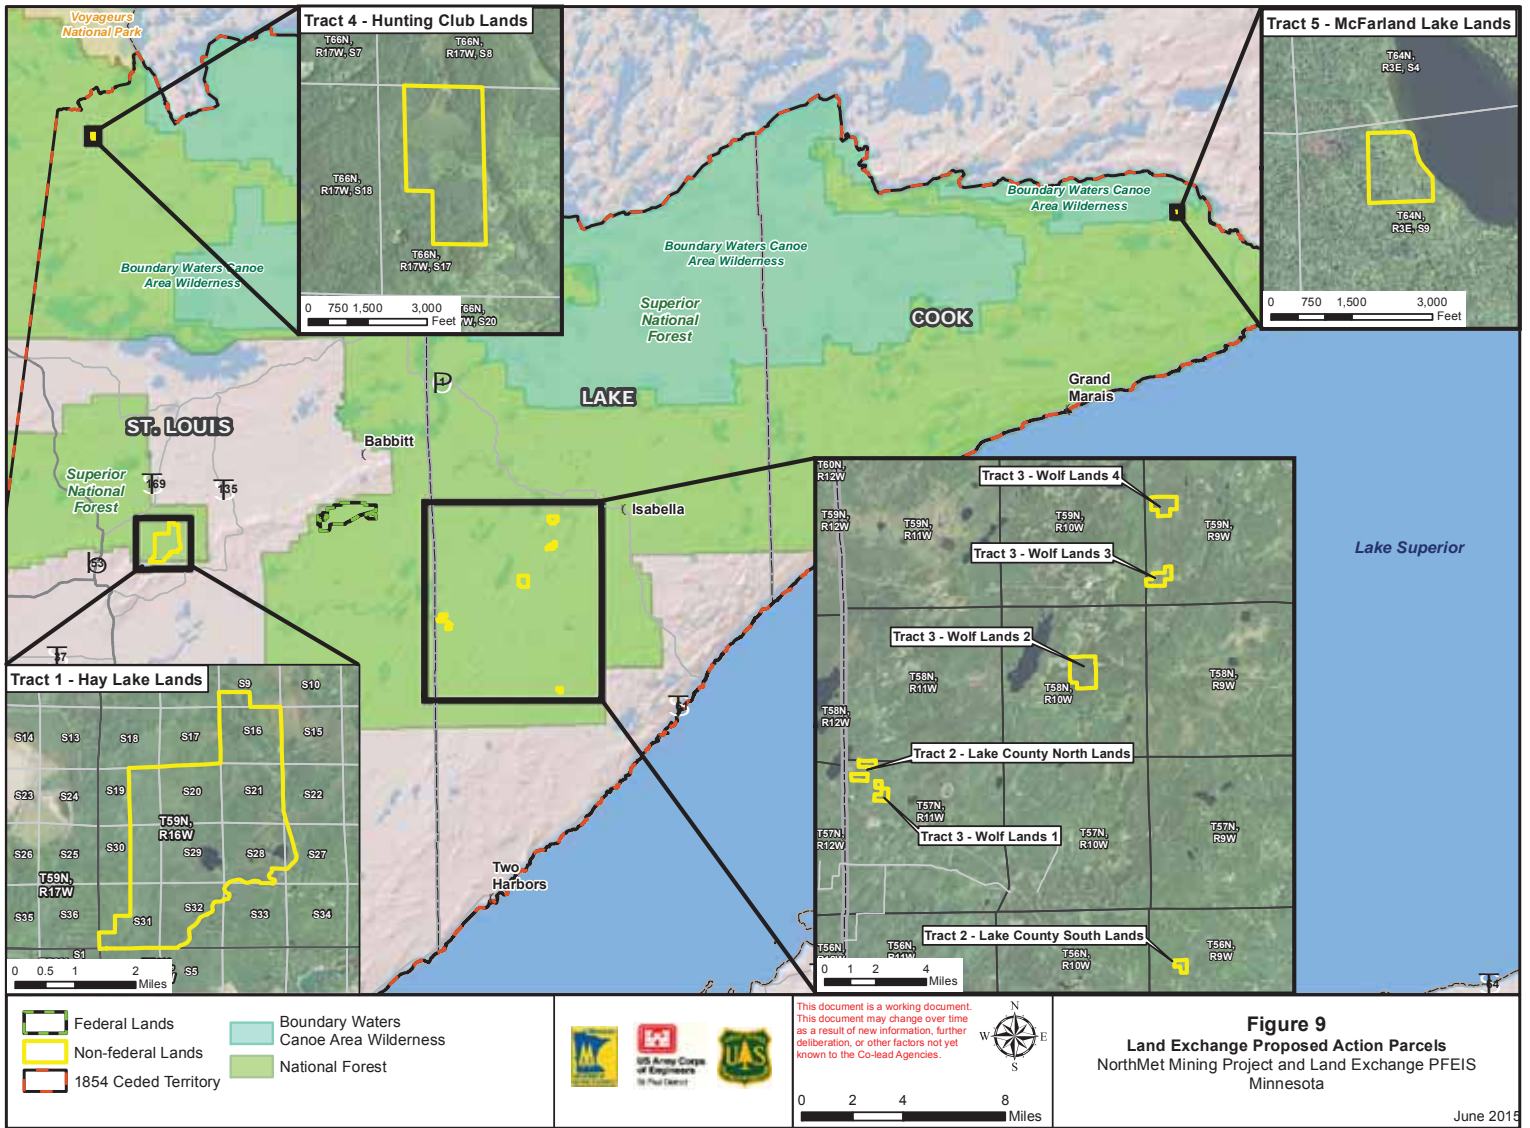

851

852 ***Non-federal Lands***

853 The Land Exchange Proposed Action would
854 include up to five tracts (Tract 1 – Hay Lake
855 lands, Tract 2 – Lake County lands, Tract 3
856 – Wolf lands, Tract 4 – Hunting Club lands,
857 Tract 5 – McFarland Lake lands) of non-
858 federal lands in St. Louis, Lake, and Cook
859 counties that would comprise up to 6,722.5
860 acres (GLO); however, the final exchange, if
861 approved, could include fewer than 6,722.5
862 acres (GLO) of non-federal land, depending
863 on the results of the environmental analysis
864 and real estate appraisals. All of the lands
865 proposed for exchange are located within the
866 1854 Ceded Territory of northeastern
867 Minnesota (see Figure 1). For more
868 information regarding the 1854 Ceded
869 Territory, please refer to the Predicted
870 Environmental Consequences section below.

871 PolyMet currently owns a portion of the
872 non-federal lands proposed for exchange;
873 however, all rights, titles, and interests of the
874 remaining non-federal lands proposed for
875 exchange have been assigned to PolyMet.
876 All of the non-federal lands except Tract 4
877 have severed mineral and surface ownership,
878 which means that the mineral resources
879 would not be acquired with the surface.
880 There are no mining activities proposed on
881 the non-federal lands as part of the Land
882 Exchange Proposed Action. The lands
883 acquired would become part of the Superior
884 National Forest and would be managed
885 under the 2004 Superior National Forest
886 Land and Resource Management Plan
887 (Forest Plan).

DRAFT

DRAFT

891 **PREDICTED ENVIRONMENTAL**
892 **CONSEQUENCES OF THE PROPOSED**
893 **CONNECTED ACTIONS**

894 Although the NorthMet Project Proposed
895 Action would take place in a region that has
896 been used for mining and timber production
897 for over 100 years, it also contains many
898 important recreational, cultural, and natural
899 resources. The FEIS describes in detail those
900 elements of the natural and human
901 environment that would be affected by the
902 NorthMet Project Proposed Action and Land
903 Exchange Proposed Action. The following
904 section briefly describes some of the critical
905 environmental effects predicted as a result of
906 the NorthMet Project Proposed Action and
907 Land Exchange Proposed Action.

908 **NorthMet Project Effects on Water**
909 **Resources**

910 The NorthMet Project Mine Site drains to
911 the Partridge River and the Plant Site mostly
912 drains to the Embarrass River with the
913 exception of Second Creek (Partridge River
914 Watershed). Both rivers are tributaries to the
915 St. Louis River, which flows to Lake
916 Superior. These rivers are not located within
917 the Hudson Bay Basin and do not flow to,
918 and would not affect the quality of, the
919 waters of the BWCAW.

920 Engineering controls at the Mine Site and
921 Plant Site would capture the majority
922 affected water for treatment. Water leaving
923 the NorthMet Project area would include
924 non-contact stormwater, clean water from
925 the WWTP and WWTF, and a small volume
926 of groundwater water escaping the liners and
927 containment systems.

928 Several groundwater, surface water, and
929 water quality models (MODFLOW,
930 XP-SWMM, and GoldSim, respectively)

931 were used to predict the hydrologic and
932 water quality effects of the NorthMet Project
933 Proposed Action, as well for a Continuation
934 of Existing Conditions scenario for
935 comparison. The water quality model, which
936 was run at monthly time steps for 200 years
937 for the Mine Site and 500 years for the Plant
938 Site, performs probabilistic simulations,
939 taking into account the uncertainty around
940 many of the model input assumptions. The
941 Co-lead Agencies have selected the 90th
942 percentile probability (P90) as its evaluation
943 threshold in determining whether the model
944 results meet established evaluation criteria.
945 This means that there is at least a 90 percent
946 probability that a constituent would not
947 exceed the evaluation criteria.

948 With the proposed engineering controls, the
949 water quality model predicts that the
950 NorthMet Project Proposed Action would
951 not cause any significant water quality
952 impacts because: 1) exceedances of the P90
953 threshold did not occur, 2) the NorthMet
954 Project Proposed Action concentrations
955 were no higher than concentrations
956 predicted for the Continuation of Existing
957 Conditions scenario, and 3) the frequency of
958 exceedances for NorthMet Project Proposed
959 Action conditions was within an acceptable
960 range or not attributable to NorthMet Project
961 Proposed Action discharges or both.

962 The NorthMet Project Proposed Action
963 would not result in significant changes to
964 sulfate concentrations in the Partridge River,
965 but would significantly decrease sulfate
966 concentrations in the Embarrass River.
967 Furthermore, the engineering controls would
968 provide a high degree of reliability and
969 flexibility to ensure that the NorthMet

970 Project Proposed Action would not cause or
971 contribute to an exceedance of evaluation
972 criteria for sulfate in the future.

973 Nearly all contact or process water at the
974 NorthMet Project area would be treated at
975 the Mine Site WWTF or Plant Site WWTP
976 before release to the environment. At the
977 Mine Site, about 10 gallons per minute of
978 untreated water would be released during
979 closure (all related to groundwater seepage),
980 which represents less than 5 percent of total
981 Mine Site water releases (including treated
982 and untreated water). At the Tailings Basin,
983 about 20 gallons per minute of untreated
984 water would be released during closure (all
985 related to Tailings Basin seepage that
986 bypasses the groundwater containment
987 system), which represents less than 1
988 percent of total Tailings Basin water releases
989 (including treated and untreated water). The
990 NorthMet Project Proposed Action is also
991 not predicted to result in any significant
992 changes to groundwater and surface water
993 flows when compared to existing conditions.

994 Mercury is another constituent of concern,
995 primarily because many of the lakes and
996 rivers in the area are currently classified as
997 “impaired waters” by the MPCA due to
998 elevated mercury content in fish tissue. The
999 NorthMet Project Proposed Action is
1000 located within the Lake Superior Basin and
1001 would be subject to the Great Lakes
1002 Initiative (GLI) mercury water quality
1003 standard of 1.3 nanograms per liter (ng/L).
1004 The NorthMet ore and waste rock contain
1005 trace amounts of mercury; however, the
1006 modeling and data suggest that the mercury
1007 concentration in the West Pit Lake, the only
1008 surface water discharge at the Mine Site,
1009 would stabilize below the GLI standard at
1010 approximately 0.9 ng/L. There would also
1011 be mercury in the tailings, where about 95
1012 percent of the mercury in the ore is predicted
1013 to remain in the solids disposed of in the
1014 Tailings Basin and Hydrometallurgical
1015 Residue Facility. The mercury concentration

1016 in seepage from the Tailings Basin is
1017 anticipated to be below the GLI standard.
1018 Water from the NorthMet Project Proposed
1019 Action is predicted to increase mercury
1020 loadings in the Embarrass River Watershed
1021 (from 22.3 to 22.5 grams per year) but
1022 decrease mercury loadings in the Partridge
1023 River (24.2 to 23.0 grams per year). The net
1024 effect of these changes would be an overall
1025 reduction in mercury loadings to the
1026 downstream St. Louis River.

1027 The BWCAW and Voyageurs National Park
1028 are located in a different watersheds than the
1029 NorthMet Project area, and lie 20 miles and
1030 50 miles away, respectively. The NorthMet
1031 Project Proposed Action would not directly,
1032 indirectly, or cumulatively affect the water
1033 quality of these areas.

1034 **NorthMet Project Effects on** 1035 **Biological Resources**

1036 Direct and indirect effects to wetlands would
1037 result from mining operations. The
1038 NorthMet Project Proposed Action would
1039 directly affect 913.8 acres of wetlands
1040 located within the NorthMet Project area,
1041 mostly within the Mine Site, as a result of
1042 activities such as filling, excavation, and
1043 installation of a containment system within
1044 the wetland boundary, and, therefore, these
1045 wetlands would be permanently lost. Direct
1046 effects would occur on the following
1047 wetland types: coniferous bog, shrub
1048 swamp, coniferous swamp, shallow marsh,
1049 deep marsh, sedge/wet meadow, hardwood
1050 swamp, and open bog.

1051 A wetland may be fragmented as the result
1052 of direct impacts that split a wetland
1053 resource area into multiple parts. These
1054 fragmented parts could potentially be
1055 isolated from other wetlands and would no
1056 longer have any adjacent upland watershed
1057 area, which could result in the loss of
1058 functions in the wetland fragments. The
1059 fragmented wetlands that were determined

1060 to lose their functions (26.9 acres) would be
1061 mitigated up front and included in the
1062 compensatory mitigation.

1063 The overall wetland mitigation strategy for
1064 the NorthMet Project Proposed Action
1065 would be to compensate for unavoidable
1066 wetland impacts in-place (within the same 8-
1067 digit Hydrologic Unit Code), in-kind where
1068 possible, and in advance of impacts when
1069 feasible in order to replace lost wetland
1070 functions. The USACE St. Paul District has
1071 not made a final determination of the
1072 compensation ratios that would be required
1073 for the NorthMet Project Proposed Action.
1074 The final decision on compensatory
1075 mitigation ratios will be determined at the
1076 time of the decision on the DA permit and
1077 would be based on current District guidance.
1078 PolyMet would ultimately need to satisfy
1079 both the federal and state mitigation
1080 requirements. The number of mitigation
1081 credits to be earned by replacement wetlands
1082 will be determined during permitting by the
1083 appropriate agencies reviewing the wetland
1084 mitigation plan. This will be based on the
1085 extent to which the sites meet the target
1086 goals established during permitting. These
1087 include, among other things, restoration of
1088 wetland-appropriate hydrology and the
1089 establishment of a target plant community or
1090 type.

1091 Compensatory mitigation would be required
1092 for the 913.8 acres of wetlands that would
1093 be directly affected. Depending on the
1094 location, type, and timing of compensatory
1095 mitigation, the minimum required amount of
1096 replacement wetlands for direct effects
1097 could potentially range from 913.8 acres up
1098 to 1,827.6 acres (i.e., compensation ratios
1099 of 1:1 up to 2:1). In addition, compensatory
1100 mitigation for the 26.9 acres of wetland
1101 fragmentation would be provided up front.
1102 Due to both on- and off-site limitations and
1103 technical feasibility, it is not practicable to
1104 replace all affected wetland types with an
1105 equivalent area of in-kind wetlands.

1106 Proposed off-site wetland compensation of
1107 1,602.7 acres could provide 1,513.3 wetland
1108 mitigation credits. In addition, a total of
1109 197.1 acres of upland buffer areas are
1110 proposed to be established with native
1111 vegetation around the wetland restoration
1112 areas. In accordance with USACE
1113 guidelines, credit for the upland buffer areas
1114 would be at a 4:1 ratio, resulting in an
1115 additional 49.3 credits. The total off-site
1116 mitigation could provide 1,562.5 wetland
1117 mitigation credits. Actual compensatory
1118 ratios determined during permitting may
1119 vary from these assumptions. The
1120 determination of final mitigation credits
1121 required to offset the effects of the
1122 NorthMet Project Proposed Action would be
1123 determined by the agencies during wetland
1124 permitting.

1125 Financial assurances for the direct wetland
1126 impact mitigation would be required until
1127 success of the mitigation sites is assured.
1128 While this wetland mitigation would be
1129 expected to be approved and constructed in
1130 advance of any authorized wetland impacts,
1131 it is unclear whether these sites would be
1132 well-established enough for financial
1133 assurances to be waived. The USACE would
1134 also consider the application of financial
1135 assurances for potential indirect wetland
1136 effects and monitoring. Both the USACE
1137 and state would require consideration of
1138 financial assurances during the permitting
1139 process.

1140 Wetlands that were not filled or excavated
1141 (permanently lost), but having a reduced
1142 function, would be considered indirectly
1143 affected. Indirect effects on wetlands from
1144 the NorthMet Project Proposed Action
1145 would result from one or more of the
1146 following six factors: 1) wetland
1147 fragmentation; 2) changes in wetland
1148 hydrology resulting from changes in
1149 watershed area; 3) changes in wetland
1150 hydrology due to groundwater drawdown
1151 resulting from open pit mine dewatering; 4)

1152 changes in wetland hydrology from
1153 groundwater drawdown resulting from
1154 operation of the Plant Site, including
1155 groundwater seepage containment; 5)
1156 changes in stream flow near the Mine Site
1157 and Plant Site and associated effects on
1158 wetlands abutting the streams; and 6) change
1159 in wetland water quality related to
1160 atmospheric deposition of dust and rail car
1161 spillage associated with Mine Site and Plant
1162 Site operations.

1163 Wetland mitigation for potential indirect
1164 wetland effects would be determined by the
1165 agencies during permitting. If the NorthMet
1166 Project Proposed Action were to be
1167 permitted, mitigation for indirectly affected
1168 wetlands would be determined through
1169 monitoring. Additional compensation may
1170 be required if determined necessary based
1171 on monitoring results.

1172 Wetland hydrology and vegetation
1173 monitoring would be conducted during the
1174 operations phase of the NorthMet Project
1175 Proposed Action to document indirect
1176 effects on wetlands. Prior to the start of the
1177 NorthMet Project Proposed Action,
1178 monitoring would be established based on
1179 permit conditions. The monitoring would
1180 describe the purpose, methods, and criteria
1181 to be implemented to document indirect
1182 effects on wetlands. A component of the
1183 monitoring plan would be based on those
1184 wetlands that would have a high likelihood
1185 of indirect effects as a result of groundwater
1186 drawdown. In the event that the required
1187 wetland monitoring identifies additional
1188 indirect effects, permit conditions would
1189 likely include a plan for adaptive
1190 management practices to be implemented,
1191 such as expanded monitoring and hydrologic
1192 controls. Additionally, compensatory
1193 mitigation would be required if indirect
1194 impacts were identified during annual
1195 reporting. Permit conditions would likely
1196 include an adaptive management plan to
1197 account for any additional impacts that may

1198 be identified in the annual monitoring and
1199 reporting.

1200 For vegetation, the NorthMet Project
1201 Proposed Action would directly affect
1202 approximately 1,719 acres that are mapped
1203 by the MDNR as MBS Sites of High
1204 Biodiversity Significance. Within these Sites
1205 of High Biodiversity Significance, several
1206 native plant communities are mapped that
1207 would be affected by the NorthMet Project
1208 Proposed Action, including 698.2 acres with
1209 a conservation status rank of “imperiled-
1210 vulnerable” (conservation status rank S2 or
1211 S3) or “vulnerable” (conservation status
1212 rank S3), 92.6 acres with a conservation
1213 status rank of “apparently secure”
1214 (conservation status rank S4), and 178.9
1215 acres with a conservation status rank of
1216 “widespread and secure” (conservation
1217 status rank S5). Disturbed areas would be
1218 reclaimed during operations and at closure.
1219 Reclamation objectives would include
1220 rapidly establishing a self-sustaining plant
1221 community, controlling air emissions,
1222 controlling soil erosion, providing wildlife
1223 habitat, and minimizing the need for
1224 maintenance. Seed mixes and methodologies
1225 would be designed to minimize the
1226 introduction of invasive species.
1227 Reclamation seed mixes would be approved
1228 during permitting.

1229 There are no federally listed plant species in
1230 the NorthMet Project area. There are 10
1231 state-listed plant species, all at the Mine
1232 Site; eight species would be directly affected
1233 and two would be indirectly affected by the
1234 NorthMet Project Proposed Action.

1235 There are no federally or state-listed
1236 threatened or endangered fish or
1237 macroinvertebrate species known to occur in
1238 the NorthMet Project area. The NorthMet
1239 Project Proposed Action could potentially
1240 affect aquatic physical habitat via changes in
1241 streamflow, affect riparian and aquatic
1242 connectivity via construction activities

1243 within the riparian zone, and affect water
1244 quality by increasing solute concentrations
1245 above Class 2B (aquatic life) standards. As a
1246 result of these changes, the NorthMet
1247 Project Proposed Action could potentially
1248 affect special status species (i.e., federally or
1249 state-listed threatened and endangered
1250 species, Regional Forester Sensitive Species
1251 [RFSS], and MDNR Species of Greatest
1252 Conservation Need [SGCN]).

1253 The NorthMet Project Proposed Action
1254 would reduce water flows in several
1255 tributary streams to the Partridge and
1256 Embarrass rivers, but the flows would
1257 remain within the range of annual natural
1258 variability. Therefore, changes in flow are
1259 not anticipated to result in any measurable
1260 effects on existing aquatic habitat in any
1261 streams downstream of the NorthMet
1262 Project area.

1263 Water quality modeling predicts that the
1264 NorthMet Project Proposed Action would
1265 not cause an exceedance of the Class 2B
1266 (aquatic life) water quality standards, with
1267 the exception of aluminum and lead not
1268 attributable to process water from the
1269 NorthMet Project Proposed Action (i.e.,
1270 attributable to non-contact stormwater
1271 runoff and Colby Lake water). In a few
1272 cases where solute concentrations naturally
1273 exceed the Class 2B standards in NorthMet
1274 Project area waters (i.e., aluminum, iron,
1275 and manganese), the NorthMet Project
1276 Proposed Action would either reduce or not
1277 measurably increase concentrations of these
1278 solutes.

1279 Three federally listed wildlife species—the
1280 Canada lynx, gray wolf, and northern long-
1281 eared bat—may be affected by localized
1282 direct decrease and fragmentation of habitat
1283 and designated critical habitat. The Canada
1284 lynx and gray wolf may also be affected by
1285 the increased, but low, potential for
1286 incidental take resulting from vehicular
1287 collisions due to increased project-related

1288 traffic. The northern long-eared bat would
1289 likely be affected through loss of potential
1290 summer roost habitat and foraging areas.
1291 Restoration of disturbed areas as part of
1292 mine closure would potentially create lynx
1293 and wolf habitat, although this successional
1294 process could take decades. Thirteen
1295 additional state-listed species—including the
1296 moose, little brown bat, eastern brown bat,
1297 northern goshawk, boreal owl, eastern
1298 heather vole, wood turtle, yellow rail,
1299 Laurentian tiger beetle, taiga alpine
1300 butterfly, Freija's grizzled skipper butterfly,
1301 Nabokov's blue butterfly, and Quebec
1302 emerald dragonfly—may be affected by the
1303 NorthMet Project Proposed Action. RFSS,
1304 MDNR SGCN, and other wildlife species,
1305 including those considered culturally
1306 important, may be affected by increased
1307 human activity, noise and vibration, rail and
1308 vehicle traffic, or decrease of habitat.

1309 Rulemaking was conducted with the intent
1310 to update the list of Endangered, Threatened,
1311 and Special Concern species (*Minnesota*
1312 *Rules*, parts 6134.0100 to 6134.0400), with
1313 new listings becoming effective on August
1314 19, 2013. The FEIS considers any new
1315 listings, or changes in the previous listings,
1316 associated with the updated list.

1317 **NorthMet Project Effects on** 1318 **Cultural and Socioeconomic** 1319 **Resources**

1320 The NorthMet Project area is located within
1321 the territory ceded by the Chippewa of Lake
1322 Superior to the United States in 1854. The
1323 Chippewa reserve rights to hunt, fish, and
1324 gather on lands in the 1854 Ceded Territory.
1325 Harvest levels and other activities are
1326 governed by either individual tribal entities
1327 (in the case of the Fond du Lac Band) or the
1328 1854 General Codes and subsequent
1329 Amendments under the 1854 Treaty
1330 Authority (in the case of the Grand Portage
1331 and Bois Forte bands).

1332 Pursuant to Section 106 of the National
1333 Historic Preservation Act, the federal Co-
1334 lead Agencies identified several historic
1335 properties in consultation with the State
1336 Historic Preservation Office (SHPO), Bands,
1337 and PolyMet. The entities consulted
1338 regarding the eligibility of the Spring Mine
1339 Lake Sugarbush (maple sugar camp site); a
1340 segment of the *Mesabe Widjiu* (or
1341 Laurentian Divide, which is regarded as
1342 culturally significant to many Ojibwe
1343 Bands); a segment of the Beaver Bay to
1344 Lake Vermilion Trail; the Erie Mining
1345 Company Concentrator Building; the Erie
1346 Mining Company Administration Building;
1347 Erie Mining Company Railroad Mine and
1348 Plant Track, Main Line Segment, and Dunka
1349 Railroad Segment; Erie Mining Company
1350 Railroad Corridor Historic District; Duluth,
1351 Missabe, and Iron Range Segment; and the
1352 Erie Mining Company Landscape Historic
1353 District.

1354 Effect determinations have been drafted by
1355 the federal Co-lead Agencies for review and
1356 comment by the Bands, SHPO, and
1357 PolyMet. The federal Co-lead Agencies
1358 believe that there would be no adverse effect
1359 on the Erie Mining Company Railroad Mine
1360 and Plant Track, Main Line Segment, and
1361 Dunka Railroad Segment; Erie Mining
1362 Company Railroad Corridor Historic
1363 District; Duluth, Missabe, and Iron Range
1364 Segment; or Erie Mining Company
1365 Administration Building. However, a
1366 segment of the *Mesabe Widjiu*, Spring Mine
1367 Lake Sugarbush, a segment of the Beaver
1368 Bay to Lake Vermilion Trail, the Erie
1369 Mining Company Concentrator Building,
1370 and the Erie Mining Company Landscape
1371 Historic District would be adversely affected
1372 by the NorthMet Project Proposed Action.
1373 These determinations will be used to
1374 facilitate ongoing consultation with the
1375 Bands, SHPO, and PolyMet pertaining to the
1376 application of adverse effect criteria to these
1377 properties. Mitigation measures to resolve

1378 adverse effects would be identified after
1379 consultation on the final effects
1380 determinations and consideration of any
1381 measures to avoid or minimize adverse
1382 effects.

1383 Natural resources and the lands on which
1384 they are gathered are important to the Bands
1385 for a number of reasons, including their
1386 cultural, spiritual, and/or historic meanings,
1387 and will be considered under federal agency
1388 tribal trust responsibilities as outlined above
1389 and also as cultural resources under NEPA.

1390 The Arrowhead region of northeastern
1391 Minnesota is home to communities that are
1392 economically dependent on the natural
1393 environment for their existence. Given the
1394 region's location in an historic mining
1395 district, many towns and cities have
1396 provided and continue to provide workers
1397 and services to the local mines. Other
1398 communities closer to the BWCAW and
1399 Voyageurs National Park primarily serve the
1400 needs of recreational users (see Figure 1).

1401 According to PolyMet, the NorthMet Project
1402 Proposed Action would create up to 500
1403 direct jobs during peak construction and 360
1404 direct jobs during operations. These direct
1405 jobs would generate additional indirect and
1406 induced employment, estimated to be 332
1407 additional construction-phase jobs and 631
1408 additional operations-phase jobs. Indirect
1409 and induced effect employment numbers are
1410 calculated by IMPLAN and may include
1411 temporary, part-time, full-time, long-term,
1412 or short-term jobs. While some skilled
1413 workers would be involved only temporarily
1414 and would possibly relocate from outside the
1415 region, the majority of the NorthMet Project
1416 Proposed Action-related jobs are expected to
1417 be filled by those currently residing in the
1418 Arrowhead region.

1419 Federal, state, and local taxes would total an
1420 estimated \$80 million annually. During
1421 operations, there would be approximately
1422 \$231 million per year in direct value added

1423 through wages and rents and \$332 million
1424 per year in direct output related to the value
1425 of the extracted minerals. As with
1426 employment, these direct economic
1427 contributions would create indirect and
1428 induced contributions, estimated at \$99
1429 million in value added and \$182 million in
1430 output.

1431 **Other Environmental** 1432 **Consequences of the NorthMet** 1433 **Project**

1434 In addition to the effects discussed above,
1435 the NorthMet Project Proposed Action
1436 would also affect other resources to a lesser
1437 degree. For instance, it would contribute
1438 criteria air pollutants during construction,
1439 mining, and processing activities, though
1440 they would be less than applicable
1441 Prevention of Significant Deterioration
1442 emission thresholds. The NorthMet Project
1443 Proposed Action would also contribute air
1444 pollutants with risk guideline values for
1445 assessing potential human health effects (air
1446 toxic pollutants) during construction,
1447 mining, and processing activities. These
1448 pollutants were all found to be below state
1449 and federal risk guidelines. Additionally, the
1450 NorthMet Project Proposed Action would
1451 not adversely affect visibility in nearby
1452 Class I areas, such as the BWCAW and
1453 Voyageurs National Park. The NorthMet
1454 Project Proposed Action would cause noise,
1455 affecting some sensitive receptors. Nearby
1456 residences or other permanent sensitive
1457 receptors would not be affected, and some
1458 wildlife may avoid the area at times.

1459 **Environmental Consequences of the** 1460 **Land Exchange**

1461 The non-federal parcels that would be part
1462 of the Land Exchange Proposed Action are
1463 largely undisturbed tracts that would be
1464 managed under the Forest Plan, which
1465 would allow for some timber harvesting

1466 under varying rotation periods. For the most
1467 part, however, the acquired lands would be
1468 left undeveloped and would be open for
1469 public use and enjoyment.

1470 The federal lands acquired by PolyMet
1471 would largely be used for mining, and would
1472 eventually be restored in accordance with
1473 the NorthMet Project Reclamation Plan.
1474 There is no legal public access to the federal
1475 lands via land, so any current public use or
1476 exercise of usufructuary rights requires the
1477 permission of adjacent private landowners.

1478 **Cumulative Effects**

1479 In accordance with NEPA and MEPA, this
1480 FEIS contains an analysis of the cumulative
1481 effects of the NorthMet Project Proposed
1482 Action and Land Exchange Proposed
1483 Action. Cumulative effects are defined by
1484 the Council on Environmental Quality
1485 (CEQ) NEPA regulations as:

1486 the impact on the environment which
1487 results from the incremental impact of
1488 the action when added to other past,
1489 present, and reasonably foreseeable
1490 future actions regardless of what agency
1491 (federal or non-federal) or person
1492 undertakes such other action.
1493 Cumulative impacts can result from
1494 individually minor but collectively
1495 significant actions taking place over a
1496 period of time. (40 Code of Federal
1497 Regulations [CFR] § 1508.7)

1498 The Minnesota Environmental Quality
1499 Board's rules at *Minnesota Rules*, Chapter
1500 4410.0200, subparts 11 and 11a, mirror the
1501 CEQ's definition of cumulative effects.

1502 To assess cumulative effects, the Co-lead
1503 Agencies identified other past, present, and
1504 reasonably foreseeable future projects and
1505 activities in the region that, when combined
1506 with the NorthMet Project Proposed Action
1507 and Land Exchange Proposed Action, could
1508 incrementally cause cumulative effects.

1509 Given the geographic and temporal scale of
1510 effects, each component of the NorthMet
1511 Project Proposed Action was analyzed.

1512 For example, construction and mining
1513 operations would require stripping and
1514 excavation of the surface. These activities
1515 require heavy equipment and explosives,
1516 which would emit air pollutants and noise.
1517 The cumulative effects assessment focused
1518 on how air emissions travel and may interact
1519 with other sources. Air emissions can travel
1520 many miles before they are no longer
1521 detectable. Hence, the analysis includes the
1522 emissions from other projects and activities
1523 well beyond the boundaries of the NorthMet
1524 Project area. Noise effects from NorthMet
1525 Project Proposed Action activities, on the
1526 other hand, would dissipate much closer to
1527 their source and would not interact with
1528 other activities elsewhere in the area.

1529 In summary:

- 1530 • The Proposed Connected Actions would
1531 cause some additive effects on certain
1532 resources, such as loss of vegetation and
1533 wetlands in the NorthMet Project area,
1534 as well as changes in water quality and
1535 use, air quality, and increased economic
1536 activity for the life of the mine.
- 1537 • There would be few cumulative effects
1538 from the NorthMet Project Proposed
1539 Action after proposed mitigation and
1540 adaptive management measures are
1541 applied. The affected resources included
1542 water quantity and quality, air quality,
1543 wetlands, and vegetation.
- 1544 • No Endangered, Threatened, or Special
1545 Concern plant or animal species would
1546 be cumulatively affected.

1547

1548 ALTERNATIVES

1549 Consistent with federal and state law, the
1550 EIS process identified and analyzed
1551 alternatives that could have resulted in
1552 improved environmental and socioeconomic
1553 benefits and still achieve the NorthMet
1554 Project's Purpose and Need. Alternatives
1555 offer decision-makers and the public options
1556 to the proposal and include a No Action
1557 Alternative that considers the effects that
1558 would occur if the proposed project was not
1559 implemented.

1560 Alternatives were identified and screened in
1561 accordance with the requirements of NEPA
1562 (40 CFR 1505.1(e)) and/or Minnesota
1563 Environmental Quality Board Rules for
1564 MEPA (*Minnesota Statutes*, §§116D.04 and
1565 116D.045, and *Minnesota Rules*, parts
1566 4410.0200–4410.7500) to determine
1567 whether they met prescribed criteria to
1568 warrant further consideration in the FEIS.
1569 Screening criteria were developed to
1570 account for technical and economic
1571 feasibility and consistency with the
1572 NorthMet Project's Purpose and Need. The
1573 alternatives that met the screening criteria
1574 were evaluated in detail as part of the FEIS.
1575 A number of other potential alternatives
1576 were screened throughout the NEPA/MEPA
1577 process and were either incorporated into the
1578 NorthMet Project Proposed Action by
1579 PolyMet or were eliminated from detailed
1580 analysis because they did not meet the
1581 screening criteria. Early alternatives
1582 incorporated into the NorthMet Proposed
1583 Action included enhanced waste
1584 management at the Mine Site, where the
1585 most reactive waste would now be
1586 ultimately backfilled and covered with water
1587 in the East Central Pit, and enhanced
1588 engineering design to capture and treat
1589 affected water from the Mine Site and
1590 Tailings Basin.

1591 Alternatives considered but eliminated from
1592 further consideration included alternative
1593 wet and dry closure options for the Tailings
1594 Basin, backfilling the West Pit with
1595 Category 1 waste rock, and underground
1596 mining.

1597 Two alternatives to the Proposed Connected
1598 Actions are analyzed in detail in the FEIS:

- 1599 • Proposed Connected Actions Alternative
1600 B, which would involve the NorthMet
1601 Project Proposed Action, but a smaller-
1602 scale land exchange component; and
- 1603 • No Action Alternative, under which
1604 neither the NorthMet Project Proposed
1605 Action, nor the Land Exchange Proposed
1606 Action would occur.

1607 **Proposed Connected Actions** 1608 **Alternative B**

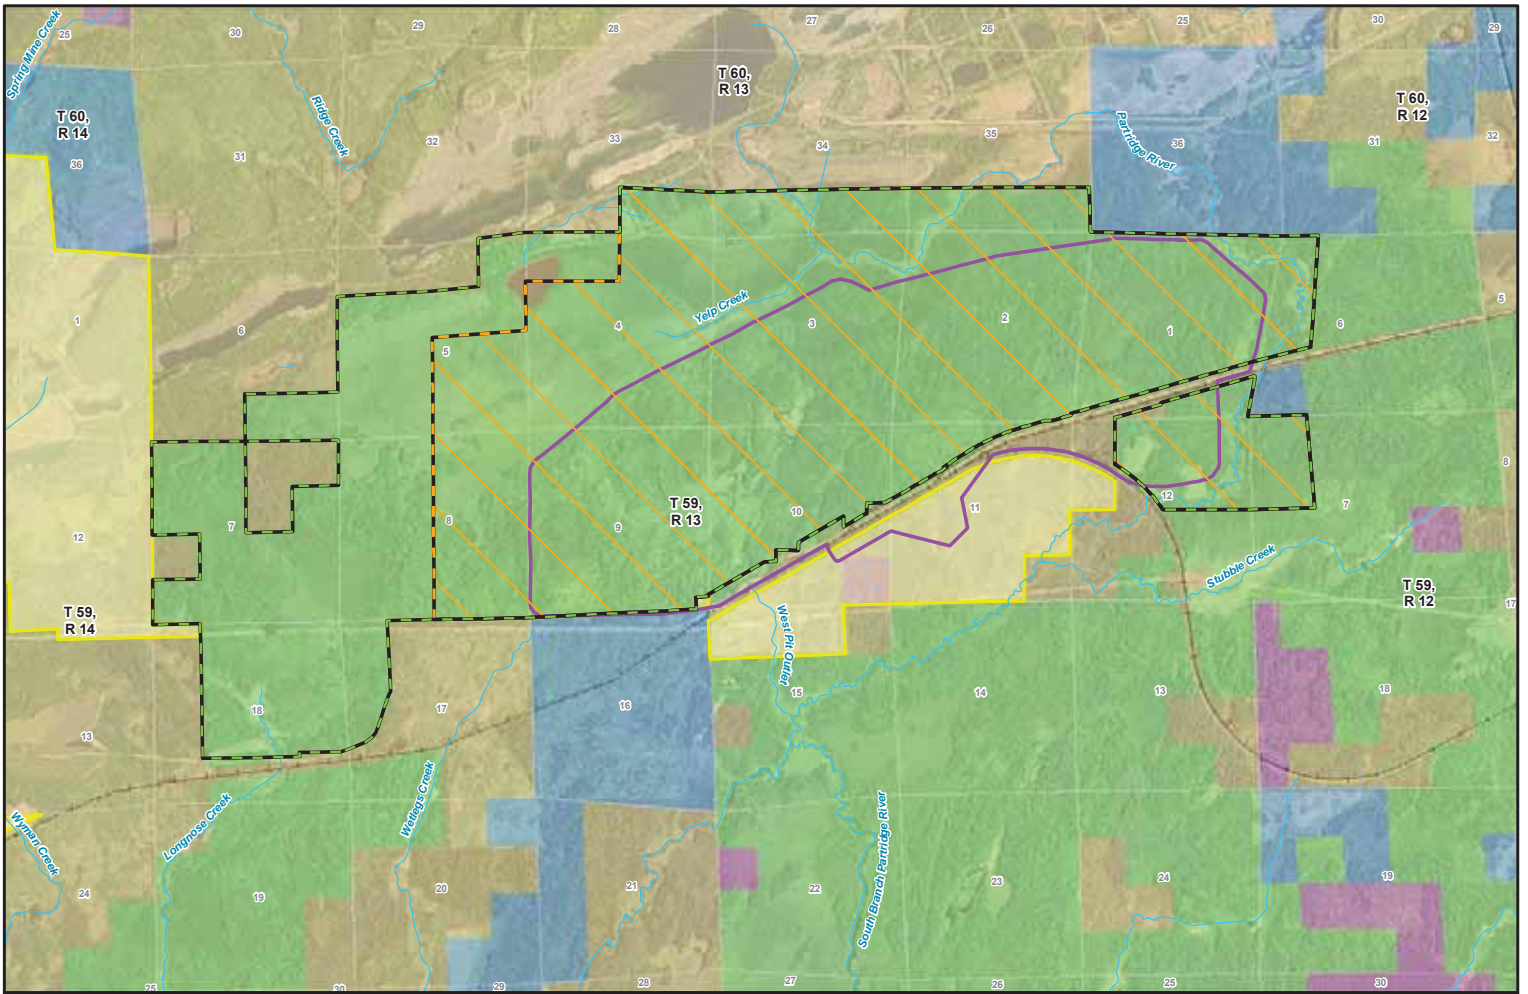

1609 Proposed Connected Actions Alternative B
1610 would involve the NorthMet Project
1611 Proposed Action as previously described
1612 and a land exchange involving a smaller
1613 federal parcel (see Figure 10). Compared to
1614 the Land Exchange Proposed Action, Land
1615 Exchange Alternative B would convey
1616 fewer acres of federal land (4,833.7 [GLO]
1617 acres) for fewer acres of non-federal land
1618 (4,651.5 [GLO] acres contained within a
1619 single tract).

1620 **No Action Alternative**

1621 Under the No Action Alternative, the
1622 NorthMet Project Proposed Action would
1623 not be implemented and no land exchange
1624 would take place. The federal government
1625 would not exchange lands with PolyMet,
1626 and the USFS would continue to manage the
1627 lands in accordance with the Forest Plan.
1628 Private lands would not be acquired in
1629 exchange for the USFS lands at the Mine

1630 Site. At the Mine Site, PolyMet would be
1631 required under existing exploration
1632 approvals to reclaim surface disturbance
1633 associated with exploratory and
1634 development drilling activities. No further
1635 upgrades or new segments would be
1636 constructed along the existing power
1637 transmission line, railroad, or Dunka Road,
1638 which would continue to be used by their
1639 private owners. At the former LTVSMC
1640 processing plant and Tailings Basin, the land
1641 owner, Cliffs Erie, would continue to
1642 complete closure and reclamation activities
1643 as specified under state permits and plans,
1644 and the Cliffs Erie Consent Decree.

DRAFT

1647 **Comparison of Effects by**
1648 **Alternative**

1649 Table 1 provides a comparison of the effects
1650 on resources from the Proposed Connected
1651 Actions (NorthMet Project Proposed Action
1652 and Land Exchange Proposed Action),
1653 Proposed Connected Actions Alternative B,
1654 and the No Action Alternative. It is intended
1655 to be a brief description of the major effects
1656 under the alternatives and not an exhaustive
1657 list or in-depth analysis. Chapters 5 and 6 of
1658 the FEIS provide detailed explanations of
1659 the predicted direct, indirect, and cumulative
1660 effects under these alternatives.

1661 In comparison to the Proposed Connected
1662 Actions, the Proposed Connected Actions
1663 Alternative B (NorthMet Project Proposed
1664 Action and Land Exchange Alternative B)
1665 would have the same effects as the
1666 NorthMet Project Proposed Action, but
1667 fewer lands would be conveyed through the
1668 land exchange. The No Action Alternative
1669 would not directly affect the existing
1670 environment and management of these lands
1671 would continue in accordance with their
1672 current permits. Compared to the Proposed
1673 Connected Actions and Proposed Connected
1674 Actions Alternative B, the No Action
1675 Alternative would result in active but
1676 different comprehensive management of
1677 water from the existing LTVSMC Tailings
1678 Basin. There would be no other measurable
1679 effects on other resources compared to their
1680 existing conditions.

1681

1682 **Agency-Preferred Alternative**

1683 Consistent with the CEQ regulations, the
1684 federal Co-lead Agencies are required to
1685 identify an agency-preferred alternative in
1686 the FEIS, unless another law prohibits the
1687 expression of such a preference. For the
1688 USFS, the agency-preferred alternative is
1689 the Land Exchange Proposed Action. For
1690 the USACE, Appendix B of 33 CFR 325
1691 supersedes the CEQ requirement to identify
1692 an agency-preferred alternative. These
1693 procedures state that, *“the Corps is neither*
1694 *an opponent nor a proponent of the*
1695 *applicant’s proposal; therefore the*
1696 *applicant’s final proposal will be identified*
1697 *as the ‘applicant’s preferred alternative’ in*
1698 *the Final EIS.”* No similar requirement to
1699 identify a preferred alternative exists for the
1700 MDNR under state law.

DRAFT

1703 **Table 1 Comparison of Effects by Alternative**

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
Land Use	<ul style="list-style-type: none"> No effects on land use that would require changes in ordinances or comprehensive forest plans Federal lands within the NorthMet Project area would be replaced with acreage of equal value through a land exchange 	<ul style="list-style-type: none"> Mostly similar effects as Proposed Connected Actions, with fewer federal acres exchanged 	<ul style="list-style-type: none"> Existing LTVSMC site would be reclaimed in accordance with the reclamation/closure plan
Water Resources	<ul style="list-style-type: none"> Greater than 90 percent of groundwater and 100 percent of surface water at the Tailings Basin would be captured and treated to a concentration at or below applicable water quality evaluation criteria The NorthMet Project Proposed Action would not cause any significant water quality impacts because: 1) exceedances of the P90 threshold would not occur; 2) the NorthMet Project Proposed Action concentrations would not be higher than concentrations predicted for the Continued Existing Conditions scenario; or 3) the frequency of exceedances for the NorthMet Project Proposed Action conditions would be within an acceptable range or not attributable to the NorthMet Project Proposed Action discharges or both Mercury loadings to the Embarrass River would increase slightly, decrease slightly to the Partridge River, with an overall net decrease in NorthMet Project Proposed Action loadings to the downstream St. Louis River. 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> Seepage water quality from the existing LTVSMC Tailings Basin would be expected to improve over time as a result of the Cliffs Erie Consent Decree, other permit requirements (e.g., Permit to Mine), and natural attenuation of contaminants

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
	<p>Discharges from the Plant Site WWTP and Mine Site WWTF would be at or below the GLI water quality standard of 1.3 ng/L</p> <ul style="list-style-type: none"> Sulfate concentrations would remain unchanged in the Partridge River and would be significantly reduced in the Embarrass River Plant Site WWTP effluent would be used to augment flows to tributary streams and wetlands downgradient from the Tailings Basin to offset groundwater seepage captured in the containment system and the south surface seepage management system for water quality reasons 		
Wetlands and Floodplains	<ul style="list-style-type: none"> 913.8 acres of wetlands in NorthMet Project area would be directly affected 6,568.8 to 7,694.2 acres of wetlands in NorthMet Project area would be indirectly affected 940.7 acres of directly affected and fragmented wetlands to be mitigated up front 1,602.7 acres of compensatory off-site wetlands Wetland mitigation plan would be implemented to offset increased CO₂ emissions to extent practicable 505.5-acre net increase of wetlands to the federal estate (through Land Exchange Proposed Action); therefore, Land Exchange Proposed Action conforms to EO 11990 376.2-acre net increase of mapped floodplain but would result in a 1,226.0-acre net decrease of floodplain 	<ul style="list-style-type: none"> Same direct and indirect effects and compensatory mitigation at NorthMet Project area as under Proposed Connected Actions 69.9-acre net increase of wetlands to the federal estate (through Land Exchange Alternative B); therefore, Land Exchange Alternative B conforms to EO 11990 376.2-acre net increase of mapped floodplain but would result in a 861.7-acre net decrease of floodplains to the federal estate (through Land Exchange Alternative B); however, no decrease in regulatory floodplains, no increase in flood damage potential, and no change in ecological function of floodplain; therefore, Land Exchange Alternative B conforms to EO 11988 	<ul style="list-style-type: none"> No change in wetland or floodplain acreage

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
	<p>area to the federal estate (through Land Exchange Proposed Action); however, no decrease in mapped floodplains, no increase in flood damage potential, and no change in ecological function of floodplain. Therefore, Land Exchange Proposed Action conforms to EO 11988</p>		
<p>Vegetation (includes habitat and Special Status Species)</p>	<ul style="list-style-type: none"> • 4,028.5-acre decrease in vegetation in the NorthMet Project area • Special concern plant species: eight directly affected, two indirectly affected in the NorthMet Project area • 579.6-acre net increase of vegetation land cover types to federal estate (through Land Exchange Proposed Action) • Decrease of 10 plant species, increase of three different plant species to the federal estate (through Land Exchange Proposed Action) 	<ul style="list-style-type: none"> • Same decrease of vegetation in NorthMet Project area as under Proposed Connected Actions • Same effects on plant species in the NorthMet Project area as under Proposed Connected Actions • 173.6-acre net increase of vegetation land cover types to the federal estate (through Land Exchange Alternative B) 	<ul style="list-style-type: none"> • No effects on vegetation
<p>Wildlife (includes Special Status Species)</p>	<ul style="list-style-type: none"> • 4,028.5-acre decrease of wildlife habitat in the NorthMet Project area • Localized population decrease and fragmentation of critical habitat of the gray wolf and Canada lynx • Localized population decrease and loss of habitat for northern long-eared bat • Low potential for incidental take resulting from vehicular collisions due to increased NorthMet Project Proposed Action-related traffic • Special status species, including SGCN, RFSS, and other wildlife species (such as those considered tribally or culturally significant) may 	<ul style="list-style-type: none"> • Same as under Proposed Connected Actions at the NorthMet Project area • 173.6-acre net increase of vegetation land cover types for wildlife habitat to the federal estate (through Land Exchange Alternative B) 	<ul style="list-style-type: none"> • No effects on wildlife

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
	<p>be affected by human activity, noise and vibration, rail and vehicle traffic, and decrease of habitat</p> <ul style="list-style-type: none"> • Wildlife corridors at and adjacent to the NorthMet Project area would be affected through the reduction of access to these corridors • 579.6-acre net increase of vegetation land cover types for wildlife habitat to the federal estate (through Land Exchange Proposed Action) 		
Aquatic Species	<ul style="list-style-type: none"> • No effects from changes in stream flow, which would remain within natural variability • No decrease in the Riparian Connectivity Index • Would not directly exceed or increase existing exceedances of Class 2B water quality standards, with the exception of aluminum that is not attributable to process water from the NorthMet Project Proposed Action (i.e., is attributable to non-contact stormwater runoff) • No effect on federally or state-listed aquatic species 	<ul style="list-style-type: none"> • Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> • Seepage water quality from the existing LTVSMC Tailings Basin would be expected to improve over time as a result of the Cliffs Erie Consent Decree, other permit requirements (e.g., Permit to Mine), and natural attenuation of contaminants
Air Quality (includes Greenhouse Gases and Global Climate Change)	<ul style="list-style-type: none"> • Increased emissions of criteria air pollutants, but below Prevention of Significant Deterioration major source thresholds • Amphibole mineral fiber emissions minimized by installing best available particulate emission control equipment and preventing fugitive dust generation • The air quality of the BWCAW would not be adversely affected by the 	<ul style="list-style-type: none"> • Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> • Continued air (fugitive dust) effects at LTVSMC site until remediation occurs under closure/reclamation plan

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
Noise and Vibration	<p>NorthMet Project Proposed Action</p> <ul style="list-style-type: none"> Added noise emissions and vibration. However, in all cases, the NorthMet Project Proposed Action, during the operations phase, would comply with the applicable state standards Noise, ground vibration, and air blast impact area/zone would be limited to 11,456, 11,334, and 11,469 acres, respectively. The BWCAW, which is 20 miles away, is outside the maximum area of audibility (247,612 acres) 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects
Cultural Resources & Historic Properties	<ul style="list-style-type: none"> Adverse direct and indirect effects on the Mesabe Widjiu (Laurentian Divide), Spring Mine Lake Sugarbush, Beaver Bay to Lake Vermilion Trail Segment, Erie Mining Company Concentrator Building, and Erie Mining Company Landscape Historic District due to loss of sites and proximity to proposed activities Direct effects, but no adverse effects, on the Erie Mining Company Railroad Mine and Plant Track, Main Line Segment, and Dunka Railroad Segment; Erie Mining Company Railroad Corridor Historic District; DM&IR Segment; and Erie Mining Company Administration Building due to refurbishment and new construction Potential to affect 1854 Treaty resources by potential limitation or elimination of access to public lands within the 1854 Ceded Territory and potential loss of 1854 Treaty resources 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects
Socioeconomics (includes	<ul style="list-style-type: none"> Up to 500 new direct jobs (maximum during construction), plus additional 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects

Resource	Proposed Connected Actions	Proposed Connected Actions Alternative B	No Action Alternative
Environmental Justice)	<ul style="list-style-type: none"> indirect and induced jobs Millions of dollars revenue for State of Minnesota and federal taxes Environmental Justice (Native American) populations affected by changes in subsistence uses and potential increased living costs 		
Recreation and Visual Resources	<ul style="list-style-type: none"> Net increase to the federal estate of recreational land on acquired tracts through Land Exchange Proposed Action Visual effects would occur, but would not exceed USFS standards 	<ul style="list-style-type: none"> Fewer federal lands conveyed at NorthMet Project Mine Site under Land Exchange Alternative B Remaining federal lands at Mine Site would not have public access Fewer acres acquired through Land Exchange Alternative B Same visual resources effects as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects
Wilderness and Special Designation Areas	<ul style="list-style-type: none"> No effects on Wilderness or Special Designation Areas The air quality of the BWCAW would not be adversely affected by the NorthMet Project Proposed Action 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects
Hazardous Materials	<ul style="list-style-type: none"> Potential effects from spills and use of explosives during operations 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> No effects
Geotechnical Stability	<ul style="list-style-type: none"> Wasterock stockpiles, Tailings Basin, and Hydrometallurgical Residue Facility would be constructed in accordance with applicable State of Minnesota standards Monitoring and adaptive management would maintain geotechnical stability 	<ul style="list-style-type: none"> Same as under Proposed Connected Actions 	<ul style="list-style-type: none"> Tailings Basin would be subject to closure and reclamation activities in accordance with MDNR requirements

1705

NEXT STEPS

1706 Agency Use of the FEIS in Decision- 1707 making

1708 The USACE will use the FEIS as the basis
1709 for its ROD whether to issue a DA permit
1710 for impacts to waters of the United States
1711 associated with the NorthMet Project
1712 Proposed Action. Similarly, the USFS will
1713 use the FEIS as the basis for its ROD for the
1714 Land Exchange Proposed Action. The
1715 MDNR will determine if the FEIS
1716 adequately provides the necessary analysis
1717 for state and local agencies to issue their
1718 respective permits and take resulting actions.

1719 The Land Exchange is subject to the pre-
1720 decisional objection regulations at 36 CFR
1721 218 effective March 27, 2013. Individuals
1722 and entities who provide specific written
1723 comment, as defined in § 218.2, during
1724 scoping or the comment period will be
1725 eligible to participate in the objection
1726 process.

1727 Financial Assurance

1728 State law requires that PolyMet provide
1729 financial assurance before a Permit to Mine
1730 can be granted. Financial assurance
1731 instruments covering the estimated cost of
1732 reclamation, should the mine be required to
1733 close for any reason at any time, must be
1734 submitted and approved by the MDNR.
1735 There are no applicable federal financial
1736 assurance requirements that would be
1737 incorporated into the Permit to Mine, but the
1738 USACE would consider the application of
1739 financial assurances for potential indirect
1740 wetland effects and monitoring.

1741

1742 Financial assurance could be required
1743 indefinitely and could include self-
1744 sustaining instruments. The level of
1745 engineering design and planning required to
1746 calculate detailed financial assurance
1747 amounts is not currently available, but
1748 would be evaluated in detail during the
1749 permitting process.

1750 Both the USACE and state would require
1751 consideration of financial assurances during
1752 the permitting process and these
1753 requirements would be reviewed and
1754 updated on an annual basis.

1755 Permits and Approvals

1756 PolyMet would be required to obtain the
1757 required federal, state, and local permits and
1758 approvals summarized in Table 2 below.

1759

1760 **Table 2 Key Government Permits or Actions**

Agency	Permit/Action	Reason Permit or Action is (or may be) Needed
Federal		
USACE	Department of the Army Permit	For affected waters within the jurisdiction of the USACE under the CWA, 40 CFR Part 230: Section 404(b)(1)
	Section 106 NHPA Compliance (Minnesota Historic Preservation Office)	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 36 CFR Part 800
U.S. Fish and Wildlife Service	Section 7 Endangered Species Act (ESA) Compliance	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 50 CFR 402
USFS	Land Exchange	To resolve the conflict between surface and mineral estates
	Section 106 NHPA Compliance (Minnesota Historic Preservation Office)	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 36 CFR Part 800
State		
MDNR	Permit to Mine	Required for all nonferrous metallic mining operations, <i>Minnesota Rules</i> , chapter 6132
	Endangered Species Taking Permit (if required)	If there are state-listed species that may be taken by the NorthMet Project Proposed Action, <i>Minnesota Rules</i> , parts 6212.1800-6212.2300 and 6134
	Water Appropriations Permit for plant make-up water	For withdrawal of water from Colby Lake for plant make-up water; for mine dewatering; for stream augmentation; <i>Minnesota Rules</i> , part 6115
	Dam Safety Permit	For the Tailings Basin, Hydrometallurgical Residue Facility, and potentially the water retention dikes at the Mine Site (e.g., water treatment plant pond dikes), <i>Minnesota Rules</i> , parts 6115.0300-6115.0520
	Permit for Work in Public Waters	For possible modifications and diversions of local streams in constructing the West Pit outfall; <i>Minnesota Rules</i> , part 6115
	Wetland Replacement Plan approval under WCA	For affected wetlands within the scope of the WCA or that constitute “public wetlands”
	Burning Permit (if required)	If vegetative material would need to be burned on site during times with no snow cover

Agency	Permit/Action	Reason Permit or Action is (or may be) Needed
MPCA	Section 401 Water Quality Certification/Waiver	Required in conjunction with the DA Permit (Section 404 Permit)
	National Pollutant Discharge Elimination System and State Disposal System (NPDES/SDS) Permits	For construction and industrial activity that would disturb 1 acre or more of land, and the management, treatment and/or discharge of process wastewater to surface water or groundwater
	Solid Waste Permit	For construction debris
	Air Emissions Permit (Part 70 Permit)	For emissions of regulated air pollutants
	Waste Tire Storage Permit	For storage of waste tires generated from NorthMet Project-related vehicles (if required)
	General Storage Tank Permit	For multiple NorthMet Project Proposed Action aboveground storage tanks
MDH	Radioactive Material Registration	For measuring instruments
	Permit for Non-Community Public Water Supply System and a Wellhead Protection Plan (if proposed)	Existing Plant Site potable water treatment plant to be refurbished
	Permit for Public On-site Sewage Disposal System	For sewage waste generated during construction and operation that would be disposed of on site
Local		
City of Hoyt Lakes	Zoning Permit	To acknowledge NorthMet Project Proposed Action is an allowable use within the zoned district
City of Babbitt	Building Permit	New construction would occur on portions of the NorthMet Project area within the incorporated limits of the City of Babbitt
St. Louis County	Zoning Permit	To acknowledge NorthMet Project Proposed Action is an allowable use within the zoned district

1761

1762

1763
1764

DRAFT

1 **1.0 INTRODUCTION**

2 **1.1 OVERVIEW**

3 The Minnesota Department of Natural Resources (MDNR), U.S. Army Corps of Engineers
4 (USACE), and U.S. Forest Service (USFS) have prepared a joint state-federal Final
5 Environmental Impact Statement (FEIS) for the proposed NorthMet Mining Project and Land
6 Exchange (see Figure 1.1-1). This FEIS follows the DEIS (2009) and SDEIS (2013). For more
7 information on development of the FEIS, see Chapter 2.

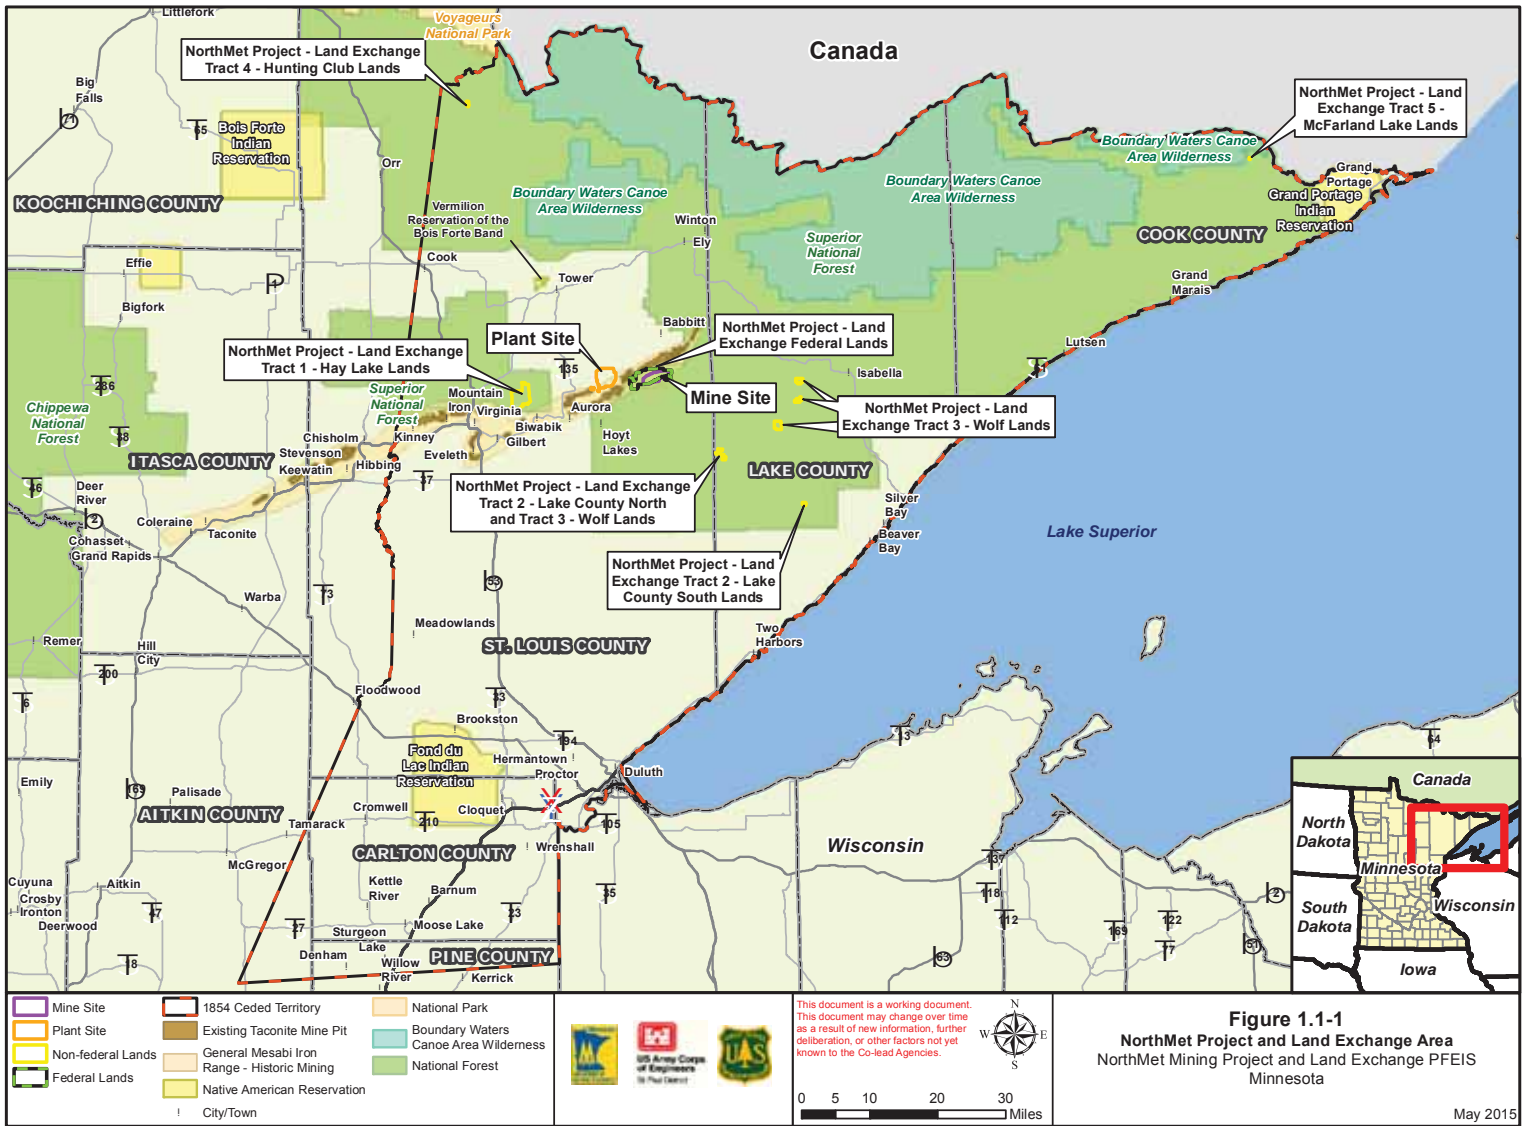

8 PolyMet Mining, Inc. (PolyMet) is proposing to develop the NorthMet copper-nickel-platinum
9 group elements (PGE) mine and associated processing facilities in northeastern Minnesota. A
10 land exchange is also proposed with the United States Forest Service (USFS) to eliminate a
11 conflict between PolyMet's desire to surface mine and the United States' surface rights,
12 including USFS administration of National Forest System (NFS) land. Because the Land
13 Exchange is closely related to the NorthMet Project, it is considered a connected action, and, as
14 such, is included in the analysis of environmental effects.

15 Under state and federal regulations, multiple actions or projects that are connected actions must
16 be considered in total in preparing an EIS. For the FEIS, the NorthMet Project Proposed Action
17 and the Land Exchange Proposed Action constitute the Proposed Connected Actions, which
18 comprise two major components (see Figure 1.1-1):

- 19 • The NorthMet Project Proposed Action consisting of:
 - 20 – Mine Site: A new surface mine, which would include development of mine pits,
21 permanent and temporary waste rock stockpiles, an overburden storage and laydown
22 area, a Wastewater Treatment Facility (WWTF), water collection and conveyance
23 pipelines, a Central Pumping Station (CPS), and a Rail Transfer Hopper.
 - 24 – Transportation and Utility Corridor: Expansion of existing and construction of new
25 infrastructure to connect the Mine Site and the Plant Site including upgrades to Dunka
26 Road, water pipelines, transmission lines, and new railroad connections.
 - 27 – Plant Site: Existing facilities remaining from the former LTV Steel Mining Company
28 (LTVSMC), which closed in 2001, would be refurbished and reused. Two new facilities
29 would be constructed, one for beneficiation and one for hydrometallurgical processing.
30 Associated with these would be the expansion of the existing LTVSMC Tailings Basin to
31 accommodate NorthMet Project tailings, construction of a Hydrometallurgical Residue
32 Facility, water collection and conveyance pipelines, and construction of a new
33 Wastewater Treatment Plant (WWTP).
- 34 • The Land Exchange Proposed Action consisting of:
 - 35 – USFS conveyance of Superior National Forest lands encompassing the proposed
36 NorthMet Mine Site and the lands surrounding the Mine Site to PolyMet.
 - 37 – USFS acquisition of up to five tracts of private land that lie within the Superior National
38 Forest proclamation boundary that are currently owned or would be acquired by PolyMet.

39 The final proposed configuration of land would be determined after the market value of
40 the parcels is determined by appraisals and would be presented in the Record of Decision
41 (ROD).

DRAFT

DRAFT

44 **1.1.1 NorthMet Project**

45 The NorthMet Project area, including the Mine Site, Plant Site, and connecting infrastructure,
46 would be located in St. Louis County, Minnesota, and situated at the eastern end of the Mesabi
47 Iron Range (see Figure 1.1-2). The NorthMet Project area is located within the St. Louis River
48 Watershed and is not hydrologically connected to the Boundary Waters Canoe Area Wilderness
49 (BWCAW). The Mine Site is an area of the Superior National Forest that has not previously
50 been mined. It is located approximately 6 miles south of the City of Babbitt and directly south of
51 the Northshore Mining Company's Northshore Mine, which is an active taconite/iron mine.

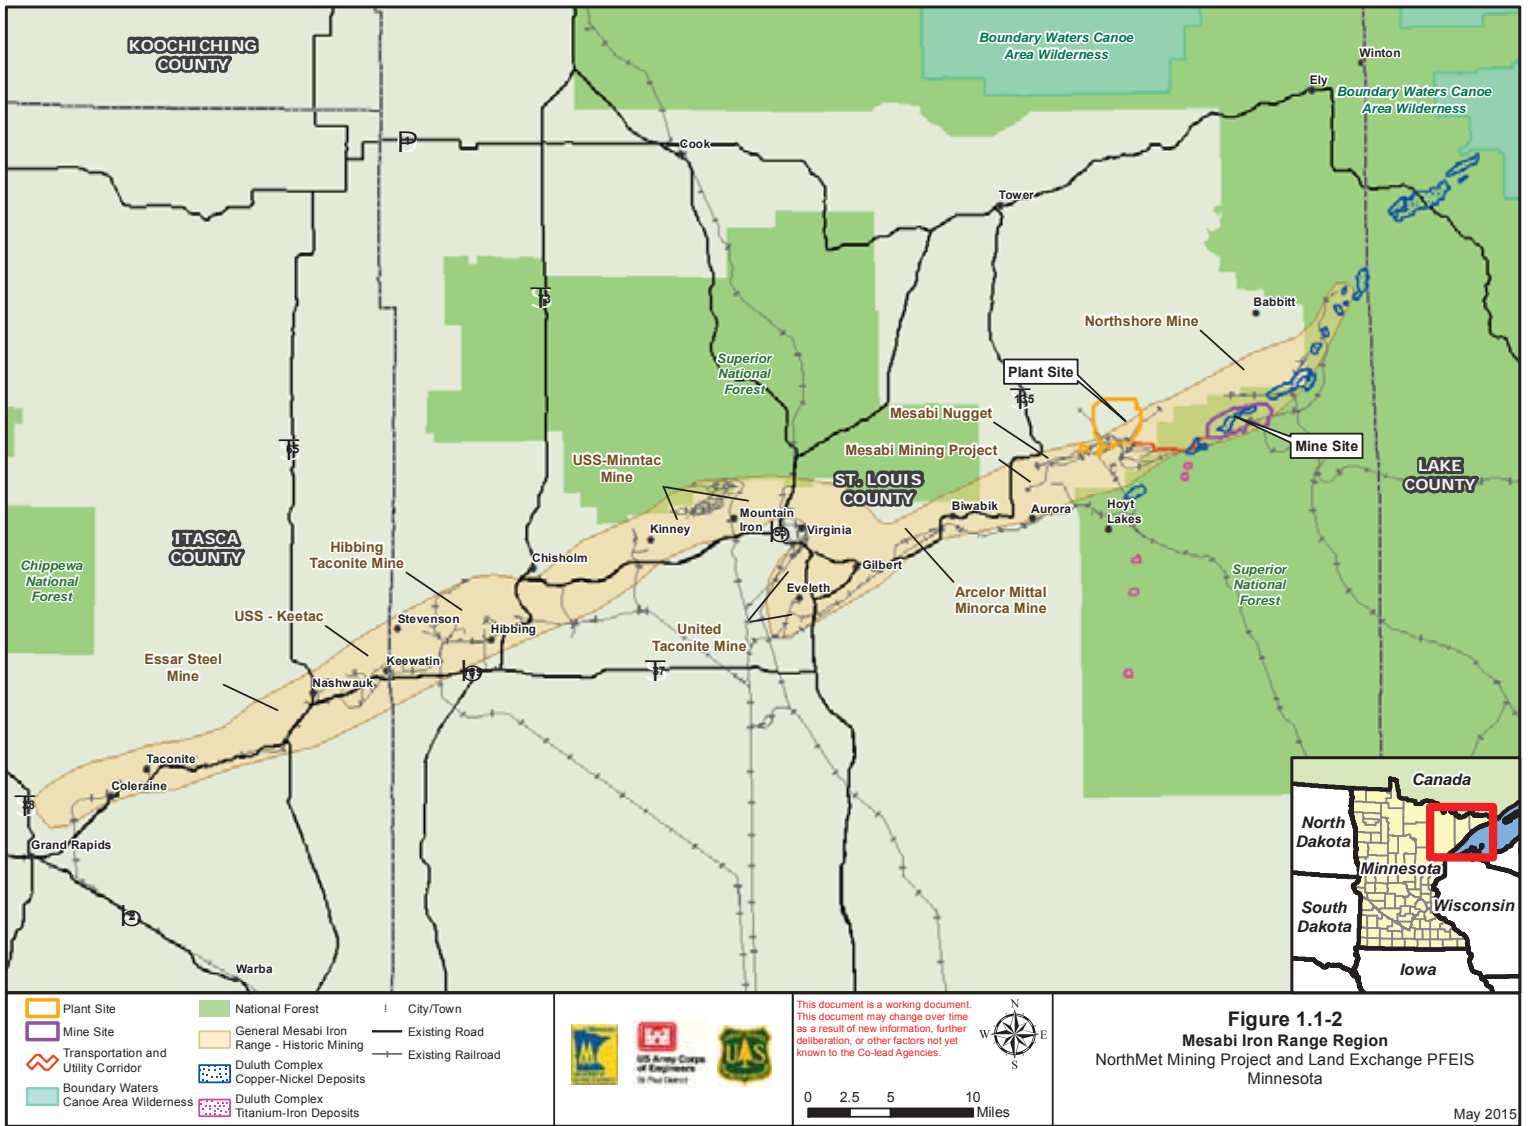

52 The Plant Site would be approximately 6 miles north of the City of Hoyt Lakes at the former
53 LTVSMC processing plant. This facility would be refurbished and would include a new
54 Beneficiation Plant and Hydrometallurgical Plant.

55 When operational, surface mining and processing of copper-nickel-PGE ore would take place
56 over an approximately 20-year mine life and have the following outputs:

- 57 • Approximately 73,068 tons per day (tpd) of rock, including up to 32,000 tpd of ore from a
58 surface mine with three pits (i.e., East Pit, Central Pit, and West Pit);
- 59 • Approximately 15 million tons of waste rock annually;
- 60 • Approximately 11.3 million tons of tailings from the Beneficiation Plant annually;
- 61 • Residues from the Hydrometallurgical Plant, up to 313,000 tons annually (dependent upon
62 factors such as feedstock, markets, etc.); and
- 63 • 113,000 tons of copper concentrate, 18,000 tons of mixed nickel/cobalt hydroxide, and 500
64 tons of PGE precipitate annually (based on an average mining rate).

65 Generally, facilities in the NorthMet Project area would be concurrently reclaimed, leaving a
66 smaller portion of the NorthMet Project area to be reclaimed at closure. At the end of mining,
67 PolyMet would first remove all infrastructure and facilities not approved for potential future use,
68 followed by reclamation of disturbed lands. Post-reclamation activities would include monitoring
69 and maintenance of reclamation and water quality until the various facility features were deemed
70 environmentally acceptable, in a self-sustaining and stable condition. See Section 3.2 for a
71 detailed description of the NorthMet Project Proposed Action.

DRAFT

DRAFT

75 **1.1.2 Land Exchange**

76 The Land Exchange Proposed Action is considered a “connected action” to the NorthMet Project
77 Proposed Action (40 Code of Federal Regulations [CFR] part 1508.25). It is included in the
78 analysis of environmental effects as part of the Proposed Connected Actions. The proposed
79 NorthMet Mine Site would affect federal lands for which PolyMet leases the private subsurface
80 mineral rights. The area affected by the Mine Site was acquired by the United States, for
81 National Forest purposes, under the authority of the Weeks Act of 1911 (16 United States Code
82 [USC] § 515) and is managed by the USFS.

83 The Land Exchange Proposed Action would involve the transfer of 6,650.2 acres (General Land
84 Office [GLO]) of federal lands from public to private ownership, and up to 6,722.5 acres (GLO)
85 of land from private to public ownership, depending on the results of the environmental analysis
86 and real estate appraisals. See Section 3.3.2 for a detailed description of the Land Exchange
87 Proposed Action.

88 GLO acres represent the acreages associated with the legal descriptions of the parcels based on
89 original surveys performed by the GLO surveyors between 1858 and 1907. As such, GLO
90 acreages are being used as part of the project description and would also be used to define the
91 real estate transaction if the Land Exchange Proposed Action were approved. The analyses of
92 effects presented in Chapters 5 and 6 are based upon Geographic Information System (GIS) data.
93 GIS values indicate the size of the Land Exchange Proposed Action parcels as computed
94 geometrically using mapping software, which may be different than the GLO legal acreage.
95 Unless noted as GLO acres, all values shown in the document are GIS values.

96 The Land Exchange Proposed Action would allow use of parts of the federal lands for the
97 NorthMet Project Proposed Action mining activities. PolyMet has indicated that management of
98 the exchanged federal lands outside of the proposed mining development could include some
99 upland timber management to enhance wildlife habitat; however, there are no current proposed
100 disturbances to this area. There are no activities proposed on the non-federal lands as part of the
101 Land Exchange Proposed Action.

102 **1.2 EIS ROLES AND RESPONSIBILITIES**

103 **1.2.1 Co-lead Agencies**

104 Since both USACE and USFS have federal actions pertaining to the NorthMet Project and Land
105 Exchange, these agencies have elected to become Co-lead federal Agencies for the
106 implementation of the National Environmental Policy Act (NEPA) and the preparation of the
107 FEIS. The USACE is responsible for determining if a project is in the public’s interest and
108 complies with the Section 404 (33 USC § 1344) guidelines before issuing a Department of the
109 Army permit pursuant to the Clean Water Act (CWA). The NorthMet Project Proposed Action
110 also requires preparation of a mandatory State Environmental Impact Statement (EIS) under the
111 Minnesota Environmental Policy Act (MEPA) and *Minnesota Rules*, part 4410.4400(8)(C),
112 which designate the MDNR as the Responsible Governmental Unit (RGU) or lead state agency.

113 MDNR, USACE, and USFS are Co-lead Agencies for the joint state-federal EIS and, therefore,
114 are responsible for the content of the FEIS and have final authority over the language used.

115 **1.2.2 Cooperating Agencies**

116 Under Section 309 of the Clean Air Act (CAA) (42 USC § 7609), the Administrator of the
117 United States Environmental Protection Agency (USEPA) is directed to review and comment
118 publicly on the environmental impacts of federal activities, including actions for which EISs are
119 prepared. In addition to the USEPA’s responsibilities under the CAA, the USEPA also
120 participated in the NorthMet Mining Project and Land Exchange EIS as a Cooperating Agency.

121 The USEPA submitted comments on the DEIS on February 18, 2010 and assigned the DEIS a
122 rating of EU-3 (Environmentally Unsatisfactory – Inadequate Information). Following the DEIS,
123 USEPA agreed to become a Cooperating Agency pursuant to NEPA for development of the
124 SDEIS in order to participate in resolving issues identified in USEPA’s comment letter on the
125 NorthMet Project's initial DEIS. The USEPA was engaged on specific issues and was provided
126 the opportunity to review a preliminary version of the SDEIS. The USEPA submitted comments
127 on the SDEIS on March 12, 2014, and noted that the Co-lead Agencies had adequately addressed
128 the USEPA’s comments on the preliminary SDEIS (committing to work further with USACE
129 and MPCA on permit-related issues) and assigned the SDEIS an improved rating of EC-2
130 (Environmental Concerns – Insufficient Information).

131 Along with the USEPA, the Bois Forte Band of Chippewa (Bois Forte), Grand Portage Band of
132 Lake Superior Chippewa (Grand Portage), and Fond du Lac Band of Lake Superior Chippewa
133 (Fond du Lac) (collectively, “the Bands”) have been invited by the Co-lead Agencies to
134 participate as Cooperating Agencies. The Mine Site, Plant Site, federal lands, and non-federal
135 lands as part of the Land Exchange Proposed Action are all located within the 1854 Ceded
136 Territory where the Bands reserve usufructuary rights (i.e., for hunting, fishing, and gathering).
137 A Memorandum of Understanding (MOU) was signed on February 23, 2005 (with a revision on
138 March 15, 2005) between the USACE, MDNR, Bois Forte, Fond du Lac, and PolyMet. The
139 MOU discussed the roles and procedures in which the signatories would interact as Co-lead and
140 Cooperating agencies. The MOU was again revised on May 19, 2008, to include Grand Portage.
141 Following the addition of the USFS as a Co-lead Agency and the decision to prepare an SDEIS,
142 this MOU was terminated and a Coordination and Communication Plan (CCP) was developed.
143 The CCP was produced jointly by the MDNR, USACE, USFS, and Bands to guide interactions
144 during preparation of the SDEIS. The Great Lakes Indian Fish & Wildlife Commission
145 (GLIFWC) and the 1854 Treaty Authority have assisted the Bands in their roles as Cooperating
146 Agencies. The federal Co-lead Agencies are conducting a parallel process with Section 106 of
147 the National Historic Preservation Act (NHPA) of 1966 (16 USC § 470 et seq.), along with
148 NEPA.

149 The USEPA and the Bands participated as Cooperating Agencies based on regulatory authority
150 and/or subject matter expertise. All Cooperating Agencies were provided the opportunity to
151 review preliminary versions of the SDEIS and FEIS prior to publication. While the Cooperating
152 Agencies provided input on specific issues during the development of the FEIS, the Co-lead
153 Agencies are solely responsible for the final content of the FEIS.

154 **1.2.3 Other Agencies**

155 While not Co-lead or Cooperating Agencies, other federal and state agencies have important
156 roles on the project. The Minnesota Pollution Control Agency (MPCA) and Minnesota
157 Department of Health (MDH) are assisting the MDNR pursuant to *Minnesota Rules*, part

158 4410.2200. The United States Fish and Wildlife Service (USFWS) reviewed the Biological
159 Assessment (BA) and provided a Biological Evaluation (BE), which are included as Appendix D
160 to the FEIS.

161 **1.3 PURPOSE AND NEED**

162 **1.3.1 Applicant's Purpose and Need Statement**

163 The applicant's stated purpose of the NorthMet Project is to exercise PolyMet's mineral lease to
164 continuously mine, via open pit methods, the known ore deposits (NorthMet Deposit) containing
165 copper, nickel, cobalt, and PGEs to produce base and precious metal precipitates and flotation
166 concentrates by uninterrupted utilization of the former LTVSMC processing plant.

167 The purpose of the proposed Land Exchange is to consolidate the surface and mineral ownership
168 of the lands involved at the Mine Site. PolyMet has a lease to mine the minerals on its NorthMet
169 Deposit, which is surrounded by active and abandoned taconite mines near Hoyt Lakes. The
170 surface of these lands is owned by the United States.

171 The need for the NorthMet Project is driven by domestic and global demand of these products.
172 Demand continues to rise for these metals due to the expansion of the green economy and rising
173 demand from developing countries like India, China, and Brazil. Based on the closure of
174 LTVSMC and other job losses in northeastern Minnesota, there is also a need for jobs and
175 economic development in the area.

176 **1.3.2 Co-lead Agencies' Purpose and Need Statements**

177 **1.3.2.1 NorthMet Project and Land Exchange Purpose and Need Statement**

178 The Purpose and Need for the Proposed Connected Actions is:

- 179 • For PolyMet to utilize its leased mineral rights and recover commercial quantities and quality
180 of semi-refined metal concentrates, hydroxides, and precipitates from the NorthMet ore body
181 in northern Minnesota, and to process the recovered ore by reutilizing the former LTVSMC
182 processing plant.
- 183 • To extract metals in a safe, environmentally responsible, energy-efficient, and economically
184 feasible manner subject to mitigation measures designed to avoid or minimize environmental
185 effects to the extent practicable.
- 186 • To extract and process metals in a technically and economically feasible manner, such that
187 there would be sufficient income to cover: operating cost (which includes but is not limited
188 to the cost of mining, processing, transportation, and waste management), capital cost
189 (needed to build and sustain facilities), an adequate return to investors, reclamation, and
190 closure costs and taxes.
- 191 • To eliminate the conflict between PolyMet's desire to surface mine and the USFS ownership
192 and management of NFS lands, by exchanging federal lands for non-federal lands that have
193 equal or greater value.

194 **1.3.2.2 United States Forest Service**

195 The purpose for the USFS is to meet desired conditions in the Superior National Forest Land and
196 Resource Management Plan (Forest Plan) (USFS 2004b), including ensuring the proposed land
197 exchange Proposed Action eliminates existing conflict and ensuring mineral resources are
198 produced in an environmentally sound manner contributing to economic growth.

199 In regards to desired conditions for land exchange and mineral development, the Superior
200 National Forest’s Forest Plan includes the following direction:

201 “D-LA-1 – The amount and spatial arrangement of National Forest System land within
202 the proclamation boundary of the Forest are sufficient to protect resource values and
203 interests, improve management effectiveness, eliminate conflicts, and reduce the costs of
204 administering landlines and managing resources.” (Forest Plan, Land Adjustment, pg.
205 2-51)

206 “D-MN-2 – Ensure that exploring, developing, and producing mineral resources are
207 conducted in an environmentally sound manner so that they may contribute to economic
208 growth and national defense.” (Forest Plan, Minerals, pg. 2-9)

209 PolyMet intends to exercise private mineral rights that were reserved when lands were conveyed
210 to the United States and has proposed the development of a surface mine. This land was
211 purchased by the USFS, for National Forest purposes, under the authority of the Weeks Act. The
212 USFS has taken the position that the mineral rights that were reserved do not include the right to
213 surface mine as proposed by PolyMet. PolyMet disagrees with the USFS position and argues that
214 the mineral rights it seeks to utilize provide for access to the minerals by any mining method,
215 including open pit or surface mining. Rather than the possibility of litigation that has no certain
216 outcome, a land exchange is being considered to resolve the fundamental conflict.

217 The USFS has determined that allowing private surface mining would be inconsistent with USFS
218 legal mandates for acquiring and managing these land and that the USFS needs to resolve this
219 fundamental conflict. See Section 2.3.3 for more information.

220 **1.3.2.3 United States Army Corps of Engineers**

221 The Purpose and Need of the Proposed Action is to produce base and precious metals
222 precipitates and flotation concentrates from ore mined at the NorthMet Deposit by uninterrupted
223 operation of the former LTVSMC processing plant. The processed resources would help meet
224 domestic and global demand by sale of these products to domestic and world markets.

225 **1.3.2.4 Minnesota Department of Natural Resources**

226 The Purpose and Need of the Proposed Action is to produce base and precious metals
227 precipitates and flotation concentrates from ore mined at the NorthMet Deposit by uninterrupted
228 operation of the former LTVSMC processing plant. The processed resources would help meet
229 domestic and global demand by sale of these products to domestic and world markets.

230 **1.4 REGULATORY FRAMEWORK**

231 **1.4.1 National Environmental Policy Act**

232 **1.4.1.1 Overview**

233 NEPA requires that federal agencies consider the potential environmental consequences of
234 proposed actions in their decision-making process. The law’s intent is to protect, restore, or
235 enhance the environment through well-informed federal decisions. The CEQ was established
236 under NEPA for the purpose of implementing and overseeing federal policies as they relate to
237 this process.

238 In 1978, the CEQ issued regulations for implementing NEPA (40 CFR parts 1500-1508). Section
239 102(2)(c) of NEPA, 42 USC § 4332(2)(C), mandates that federal agencies shall include a
240 “detailed statement” in “proposals for legislation and other major Federal actions significantly
241 affecting the quality of the human environment” that addresses, among other things, the
242 environmental effects of the proposed action. Such projects include: any actions under the
243 jurisdiction of the federal government or subject to federal permits; actions requiring partial or
244 complete federal funding; actions on federal lands or affecting federal facilities; continuing
245 federal actions with effects on land or facilities; and new or revised federal rules, regulations,
246 plans, or procedures. Any major federal action significantly affecting the human environment
247 requires the preparation of an EIS and a ROD. The USACE permit decision, including its
248 evaluation under the 404(b)(1) guidelines and the Public Interest Review, will be documented in
249 the USACE ROD, which will be issued following issuance of the FEIS. The USACE will use the
250 FEIS to support the ROD documenting its decision on the CWA Section 404 Permit application.
251 The USFS will implement NEPA per 36 CFR part 220, and would use the FEIS to support the
252 ROD documenting its decision on the Land Exchange Proposed Action.

253 The USACE, during its review of PolyMet’s permit application, determined that the NorthMet
254 Project Proposed Action would require the preparation of an EIS in accordance with the
255 requirements of NEPA and the CEQ regulations. To comply with other relevant environmental
256 statutes described below, in addition to NEPA, the decision-making process for the Proposed
257 Connected Actions involves a thorough examination of all pertinent environmental issues per 40
258 CFR 1505.

259 **1.4.1.2 Alternatives**

260 NEPA requires that a "range of alternatives" must be discussed in the environmental documents
261 prepared for a proposed action (40 CFR 1502.14). This includes all practicable alternatives,
262 which must be rigorously explored and objectively evaluated, as well as those other alternatives,
263 which are eliminated from detailed study with a brief discussion of the reasons for eliminating
264 them. The emphasis is on what is “practicable” rather than on whether a proponent or applicant
265 prefers or is itself capable of carrying out a particular alternative. NEPA also requires
266 consideration of the No Action Alternative, in which the proposed project would not proceed.

267 **1.4.2 Minnesota Environmental Policy Act**

268 **1.4.2.1 Overview**

269 In addition to the federal NEPA process, *Minnesota Statutes*, Chapter 116D requires
270 environmental review. The MEPA environmental review process is an information collection
271 and disclosure tool for state agencies. It informs the subsequent permitting and approval
272 processes and describes mitigation measures that may be available. The MEPA process operates
273 according to rules adopted by the Minnesota Environmental Quality Board (MEQB). However,
274 the actual reviews are usually conducted by a local governmental unit or a state agency. The
275 organization responsible for conducting the review is referred to as the RGU. The MEQB staff
276 advises the RGU and state agencies on the proper procedures for environmental review and
277 monitors the effectiveness of the process in general. By rule, the MDNR is the designated RGU
278 for the NorthMet Project. Pursuant to MEPA, the RGU will determine the adequacy of the FEIS.
279 If the FEIS is determined to be adequate, then final decisions can be made by the appropriate
280 governmental units on state permits.

281 *Minnesota Rules*, part 4410.4400, subpart 8 dictates that an EIS shall be prepared because the
282 NorthMet Project exceeds the threshold listed for construction of a new metallic mineral mining
283 and processing facility. Under MEPA, the FEIS must be consistent with *Minnesota Rules*, part
284 4410.0200 to part 4410.7800 and the scoping determination. The adequacy of the FEIS is
285 governed by *Minnesota Rules*, part 4410.2800.

286 **1.4.2.2 Alternatives**

287 MEQB statutes and rules (*Minnesota Statutes*, chapter 116D, sections 04 and 045; and
288 *Minnesota Rules*, part 4410, subpart 0200 through 7500) require that an EIS include at least one
289 alternative in each of the following categories (in addition to the No Action Alternative):

- 290 • Alternative sites,
- 291 • Alternative technologies,
- 292 • Modified designs or layouts,
- 293 • Modified scale or magnitude, and
- 294 • Alternatives incorporating reasonable mitigation measures identified through comments
295 received during the comment periods for EIS scoping or for the DEIS.

296 If no alternative is included for any given category, an explanation must be provided in the EIS.
297 An alternative may be excluded if it fails to meet the underlying need for or purpose of the
298 project, is unlikely to have any significant environmental benefit compared to the project as
299 proposed, or another alternative would likely have similar environmental benefits but
300 substantially less adverse economic, employment, or sociological effects.

301 **1.4.3 Land Exchange Requirements**

302 Most of the public lands involved in the NorthMet Project Proposed Action were acquired by the
303 United States under the authority of the Weeks Act of 1911. Other authorities that would govern
304 the Land Exchange Proposed Action between PolyMet and the United States include the Federal
305 Land Policy and Management Act of 1976 (43 USC §§ 1716-1717) (FLPMA) and the Federal

306 Land Exchange Facilitation Act of 1988. Regulations promulgated to implement FLPMA are
307 found in 36 CFR 254, Subpart A (36 CFR 254).

308 Land exchanges are discretionary, voluntary real estate transactions between federal and non-
309 federal parties. Regulations provide that the Forest Supervisor “may complete an exchange only
310 after a determination is made that the public interest will be well served” (36 CFR 254.3(b)).
311 Factors that must be considered include: the opportunity to achieve better management of federal
312 lands and resources, to meet the needs of state and local residents and their economies, and to
313 secure important objectives, including but not limited to: protection of fish and wildlife habitats,
314 cultural resources, watersheds, and wilderness and aesthetic values; enhancement of recreation
315 opportunities and public access; consolidation of lands and/or interests in lands, such as mineral
316 and timber interests, for more logical and efficient management and development; consolidation
317 of split estates; expansion of communities; accommodation of existing or planned land use
318 authorizations; promotion of multiple-use values; implementations of applicable Forest Land and
319 Resource Management Plans; and fulfillment of public needs. See 36 CFR 254.3(b) and
320 254.4(c)(4). Table 7.3.5-1 in Chapter 7 of the FEIS presents a comparison of how the alternatives
321 address these factors.

322 Under the FLPMA, a land exchange involves the transfer of equal valued land. If land values are
323 not equal, every effort is made to equalize values by adding or deleting land. Cash equalization
324 may then be paid by either party up to 25 percent of the value of the federal land. See 36 CFR
325 254.12.

326 The Land Exchange Proposed Action must comply with two Executive Orders (EOs) that are
327 related to wetlands and floodplains. EO 11990 was signed by President Jimmy Carter on May
328 24, 1977, “*in order to avoid to the extent possible the long and short term adverse impacts*
329 *associated with the destruction or modifications of wetlands....*” This order applies to land
330 exchanges such that, as much as practicable, the exchange does not result in the loss of wetland
331 resources. EO 11988 was also signed by President Jimmy Carter on May 24, 1977 “*in order to*
332 *avoid to the extent possible the long and short term adverse impacts associated with the*
333 *occupancy and modification of floodplains and to avoid direct or indirect support of floodplain*
334 *development wherever there is a practicable alternative....*” This order applies to land exchanges
335 such that, as much as practicable, the exchange does not result in an increase in the flood damage
336 potential.

337 USFS policy (Forest Service Handbook 5409.13 § 33.43c) provides that the following list of
338 three conditions satisfy the requirements of EOs 11990 and 11988:

339 The value of the wetlands or floodplains for properties received and conveyed is equal
340 (balancing test) and the land exchange is in the public interest.

341 Reservations or restrictions are retained on the unbalanced portion of the wetlands and
342 floodplains on the federal lands when the land exchange is in the public interest but does not
343 meet the balancing test.

344 The federal property is removed from the exchange proposal when the conditions described in
345 the preceding paragraphs 1 or 2 cannot be met.

346 The USFS is also required, by EOs 11988 and 11990, to reference in a conveyance those uses
347 that are restricted under identified federal, state, or local wetland and floodplain regulations. In
348 Minnesota, the CWA (USACE/USEPA/MPCA), Protected Waters Permit Program (MDNR),

349 and the Wetland Conservation Act (WCA), Board of Water and Soil Resources regulate certain
 350 activities in wetlands. Under WCA provisions, wetlands must not be impacted as part of a
 351 project for which a Permit to Mine is required, except as approved by the commissioner
 352 (*Minnesota Rules*, part 8420.0930). Floodplain management ordinances are administered at the
 353 local (county) level.

354 The Land Exchange Proposed Action would be designed to be consistent with the goals and
 355 objectives of the Forest Plan (USFS 2007c) including G-LA-2 and G-LA-3 (Forest Plan, pages
 356 2-51 and 2-52, see FEIS Section 3.3.1.1). The non-federal lands for Land Exchange Proposed
 357 Action would need to be incorporated within the adjacent federal ownership and managed in
 358 accordance with the Forest Plan direction for the particular management area.

359 As part of the USFS decision to be made, the Responsible Official has the responsibility to
 360 determine if the proposed exchange serves the public interest and supports the direction and
 361 guidance in the forest land management plan. The public interest determination must show that
 362 the resource values and the public objectives of the non-federal lands equal or exceed the
 363 resource values and the public objectives of the federal lands and that the intended use of the
 364 conveyed federal land would not substantially conflict with established management objectives
 365 on adjacent federal lands, including Indian trust lands. The findings and supporting rationale
 366 shall be made part of the decision (Forest Service Handbook 5409.13, section 34.1; 36 CFR
 367 254.3(b)). The ROD will contain the findings and supporting rationale for the selected alternative
 368 and how the public interest is served under 36 CFR 254.3(b), as well as provide information for
 369 compliance with USFS requirements and the Forest Plan.

370 **1.4.4 Other Permits and Requirements**

371 In accordance with *Minnesota Rules*, part 4410.3900, which seeks to reduce duplication to the
 372 fullest extent between the Minnesota Statutes and NEPA, a joint state-federal EIS has been
 373 prepared to comply with both NEPA and MEPA regulations. In addition, PolyMet must obtain
 374 the required federal, state, and local permits and approvals summarized in Table 1.4.4-1 below.

375 **Table 1.4.4-1 Government Permits and Approvals for the Proposed Connected Actions**

Agency	Permit/Action	Reason Permit or Action is (or may be) Needed
Federal		
USACE	Department of the Army Permit	For affected waters within the jurisdiction of the USACE under the CWA, 40 CFR Part 230: Section 404(b)(1)
	Section 106 NHPA Compliance (Minnesota Historic Preservation Office)	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 36 CFR Part 800
USFWS	Section 7 Endangered Species Act (ESA) Compliance	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 50 CFR 402
USFS	Land Exchange	To resolve the conflict between surface and mineral estates

Agency	Permit/Action	Reason Permit or Action is (or may be) Needed
	Section 106 NHPA Compliance (Minnesota Historic Preservation Office)	Necessary due to the NorthMet Mining Project and Land Exchange being a federal undertaking, 36 CFR Part 800
State		
MDNR	Permit to Mine	Required for all nonferrous metallic mining operations, <i>Minnesota Rules</i> , chapter 6132
	Endangered Species Taking Permit (if required)	If there are state-listed species that may be taken by the NorthMet Project Proposed Action, <i>Minnesota Rules</i> , parts 6212.1800-6212.2300 and 6134
	Water Appropriations Permit for plant make-up water	For withdrawal of water from Colby Lake for plant make-up water; for mine dewatering; for stream augmentation; <i>Minnesota Rules</i> , part 6115
	Dam Safety Permit	For the Tailings Basin, Hydrometallurgical Residue Facility, and potentially the water retention dikes at the Mine Site (e.g., water treatment plant pond dikes), <i>Minnesota Rules</i> , parts 6115.0300-6115.0520
	Permit for Work in Public Waters	For possible modifications and diversions of local streams in constructing the West Pit outfall; <i>Minnesota Rules</i> , part 6115
	Wetland Replacement Plan approval under WCA	For affected wetlands within the scope of the WCA or that constitute “public wetlands”
	Burning Permit (if required)	If vegetative material would need to be burned on site during times with no snow cover
MPCA	Section 401 Water Quality Certification/Waiver	Required in conjunction with the DA Permit (Section 404 Permit)
	National Pollutant Discharge Elimination System and State Disposal System (NPDES/SDS) Permits	For construction and industrial activity that would disturb 1 acre or more of land, and the management, treatment and/or discharge of process wastewater to surface water or groundwater
	Solid Waste Permit	For construction debris
	Air Emissions Permit (Part 70 Permit)	For emissions of regulated air pollutants
	Waste Tire Storage Permit	For storage of waste tires generated from NorthMet Project-related vehicles (if required)

Agency	Permit/Action	Reason Permit or Action is (or may be) Needed
	General Storage Tank Permit	For multiple NorthMet Project Proposed Action aboveground storage tanks
MDH	Radioactive Material Registration	For measuring instruments
	Permit for Non-Community Public Water Supply System and a Wellhead Protection Plan (if proposed)	Existing Plant Site potable water treatment plant to be refurbished
	Permit for Public On-site Sewage Disposal System	For sewage waste generated during construction and operation that would be disposed of on site
Local		
City of Hoyt Lakes	Zoning Permit	To acknowledge NorthMet Project Proposed Action is an allowable use within the zoned district
City of Babbitt	Building Permit	New construction would occur on portions of the NorthMet Project area within the incorporated limits of the City of Babbitt
St. Louis County	Zoning Permit	To acknowledge NorthMet Project Proposed Action is an allowable use within the zoned district

376 **1.4.5 Financial Assurance**

377 Financial assurance is required by state law. *Minnesota Rules* part 6132.1200 requires that before
 378 a Permit to Mine can be granted, financial assurance instruments covering the estimated cost of
 379 reclamation should the mine be required to close for any reason at any time must be submitted
 380 and approved by the MDNR. The financial assurance requirements would be reviewed and
 381 updated on an annual basis. Financial assurance is discussed in further detail in Sections 2.5 and
 382 3.2.2.4.

383 **1.5 PURPOSE OF THE FEIS**

384 The purpose of this FEIS is to provide an analysis of effects that would result from the NorthMet
 385 Project and Land Exchange, consider USEPA and Tribal Cooperating Agency concerns and
 386 public comments, describe alternatives considered, and disclose PolyMet’s project refinements
 387 identified through the EIS process. The FEIS discusses key themes, which include air, wetlands,
 388 geotechnical stability, socioeconomics, water resources, cultural resources, and alternatives.

389 **1.6 ORGANIZATION OF THE FEIS**

390 This FEIS follows the CEQ’s recommended organization (40 CFR 1502.10) and MEPA content
 391 requirements (*Minnesota Rules*, part 4410.2300).

392 Chapter 1.0 (Introduction) provides an overview and descriptions of the purpose of and need for
 393 the NorthMet Project Proposed Action and the Land Exchange Proposed Action, regulatory
 394 framework, agency roles and responsibilities, and the organization of the FEIS.

395 Chapter 2.0 (EIS Development) describes the EIS development process for the NorthMet Project
 396 Proposed Action and Land Exchange Proposed Action. Discussion includes scoping,

397 identification of issues, development of the NorthMet Project Proposed Action and Land
398 Exchange Proposed Action and alternatives, public and agency participation, consultation and
399 coordination undertaken to prepare the DEIS, SDEIS, and FEIS, incorporation of the Land
400 Exchange, reevaluation of DEIS alternatives, and impact analysis process.

401 Chapter 3.0 (Proposed Action and Project Alternatives) describes the NorthMet Project Proposed
402 Action and Land Exchange Proposed Action and alternatives including the No Action
403 Alternative, Land Exchange Alternative B, and Alternatives Considered but Eliminated from
404 detailed consideration.

405 Chapter 4.0 (Affected Environment) summarizes the existing conditions of the NorthMet Project
406 Proposed Action and the surrounding environment and the Land Exchange parcels including the
407 land and its physical, biological, cultural, socioeconomic, and recreational resources.

408 Chapter 5.0 (Environmental Consequences) presents the direct and indirect environmental
409 consequences of the NorthMet Project Proposed Action and associated alternatives and the direct
410 and indirect environmental consequences of the Land Exchange Proposed Action and associated
411 alternatives.

412 Chapter 6.0 (Cumulative Effects) describes the cumulative effects on the surrounding
413 environment and uniquely affected communities with regard to the NorthMet Project Proposed
414 Action and the alternatives for the Land Exchange.

415 Chapter 7.0 (Comparison of Alternatives and Other Considerations) contains a comparison of the
416 Proposed Connected Actions and alternatives, conclusions of the impacts (including human
417 health), Land Exchange public interest considerations, and also addresses other NEPA
418 considerations.

419 Chapter 8.0 (Major Differences of Opinion) describes the Tribal Cooperating Agencies' major
420 differences of opinion with aspects of the EIS.

421 Appendix A (Response to Comments on the NorthMet Mining Project and Land Exchange Draft
422 and Supplemental Draft EIS) identifies the process for public engagement throughout the EIS
423 and provides responses to comments received on the DEIS and SDEIS.

424 Appendix B (Underground Mining Alternative Assessment for the NorthMet Mining Project and
425 Land Exchange Environmental Impact Statement) describes the analysis that the Co-lead
426 Agencies undertook in consideration of a potential Underground Mining Alternative.

427 Appendix C (Tribal Agency Position Supporting Materials) includes verbatim comments and
428 supporting documentation provided by the Tribal Cooperating Agencies.

429 Appendix D (Biological Assessment and Biological Evaluation) identifies whether NorthMet
430 Mining Project and Land Exchange-related actions may affect listed or proposed species and
431 critical habitat as required under the ESA.

432 ***1.7 CONSTITUENTS OF INTEREST***

433 Key constituents of interest are discussed in various chapters of the FEIS. Below is a list of the
434 major constituents referenced within this FEIS. A number of additional constituents were also
435 analyzed; however, this list represents those that are of most significance to the FEIS.

- 436 • Carbon monoxide (CO): May cause fatigue, chest pain, headaches, confusion, nausea, and
437 dizziness.
- 438 • Greenhouse gases (GHGs): Increased GHGs in the atmosphere can change climate
439 conditions.
- 440 • Hazardous Air Pollutants (HAPs): Group of toxic constituents known or suspected to cause
441 significant health effects, such as cancer.
- 442 • Mercury, mercury compounds (Hg): Elemental metal, high-level exposure may harm the
443 brain, gastrointestinal tract, nervous system, and kidneys.
- 444 • Metals/Metalloids (arsenic, cobalt, copper, nickel, antimony): Depending on constituent and
445 exposure, can affect the skin, heart, kidneys, liver, and/or gastrointestinal tract.
- 446 • Methylmercury: Organic mercury, bioaccumulates in fish and animals, can be transmitted to
447 humans that consume contaminated fish and game, may harm the fetal nervous system and
448 brain.
- 449 • Nitrogen dioxide (NO₂): May cause respiratory effects.
- 450 • Nitrogen oxides (NO_x): May form nitric acid and create acid rain, which can alter water and
451 soil pH. May also affect regional visibility conditions (haze).
- 452 • Particulate matter (PM): Particles smaller than 10 micrometers (PM₁₀) may enter the lungs
453 or bloodstream, particles smaller than 2.5 micrometers (PM_{2.5}) affect regional visibility
454 conditions (haze).
- 455 • Sulfate (SO₄): Can contribute to methylation of mercury, may affect wild rice.
- 456 • Sulfur dioxide (SO₂): Acute exposure may cause respiratory effects such as
457 bronchoconstriction or increased asthma symptoms. May also affect regional visibility
458 conditions (haze).
- 459 Table 1.7-1 below describes the FEIS chapters in which the above constituents and related topics
460 are discussed. Potential impacts on human health is addressed in Section 7.3.4.

461 **Table 1.7-1** *Constituents of Interest Discussed in the FEIS*

Constituent	Topic	FEIS Section
Carbon monoxide (CO)	Air emissions effects	5.2.7.1.3
Greenhouse gases (GHGs)	Air emissions effects	5.2.7.2.4, 5.2.7.4.1
	Climate change – cumulative effects	6.2.3.8.10
Hazardous Air Pollutants (HAPs)	Air emissions effects	5.2.7.1.3
Mercury, mercury compounds (Hg)	Air emissions effects	5.2.7.2.5
	Mercury balance, TMDL	5.2.7.2.5
	Aquatic species/bioaccumulation effects	5.2.2.3.4
Metals/Metalloids (arsenic, cobalt, copper, nickel, antimony)	Wild rice/water effects	5.2.2.1.2, 5.2.2.3.4
	Air emissions effects	5.2.7.2.3
Methylmercury	Surface water and groundwater effects	5.2.2.3.2, 5.2.2.3.3
	Aquatic species/bioaccumulation effects	5.2.2.3.4
Nitrogen dioxide (NO ₂)	Air emissions effects	5.2.7.2.3, 6.2.3.8.5
Nitrogen oxides (NO _x)	Air emissions effects	5.2.7.1.3, 5.2.7.2.3, 6.2.3.8.5
Particulate matter (PM)	Air emissions effects	5.2.7.1.3, 5.2.7.2.1, 6.2.3.8.4
	Class I and Class II areas – regional haze effects	5.2.7.1.4, 5.2.7.2.1, 5.2.7.2.2, 6.2.3.8.9
Sulfate (SO ₄)	Air emissions/deposition effects	6.2.3.8.5
	Surface and ground water effects	5.2.2.1.1, 5.2.2.3.1, 5.2.2.3.2, 5.2.2.3.3
	Effects to wild rice	5.2.2.1.2, 5.2.2.3.2, 5.2.2.3.3, 5.2.2.3.4
	Aquatic species effects	5.2.6.2.1, 6.2.3.7.2
Sulfur dioxide (SO ₂)	Mercury methylation effects	5.2.2.3.4
	Air emissions effects	5.2.7.2.1

462 TMDL = Total Maximum Daily Load

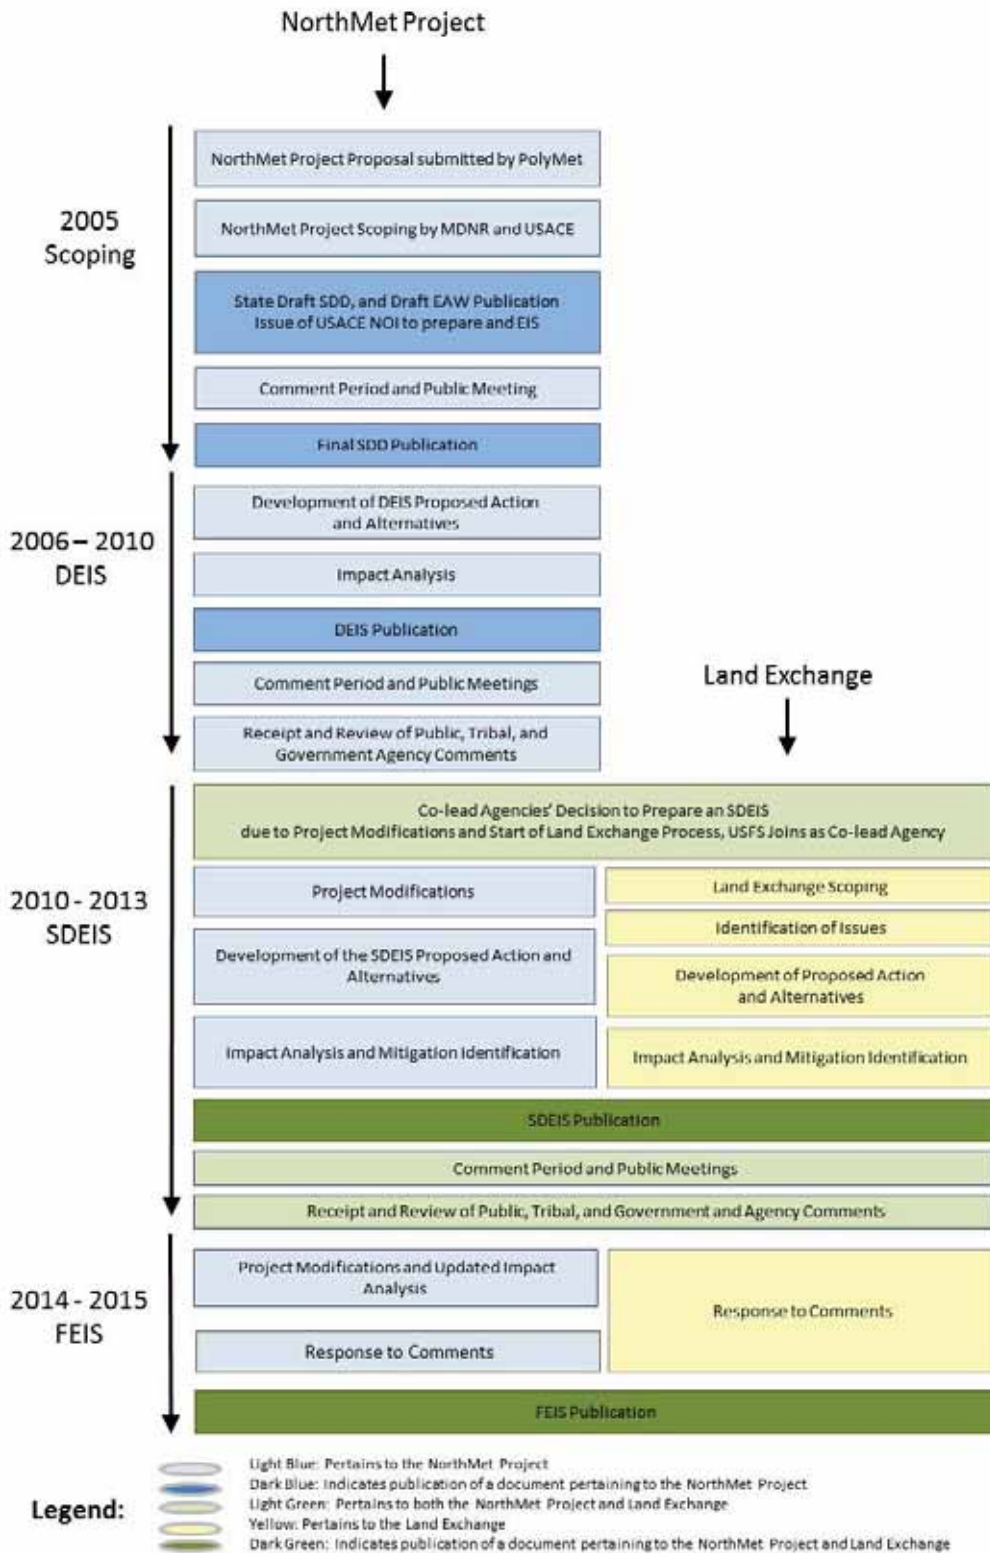

DRAFT

1 **2.0 EIS DEVELOPMENT**

2 ***2.1 INTRODUCTION***

3 This section describes the development of the EIS for the NorthMet Project from when it was
4 first proposed in 2005, through development of this FEIS. It includes a discussion of the EIS
5 development from scoping to publishing; public, tribal, and government agency comments; the
6 Co-lead Agencies' deliberations and decisions; incorporation of the Land Exchange Proposed
7 Action as a connected action, and subsequent development of the SDEIS and FEIS. An overview
8 of this process is shown in Figure 2.1-1.

DRAFT

9

10 **Figure 2.1-1 NorthMet Mining Project and Land Exchange EIS Development Process**

11 **2.2 DEIS DEVELOPMENT**

12 **2.2.1 NorthMet Project Scoping**

13 In early 2005, the USACE received a permit application from PolyMet to discharge fill material
14 to waters of the United States, including wetlands, in order to develop the NorthMet Project,
15 requiring the preparation of an EIS pursuant to NEPA. The preparation of a state-level MEPA
16 EIS would also be mandatory for the NorthMet Project.

17 Scoping is required by both NEPA and MEPA. The scoping process in Minnesota includes all
18 procedural and substantive requirements to satisfy scoping for preparation of a federal EIS under
19 NEPA. As the RGU for this EIS, the MDNR was responsible for administering the state's
20 scoping process.

21 The DEIS scoping for the NorthMet Project, as originally proposed, involved the preparation of
22 the following three documents:

- 23 • the state Scoping Environmental Assessment Worksheet (EAW);
24 • the state Draft Scoping Decision Document (SDD); and
25 • the state Final SDD.

26 After the Draft SDD and EAW were issued via the Environmental Quality Board (EQB) Monitor
27 on June 6, 2005, comments were collected during a 30-day comment period that concluded on
28 July 6, 2005. A public scoping meeting was held in Hoyt Lakes, Minnesota, on June 29, 2005.
29 This meeting was hosted by the MDNR and USACE. Comments were addressed in the Response
30 to Public Scoping Comments issued with the Final SDD on October 25, 2005. The USACE
31 issued a Notice of Intent (NOI) to prepare an EIS in the Federal Register on July 1, 2005
32 (Volume 70, Number 126).

33 **2.2.2 Identification of Issues**

34 The scoping process was used to identify potentially significant issues that would trigger the
35 analysis of effects and the development of potential alternatives and mitigation measures.

36 As discussed in the Final SDD, potentially significant effects included those on fish and wildlife
37 resources, threatened and endangered species, water resources, water appropriations, surface
38 water runoff and erosion/sedimentation, wastewater, and solid waste, as well as cumulative
39 impacts. These impacts required a more detailed discussion than had been provided in the EAW;
40 as a result, they were discussed in detail in the DEIS.

41 Other issues identified during scoping that were discussed in detail in the DEIS included
42 vegetation cover types, point and non-point source air emissions, noise, cultural resources,
43 visibility, compatibility with land use plans and regulations, infrastructure, asbestiform fibers,
44 and tribal concerns regarding access to lands within the 1854 Ceded Territory.

45 Additional issues were also considered but eliminated from detailed analysis in the DEIS
46 because they were determined to have no significant predictable effect or had been adequately
47 discussed in the EAW. These issues included land use conflicts, water-related land use
48 management, surface water use, geologic hazards and soil conditions, traffic, and odors.

49 **2.2.3 DEIS Proposed Action and Alternatives**

50 The proposed action analyzed in the DEIS called for surface mining and mineral processing of
51 approximately 228 million (short) tons of copper-nickel-PGE ore over an approximate 20-year
52 mine life. Proposed mining would occur at the NorthMet Deposit, which is located on
53 undeveloped federal land. Existing infrastructure would be utilized to transport the ore
54 approximately 8 miles to the west for processing at the former LTVSMC processing plant, which
55 would be refurbished if necessary.

56 In accordance with NEPA and MEPA, a number of project alternatives were identified through
57 scoping. After consideration, the following were evaluated in the DEIS (refer to Section 3.2.3):

- 58 • Proposed Action,
- 59 • No Action Alternative,
- 60 • Mine Site Alternative, and
- 61 • Tailings Basin Alternative.

62 The DEIS included provisions for a surface use permit from the USFS to use its lands for the
63 mine. PolyMet and the USFS had been exploring options to avoid a conflict between the use of
64 the surface (federal) and subsurface (private) estates. One option was to exchange the federally
65 owned surface land necessary for the proposed mine with other private lands in the area.
66 However, no agreement was reached and the DEIS did not include a land exchange.

67 **2.2.4 Impact Analysis**

68 Potential effects of the NorthMet Project Proposed Action and alternatives were determined
69 using baseline data, predictive modeling programs, GIS and spatial data analysis, and other
70 impact assessment methods both qualitative and quantitative. The predicted effects and potential
71 mitigation measures were discussed in Chapter 4 of the DEIS.

72 **2.2.5 DEIS Publication**

73 The DEIS was made available to the public through notification in the November 2, 2009 EQB
74 Monitor (Volume 33, Number 22) and November 6, 2009 (Volume 74, Number 214) Federal
75 Register (FR). The notification informed the public that paper copies of the DEIS were available
76 for review at MDNR offices and public libraries in Grand Rapids, Hibbing, Hoyt Lakes, Duluth,
77 Minneapolis, and St. Paul. Summary versions of the document and compact disks containing the
78 full version of the DEIS were provided upon request, and the entire document was also made
79 available via the MDNR's website. Summary versions or full copies on paper or disk were
80 distributed to parties on the MEQB distribution list as well as additional interested parties.

81 **2.2.6 Comment Period and Public Meetings**

82 The MEQB notification also identified that the 90-day comment period would end on February
83 3, 2010. Instructions and contact information were provided for submittal of public comments.

84 Following the release of the DEIS, public meetings were held in Aurora, Minnesota, on
85 December 9, 2009 and Blaine, Minnesota, on December 10, 2009, to gather public comments on
86 the DEIS.

87 **2.2.7 Receipt and Review of Public and Agency Comments**

88 Public and agency comments on the DEIS were collected during the 90-day comment period.
89 Submissions came from government agencies (federal, state, and local), tribal entities, local
90 businesses, non-governmental organizations, private individuals, and PolyMet. Approximately
91 3,800 comment submissions were received.

92 The comments were analyzed, and the key issues identified included effects on cultural
93 resources, air quality, wetlands, geotechnical stability, socioeconomics, and water resources.
94 Topic-focused workgroups were assembled from members of the Co-lead and Cooperating
95 Agencies to further consider these issues.

96 **2.3 SDEIS DEVELOPMENT**

97 **2.3.1 Co-lead Agency Decision to Prepare an SDEIS**

98 In mid-2010, the Co-lead Agencies decided to prepare an SDEIS that would incorporate a Land
99 Exchange (see Section 2.3.1.1), Cooperating Agency and public comments, evolving MPCA
100 guidance, and project refinements made by PolyMet (see Section 2.3.2.1). The USACE and
101 USFS published a NOI on October 13, 2010 in the FR (Volume 75, Number 197) indicating the
102 intent to prepare the SDEIS. The NOI identified that scoping would be conducted only for the
103 Land Exchange, with no additional scoping for the proposed NorthMet Project because the issues
104 regarding the mine had not changed. The MDNR published a Notice of Amendment to the
105 Scoping Decision in the EQB Monitor on November 1, 2010.

106 The SDEIS included analyses of both the NorthMet Project Proposed Action and the Land
107 Exchange Proposed Action as a connected action.

108 **2.3.1.1 Addition of the Land Exchange**

109 The USFS determined that an EIS would be required to analyze the Land Exchange Proposed
110 Action. Since the Land Exchange constitutes a connected action to the NorthMet Project
111 Proposed Action, it has been incorporated into the NorthMet Mining Project EIS. The USFS
112 subsequently joined the USACE and MDNR as a Co-lead Agency.

113 **2.3.2 NorthMet Project**

114 **2.3.2.1 Project Modifications**

115 Several key decisions made by the Co-lead Agencies following the DEIS prompted PolyMet to
116 make project modifications, which further supported the need for an SDEIS to assess effects
117 resulting from the proposed NorthMet Project.

118 Starting in January 2010, PolyMet made a number of modifications to the original mine plan.
119 These modifications addressed issues identified in DEIS comments and during agency
120 deliberations. The changes were detailed in a series of documents prepared by PolyMet for Co-
121 lead Agency consideration.

122 In June 2010, the MPCA issued staff recommendations on the site-specific application of the
123 wild rice standard, which states that 10 milligrams per liter (mg/L) of sulfate be applied to waters
124 used for the production of wild rice; this standard applies from April 1 to August 31 each year

125 for the Partridge and Embarrass river systems. The recommendations were updated in March and
126 June 2011. The MPCA guidance also included Tailings Basin performance requirements
127 regarding seepage discharges, limitations to sulfate contributions in surface waters, and
128 monitoring requirements. In August 2012, the recommendations were updated to apply the
129 seasonal application to just the Partridge River. The recommendations also suggest continuation
130 of monitoring of wild rice.

131 Topic-focused workgroups were established to discuss key issues that needed to be closely
132 examined in the SDEIS. Workgroup participation was varied and included representatives from
133 the Co-lead Agencies, other regulating agencies, and/or the Cooperating Agencies and PolyMet.
134 These groups participated in the impact assessment planning (IAP) process, which led to the
135 development of work plans for data packages and management plans (MDNR et al. 2011). The
136 workgroups discussed evaluation criteria, methodologies for analysis, potential effects, and
137 possible mitigation measures. Topics addressed by the workgroups included geotechnical
138 stability, wetlands, air resources, and water resources. The water resources group was further
139 divided into four subgroups to address evaluation criteria, groundwater issues, surface water
140 issues, and geochemistry. A socioeconomics workgroup was also established to address tribal
141 concerns regarding potential socioeconomic effects on the Bands from the NorthMet Project
142 Proposed Action.

143 A Co-lead Agencies workgroup was also established to discuss issues related to the project
144 modifications, alternatives (predominantly the Mine Site and Tailings Basin Alternatives
145 addressed in the DEIS), the wild rice standard, and various mitigation measures identified by the
146 topic-focused workgroups. The discussions, in consultation with PolyMet, resulted in
147 development of the Draft Alternative. In January 2011, the Co-lead Agencies briefed the
148 Cooperating Agencies and other involved agencies on the Draft Alternative. Due to changes in
149 the project, the Draft Alternative was updated, recirculated, and released again in March 2011
150 and October 2011.

151 In October 2011, PolyMet incorporated the Draft Alternative into its Proposed Action for the
152 NorthMet Project. As discussed in Section 3.2.3, a full range of reasonable alternatives was
153 evaluated in developing the Draft Alternative.

154 **2.3.2.2 Revised Proposed Action and Alternatives**

155 As described in Section 2.3.2.1 above, the NorthMet Project Proposed Action was modified
156 following the DEIS as a result of input from the public, Cooperating Agencies, and the Co-lead
157 Agencies via the workgroups, and additional modeling and impact analyses. Project
158 modifications incorporated additional mitigation measures designed to meet applicable
159 regulatory standards over the life of the mine.

160 Given the changes to the NorthMet Project Proposed Action, some previously considered
161 alternatives were deemed no longer valid because:

- 162 • they have been incorporated into the current NorthMet Project Proposed Action;
- 163 • they do not correspond to the current design of the NorthMet Project Proposed Action; or
- 164 • they do not correspond to effects under the current NorthMet Project Proposed Action.

165 Thus, only those previously considered alternatives that were still relevant were rescreened in the
166 SDEIS. The Underground Mining Alternative and backfilling the West Pit with Category 1 waste
167 rock were deemed necessary for reconsideration and are discussed in Section 3.2.3. Other
168 previously considered alternatives screened throughout the EIS process including during
169 scoping, the DEIS, and the SDEIS are also discussed in Section 3.2.3.

170 **2.3.2.3 Impact Analysis**

171 Similar to the analysis in the DEIS, potential effects of the revised NorthMet Project were
172 determined using probabilistic and/or deterministic modeling programs, GIS and spatial data
173 analysis, and other impact assessment calculations. These predicted effects are described in
174 Chapter 5.

175 **2.3.3 Land Exchange**

176 The USFS and PolyMet developed a Land Exchange proposal by which the federal surface lands
177 at the proposed Mine Site would be transferred to PolyMet ownership in exchange for non-
178 federal lands (to be owned by PolyMet) that would meet the USFS criteria identified in the
179 Forest Plan. Alternatives to the Land Exchange proposal, including the No Action Alternative,
180 were developed and analyzed in the SDEIS.

181 A feasibility analysis, completed by the USFS in November 2009, assessed the potential for a
182 land exchange between the USFS and PolyMet that would involve the federally owned parcel on
183 which the NorthMet Project Mine Site is proposed. The feasibility analysis evaluated one federal
184 tract (encompassing much of the proposed Mine Site) and two non-federal tracts for
185 conformance with the Forest Plan, which included current and future uses of the land tracts. A
186 preliminary monetary valuation indicated that additional parcels would be needed to bring the
187 market value of federal and non-federal lands within the limits required for an exchange. The
188 analysis also determined that additional parcels would be needed to supplement the amount of
189 wetland acres being exchanged in order to meet the requirements of EO 11990. Three non-
190 federal tracts were subsequently added for consideration in the Land Exchange Proposed Action.
191 These tracts were evaluated for conformance by the same criteria used in the feasibility analysis.

192 **2.3.3.1 Land Exchange Scoping**

193 As discussed in Section 2.3.1, the USACE and USFS published an NOI to prepare an SDEIS;
194 this NOI discussed both the intent to prepare an SDEIS, which would supplement the DEIS, and
195 the inclusion of the Land Exchange Proposed Action as a connected action. The NOI identified
196 that the comment period would be held for 45 days and provided notification that scoping
197 comments were limited to the Land Exchange Proposed Action.

198 Open house scoping sessions were held in Aurora, Minnesota on October 26, 2010 and in New
199 Brighton, Minnesota, on October 27, 2010. At each open house, representatives from the USFS,
200 USACE, MDNR, PolyMet, and the Co-lead Agencies' third-party consultant provided
201 information on the NEPA process, the NorthMet Project Proposed Action and Land Exchange
202 Proposed Action, and how to provide scoping comments.

203 **2.3.3.2 Identification of Issues**

204 Similar to the scoping for the DEIS, the Land Exchange scoping process was used to identify
205 potentially significant issues, less significant issues, and issues considered but eliminated from
206 further consideration as discussed in Appendix G of the May 2011 Detailed Scoping Report for
207 the PolyMet Land Exchange (USFS 2011n).

208 Potentially significant issues identified included the development of exchange alternatives, tribal
209 access rights, and federal trust obligations. These issues are discussed in detail in Chapter 5 of
210 the FEIS.

211 Other issues identified in scoping for the Land Exchange included air quality, climate change,
212 cultural/tribal concerns, cumulative effects, ecological functions and values, forest resources,
213 hazardous materials, market value and legal implications, conformance with the Forest Plan,
214 socioeconomics, threatened and endangered species, vegetation and wildlife habitat, water
215 resources, and wetland effects.

216 Issues considered but eliminated from further consideration included mining-related effects, as
217 these would be discussed as part of the mining action; corporate profits resulting from the Land
218 Exchange; land value disclosures; and adequacy of scoping materials.

219 **2.3.3.3 Proposed Action and Alternatives**

220 A Proposed Action for the Land Exchange was developed that identified potential lands for
221 exchange (see Section 3.3.2 for a description of the federal and non-federal parcels).

222 Several alternatives to the Land Exchange Proposed Action were identified, including the No
223 Action Alternative required by NEPA and MEPA. The USFS evaluated these alternatives for
224 detailed analysis in the SDEIS based on criteria including conformance with the Purpose and
225 Need statements from the project proponent and Co-Lead Agencies, technical and economic
226 feasibility, land availability, and potential environmental benefits. Further detail on the screening
227 process is available in Section 3.3.3.

228 Along with the No Action Alternative, only the Land Exchange Alternative B met these criteria
229 and is fully analyzed in the FEIS. The remaining alternatives—exchange of a single contiguous
230 non-federal parcel, underground mining and other alternative methods of mineral extraction,
231 exchange of other non-federal parcels, and full land exchange with deed restrictions—did not
232 meet these criteria and were eliminated from detailed analysis in the EIS.

233 **2.3.3.4 Impact Assessment**

234 The USFS identified resource topic-specific issues, effects, area(s) of analysis, impact indicators,
235 data needs, and analysis methods for assessment of the Land Exchange. These topics, along with
236 assessment results, are discussed in Chapter 5.3 of the FEIS.

237 **2.3.4 SDEIS Publication**

238 The SDEIS was made available to the public through notification in the December 9, 2013 EQB
239 Monitor (Volume 37, Number 25) and December 13, 2013 (Volume 78, Number 240) Federal
240 Register (FR). The notification informed the public that paper copies of the SDEIS were
241 available for review at MDNR offices and public libraries in Grand Rapids, Hibbing, Hoyt

242 Lakes, Babbitt, Duluth, Minneapolis, and St. Paul. Executive Summaries of the document and
243 compact disks containing the full version of the SDEIS were provided upon request, and the
244 entire document was also made available via the MDNR's website. Executive Summaries or full
245 copies on paper or disk were distributed to parties on the MEQB distribution list as well as
246 additional interested parties.

247 ***2.3.5 Comment Period and Public Meetings***

248 The MEQB notification also identified that the 90-day comment period would end on March 13,
249 2014. Instructions and contact information were provided for submittal of public comments.

250 Following the release of the SDEIS, public meetings were held in Duluth, Minnesota, on January
251 16, 2014, Aurora, Minnesota, on January 22, 2014 and St. Paul, Minnesota, on January 28, 2014,
252 to gather public comments on the SDEIS.

253 ***2.3.6 Receipt and Review of Public and Agency Comments***

254 Public and agency comments on the SDEIS were collected during the 90-day comment period.
255 Submissions came from federal, state, and local government agencies, tribal entities, local
256 businesses, non-governmental organizations, private individuals, and PolyMet. Approximately
257 58,000 comment submissions were received by the Co-lead Agencies during the 90-day
258 comment period.

259 Each submission was reviewed and individual unique comments were identified. The comments
260 were then grouped into relevant topic areas and further categorized into comment themes. This
261 process is described in more detail in Appendix A.

262 ***2.4 FEIS DEVELOPMENT***

263 ***2.4.1 Consideration of Public Comments Received on the SDEIS***

264 The SDEIS comments were considered and addressed through FEIS text edits and clarifications,
265 project design modifications, and updated analysis where deemed appropriate. The comment
266 themes and each individual Cooperating Agency comment received were also responded to. A
267 description of the process taken to consider, manage, and respond to the submissions, comments,
268 and themes, as well as copies of the comments, themes, and responses are provided in Appendix
269 A.

270 ***2.4.2 NorthMet Project Modifications***

271 Comments received on the SDEIS highlighted some areas where project modifications could be
272 made to enhance the environmental performance of the NorthMet Project Proposed Action.
273 Under advisement from the Co-lead Agencies, PolyMet made several engineering design
274 modifications to the NorthMet Project Proposed Action based on updated business needs, and to
275 address comments received on the SDEIS. The project modifications were:

- 276 • adding a water containment system on the east side of the Tailings Basin to capture potential
277 future seepage in that area;
- 278 • adding in semi-autonomous grinding (SAG) mill to the plant site for more energy efficient
279 ore grinding process;

- 280 • adding cement deep soil mixing component to strengthen the existing LTVSMC Tailings
281 Basin prior to using that facility for the NorthMet tailings;
- 282 • removing the coal ash landfill located within the proposed Tailings Basin footprint; and
- 283 • treating water from Colby Lake prior to its use as stream augmentation.

284 These project modifications were considered by the Co-lead Agencies as being generally
285 beneficial to the environmental performance of the NorthMet Project Proposed Action and did
286 not represent a significant change in the project design.

287 ***2.4.3 Changes to the SDEIS and Preparation of the FEIS***

288 Consistent with NEPA and MEPA, the Co-lead Agencies revised the SDEIS to address
289 substantive comments received on the draft statement and minor project modifications made by
290 the proposer, described in Section 2.4.2, which resulted in updated data and analyses for the
291 FEIS. These changes, however, are not considered to be substantial and have not resulted in new
292 conclusions or resulted in any new significant impacts. The methodology used for the analysis
293 was consistent with that in the SDEIS. These predicted effects are described in Chapter 5 for
294 direct and indirect impacts of the NorthMet Project Proposed Action and Land Exchange
295 Proposed Action and in Chapter 6 for cumulative impacts. Appendix A of the FEIS contains the
296 SDEIS public comments, comment themes, and theme responses, as well as the responses to the
297 DEIS comment themes.

298 ***2.5 ADEQUACY DETERMINATION/RECORDS OF DECISION***

299 Following release of the FEIS:

- 300 • The MDNR will make a determination on the adequacy of the FEIS, per *Minnesota Rules*,
301 Part 4410.2800. This determination will be included in the MDNR's Adequacy Decision.
- 302 • The USACE will issue a ROD on the applicant's Department of the Army (DA) permit
303 application pursuant to Section 404(b)(1) of the CWA. Under NEPA, per 33 CFR 230.19(d),
304 comments on the FEIS will be addressed in the USACE ROD only if substantive issues are
305 raised which have not been addressed in the FEIS.
- 306 • The USFS will issue a ROD on the Land Exchange once any objections filed per 36 CFR 218
307 (updated from the previous appeals process per 36 CFR 215) are resolved. Individuals and
308 entities who provide specific written comment as defined in § 218.2 during scoping or the
309 comment period will be eligible to participate in the objection process. For more information
310 on the objection process, see www.fs.usda.gov/goto/superior/projects.

311 ***2.6 PROJECT PERMITTING***

312 Information (data, analyses, and assessments) being generated during the EIS process is an
313 integral part of the permitting process. There may be multiple permit applications for the
314 NorthMet Project and they would be processed in various timeframes and under various
315 procedures, often including detailed information beyond that required in an EIS. Although
316 permits may be publicly noticed during the EIS process, deeming an EIS adequate does not
317 guarantee issuance of the permits. In general, once the permitting authority receives its complete

318 permit application, permits are public noticed for review. Following public comment periods,
319 meetings and/or hearings, permit determinations could be made by the permitting authorities.

320 Permits and approvals for the NorthMet Project would involve detailed review of regulatory
321 compliance with local, state, and federal rules, statutes, and guidance. Below are some of the
322 major permitting efforts and coordination and consultation processes required for the NorthMet
323 Project:

324 • MDNR:

- 325 – Permit to Mine
- 326 – Water Appropriations
- 327 – Dam Safety
- 328 – Wetland Replacement Plan

329 • MPCA:

330 – NPDES/SDS Permit covering the Mine Site and Plant Site that addresses state and
331 federal permitting rules, that at a minimum includes the following components:

- 332 ▪ “reasonable potential” analyses for applicable discharges;
- 333 ▪ development of effluent limits for applicable discharges taking into account
334 applicable water quality standards for immediate receiving waters and downstream
335 waters;
- 336 ▪ a non-degradation analysis, where applicable;
- 337 ▪ monitoring requirements for wastewater discharges, groundwater, surface water, and
338 internal wastewater streams, as appropriate;
- 339 ▪ Industrial stormwater requirements; and
- 340 ▪ an evaluation of state and federal rules related to the transfer of portions of existing
341 Cliffs Erie (former LTVSMC) permits.

- 342 – Air Emission Permit
- 343 – NPDES Construction Storm Water Permit
- 344 – Storage Tank Permit
- 345 – Solid Waste Permit
- 346 – Section 401 Certification (water quality)

347 • USACE:

- 348 – Section 404 CWA Permit (wetlands)
- 349 – Section 106 Consultation
- 350 – Section 7 Endangered Species Act

- 351 • USFS:
- 352 – Land Exchange
- 353 – Section 106 NHPA Consultation
- 354 • USFWS:
- 355 – Section 7 Endangered Species Act

356 ***2.7 FINANCIAL ASSURANCE***

357 Per the State Permit to Mine, financial assurance would be required to ensure a source of funds
358 that could be used by the MDNR in the event that PolyMet fails to complete closure and
359 reclamation activities. Reclamation and post-reclamation cost estimates must be updated on an
360 annual basis to account for the activities completed during the previous year. Estimates must be
361 made for the contingency funds required in the event of unplanned closure during the course of
362 the year.

363 Per *Minnesota Rules*, part 6132.1200, subparts 4 and 5, the financial assurance instruments for
364 the NorthMet Project Proposed Action must be approved by the MDNR and be available to the
365 MDNR when needed. The level of engineering design and planning required to calculate detailed
366 financial assurance amounts is typically made available during the permitting process. Section
367 3.2.2.4.2 provides further discussion on the applicable financial assurance for the NorthMet
368 Project.

369 Additionally, financial assurance for wetland mitigation may be required. Section 5.2.3 presents
370 additional information relative to such mitigation measures.

1 **3.0 PROPOSED ACTION AND ALTERNATIVES**

2 **3.1 INTRODUCTION**

3 The NorthMet Project and Land Exchange areas are located in northeastern Minnesota
4 (see Figure 1.1-1). The NorthMet Project area is located on the Mesabi Iron Range in St. Louis
5 County. The Boundary Waters Canoe Area Wilderness (BWCAW) and Voyageurs National Park
6 are approximately 20 miles north and 50 miles northwest, respectively, of the NorthMet Project
7 area. The NorthMet Project area is within the St. Louis River (Lake Superior) Watershed, which
8 ultimately drains to Lake Superior. This area is located on lands acquired by the United States on
9 September 30, 1854, when the Chippewa of Lake Superior ceded ownership of the land to the
10 United States. These lands are often referred to today as the 1854 Ceded Territory.

11 Current land use in the region includes mining, forestry, urban development, and recreation on a
12 mixture of private and public land. The NorthMet Project Proposed Action would be the first
13 copper-nickel-PGE mine in Minnesota, though feasibility studies are underway for other
14 potential copper-nickel-PGE mines. However, as shown in Figure 1.1-2, commercial mining has
15 been undertaken in northeastern Minnesota since the late of the 19th century when iron ore
16 (hematite and later taconite) was discovered on the Vermilion, Mesabi, and Cuyuna ranges. The
17 development of open pit mines and processing facilities, supported by the development of many
18 small towns, has facilitated continued iron ore/taconite mining over the last century. Today, only
19 the Mesabi Range is actively mined for iron ore/taconite, though several copper/nickel mines are
20 undergoing feasibility studies in this area.

21 Section 3.1 summarizes the NorthMet Project Proposed Action and alternatives as well as the
22 Land Exchange Proposed Action and alternatives. The NorthMet Project Proposed Action is
23 described in detail in Section 3.2.2, and the alternatives, including reconsideration of alternatives
24 from the DEIS, are described in Section 3.2.3. The Land Exchange Proposed Action is described
25 in Section 3.3.2, and the alternatives are described in Section 3.3.3. The affected environment
26 and the potential environmental consequences are addressed in subsequent chapters in this FEIS.

27 **3.1.1 NorthMet Project Overview**

28 The NorthMet Project Proposed Action has three major components: a Mine Site, a
29 Transportation and Utility Corridor, and a Plant Site comprising the following three phases:

- 30 • Construction, which would last for approximately 18 months and would include land
31 clearing, building renovation and construction, stockpile construction, and utility upgrades.
- 32 • Operations, which would last approximately 20 years and would include ore mining and
33 processing, continued construction, and progressive reclamation (at the same time as
34 mining).
- 35 • Reclamation, closure, and post-closure maintenance, which would last for an unknown
36 duration and would occur after mining, and would include infrastructure removal and final
37 land reclamation, maintenance, monitoring, and transitioning from mechanical to non-
38 mechanical water treatment if or when proven effective.

39 An overview of the NorthMet Project Proposed Action layout, operations, closure, and
40 alternatives is provided below.

41 **3.1.1.1 Site Preparation and Construction Overview**

42 In preparation, existing vegetation would be cleared from sites where mining would take place
43 and where infrastructure would be built. Overburden (i.e., the soils and rocks overlying bedrock
44 or ore) would be removed from the mine pits and as required from foundations of stockpiles,
45 infrastructure, and haul roads. Buildings and infrastructure would be constructed on site.

46 Existing facilities at the former LTVSMC processing plant would be refurbished to working
47 order. New processing buildings would be constructed to further refine the copper-nickel-PGE
48 ores—a process different from that utilized for taconite previously processed at the facility.
49 Construction would occur for approximately 18 months prior to the start of mining.

50 **3.1.1.2 Mine Site Layout Overview**

51 The NorthMet Project Proposed Action includes several new facilities necessary to manage the
52 material removed from three mine pits: the East Pit, Central Pit, and West Pit. Infrastructure at
53 the Mine Site would include haul roads, a temporary ore storage pile, a rail-loading facility,
54 water-containment systems, a Waste Water Treatment Facility (WWTF), temporary and
55 permanent waste rock stockpiles, and an overburden stockpile. Waste rock that has a low
56 potential to contaminate water would be stored mostly in a permanent stockpile, with some being
57 backfilled into the empty mine pits when they become available. Waste rock with a high
58 potential to contaminate water would be temporarily stored in lined stockpiles, then moved
59 permanently into the empty East and Central pits.

60 **3.1.1.3 Mine Operations Overview**

61 The mining operations would involve the use of conventional surface mining methods, such as
62 blasting and excavating rock from the NorthMet Deposit, a low to medium quality copper-
63 nickel-PGE deposit with a low sulfide content. The East Pit and West Pit would be mined
64 simultaneously through the first 11 years of the mine life. Mining would cease at the East Pit at
65 approximately year 11 and continue at the West Pit until year 20. The Central Pit would be
66 mined between years 11 and 16 and would ultimately combine with the East Pit. The maximum
67 depths of the pits below the original surface level would be 696 ft for the East Pit (at year 11),
68 356 ft for the Central Pit (at year 16), and 630 ft for the West Pit (at year 20).

69 The ore, waste rock, and overburden would be transported by truck within the Mine Site via a
70 series of haul roads. Ore would be hauled to a rail-loading facility for transport to the Plant Site.
71 The waste rock would be sorted into four categories based on its potential to contaminate
72 water—Category 1 waste rock would have a low potential and Category 4 waste rock would
73 have a high potential.

74 Until the completion of mining in the East Pit (approximately year 11), waste rock would be
75 hauled to the following stockpiles at the Mine Site:

- 76 • Permanent Category 1 Stockpile;
- 77 • Temporary Category 2/3 Stockpile; or
- 78 • Temporary Category 4 Stockpile.

79 After year 11 (that is, at the completion of mining at the East Pit), the waste rock in the
80 temporary stockpiles would be moved into the East Pit. Waste rock generated from ongoing
81 mining in the West Pit and Central Pit after year 11 would be directly disposed of in the East Pit.
82 Some Category 1 waste rock would continue to be placed on the Category 1 Stockpile until year
83 13.

84 Water control systems would be constructed to capture water that has contacted surfaces
85 disturbed by mining operations, as well as water collected on stockpile liners (i.e., process
86 water). Process water would be treated at a treatment facility located at the Mine Site and either
87 pumped via a Central Pumping Station to the Plant Site for discharge to the Tailings Basin, or
88 used to supplement flooding of the East Pit after year 11.

89 **3.1.1.4 *Transportation and Utility Corridor Overview***

90 The Mine Site would be connected to the Plant Site, located approximately 7 to 8 miles to the
91 west, by an approximately 7- to 8-mile-long Transportation and Utility Corridor that would
92 contain the following:

- 93 • A private railroad consisting of new spurs that would connect the Mine Site and Plant Site to
94 the existing Cliffs Erie, LLC (Cliffs Erie) private railroad and would be used to transport ore
95 from the Mine Site to the Plant Site;
- 96 • An existing segment of the private Dunka Road that would provide vehicle access between
97 the Mine Site and the Plant Site (separate from the railroad);
- 98 • New water pipeline that would be constructed along Dunka Road to transport water between
99 the Mine Site and the Plant Site; and
- 100 • New transmission lines that would be constructed along a portion of Dunka Road near the
101 Mine Site.

102 **3.1.1.5 *Plant Site Layout Overview***

103 Some facilities at the former LTVSMC processing plant would be refurbished and new facilities
104 would be added for the Plant Site. The existing infrastructure at the Plant Site includes roads,
105 railroads, maintenance facilities (shops), electrical transmission lines, sanitary and potable water
106 treatment facilities, coarse- and fine-crusher buildings, and a concentrator building. New
107 construction would include the Hydrometallurgical Plant, oxygen plant, flotation buildings,
108 pipelines, concentrate dewatering, storage and load out buildings, and a Waste Water Treatment
109 Plant (WWTP).

110 The existing LTVSMC Tailings Basin would be used as the base for NorthMet Project Proposed
111 Action tailings disposal. The existing LTVSMC Tailings Basin consists of three areas: Cell 1E,
112 Cell 2E, and Cell 2W. Cell 2W, the most built-up cell, is located on the western half of the

113 existing LTVSMC Tailings Basin and is not proposed for use as part of the NorthMet Project
114 Proposed Action. A containment system would be installed around the northern, western, and
115 portions of the eastern sides of the Tailings Basin. Improvements would be made to the existing
116 containment system to the south. To enhance stability of the existing tailings prior to the
117 placement of NorthMet tailings, cement pillars would be installed (i.e., CDSM) in the existing
118 tailings and peat layers in the northern dams of the LTVSMC Tailings Basin. Additionally, the
119 northern embankment of Cell 2E and southern embankments of Cell 1E of the existing LTVSMC
120 Tailings Basin would be reinforced with a rock buttress.

121 A Hydrometallurgical Residue Facility would be constructed to contain residue from
122 hydrometallurgical processing. This facility would be built at the existing LTVSMC Emergency
123 Basin, immediately southwest of Cell 2W at the Tailings Basin. The Hydrometallurgical Residue
124 Facility would have a double geomembrane liner, with a leachate collection system between the
125 liners. A Geosynthetic Clay Liner would be installed above the lower geomembrane liner.

126 **3.1.1.6 Plant Operations Overview**

127 Once mined, the ore would be shipped to the Plant Site by rail, to be crushed and processed.
128 Processing would involve concentration in a new flotation building to separate metallic sulfide
129 minerals (ore concentrate) from feldspar and other non-ore minerals (tailings).

130 Then, the ore concentrate either would be dewatered and shipped off-site as copper and nickel
131 concentrate final products, or the nickel concentrate would be processed in an autoclave at the
132 Hydrometallurgical Plant and base/precious metal precipitates would be produced; these
133 precipitates would be shipped off-site as final products. Based on the anticipated rate of mining,
134 annual production post-processing would total about 113,000 short tons of copper concentrate,
135 18,000 short tons of mixed (nickel/cobalt) hydroxide, and 500 short tons of gold and PGE
136 precipitate.

137 After passing through a scavenger flotation cycle to remove as many sulfide minerals as
138 possible, the tailings would be transferred as slurry to the Tailings Basin. The tailings would be
139 deposited on top of Cell 1E and Cell 2E at the existing LTVSMC Tailings Basin and, at
140 completion, would be approximately the same height as the existing Cell 2W. Bentonite would
141 be incorporated into the exposed outer side-slopes of the Tailings Basin as it would be built up to
142 create a barrier that would limit oxidation. This limiting of oxygen transfer would reduce
143 pollutants generated from the Tailings Basin.

144 Water seepage from the Tailings Basin would be collected by the containment system and sent to
145 either the Tailings Basin pond or the Plant Site WWTP. Treated water from the WWTP would be
146 discharged to maintain flows in the streams that would be affected by the Tailings Basin
147 containment system. The waste (residue) from the Hydrometallurgical Plant would be transferred
148 to the lined Hydrometallurgical Residue Facility. Water captured by the liner system during
149 operations would be returned to the Hydrometallurgical Residue Facility pond.

150 **3.1.1.7 Project Closure Overview**

151 In general, proposed facilities have been designed and would be operated to allow for concurrent
152 reclamation, which would include backfilling the East Pit once it was exhausted (after year 11 of
153 mining) using waste rock generated through mining beyond year 11 and relocating waste rock
154 from the temporary waste rock stockpiles. Undertaking reclamation concurrently with mining

155 would reduce the effort and cost of final closure and is required by rule. The Category 1
156 Stockpile would also be covered starting in year 14, after it is completed in year 13.

157 Mining is expected to be completed approximately 20 years after operations begin. In
158 anticipation, PolyMet would prepare a mining and reclamation plan as part of the Permit to Mine
159 application. The mining and reclamation plan would include planned scheduling and costing for
160 closure and post-closure activities. At closure, PolyMet would first remove all unnecessary
161 infrastructure and facilities, then reclaim disturbed lands. Reclamation objectives would include
162 rapidly establishing a self-sustaining plant community, controlling dust, controlling soil erosion,
163 providing wildlife habitat, and minimizing the need for maintenance. Post-closure activities
164 would include monitoring and maintenance of reclamation and operation of mechanical water-
165 treatment infrastructure until facility features were deemed environmentally acceptable in a self-
166 sustaining and stable condition (refer to Sections 3.2.2.1.10, 3.2.2.3.12, and 3.2.2.4).

167 The water quality objective of closure is to provide mechanical or non-mechanical treatment for
168 as long as necessary to protect regulatory standards at applicable groundwater and surface water
169 compliance points. Water quality modeling performed in support of this FEIS indicates that
170 water treatment systems would be needed indefinitely at the Mine Site and Plant Site. The water
171 models constructed to assess the potential effects from the NorthMet Project Proposed Action
172 were not designed to predict the duration of treatment nor do they capture all the factors that
173 influence the duration of treatment (e.g., potential future regulatory and technological changes).
174 Therefore, the models cannot be used to predict when treatment would end. Actual treatment
175 requirements would be assessed on a recurring basis throughout operations, reclamation, and
176 closure considering influent and effluent water quality and monitoring results. Those periodic
177 assessments would be carried out to ensure continuous protection of groundwater and surface
178 water quality and compliance with water quality-based effluent limits. The periodic assessment
179 process would rely on monitoring results coupled with predictive modeling rather than the results
180 of the predictive modeling alone. Regardless of the precise duration of effects or water treatment
181 at either the Mine Site or Plant Site, there are measures available to address impacts to natural
182 resources, such as those identified in the Adaptive Water Management Plan (PolyMet 2015d)
183 and permit conditions. PolyMet would be held accountable for maintenance and monitoring
184 required under the permit and would not be released from financial assurance until all permit
185 conditions have been met. PolyMet would be required to provide financial assurance to MDNR
186 (managed independently) for closure and maintenance costs as a contingency if PolyMet or the
187 operating company at that time were unable to fulfill the obligations under the Permit to Mine.

188 **3.1.1.8 NorthMet Project Proposed Action Alternatives Overview**

189 The NorthMet Project Proposed Action incorporates activities and environmental impact
190 mitigation measures that have been evaluated through the EIS process. In addition, a number of
191 alternatives and mitigation measures were identified and considered through the EIS process and
192 were either:

- 193 • Incorporated into the NorthMet Project Proposed Action as they offered benefits to the
194 outcomes of the NorthMet Project Proposed Action; or
- 195 • Eliminated from detailed evaluation because they did not offer measurable or substantial
196 environmental benefits over other alternatives (including the NorthMet Project Proposed

197 Action), they were not reasonable (i.e., they were not economically or technically feasible in
198 accordance with CEQ guidelines), or would not meet the Purpose and Need.

199 As a result of screening and analysis, the NorthMet Project No Action Alternative (i.e., the
200 NorthMet Project Proposed Action would not occur) is the only alternative evaluated in detail in
201 this FEIS.

202 **3.1.2 Land Exchange Overview**

203 The Land Exchange Proposed Action includes undertaking a land exchange of 6,650.2 (GLO)
204 acres of federal land with up to 6,722.5 (GLO) acres of privately owned land of a combined
205 equal value, located within the 1854 Ceded Territory in Minnesota.

206 The federal land for the Land Exchange Proposed Action consists of a single contiguous area of
207 land located within the Laurentian Ranger District approximately 6 miles south of the City of
208 Babbitt in St. Louis County in northeastern Minnesota. It was acquired by the United States
209 under the authority of the Weeks Act of 1911 and is managed by the USFS.

210 The federal lands are located adjacent to historic mining projects on the Mesabi Iron Range and
211 are mostly surrounded by privately held land used for mining and other industrial purposes;
212 portions of the east and southwest areas of the federal lands are bordered by Superior National
213 Forest lands. The surface lands are located above the NorthMet Deposit. PolyMet leases the
214 NorthMet Deposit's private subsurface mineral rights. However, under the Weeks Act of 1911,
215 the USFS is restricted from allowing, by decision, surface mining on federal land, such as that
216 proposed by PolyMet. The Land Exchange Proposed Action would unite surface and mineral
217 rights on the federal lands and is therefore considered to be a connected action to the NorthMet
218 Project Proposed Action. Please refer to Section 1.3.2.2 for more information on the USFS
219 Purpose and Need for the Land Exchange Proposed Action.

220 The Land Exchange Proposed Action would include up to five tracts of non-federal lands in St.
221 Louis, Lake, and Cook counties that would comprise up to 6,722.5 acres (GLO); however, the
222 final exchange, if approved, could include fewer than 6,722.5 acres (GLO) of non-federal land
223 depending on the results of the environmental analysis and real estate appraisals. All of the lands
224 proposed for exchange are located throughout the 1854 Ceded Territory of northeastern
225 Minnesota. Appraisal reports completed in 2013 indicate that the Land Exchange Proposed
226 Action would meet federal value requirements if all five non-federal land tracts (6,722.5 (GLO)
227 acres) offered by PolyMet would be exchanged for 6,650.2 (GLO) acres of federal land. If the
228 ROD approves the Land Exchange Proposed Action, a current appraisal approved by the USFS
229 would be required to verify equal value. Appraisals must conform to Uniform Appraisal
230 Standards for Federal Land Acquisitions and the Uniform Standards of Professional Appraisal
231 Practice of the Appraisal Foundation. The final proposed configuration of land would be
232 determined after the market value of the parcels is determined by appraisals and the
233 environmental analysis has been completed. This information would be presented in the ROD.

234 **3.1.2.1 Land Exchange Proposed Action Alternatives Overview**

235 Two alternatives to the Land Exchange Proposed Action, the Land Exchange Alternative B and
236 Land Exchange No Action Alternative, are evaluated in detail in this FEIS. Land Exchange
237 Alternative B would convey fewer acres of federal lands for fewer acres of non-federal land.
238 Other alternatives were considered but eliminated from further analysis because they did not

239 meet the screening criteria. These included a direct purchase alternative, exchange of a single
240 contiguous federal parcel, exchange of other non-federal lands, exchange of only the federal
241 lands needed for the NorthMet Project Proposed Action, exchange of lands with use restrictions,
242 and underground mining for the NorthMet Project Proposed Action, which would eliminate the
243 need for a land exchange.

244 **3.2 NORTHMET PROJECT DETAILED DESCRIPTION**

245 **3.2.1 Overview**

246 The NorthMet Project Proposed Action includes three major components: a Mine Site,
247 Transportation and Utility Corridor, and a Plant Site. These areas are shown in Figure 3.2-1.
248 Figure 3.2-2 shows a schematic diagram of the main activities and flow of material. The
249 NorthMet Project Proposed Action would incorporate activities and environmental impact
250 mitigation measures that have been evaluated through the EIS process with the benefit of public
251 review and comment. The NorthMet Project Proposed Action would involve the following:

- 252 • Development of a 20-year open pit mine at the NorthMet Deposit (Mine Site).
- 253 • Copper-nickel-PGE ore processing at an upgraded former LTVSMC processing plant (Plant
254 Site).
- 255 • Transportation of ore and other materials using existing road, existing and new rail
256 infrastructure, and a new water pipeline between the Mine Site and Plant Site (Transportation
257 and Utility Corridor).
- 258 • Construction of permanent features, including the following, described in post-reclamation
259 state:
 - 260 – One backfilled pit (filled with the most reactive rock for underwater storage);
 - 261 – One flooded mine pit;
 - 262 – One capped waste rock stockpile;
 - 263 – A reclaimed Hydrometallurgical Residue Facility (over an existing brownfield site); and
 - 264 – A bentonite-covered Tailings Basin with pond (over an existing Tailings Basin).
- 265 • Construction of temporary features that would be removed and/or reclaimed before or at
266 closure, including:
 - 267 – Two lined waste rock stockpiles (removed and reclaimed);
 - 268 – An Overburden Storage and Laydown Area (reclaimed); and
 - 269 – Roads and other ancillary infrastructure (removed and/or reclaimed).
- 270 • Engineered water management controls including:
 - 271 – Fixed liners on temporary stockpiles;
 - 272 – Fixed containment systems and surface seepage management systems encompassing a
273 permanent stockpile and Tailings Basin to capture groundwater and surface seepage from
274 those facilities;

- 275 – Leachate collection system under the Hydrometallurgical Residue Facility;
- 276 – Mine Site WWTF and Plant Site WWTP to treat contaminated waters;
- 277 – An updated sewage treatment system; and
- 278 – Covers on the permanent stockpile and Tailings Basin applied at closure that could be
- 279 adapted to alter water infiltration as needed.

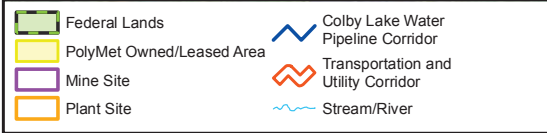

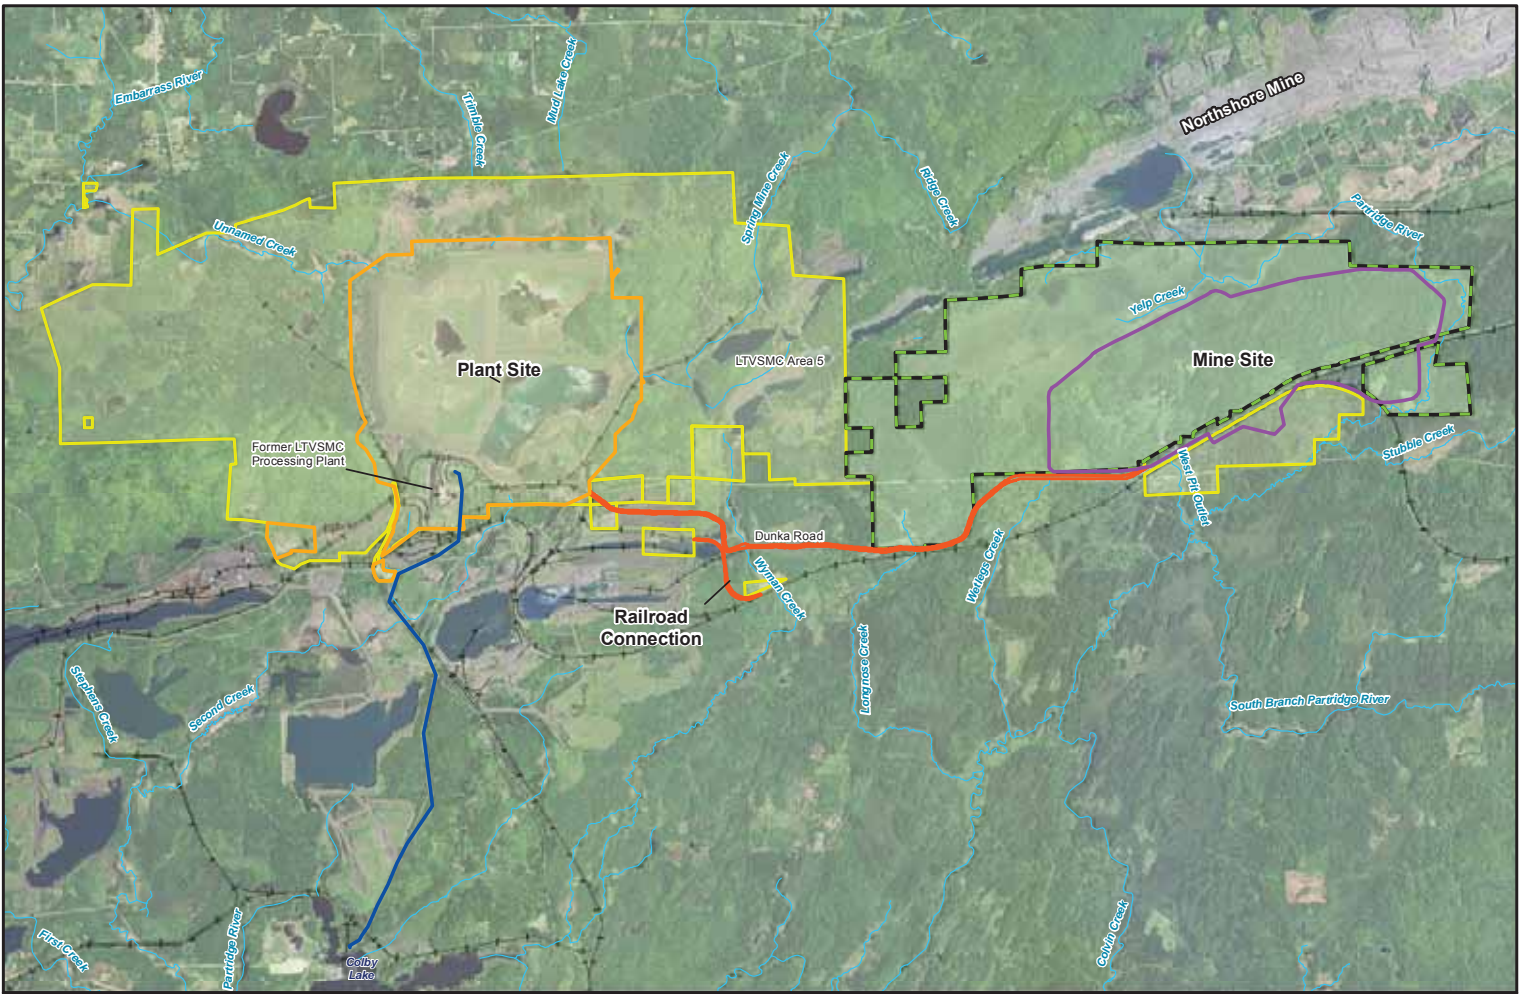

- 280 • Long-term, post-closure monitoring and adaptive management involving mechanical
- 281 treatment for as long as required until if and when non-mechanical treatment is proven at the
- 282 site, for affected water from the pits, permanent stockpile, Hydrometallurgical Residue
- 283 Facility, and Tailings Basin.

284 A number of alternatives have been evaluated and either incorporated into the NorthMet Project
285 Proposed Action by the applicant, or eliminated in accordance with NEPA and MEPA on the
286 basis of not being reasonable or not having the potential to offer substantial environmental
287 benefit. These alternatives are discussed in Section 3.2.3.

288 Ultimately, the NorthMet Project No Action Alternative was the only alternative evaluated in
289 detail in this FEIS for reasons detailed in Section 3.2.3. Under the NorthMet Project No Action
290 Alternative:

- 291 • NorthMet Project Proposed Action activities would not occur;
- 292 • Public land would continue to be managed by the USFS, and private land would continue to
- 293 be managed under private ownership; and
- 294 • The former LTVSMC processing plant and the existing LTVSMC Tailings Basin would be
- 295 managed and closed as required under the state permits and plans, and Consent Decree (State
- 296 of Minnesota v. Cliffs Erie, LLC 2010).

297 A summary of the NorthMet Project Proposed Action and the NorthMet Project No Action
298 Alternative is provided in Table 3.2-1. See Section 3.2.3 for a discussion of alternatives
299 development and alternatives considered for the NorthMet Project but eliminated from detailed
300 analysis. Alternatives for the Land Exchange are discussed in Section 3.3.3.

This document is a working document. This document may change over time as a result of new information, further deliberation, or other factors not yet known to the Co-lead Agencies.

Project Component	Location and Existing Land Use	NorthMet Project Proposed Action	NorthMet Project No Action Alternative
Mine Site	<ul style="list-style-type: none"> • Undeveloped federal land located 0.5 mile south of the Northshore Mine and 7 miles east of the former LTVSMC processing plant • Surface lands are publicly owned by the USFS • Mineral rights are privately held 	<ul style="list-style-type: none"> • Development of three open pits that, upon closure, would include one backfilled pit wetland and one flooded pit void • Construction of one permanent and two temporary waste rock stockpiles, overburden stockpile, and a temporary Ore Surge Pile • Construction and operation of a WWTF, a Rail Transfer Hopper, and other Mine Site support infrastructure • Treatment of water prior to discharge for as long as required in accordance with permit conditions (mechanical treatment until if and when non-mechanical treatment is proven) 	<ul style="list-style-type: none"> • No mining • Continued management of public land by USFS or private ownership (see Table 3.3-1)
Transportation and Utility Corridor	<ul style="list-style-type: none"> • Privately owned rail and road (Dunka Road) infrastructure • Generally runs east-west from the southern edge of the Mine Site to Plant Site 	<ul style="list-style-type: none"> • Refurbishment and additions to an existing Transportation and Utility Corridor including: <ul style="list-style-type: none"> • refurbished railway, • refurbished Dunka Road, • new rail spur, • new rail connection track, and • new water pipeline • To be used to transport materials and ore between the Mine Site and the Plant Site 	<ul style="list-style-type: none"> • Continued private ownership and use
Plant Site	<ul style="list-style-type: none"> • Privately owned, inactive plant infrastructure (formerly the LTVSMC processing plant site) and Tailings Basin • 	<ul style="list-style-type: none"> • Refurbishment and additions to existing mineral processing facilities at the former LTVSMC processing plant • Tailings disposal on existing Tailings Basin Cells 1E and 2E • Construction of additional dams with LTVSMC tailings on top of the existing Tailings Basin Cells 1E and 2E with bentonite on the outer slopes and CDSM and Rock Buttress for added stability • Construction of Tailings Basin containment system around the base of the Tailings Basin • During closure, addition of a bentonite layer on top of the Tailings Basin to restrict oxygen and water infiltration from the pond • Hydrometallurgical residue disposed of at a new Hydrometallurgical Residue Facility constructed over the existing LTVSMC Emergency Basin • During closure, Hydrometallurgical Residue Facility to be drained, covered, and reclaimed/revegetated 	<ul style="list-style-type: none"> • Brownfield site managed and closed as required under state permits and plans and Cliffs Erie Consent Decree

Project Component	Location and Existing Land Use	NorthMet Project Proposed Action	NorthMet Project No Action Alternative
		<ul style="list-style-type: none"> • Construction of a WWTP that would discharge water to Plant Site tributaries. • Treatment of water captured from the Tailings Basin and the Hydrometallurgical Residue Facility to continue as long as required in accordance with permit conditions (mechanical treatment until if, and when non-mechanical, passive treatment is proven) 	

DRAFT

306 **3.2.2 NorthMet Project Proposed Action**

307 The description of the NorthMet Project Proposed Action in the following sections is broken
308 down into the main project components: the Mine Site (see Section 3.2.2.1), Transportation and
309 Utility Corridor (see Section 3.2.2.2), and Plant Site (see Section 3.2.2.3). Financial assurance
310 also forms part of the NorthMet Project Proposed Action and is discussed in Section 3.2.2.4.

311 The NorthMet Project Proposed Action has been defined by PolyMet Project Description
312 Version 9 (PolyMet 2015a) and includes design elements and mitigation measures identified in
313 the management plans described below. These management plans are preliminary in nature and
314 would be adjusted as appropriate during final design and permitting. The mitigation measures
315 contained within these plans are treated as part of the NorthMet Project Proposed Action.

- 316 • Mine Plan (PolyMet 2014q): Describes the site development (infrastructure and facilities), pit
317 development, and mine operations including mining rates and locations to supply ore from
318 the Mine Site to the Plant Site, as well as overburden and waste rock management plans.
- 319 • Wetland Management Plan (PolyMet 2015c): Describes the on- and off-site wetland
320 mitigation design, wetland mitigation outcomes, and monitoring and reporting procedures.
- 321 • Air Quality Management Plan – Mine (PolyMet 2014m): Describes the emission control
322 systems for point and fugitive sources, air quality modeling outcomes, operating plans for
323 emission controls and fugitive dust control, and air quality monitoring/reporting and adaptive
324 management plans at the Mine Site.
- 325 • Air Quality Management Plan – Plant (PolyMet 2014n): Describes the emission control
326 systems for point and fugitive sources, air quality modeling outcomes, operating plans for
327 emission controls and fugitive dust control, and air quality monitoring/reporting and adaptive
328 management plans at the Plant Site.
- 329 • Rock and Overburden Management Plan (PolyMet 2015h): Describes baseline data, the
330 design of systems to manage overburden and waste rock (waste characterization, waste
331 classification, and construction uses), outcomes of the design, rock and overburden
332 management operational plans, Category 1 Stockpile groundwater containment system
333 extension design and circumstances that would trigger a design change, water quantity and
334 quality monitoring systems, amount of material in the stockpiles, footprint of the stockpiles,
335 annual reporting requirements, and reclamation plans for next-year closure and forecast of
336 annual estimates for years remaining to end of mining.
- 337 • Water Management Plan – Mine (PolyMet 2015r): Describes process water management
338 systems (such as the Mine Site WWTF and stormwater management infrastructure), key
339 water quality outcomes, operational water management plans, monitoring and reporting
340 requirements (including comparison to modeled outcomes and compliance), and adaptive
341 management action plans.
- 342 • Water Management Plan – Plant (PolyMet 2015i): Describes, process water management
343 systems (such as the Plant Site WWTP and stormwater management infrastructure), key
344 water quality outcomes, operational water management plans, monitoring and reporting
345 requirements (including comparison to modeled outcomes and compliance), adaptive
346 management action plans, Tailings Basin containment system design and surface seepage
347 management system design, and Plant Site reclamation plans.

- 348 • Adaptive Water Management Plan (AWMP) (PolyMet 2015d): Describes Mine Site and
349 Plant Site water management, Category 1 Stockpile geomembrane cover system design and
350 circumstances that would trigger a design change, Category 1 Stockpile water containment
351 conceptual non-mechanical treatment system design, West Pit overflow conceptual non-
352 mechanical treatment system design, Tailings Basin pond cover system design and
353 circumstances that would trigger a design change, WWTF and WWTP mechanical treatment
354 system design, and Tailings Basin conceptual non-mechanical treatment system design.
- 355 • Flotation Tailings Management Plan (PolyMet 2015n): Describes existing conditions at the
356 existing LTVSMC Tailings Basin, NorthMet Project Tailings Basin design (including
357 tailings geochemical characterization; engineering design of the dams including cement deep
358 soil mixing (CDSM) and rock buttressing, flotation tailings transport system, and return
359 water system; and seepage and stormwater management), outcomes of modeling, operational
360 plans, monitoring and reporting requirements, and the reclamation plan for the Tailings Basin
361 for next-year closure and forecast of annual estimates for years remaining to end of mining.
- 362 • Residue Management Plan (PolyMet 2014r): Describes Hydrometallurgical Residue Facility
363 design, summary of Hydrometallurgical Residue Facility geotechnical analysis outcomes,
364 operational plans (including residue transport and deposition system, return water system,
365 leachate collection system, and general maintenance), monitoring and reporting
366 requirements, and the reclamation plan for the Hydrometallurgical Residue Facility for next-
367 year closure and forecast of annual estimates for years remaining to end of operations.
- 368 • Reclamation Plan (PolyMet 2015g): Describes activities associated with demolition of
369 structures and waste disposal, reclamation of the Mine Site (mine pit; stockpile; water
370 management systems, building areas, roads, and parking lots; and removal of railroad tracks
371 and culverts), reclamation of the Plant Site (Tailings Basin; Hydrometallurgical Residue
372 Facility; water management systems, building areas, roads, and parking lots; and removal of
373 railroad tracks and culverts), remediation of legacy Areas of Concern (AOCs) and ongoing
374 mitigation of water quality at the Mining Area 5N and the Tailings Basin, ongoing
375 monitoring and maintenance for the existing solid waste disposal facilities, the methodology
376 for making reclamation estimates and the contingency reclamation estimate, and potential
377 mechanisms for financial assurance.

378 **3.2.2.1 Mine Site**

379 This section describes the proposed Mine Site with specific reference to key phases as
380 summarized in Table 3.2-2.

381 **Table 3.2-2 Key Phases and Activities (Mine Site)**

Mine Year/Phase	Figure	Key Activities at the Mine Site
Construction		
Prior to mining	Figure 3.2-4 (existing conditions)	<ul style="list-style-type: none"> Constructing Mine Site infrastructure Preparing ground for mine pits and stockpiles
• Operations		
Years 1-11	Figure 3.2-5 (year 1) Figure 3.2-6 (year 2)	<ul style="list-style-type: none"> Removal and stockpiling of overburden Mining in East Pit and West Pit Stockpiling non-acid-generating waste rock (Category 1) into a permanent stockpile (Category 1 Stockpile) Stockpiling rock with the potential to generate acid (Category 2, 3, and 4) into temporary stockpiles (Category 2/3 Stockpile, Category 4 Stockpile)
Years 11-16	Figure 3.2-7 (year 11)	<ul style="list-style-type: none"> Mining in the West Pit and Central Pit (the Central Pit would eventually expand to the completed East Pit) Backfilling the East pit with all of the Category 4 Stockpile Backfilling the East Pit with rock from the temporary Category 2/3 Stockpile, and waste rock from ongoing mining in the West Pit and Central Pit Reclaiming the Category 1 Stockpile (starting in year 14)
Years 16-20	Figure 3.2-8 (year 20)	<ul style="list-style-type: none"> Mining in the West Pit only Backfilling the combined East Central Pit with waste rock from the temporary Category 2/3 Stockpile, and all waste rock from ongoing mining in the West Pit Reclaiming the Category 1 Stockpile
• Reclamation, Closure, and Post-closure Maintenance		
Reclamation (after year 20)	Figure 3.2-8 (year 20)	<ul style="list-style-type: none"> Flooding of the West Pit Reclaiming remaining disturbed areas
Long-term management	Figure 3.2-9 (long-term closure management)	<ul style="list-style-type: none"> Monitoring and maintenance Water treatment using reverse osmosis as long as required in accordance with permits until if, and when non-mechanical treatment is proven

382 **3.2.2.1.1 Location and Ownership**

383 As shown in Figure 1.1-1, the NorthMet Deposit is located approximately 6 miles south of the
 384 City of Babbitt in St. Louis County, Minnesota. The Mine Site, shown on Figure 3.2-4,
 385 comprises 3,014.5 acres. This area represents the boundary within which the proposed mining
 386 activity and infrastructure (i.e., surface disturbance) would occur. The Mine Site would include:

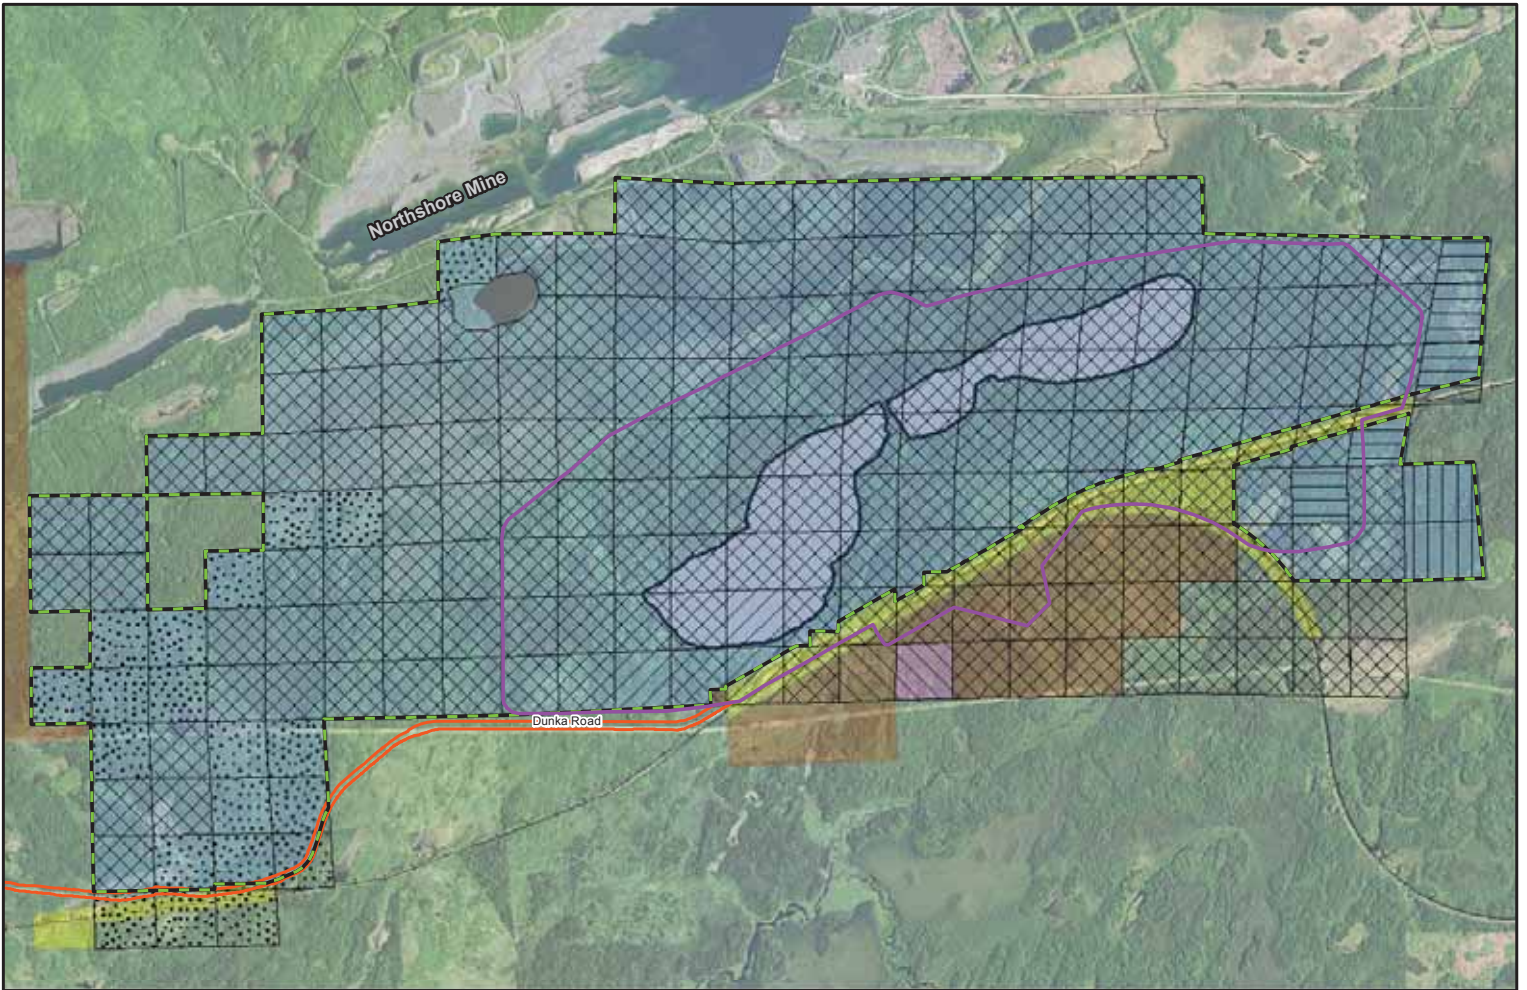

- 387 • mine pits;
- 388 • overburden and waste rock stockpiles; and
- 389 • mining infrastructure, haul roads, a rail-loading facility, and a WWTF.

390 Layout maps of the Mine Site—which include outlines of the mine pit(s) and waste rock
 391 stockpile(s), and mining infrastructure for years 1 (the first year that ore would be delivered to
 392 the processing plant), 2, 11, and 20—are shown on Figure 3.2-5 through Figure 3.2-8. Mine Site
 393 layout for long-term closure management is shown on Figure 3.2-9.

394 PolyMet leases the mineral rights required for proposed mining at the NorthMet Deposit from
395 mineral rights holders RGGGS Inc. (RGGGS) and Longyear Mesaba Company (see Figure 3.2-3).

396 The majority of the surface land at the proposed Mine Site is part of a single contiguous area of
397 publicly owned land managed by the USFS. Smaller portions of the Mine Site are owned by
398 PolyMet or leased by PolyMet from Cliffs Erie. Lands owned or leased by PolyMet are shown
399 on Figure 3.2-1. Ownership of federal land at the proposed Mine Site is subject to the Land
400 Exchange Proposed Action (see Section 3.3).

416 **3.2.2.1.2 Existing Conditions**

417 The Mine Site is mostly located on undeveloped federal land within the western/central part of
418 the Superior National Forest (see Figure 1.1-1). The area is composed of primarily small-
419 diameter trees, with the most recent harvest having occurred in 2008. As shown on Figure 3.2-4,
420 existing disturbance includes some minor access tracks used for mineral exploration, as well as
421 the existing railway line and Dunka Road that run east-west in the southern part of the Mine Site.
422 Both the rail line and road would be refurbished as part of the NorthMet Project Proposed Action
423 and would be used to transport ore and other material, as required, between the Mine Site and the
424 Plant Site (see Section 3.2.2.2).

425 Section 4.2 provides additional information on the affected environment at the Mine Site.

426 **NorthMet Deposit Geology**

427 The NorthMet Deposit is one of 10 known significant mineral deposits that have been identified
428 within the 30-mile length of the Duluth Complex and just south of the eastern end of the Mesabi
429 Iron Range. The complex is a well-known geological formation containing large quantities of
430 copper, nickel, cobalt, platinum, palladium, and gold. The MDNR has estimated that the entire
431 complex contains as many as 4.4 billion tons of mineral resources grading at 0.66 percent copper
432 and 0.20 percent nickel. The NorthMet Deposit is believed to be the second largest deposit
433 within the Duluth Complex and represents nearly 25 percent of the known mineral resources in
434 the area.

435 All of the mineral deposits share a broadly similar geologic setting to the NorthMet Deposit.
436 They are disseminated sulfides with minor, local, massive sulfides hosted in grossly layered
437 heterogeneous troctolitic rocks forming the basal unit of the Duluth Complex. The majority of
438 the metals are concentrated in, or associated with, four sulfide minerals: chalcopyrite, cubanite,
439 pentlandite, and pyrrhotite, with platinum, palladium, and gold also found as elements and in
440 bismuthides, tellurides, and alloys.

441 There have been many major drilling programs at the NorthMet Deposit since its discovery in
442 1969, and numerous bulk metallurgical samples have been collected. The general structure of the
443 NorthMet Deposit, as well as individual beds within the Biwabik Iron Formation and Virginia
444 Formation, is dominated by an overall dip ranging from 15 to 25 degrees to the southeast, and
445 striking about N56 degrees east. The mineralized zone dips to a maximum of 60 degrees in the
446 area of the proposed East Pit, where the Duluth Complex steeply cross cuts the Virginia
447 Formation footwall rocks. There is a smaller zone of economic mineralization at the western end
448 of the property in the upper units, known as the “Magenta Zone.” The NorthMet Deposit is a
449 low- to medium-quality copper-nickel-PGE deposit with a low sulfide content.

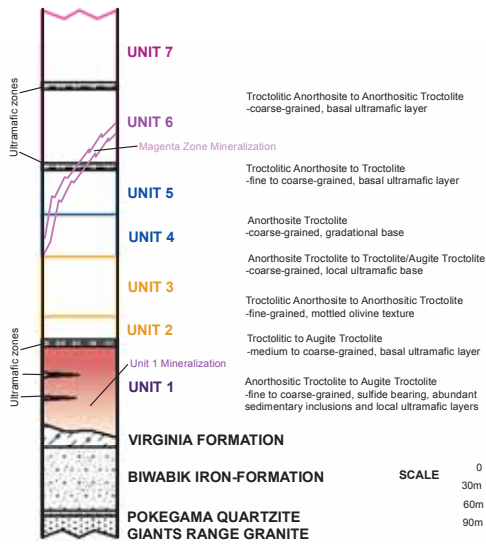

450 The lithology of the NorthMet Deposit consists of seven units, as shown on Figure 3.2-10.
451 Further information on the geology and hydrogeology of the Mine Site and Plant Site is provided
452 in Section 4.2.3.

453 Regionally, the bedrock is variably fractured in the upper sections due to glacial compression.
454 Structural faults may exist in the area; however, because the landscape is covered with surficial
455 deposits and there are few bedrock outcrops, the existence of faults can only be inferred.
456 Additional geological information is provided in PolyMet 2015a.

DRAFT

461 **3.2.2.1.3 New Construction and Pre-production Development**

462 Several construction activities would be completed during the estimated 12 to 18 months of pre-
463 production mine development. These activities would include the following:

- 464 • Clearing timber and biomass from surface footprint areas by contracted logging and biomass
465 services, which would remove forest products from the NorthMet Project area;
- 466 • Constructing site access and haul roads, upgrading the existing Dunka Road, installing rail
467 connections and spur, and constructing the Mine Site Fueling and Maintenance Facility from
468 existing facilities using standard industrial construction practices and off-site materials;
- 469 • Removing overburden from the pit areas and other areas on site, as necessary, using
470 excavation equipment such as backhoes, bulldozers, and standard (non-mining) dump trucks
471 (see Section 3.2.2.1.7);
- 472 • Constructing the Overburden Storage and Laydown Area by compaction to provide space to
473 sort and temporarily store overburden;
- 474 • Constructing the Rail Transfer Hopper;
- 475 • Constructing the liners and containment systems for the Ore Surge Pile and waste rock
476 stockpiles (see Section 3.2.2.1.8);
- 477 • Constructing water management features—including dikes, ditches, and ponds—to manage
478 surface water, the Mine Site WWTF, the Central Pumping Station, and the Treated Water
479 Pipeline (see Section 3.2.2.1.8); and
- 480 • Constructing a substation drop from the 138 kilovolt (kV) transmission line (by Minnesota
481 Power, which would retain ownership of the line) and installation of power poles and lines
482 that would be owned by PolyMet and would serve as a 13.8 kV Mine Site power distribution
483 system.

484 The MDNR would need to approve the use of waste rock, overburden, and peat during
485 construction. This material would be supplemented with rock from a state-owned taconite
486 stockpile located approximately 5 miles west of the Mine Site, adjacent to Dunka Road (refer to
487 Section 3.2.2.1.7 for more information on waste rock management).

488 **3.2.2.1.4 Equipment and Services**

489 **Equipment**

490 A variety of equipment, mostly diesel-powered unless otherwise noted, would be used at the
491 Mine Site. The anticipated fleet of Mine Site equipment is shown in Table 3.2-3.

492 **Table 3.2-3 Mine Site Equipment Fleet**

Typical Machine Type	Power	Number	Duties
Tracked dozer (Cat D10R or equivalent)	582 hp ¹	2	Stockpile maintenance, construction, stockpile reclamation
Wheel dozer (Cat 834G or equivalent)	450 hp	1	Clean-up at the pit loading faces and the Rail Transfer Hopper
Grader (Cat 16H or equivalent)	275 hp	2	Haul road maintenance
Water truck (Cat 777D or equivalent)	937 hp	2	Haul road maintenance, dust suppression, auxiliary firefighting duties
Wheel loader (Cat 992G or equivalent)	800 hp	1	Construction, general purpose loading, reclamation
Backhoe with hammer (Cat 446D or equivalent)	110 hp	1	Secondary breakage
Integrated tool carrier (Cat IT62H or equivalent)	230 hp	1	Miscellaneous tasks (i.e., snow plowing, fork lift, sweeper, etc.)
Field service trucks	114 hp	6	Field maintenance flatbed trucks fitted with hydraulic arm lift
Fuel truck	150 hp	2	Field fueling of mobile equipment and drills
Line truck	100 hp	1	Power line maintenance, excavator, and Rail Transfer Hopper service
Off-road lowboy trailer and tractor	200 hp	1	Transporting tracked equipment around mine and to service areas and workshops
Drills	Electric and/or 1,600 hp	2	Blast hole drilling for waste rock and ore
Excavators	Electric	2	Excavation of ore and waste materials (waste rock and overburden)
Haul trucks	2,500 hp	Up to 9	Haulage of ore and waste materials (waste rock and overburden)
Haul truck retriever	1,120 hp	1	Retrieving and transporting haul trucks unable to move under their own power
Light vehicles (pickups and SUVs)	150-250 hp	Up to 20	Supervisor transport, general duties

493 ¹hp = horsepower

494 **Fuel and Maintenance Facilities**

495 Equipment fueling and minor service and repair work would be conducted at the Mine Site
 496 Fueling and Maintenance Facility located near the Rail Transfer Hopper. This facility would
 497 consist of two buildings, one for fueling mobile equipment (fueling station) and the second for
 498 mobile equipment maintenance (maintenance building). The fueling station and the maintenance
 499 building would be roofed structures with enclosed sides, but open at each end to allow equipment
 500 to drive through. The structures would have reinforced concrete floors sloped to drain to a sump
 501 to collect any fuel, hydraulic oil, engine oil, and coolant/antifreeze spillage. A licensed disposal
 502 contractor would periodically pump out the sumps.

503 The fueling station would house a fuel-dispensing system, as well as dispensing equipment for
 504 lubricating and hydraulic oils, antifreeze/coolant, windshield washer fluid, and compressed air
 505 for tires. The building would house storage tanks containing lubricating and hydraulic oils and
 506 antifreeze. Two to three 12,000-gallon bulk diesel storage tanks, enclosed within a spill
 507 containment system, would be provided. Interior and area lighting would be available to enable

508 safe operation at night. A metering system would record the amount of fuel dispensed to each
 509 vehicle. There would be emergency shut-off valves at all necessary locations.

510 Stationary or slow-moving equipment such as excavators, dozers, drill rigs, and portable light
 511 generators would be fueled in the field from mobile fuel tankers specially equipped with
 512 pumping and metering devices. The fueling tankers would arrive at the Mine Site with fuel or be
 513 replenished at the fueling station.

514 Minor mobile equipment maintenance—such as oil, filter, tire, and lamp changes; maintenance
 515 of fluid levels; haul truck box welding; and other short duration maintenance—would be done at
 516 the maintenance building.

517 Major scheduled maintenance and repair work on mobile equipment—such as haul trucks, front-
 518 end loaders, dozers, and graders—that would last several days would be done in the refurbished
 519 and reactivated former LTVSMC Area 1 Shop located about 1 mile west of the former LTVSMC
 520 processing plant (see Section 3.2.2.3.8). Examples of these types of repairs include engine
 521 changes and final drive repairs. Because of the size and weight of the primary excavators and
 522 blast hole drill rigs, as well as the distance to the Area 1 Shop, most of their maintenance and
 523 repair work would be done at the Mine Site.

524 **3.2.2.1.5 Mining**

525 The key characteristics of proposed mining are summarized in Table 3.2-4 and are discussed
 526 further below.

527 **Table 3.2-4 Key Characteristics of Proposed Mining**

Aspect/ Feature	Characteristic	Proposed Description
Mining	Life of Mine (duration of metal extraction)	20 years
	Method	Surface blast (Ammonium Nitrate Fuel Oil [ANFO]) and haul from three open pits (West Pit, East Pit, and Central Pit)
	Total material removed	533 million tons of waste rock and ore
	Average ore rate	Up to 32,000 tpd
	Total ore (Life of Mine)	225 million tons
	Total waste rock (Life of Mine)	308 million tons
West Pit	Phases of development	Years 1-20: Mining Year 20+ : Flooding (pit full, and overflow)
	Waste rock management	Years 1-11: Stockpiled in respective stockpiles Years 11-13: Some stockpiled, some disposed of in the East Pit Years 14-16: Disposed of in the East Pit Years 16-20: Disposed of in the combined East Central Pit
	Maximum depth	630 ft below original surface (year 20)
	Maximum surface footprint	321 acres

Aspect/ Feature	Characteristic	Proposed Description
East Pit	Phases of development	Years 1-11: Mining Years 11-16: Backfilled with waste rock and saturated overburden Years 16+: Refer to combined East Central Pit below
	Waste rock management	Years 1-11: Stockpiled in respective stockpiles
	Maximum depth	696 ft below original surface (year 11)
	Maximum surface footprint	155 acres
Central Pit	Phases of development	Years 11-16: Mining Years 16+: Refer to combined East Central Pit below
	Waste rock management	Years 11-16: Disposed of in the East Pit
	Maximum depth	356 ft below original surface (year 16)
	Maximum surface footprint	52 acres (year 16)
Combined East Central Pit	Phases of development	Year 16 (end of mining at the Central Pit): The Central Pit would have been expanded into the East Pit, forming a combined pit Years 16-20: Backfilled with waste rock and saturated overburden Years 20+: Reclamation (constructed wetlands) and maintenance

528 The pre-production mine development would be followed by a gradual ramp-up of mining and
 529 ore output over 6 to 12 months to reach the planned rate of mining, which would be an annual
 530 average of 32,000 standard tpd. Because the processing plant feed rate would progressively
 531 increase as plant operations ramped up, mining would be scheduled so that the excavated area in
 532 the mine pits would also increase to provide an adequate supply of ore and ensure continuity of
 533 plant feed.

534 The NorthMet Project Proposed Action has been designed based on a 20-year mine plan. While
 535 mineralization is known to extend beyond the proposed pit outline, the economic feasibility for
 536 mining this material has not been assessed. There is no mine plan for any material that lies
 537 outside of the proposed open pit; as such, mining this material is not part of the NorthMet Project
 538 Proposed Action. Mining of material located beyond the proposed pit outline would be evaluated
 539 as appropriate if proposed in the future.

540 The NorthMet Project Proposed Action would use open-pit mining methods, similar to those
 541 currently in use at nearby ferrous metallic (iron) mining operations on the Mesabi Iron Range.
 542 The mine would consist of three open pits (East Pit, Central Pit, and West Pit). The development
 543 and configuration of these pits are summarized and shown in Tables 3.2-2 and 3.2-4 and on
 544 Figures 3.2-5 through 3.2-6. Ore would be hauled to a Rail Transfer Hopper for transportation to
 545 the Plant Site (see Sections 3.2.2.1.6 and 3.2.2.2, respectively) and waste rock and overburden
 546 would be categorized and disposed of as discussed in Section 3.2.2.1.7.

547 The northwest edge of the mine pits would be constrained by the northward extent of the Duluth
 548 Complex, which hosts the mineral deposit. The pits follow the mineralization, which dips
 549 southeast at about 25 percent and roughly parallels the top of the Virginia Formation (see Figure
 550 3.2-10). The mine pits would be developed in a series of benches that would be approximately 40
 551 ft high. These benches would be accessed by ramps with a driving surface approximately 85 ft
 552 wide to accommodate mine traffic, with additional width for safety berms and ditches, power
 553 lines and cables, and pipes on an as-required basis. The pit slope design has an overall pit slope

554 angle of approximately 51 degrees. This would be continuously monitored and refined
 555 throughout the life of the mine.

556 It would be necessary to dewater the pits during mining to remove groundwater and precipitation
 557 runoff. These waters would be directed to low areas in the pits, collected in sumps, and pumped
 558 to the WWTF. The mine pit sump areas and pump capacities would be designed to minimize
 559 delay to mining operations during the typical spring snowmelt or major precipitation events.
 560 Water management at the Mine Site is addressed in Sections 3.2.2.1.8 and 3.2.2.1.9.

561 **Drilling and Blasting**

562 The drilling and blasting plan has been prepared based on standard design, with consideration of
 563 specific aspects of the NorthMet Deposit. The general parameters are presented in Table 3.2-5.
 564 PolyMet would conduct blasting in accordance with *Minnesota Rules*, part 6132.2900, Air
 565 Overpressure and Ground Vibrations from Blasting. PolyMet has committed to developing an
 566 ore and rock blasting program with industry standard methods and experiences from other area
 567 mines, including blast vibration damage prevention and monitoring.

568 **Table 3.2-5 Blasting Parameters**

Blasting Parameter	Specifications
Blast hole diameter (range)	10-16 inches
Explosive type/blasting agent	ANFO, emulsion and emulsion blends (ANFO and emulsions)
Burden (distance from free face) and spacing (distance between holes)	Approximately 25 ft x 28 ft with 5 ft of subdrilling for ore and 29 ft x 33 ft with 6 ft of subdrilling for waste rock, based on a 12¼-inch diameter blasthole.
Powder factor	Approximately 0.69 pound per ton for ore and 0.45 pound per ton for waste rock, based on a 12¼-inch diameter blasthole.
Drilling rate – approximate (Assumed drilling time/rig 24 hours/day)	50 to 70 ft per hour based on a 12¼-inch diameter drill bit.
Average ft drilled per month	34,425

569 Drilling and blasting would share a common drilling fleet and have similar blast design
 570 specifications for the ore and waste rock. Based on a planned annual rock movement rate of 26.7
 571 million tons and a blast design as shown in Table 3.2-5, it is estimated that the total annual
 572 amount of blasting agent used for breaking ore would be 15.3 million pounds, not including
 573 initiators and blasting accessories. Secondary breaking of oversize pieces would be done using a
 574 wheel loader or excavator-mounted, drop-weight hammer. Blasting of ore and waste rock is
 575 anticipated to take place approximately every 2 to 3 days. This would typically include separate
 576 blasts of ore and waste rock benches totaling about 200,000 to 300,000 tons of broken rock per
 577 blast.

578 **Excavation**

579 After being drilled and blasted, the ore would be loaded by excavators into haul trucks that
 580 would transport the rock to the Rail Transfer Hopper or Ore Surge Pile. Electric-hydraulic
 581 excavators with an approximate capacity of 31 cubic yards would be the primary rock-loading
 582 tools in the mining fleet, with a large, diesel front-end loader (approximately 21.5-cubic-yard
 583 capacity) available to provide operational flexibility and additional loading capacity.

584

585 **3.2.2.1.6 Haulage, Storage, and Transport of Ore**

586 ***Haulage***

587 Haul trucks would transport the ore to the Rail Transfer Hopper for transportation to the
 588 processing plant (see Section 3.2.2.2). Should a delay or shutdown of any part of the rail haulage
 589 system occur, the ore would be temporarily stored on the lined Ore Surge Pile. A list of the
 590 equipment, including trucks, to be used at the Mine Site is provided in Table 3.2-3.

591 The haul truck fleet would initially consist of five conventional 240-ton diesel-powered rear
 592 dump trucks and increase to a maximum of nine trucks as hauls became longer and temporary
 593 stockpiles are relocated to the East Pit and, ultimately, the combined East Central Pit. Haul
 594 trucks could be reassigned between excavators loading ore, waste rock, and overburden. PolyMet
 595 intends to use only private roads that they manage and would not use or intersect any public
 596 roads.

597 ***Ore Surge Pile***

598 An Ore Surge Pile would be constructed near the Rail Transfer Hopper to allow for temporary
 599 storage of ore until it could be processed, or as required by rail haulage delays. Use of the Ore
 600 Surge Pile would allow for a steady annual flow of rock and would assist in providing a uniform
 601 grade of ore to the processing plant. Ore would flow into and out of this pile as needed to meet
 602 mine and plant operating conditions. The footprint would have a capacity of 2.5 million tons in
 603 one 40-ft lift, with side slopes at the angle of repose; additional lifts could be added to increase
 604 storage capacity. A summary of the key characteristics of the Ore Surge Pile is provided in Table
 605 3.2-6.

606 A lined foundation would be constructed (see Section 3.2.2.1.8) and drainage from the Ore Surge
 607 Pile would be collected on the liner and routed to a sump for pumping to the Mine Site WWTF
 608 (see Section 3.2.2.1.8.). The Ore Surge Pile would be removed at the completion of mining
 609 activities.

610 **Table 3.2-6 Key Characteristics of the Ore Surge Pile**

Characteristic	Proposed Description
Purpose	To temporarily store and mix ore to allow for a steady annual flow of uniform grade ore to the processing plant
Phases of Development	Pre-mining: Ground preparation (including lining) Years 1-20: Temporary storage of ore until it could fit into the rail haul and/or plant processing schedule Year 20+: Reclaimed
Capacity	2.5 million tons in one 40-ft lift. Additional lifts could be added to increase storage capacity.
Maximum surface footprint	31 acres
Maximum height	120 ft

611 ***Rail Transfer Hopper***

612 The Rail Transfer Hopper would consist of a raised platform from which haul trucks would
 613 dump into a hopper over a pan feeder. The pan feeder would pass through an opening in a
 614 retaining wall and discharge into a rail car positioned under the feeder outlet. The pan feeder and
 615 the control gate would be hydraulically powered and could be controlled by the locomotive

616 operator using controls in the operator’s cab of the Rail Transfer Hopper. Loading time would be
 617 approximately 1 minute per 100-ton rail car, or about 20 to 30 minutes to load a 16-car train,
 618 allowing for car-spotting and the operator to move between the locomotive and the Rail Transfer
 619 Hopper operator’s cab.

620 The Rail Transfer Hopper would be located to the south of the mine pits and would be connected
 621 to the existing Cliffs Erie main line track by a new spur line. The rail track in the area of the Rail
 622 Transfer Hopper would be designed to allow rail cars to be loaded directly by front-end loader at
 623 the Ore Surge Pile should the Rail Transfer Hopper break down or be unavailable due to
 624 maintenance.

625 **3.2.2.1.7 Overburden and Waste Rock Management**

626 Overburden, the surficial material that lies on top of the mineral resource and infrastructure
 627 footprints, would be stripped prior to mining and as required prior to construction of facilities
 628 and infrastructure at the Mine Site. All overburden would be removed from footprints and for
 629 stockpile construction by the end of year 11. Waste rock would be generated throughout mining.
 630 A summary of the key waste rock management features is provided in Table 3.2-7 and discussed
 631 further below.

632 **Table 3.2-7 Key Characteristics of Waste Rock Management**

Aspect/ Feature	Characteristic	Proposed Description ¹
Category 1 Stockpile	Phases of development	Pre-mining: Ground preparation and construction of water engineering controls and collection system Years 1-13: Stockpiling Years 14-21: Capping and reclamation Years 21+: Maintenance
	Maximum surface footprint	526 acres (reached at year 21; maximum footprint during operations is 508 acres, reached in year 6)
	Waste rock volume	167,922,000 tons (reached at year 13) Maximum capacity based on current design: 177,988,000 tons waste rock
	Waste rock height	240 ft above ground level; 1,840 ft above sea level Maximum height based on current design: 280 ft above ground level
	Category 2/3 Stockpile	Phases of development
	Maximum surface footprint	180 acres (reached at year 6)
	Waste rock volume	44,021,200 tons waste rock (reached at year 11 and subsequently removed) Maximum capacity based on current design: 60,602,000 tons waste rock
	Waste rock height	Maximum height based on current design: 200 ft above ground level; 1,770 ft above sea level Planned height based on current design: 160 ft above ground level
Category 4 Stockpile	Phases of development	Pre-mining: Ground preparation (including lining) and construction of collection system Years 1-11: Stockpiling Year 11: Transferring waste from stockpile to the East Pit (to allow mining in the Central Pit) Years 20+: Reclamation outside Central Pit footprint

Aspect/ Feature	Characteristic	Proposed Description¹
	Maximum surface footprint	57 acres (reached at year 3)
	Waste rock volume	6,206,700 tons waste rock (reached at year 11 and subsequently removed) Maximum capacity based on current design: 14,975,100 tons waste rock
	Waste rock height	Maximum height based on current design: 180 ft above ground level; 1,790 ft above sea level Planned height based on current design: 80 ft above ground level

¹Stockpile volumes and heights provided are based on the current design within the proposed footprints. Maximum capacities of the temporary stockpiles and planned capacity of the permanent stockpile were used for impact evaluations.

633 **Overburden**

634 Three types of overburden are present at the site: unsaturated overburden, saturated overburden,
 635 and peat. Each type of overburden would be managed according to its potential to be reactive
 636 (i.e., acid-producing through oxidization of iron sulfides).

637 Unsaturated overburden is the material that has been above the natural water table and exposed
 638 to air long enough for chemical reactions to have taken place. This material would be used for
 639 on-site construction purposes. Peat (organic soils) and unsaturated overburden that exceed
 640 immediate construction and reclamation needs would be stored in unlined overburden stockpiles
 641 at the Overburden Storage and Laydown Area.

642 Saturated overburden is material that has been below the natural water table. Because it has not
 643 been exposed to air, this material has the potential to be reactive. Saturated overburden would be
 644 used only for specific on-site construction applications, as approved by the MDNR. Applications
 645 for saturated overburden would include those where water contacting the construction material
 646 would be collected or drained to the mine pits, where it would be placed back below the water
 647 table or above a membrane liner system. Other applications where site-specific modeling has
 648 demonstrated that applicable surface and groundwater standards would be met would also be
 649 options. Saturated overburden not used for construction would be commingled in the temporary
 650 Category 2/3 Stockpile or Category 4 Stockpile, which have membrane liners, until final
 651 backfilling into the East Pit.

652 **Waste Rock Categorization and Management**

653 Geochemical characterization has identified four types of waste rock that would be managed,
 654 based on their potential to oxidize and their geochemistry and metal leaching potential. PolyMet
 655 has developed a Rock and Overburden Management Plan for monitoring and testing of waste
 656 rock during mine operations. Classification of the waste rock during operations would be based
 657 on blast hole sampling and frequent updates to a mine block model. The four categories of waste
 658 rock and the proposed management of each are summarized in Table 3.2-8. The geochemistry of
 659 the material is discussed further in Section 5.2.2.

660 Waste rock would be disposed of in a combination of permanent and temporary stockpiles, with
 661 material in the temporary stockpiles ultimately moved into the East Pit and Central Pit after
 662 completion of mining in those areas. Before construction of the stockpiles, overburden would be
 663 removed, if necessary, and foundations would be built with suitable overburden material or
 664 waste rock from the state taconite mining waste rock stockpile located approximately 5 miles
 665 west of the Mine Site, or with Category 1 waste rock, upon approval by MDNR. Proposed

666 engineered water management controls such as liners, covers, and containment systems are
 667 described in Section 3.2.2.1.8.

668 **Table 3.2-8 Waste Rock Categorization Properties**

Categorization	Sulfur Content (%S)¹	% of Total Waste Rock Mass	Management
Category 1	%S ≤ 0.12 Low potential to generate acid, but may leach heavy metals	70%	Used for construction material at the Mine Site (subject to approval by MDNR during permitting). The Category 1 waste rock not used as construction material would be placed on the permanent Category 1 Stockpile during years 1-13 and in the East Pit following year 13.
Category 2	0.12 < %S ≤ 0.31 Low to medium potential to generate acid and would leach heavy metals	24%	Temporarily stored in the lined Category 2/3 Stockpile (years 1-11). New and stockpiled material would be moved to the East Pit (years 11-16) and the combined East Central Pit (years 16-20).
Category 3	0.31 < %S ≤ 0.6 Medium potential to generate acid and would leach heavy metals	3%	Temporarily stored in the lined Category 2/3 Stockpile (years 1-11). New and stockpiled material would be moved to the East Pit (years 11-16) and the combined East Central Pit (years 16-20).
Category 4 ⁽²⁾	> 0.6 %S Duluth Complex 0.4 ≤ %S ≤ 5.0 Virginia Formation High potential to generate acid and would leach heavy metals	3%	Temporarily stored in the lined Category 4 Stockpile (years 1-11). Stockpiled material would be moved to the East Pit (year 11). New material would be disposed of in the East Pit (years 11-16) and the combined East Central Pit (years 16-20).

669 ¹ In general, the higher the rock's sulfur content, the higher its potential for generating acid rock drainage or leaching heavy
 670 metals.

671 ² Includes all Virginia Formation rock.

672 During years 1 through 11, all waste rock would be placed in stockpiles segregated by
 673 categorized sulfur content (see Table 3.2-8). Category 1 waste rock would be placed on the
 674 permanent Category 1 Stockpile located north of the West Pit. Category 2 and 3 waste rock
 675 would be placed on the lined, temporary Category 2/3 Stockpile located to the southeast of the
 676 mine pits. Category 4 waste rock would be placed on the lined, temporary Category 4 Stockpile
 677 located over the top of the future Central Pit, which is proposed to be mined starting in year 11
 678 (see Figures 3.2-5 through 3.2-9). Separation of the waste rock would be based on the material
 679 characteristics identified in the Mine Plan and during operations by blast hole sampling and
 680 frequent updates to a mine block model. Each stockpile would have engineering controls to
 681 capture and treat contact water from stockpiles (containment system around Category 1 Stockpile
 682 and liners for Category 2/3 and 4 Stockpiles).

683 The East Pit is anticipated to be exhausted in year 11 of mining. During this year, all of the
684 Category 4 waste rock, stored in a lined stockpile over the future Central Pit until this time,
685 would be backfilled into the East Pit. All new Category 2, 3, and 4 waste rock would be disposed
686 of in the East Pit between years 11 and 16, and the Category 2/3 Stockpile would begin to be
687 moved into the East Pit. New Category 1 waste rock would continue to be placed on the
688 Category 1 Stockpile until year 13, when it would be placed in the East Pit until year 16.

689 It is anticipated that mining in the Central Pit would cease at year 16. At this time, the Central Pit
690 would have been excavated into the East Pit, forming a combined pit. From year 16 to 20, all
691 waste rock generated from ongoing mining at the West Pit, as well as the remaining material in
692 the Category 2/3 Stockpile, would be placed into the combined East Central Pit. The combined
693 East Central Pit would be flooded (using groundwater, in-pit runoff, direct precipitation, and
694 treated process water from the WWTF) at approximately the same rate of backfilling to ensure
695 that backfilled material would remain saturated (see Section 3.2.2.1.10).

696 The Category 1 Stockpile that was created in years 1 to 13 would be covered and would remain
697 in perpetuity. Reclamation of the Category 1 Stockpile would start in year 14 and would continue
698 until year 21, one year after the completion of mining (see Section 3.2.2.1.10).

699 The geotechnical stability section in Chapter 5 presents more detail on the proposed construction
700 of the stockpiles.

701 **3.2.2.1.8 Engineered Water Controls**

702 The Mine Site would include water management features designed to control water potentially
703 affected by sulfides and metal leachates from oxidized rock exposed through mining. This
704 process water would be directed to the Mine Site WWTF. Non-contact stormwater that hadn't
705 been affected by sulfides and metal leachates from oxidized rock exposed through mining would
706 be directed off-site.

707 The following section describes the engineered controls that would be used for water
708 management. The flow and management of water is discussed in Section 3.2.2.1.9. Figures 3.2-5
709 through 3.2-8 show the water management features and infrastructure.

710 **Category 1 Stockpile Water Containment System and Cover**

711 The permanent Category 1 Stockpile, which has a low reactivity potential, would be constructed
712 with a water containment system to collect drainage from the stockpile.

713 Figure 3.2-11 shows the containment system that would consist of a cutoff wall (a low-
714 permeability hydraulic barrier extending down to bedrock) combined with a drainage collection
715 system surrounding the perimeter of the stockpile near its toe.

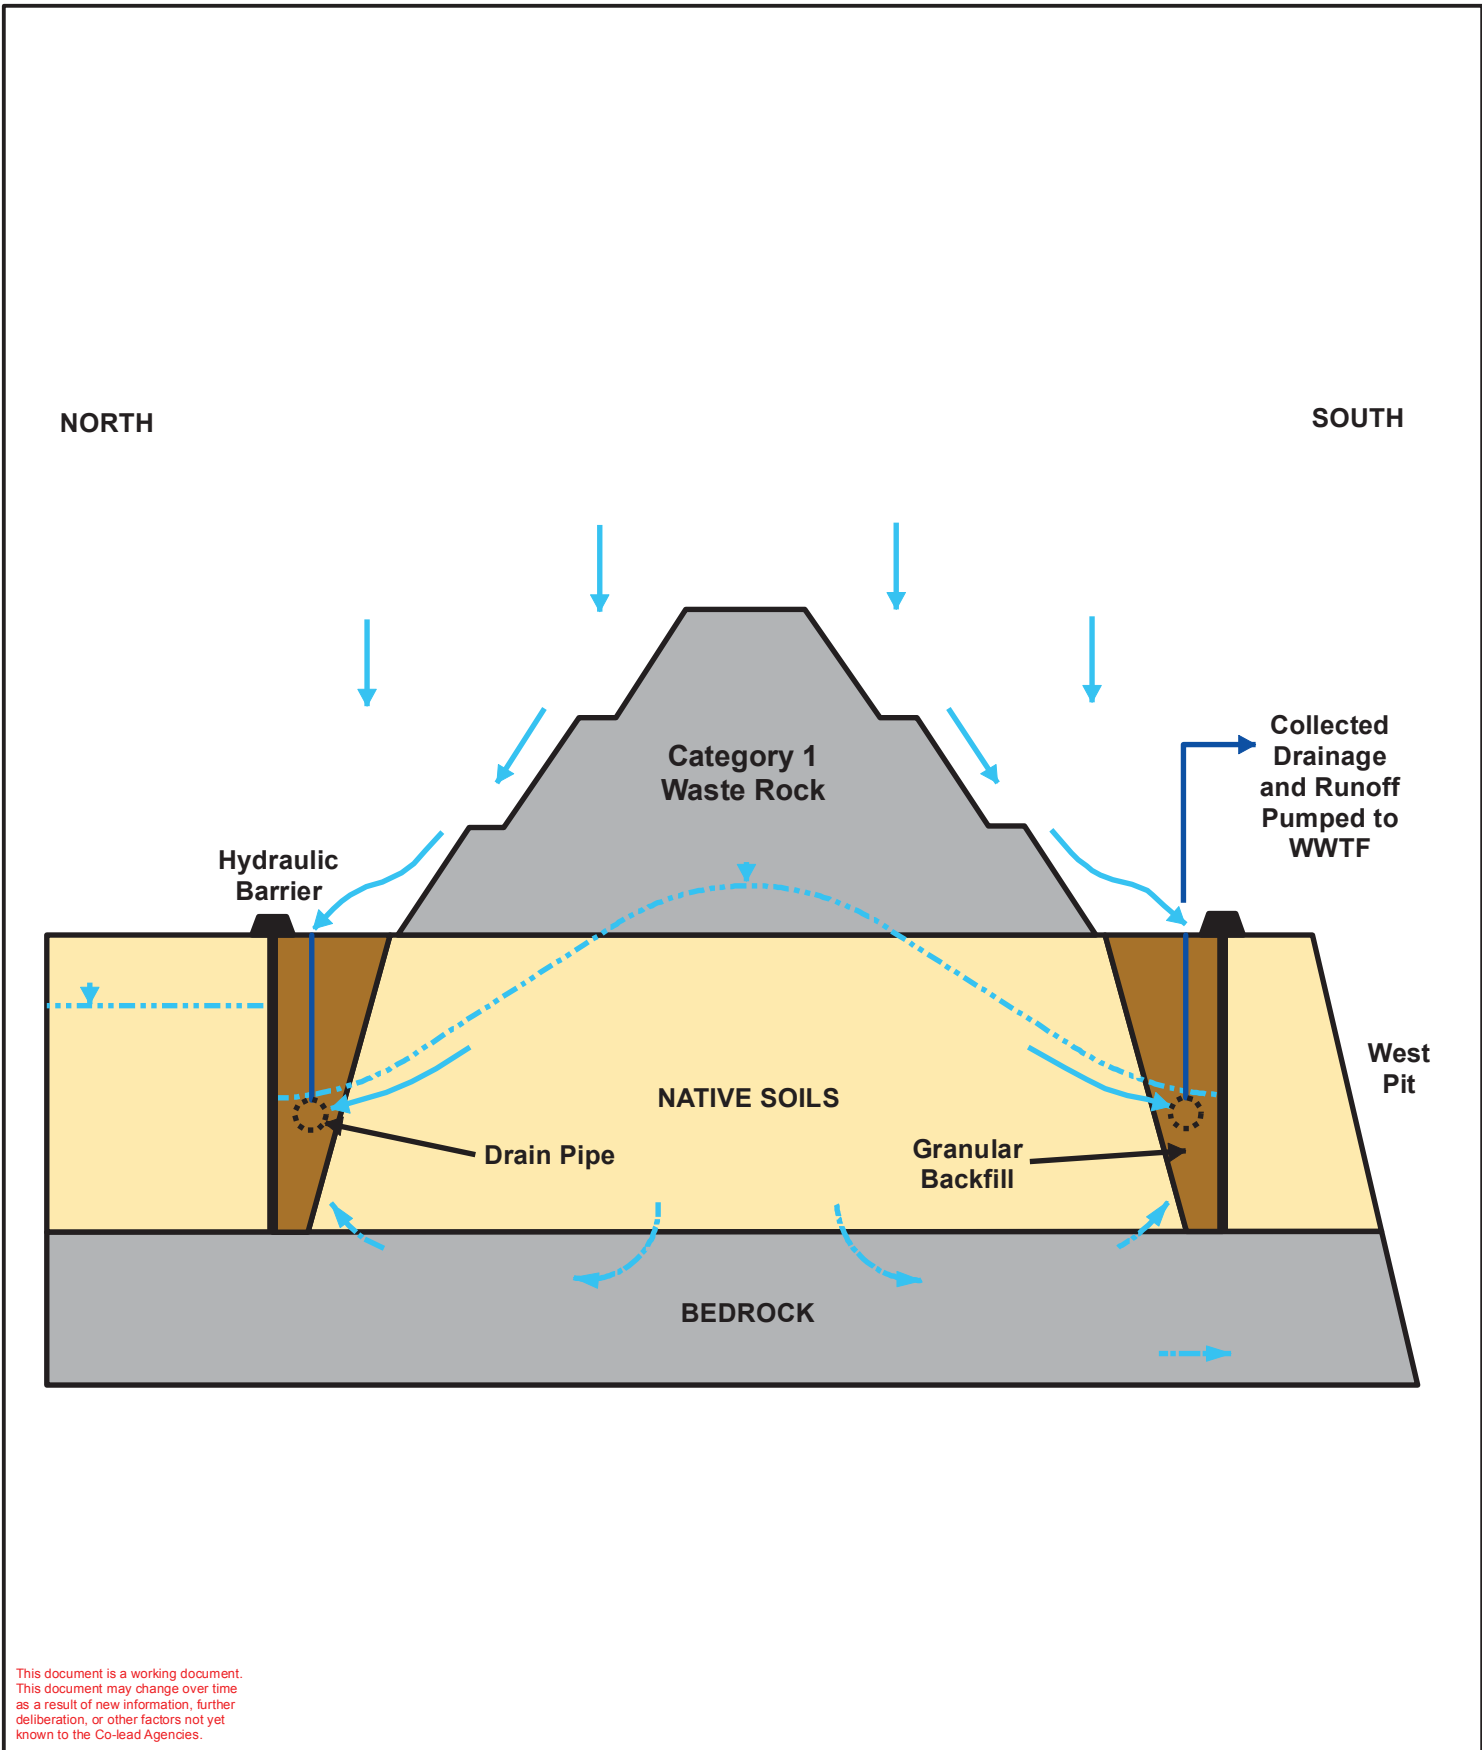

716 The cutoff wall would have a hydraulic conductivity specification of no more than 1×10^{-5}
717 centimeters per second (cm/sec). The drainage collection system would collect stockpile
718 drainage and draw down the water table on the stockpile side of the cutoff wall, thereby
719 maintaining an inward gradient along the cutoff wall and minimizing the potential for drainage
720 passing through the cutoff wall. The geologic conditions are favorable for a cutoff wall due to
721 the presence of low permeability bedrock. Performance modeling of the containment systems
722 performed by PolyMet and reviewed by the Co-leads provides strong evidence that the capture
723 efficiency would be greater than 90 percent.

724 The drainage collection component of the containment system would consist of a slotted or
725 perforated horizontal drain pipe surrounded by aggregate (coarse rock) within the trench,
726 excavated to bedrock and backfilled with granular, free-draining material. The horizontal pipe
727 would have vertical risers extending upward into a process water ditch to collect surficial seeps
728 and surface runoff. The trench would intercept stockpile drainage, collect it in the drain pipe, and
729 convey it by gravity flow to two sumps that have emergency gravity overflows to the East Pit or
730 West Pit. From the sumps, it would be pumped to the WWTF described in Section 3.2.2.1.10.

731 Reclamation of the Category 1 Stockpile would begin in mine year 14, with progressive
732 installation of an engineered geomembrane cover system to limit water percolation into the
733 stockpile. The cover would be completed by year 21. The design of this cover system is
734 discussed in Section 3.2.2.1.10.

739 **Category 2/3 and 4 Stockpiles and Ore Surge Pile Liners**

740 The temporary Category 2/3 Stockpile and Category 4 Stockpile, which have the potential to
 741 generate acid and metal leachate, would have liner systems to capture water penetrating through
 742 the stockpiles (see Table 3.2-9).

743 The liner systems would consist of an impermeable barrier layer (to limit the downward
 744 infiltration of water through the liner system) and an overlying drainage layer (to promote the
 745 conveyance, via gravity, of water that may reach the barrier layer to a collection removal point
 746 along the barrier layer). Foundation underdrains would be used, if necessary, to provide gravity
 747 drainage should elevated groundwater be encountered, to prevent or minimize the potential for
 748 excess pore pressures as the stockpile is loaded. These three design details (impermeable barrier,
 749 overliner drainage layer, and underdrains) would enhance liner effectiveness and integrity.
 750 Additional detail on the foundation materials and design would be required for permitting. The
 751 proposed Category 4 Stockpile liner has a lower permeability design criteria than the Category
 752 2/3 Stockpile liner because the Category 4 waste rock would be more reactive. These stockpiles
 753 would be removed and reclaimed prior to the end of mining (i.e., prior to year 20). The liners for
 754 these stockpiles would be expected to perform to specification.

755 **Table 3.2-9 Summary of the Stockpile Liners and Covers**

Stockpiles	Stockpile Duration	Liner and Cover System	Long-term Management
Category 1	Permanent (constructed in years 1-13)	No liner system; a containment system would collect seeped groundwater for pumping to the WWTF; 3-ft engineered cover with a 40-mil geomembrane barrier (applied progressively during years 14-21)	Containment system and cover maintained and replaced as necessary
Category 2/3	Temporary (constructed in years 1-11 and removed in years 11-20)	12-inch compacted (1×10^{-5} cm/s) subgrade overlaid by 80-mil LLDPE ¹ geomembrane, covered by a 24-inch overliner drainage layer	Stockpile and liner to be completely removed and reclaimed (years 11-20)
Category 4	Temporary (constructed in years 1-11 and removed in year 11)	12-inch compacted (1×10^{-6} cm/s) subgrade overlaid by 80-mil LLDPE geomembrane, covered by a 24-inch overliner drainage layer	Stockpile and liner to be completely removed (year 11) to allow mining in the Central Pit
Ore Surge Pile	Temporary (used as required in years 1-20)	12-inch compacted (1×10^{-6} cm/s) subgrade overlaid by 80-mil LLDPE geomembrane, covered by a 24-inch overliner drainage layer	Stockpile and liner to be completely removed and reclaimed (closure)

756 ¹LLDPE = Linear low-density polyethylene

757 **Mine Site Perimeter and Pit Rim Dike and Ditch Systems**

758 Stormwater would be managed with a system of dikes and ditches constructed at the Mine Site
 759 perimeter. The layout of drainage ditches is illustrated on Figures 3.2-5, 3.2-7, and 3.2-8 for
 760 mine years 1, 11, and 20, respectively. The dikes and ditches would minimize the amount of
 761 surface water flowing onto the site, minimize the amount of surface runoff flowing into the mine
 762 pits, manage the amount of process water collected, and control stormwater flowing off the site.

763 Dikes would be constructed of silty sands or glacial till material that would be excavated during
764 construction of ditches and removal of overburden. Side slopes would be vegetated to control
765 erosion. Small dikes would be constructed at the rims of the mine pits in all areas where the
766 existing ground surface does not naturally drain surface runoff away from the pit, and would be
767 rebuilt as the pit perimeter expands. Small dikes would also be constructed, as needed, along
768 interior stormwater ditches and around stockpile construction areas to separate stormwater and
769 process water. In some areas along the site perimeter, the existing ground is already relatively
770 high so that a ditch would be able to capture the site surface runoff without a dike.

771 Ditches would be constructed along the interior of most of the perimeter dike system and
772 throughout the interior of the Mine Site in order to:

- 773 • Convey stormwater adjacent to the dikes,
- 774 • Prevent surface runoff from entering the mine pits,
- 775 • Intercept stormwater prior to reaching process water areas, and
- 776 • Prevent water from pooling in areas where the dikes cut across low areas.

777 Dike design could be modified for shallow groundwater control if needed, such as along the
778 perimeter dike north of the Central Pit and East Pit. Where peat or high-permeability glacial till
779 is present in the dike foundation zone below the water table, seepage control measures would be
780 installed to restrict groundwater movement. Seepage control measure design would depend on
781 soil type and depth to bedrock. In areas where peat is present, seepage would be prevented by
782 compressing the peat with earthen dike materials to create a low-permeability layer. If a sand
783 seam or other high-permeability material were found in the dike foundation zone below the peat
784 deposit, a soil cutoff trench, slurry wall, or sheetpile wall would be installed (depending on depth
785 to bedrock) to cut off seepage. In areas where glacial till is present, seepage control measures
786 would include soil cut-off trenches constructed of compacted silty sand or compacted glacial till
787 or would include slurry trenches. Seepage cut-offs are generally not planned to be used in areas
788 of silty sand soils, as geotechnical testing of these soils at the Mine Site indicates these are
789 materials with relatively low permeability in their natural state.

790 **Wastewater Treatment Facility**

791 A WWTF would be constructed to treat affected water at the Mine Site and also treat the reject
792 concentrate from the Plant Site WWTP (see Section 3.2.2.3.10). The WWTF would be
793 constructed on approximately 40 acres and would include equalization and treatment basins and
794 a building that would house the treatment equipment. Water treatment would include chemical
795 precipitation and membrane filtration treatment methodologies. The design of the WWTF is
796 based on the predicted water loads and constituents modeling (see Section 5.2.2). However,
797 should water monitoring undertaken during or following operations indicate a need to do so, the
798 WWTF could be expanded or treatment capabilities modified to meet water quality standards. A
799 reverse osmosis (RO) unit or equivalently performing technology would be added to the WWTF
800 at closure (see Section 3.2.2.1.10).

801 A Central Pumping Station would be constructed to pump water to the respective management
802 areas as needed.

803 **3.2.2.1.9 Water Management**

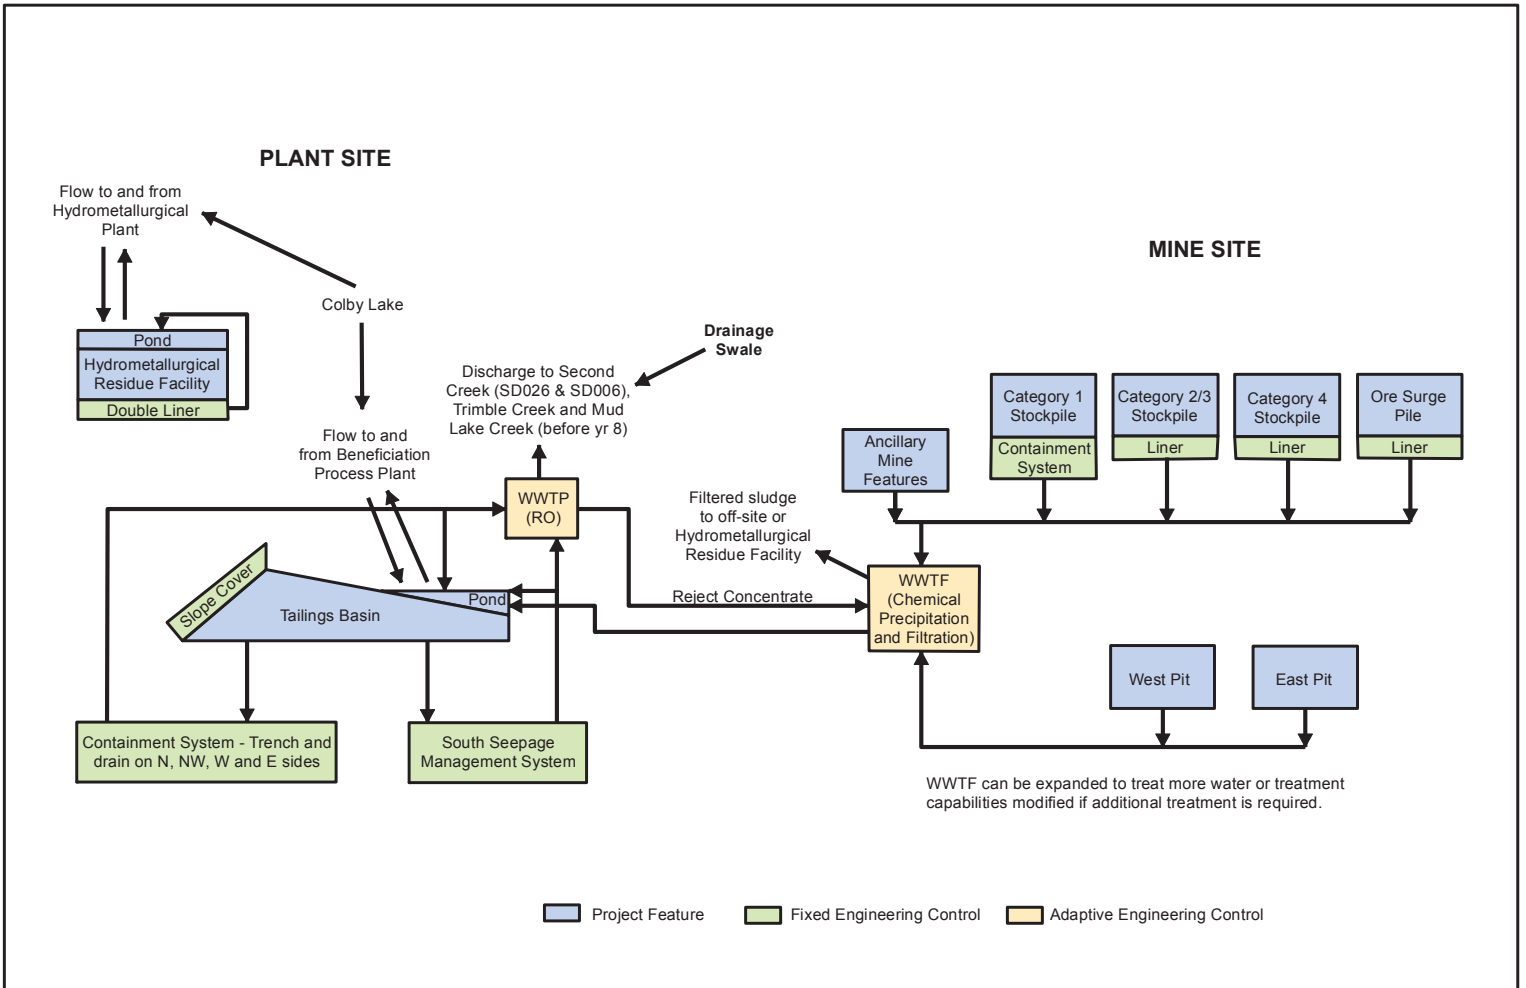

804 During mining operations, stormwater captured by the ditches would be directed to
805 sedimentation ponds and then routed into a natural drainage system off-site. Process water
806 collected from the Overburden Storage and Laydown Area would be treated for sedimentation
807 and would be routed to the East Pit or directly to the Tailings Basin for use at the Plant Site or, if
808 monitoring indicates a need, to the Mine Site WWTF.

809 The water from Mine Site project features (waste rock stockpiles, Ore Surge Pile, ancillary mine
810 features, and mine pits) would be collected and treated at the WWTF. Treated water would be
811 pumped to the Tailings Basin at the Plant Site. The sludge waste would be disposed of off-site in
812 a solid waste landfill until the Hydrometallurgical Plant became operational (see Section 3.2.2.3).
813 When available, sludge waste would be filtered and moved by truck along the Transportation and
814 Utility Corridor and introduced to the autoclave in the Hydrometallurgical Plant to recover
815 metals or placed directly into the Hydrometallurgical Residue Facility (see Section 3.2.2.3.7).

816 Starting in year 11, some water from the WWTF would be sent to the East Pit to help manage the
817 water level in the pit as it is being backfilled. Covering of the Category 1 Stockpile would begin
818 in year 14 and would be completed in year 21. Once covered, stormwater from the Category 1
819 Stockpile would be considered non-contact water and would not require treatment. A flow
820 diagram of the proposed water management at the Mine Site for the initial and later years of
821 mining is shown on Figures 3.2-12 and 3.2-13, respectively.

828 **3.2.2.1.10 Reclamation and Long-term Closure Management**

829 In general, NorthMet Project area facilities have been designed and would be operated to allow
830 for progressive reclamation, or “mining in a manner that creates areas that can be reclaimed as
831 soon after initiation of the operation as practical and as continuously as practical throughout the
832 life of operation” (*Minnesota Rules*, part 6132.0100). This would leave a smaller portion of the
833 NorthMet Project area needing to be reclaimed at the end of mining. Under the NorthMet Project
834 Proposed Action, progressive reclamation at the Mine Site would include backfilling the East Pit
835 once its ore was exhausted (from year 11 of mining) using waste rock generated through mining
836 following this time and relocating waste rock from the temporary Category 2/3 Stockpile and
837 Category 4 Stockpile. Therefore, at the end of mining, all of the temporary Category 2/3
838 Stockpile and Category 4 Stockpile would have been removed, and the combined East Central
839 Pit would be mostly backfilled.

840 At the end of mining, PolyMet would remove all infrastructure and facilities not approved for
841 potential future use, and continue reclamation of disturbed lands. Reclamation objectives would
842 include rapidly establishing a self-sustaining plant community, controlling dust, controlling soil
843 erosion, providing wildlife habitat, and minimizing the need for maintenance. Post-reclamation
844 activities would include monitoring and maintenance of reclamation and water quality until the
845 various facility features were deemed environmentally acceptable, in a self-sustaining and stable
846 condition.

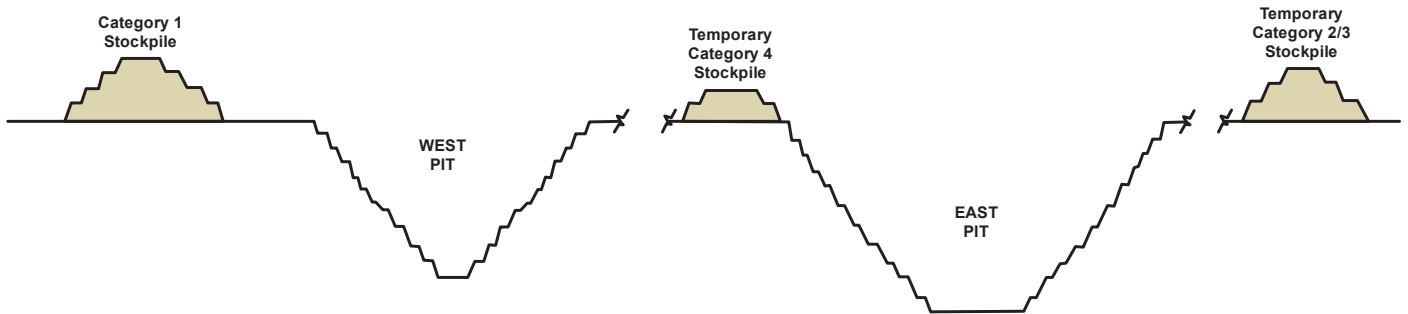

847 The water quality objective of closure would be to provide mechanical or non-mechanical
848 treatment for as long as necessary to meet regulatory standards at applicable groundwater and
849 surface water compliance points. Water quality modeling performed in support of this FEIS
850 indicates that water treatment systems would be needed indefinitely at the Mine Site and Plant
851 Site. The water models constructed to assess the potential effects from the NorthMet Project
852 Proposed Action were not designed to predict the duration of treatment nor do they capture all
853 the factors that influence the duration of treatment (e.g., potential future regulatory and
854 technological changes). Therefore, the models cannot be used to predict when treatment would
855 end. Actual treatment requirements would be assessed on a recurring basis throughout
856 operations, reclamation, and closure considering influent and effluent water quality and
857 monitoring results. Those periodic assessments would be carried out to ensure continuous
858 protection of groundwater and surface water quality and compliance with water quality-based
859 effluent limits. The periodic assessment process would rely on monitoring results coupled with
860 predictive modeling rather than the results of the predictive modeling alone. Regardless of the
861 precise duration of effects or water treatment at either the Mine Site or Plant Site, there are
862 measures available to address impacts to natural resources, such as those identified in the
863 Adaptive Water Management Plan (PolyMet 2015d) and permit conditions. PolyMet would be
864 held accountable for maintenance and monitoring required under the permit and would not be
865 released from financial assurance until all permit conditions have been met.

866 The reclamation and long-term closure activities are discussed below, along with the transition to
867 non-mechanical treatment.

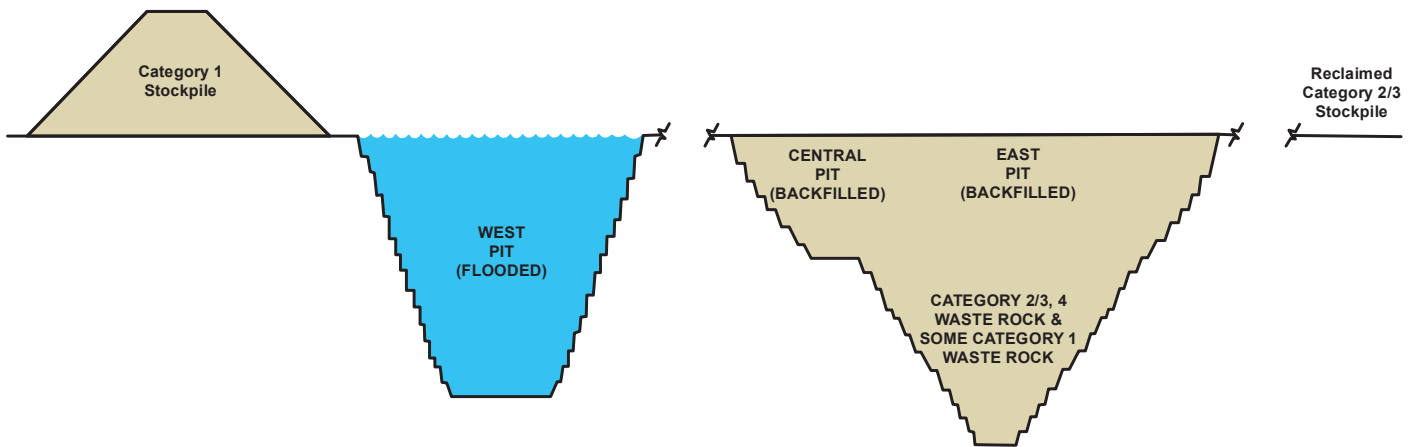

868 A schematic cross section showing the evolution of the pit and stockpile features at the Mine Site
869 from year 11 to post-closure is provided on Figure 3.2-14.

DRAFT

874 **Reclamation Planning**

875 Mining is expected to be completed approximately 20 years after operations begin. PolyMet has
876 committed to develop a Reclamation Plan as part of its application for the Permit to Mine. The
877 Reclamation Plan would be finalized to provide details and schedule for the final reclamation of
878 the actual as-built facilities. In addition, PolyMet would submit an annual Contingency
879 Reclamation Plan, per *Minnesota Rules*, part 6132.1300, subpart 4, to identify activities that
880 would be implemented if operations were to cease in that upcoming year and the financial
881 assurance necessary to implement that plan.

882 **Building and Structure Demolition and Equipment Removal**

883 All buildings and structures would be removed and foundations razed and covered with a
884 minimum of 2 ft of soil and vegetated according to *Minnesota Rules*, parts 6132.2700 and
885 6132.3200. Demolition waste from structure removal would be disposed in the existing on-site
886 demolition landfill (SW-619) located northwest of the Area 1 Shops at the Plant Site. Concrete
887 from demolition would be placed in the basements of the coarse-crusher, fine-crusher and
888 concentrator, and the plant reservoir, or placed in landfills as required.

889 Most roads, parking areas, or storage pads built to access these facilities would be demolished
890 according to the planned schedule or as approved by the MDNR. Utility tunnels would be sealed
891 and closed in place. Asphalt from paved surfaces would be removed and recycled and the
892 disturbed areas reclaimed and vegetated according to *Minnesota Rules*, part 6132.2700. Railroad
893 track and ties that were not used by common carriers would be removed and recycled. Any
894 roads, including mine pit access roads (*Minnesota Rules*, part 6132.3200), that may develop into
895 unofficial off-road vehicle trails would require a variance from MDNR reclamation rules to
896 allow a 15-ft-wide unpaved, unvegetated track down the centerline of the road. Such approvals
897 would also be coordinated with the St. Louis County Mine Inspector's Office.

898 All mine, railroad, service, and electrical equipment would be moved from the pit to ensure it
899 would be above pit water elevations until it could be scrapped, decommissioned, or sold. Debris
900 and equipment would be removed from the Mine Site.

901 Any special materials would be disposed of as discussed in Section 3.2.2.3.12.

902 **Rail Transfer Hopper Demolition and Reclamation**

903 During reclamation, aboveground concrete and steel structures would be razed and the area
904 covered with at least 2 ft of soil and vegetated according to *Minnesota Rules*, parts 6132.2700
905 and 6132.3200. If constructed with Category 1 waste rock, the rock platform from which trucks
906 dump into the hopper would be sloped and covered in the same manner as the Category 1
907 Stockpile. If constructed of inert material, the platform would be sloped and vegetated according
908 to *Minnesota Rules*, parts 6132.2700 and 6132.3200.

909 It is possible that the Rail Transfer Hopper could contain ore residuals, which would have the
910 potential to generate acid and metal leachates. Any ore remaining in the Rail Transfer Hopper,
911 Ore Surge Pile, or anywhere else in the vicinity of the Rail Transfer Hopper, as well as sediment
912 removed from ditches and process water ponds, would be placed in the East Pit. Any remaining
913 material located at the top of the rail-loading platform would be tested and placed in an
914 appropriate waste disposal location (i.e., the East Pit or covered with at least 2 ft of soil and
915 vegetated according to *Minnesota Rules*, parts 6132.2700 and 6132.3200).

916 **Mine Pit Reclamation**

917 Mining is anticipated to be completed in the East Pit, Central Pit, and West Pit in mine years 11,
918 16, and 20, respectively. Ultimately, the combined East Central Pit (after year 16 of mining)
919 would be backfilled with waste rock and flooded to form wetlands. The West Pit would be
920 flooded to form a pit lake.

921 At the end of mining in each respective pit, the walls would be sloped and graded in accordance
922 with *Minnesota Rules*, part 6132.2300. The toe of the overburden portion of all pit walls would
923 be set back at least 20 ft from the crest of the rock portion of the pit wall. Lift heights would be
924 no higher than 60 ft and would be selected based on the need to protect public safety, the
925 location of the pit wall in relation to the surrounding land uses, the soil types and their erosion
926 characteristics, the variability of overburden thickness, and the potential uses of the pit following
927 mining. The overburden portions of the pit walls would be sloped and graded at no steeper than a
928 horizontal-to-vertical ratio of 2.5:1 and would be vegetated to conform to *Minnesota Rules*, part
929 6132.2700. Safe access would be provided to the bottom of each mine pit (*Minnesota Rules*, part
930 6132.3200) via selected original haul roads built during pit development. The access road would
931 be selected such that, as the pits flood, there would always be a clear path to the water surface.

932 The dewatering systems—including power lines, substations, pumps, hoses, pipes, and
933 appurtenances—would be removed. All areas disturbed during pipe removal would be graded
934 and revegetated. Some piping and temporary pumps may remain in the pits for selected
935 dewatering that would be performed during reclamation.

936 Pit perimeter fencing systems would be installed and consist of fences, rock barricades, ditches,
937 stockpiles, and berms. A gated entrance would be placed at each pit access location. The fencing
938 system plan would be submitted to the St. Louis County mine inspector for review and approval
939 before installation. As required by the St. Louis County mine inspector and in accordance with
940 *Minnesota Statutes*, chapter 180.03, fencing would consist of five strands of barbed wire in most
941 locations and 5-ft, non-climbable mesh fencing with two strands of barbed wire at the top in
942 areas where roads would remain adjacent to the fences unless other means were agreed to with
943 the mine inspector.

944 **East Pit and Central Pit**

945 Waste rock would be placed into the East Pit at the completion of mining at year 11 and then in
946 the combined East Central Pit beginning in year 16. It is anticipated that the combined East
947 Central Pit would be completely backfilled with waste rock shortly after year 20.

948 While being backfilled with waste rock, the pits would be flooded with water to minimize the
949 amount of pit wall and backfilled waste rock exposed to the atmosphere, thus limiting the
950 oxidation of the sulfide minerals and reducing the amount of metals leaching to the pit water.
951 Water used to flood the pits would come from groundwater, in-pit runoff, direct precipitation,
952 and treated process water from the WWTF. During backfilling, the water elevation would be
953 maintained below the surface of the waste rock to safely avoid equipment working in the water
954 and to maximize the amount of material used to fill the pit. During periods of high precipitation
955 or during spring snowmelt, dewatering (to the WWTF and ultimately to the Tailings Basin) may
956 be required to allow placement of the waste rock. Lime could be added to the East Pit during
957 East Pit backfilling, as needed, in order to maintain circumneutral pH in the pit pore water. The

958 volume of lime required would be determined through monitoring (see section 5.2.2 for more
959 information).

960 Once backfilling of the East Pit is complete, a wetland would be constructed over the backfilled
961 material (see Figures 3.2-9 and 3.2-14). The water depth in the backfilled, combined East Central
962 Pit would be maintained within the wetland by a gravity overflow structure to the West Pit. The
963 East Pit overflow structure would be formed out of bedrock or a cast-in-place, reinforced
964 concrete weir.

965 **West Pit**

966 West Pit reclamation would commence when mining activity ceases, expected in year 20.
967 Primary dewatering systems would no longer be operated, and the West Pit would begin to flood
968 naturally with groundwater, precipitation, and surface runoff from the tributary watershed.
969 Flooding would also be accelerated with water from the Plant Site. With the addition of water
970 pumped from the Plant Site to the West Pit, flooding of the West Pit is projected to be completed
971 by the end of year 52. When the West Pit is full, the discharge would be controlled via a lift
972 station and pumped to the WWTF for treatment. The WWTF would be upgraded to include RO
973 or equivalently performing technology; this effluent would be discharged into an existing
974 wetland then into the West Pit Overflow creek, which flows toward Dunka Road south of the
975 West Pit and eventually into the Partridge River. The reject concentrate from the WWTF RO or
976 equivalent technology that would meet water quality targets would be evaporated and the
977 residual solids disposed of off-site (see Section 3.2.2.1.8).

978 **Stockpile Reclamation**

979 As described above, material in the temporary Category 2/3 Stockpile and Category 4 Stockpile
980 would be moved to the East Pit from year 11, and the combined East Central Pit from year 16.
981 The Category 4 Stockpile would be completely removed in year 11 to allow mining to begin in
982 the Central Pit.

983 **Category 2/3 and 4 Stockpiles and the Ore Surge Pile**

984 At year 20, any material remaining in the Category 2/3 Stockpile would be moved to the
985 combined East Central Pit. The disturbed areas would be reclaimed.

986 The ore in the Ore Surge Pile would be processed as operations wind down, and any remaining
987 material would be sent to the processing plant for processing or relocated to the East Pit after
988 operations cease. Material may still remain in the Overburden Storage and Laydown Area, but
989 the area would be graded to stable conditions and reclaimed.

990 Infrastructure (pipes, pumps, liners, etc.) associated with the temporary Category 2/3 Stockpile
991 and Category 4 Stockpile and the Ore Surge Pile would be removed and the footprint of each
992 area would be reclaimed to wetlands where practical.

993 **Category 1 Stockpile**

994 Following completion of its construction in year 13, a cover would be installed incrementally
995 over the permanent Category 1 Stockpile. This cover would include an engineered geomembrane
996 system that would be vegetated to meet the requirements of *Minnesota Rules*, part 6132.2200,
997 subpart 2, item B. A subgrade layer would be placed over the Category 1 Stockpile to provide a

998 uniform layer to construct the cover system. As shown in Figure 3.2-15, this cover system would
999 consist of, from top to bottom: 18 inches of rooting zone soil consisting of on-site unsaturated
1000 overburden mixed with peat as needed to provide organic matter, 12 inches of granular drainage
1001 material with drain pipes to facilitate lateral drainage of infiltrating precipitation and snowmelt
1002 off the stockpile cover, the 40-mil geomembrane barrier layer, and a 6-inch soil bedding layer
1003 below the geomembrane. The design of the Category 1 Stockpile cover system was derived from
1004 landfill requirements, *Minnesota Rules*, part 7035.2815, subpart 6, item D.

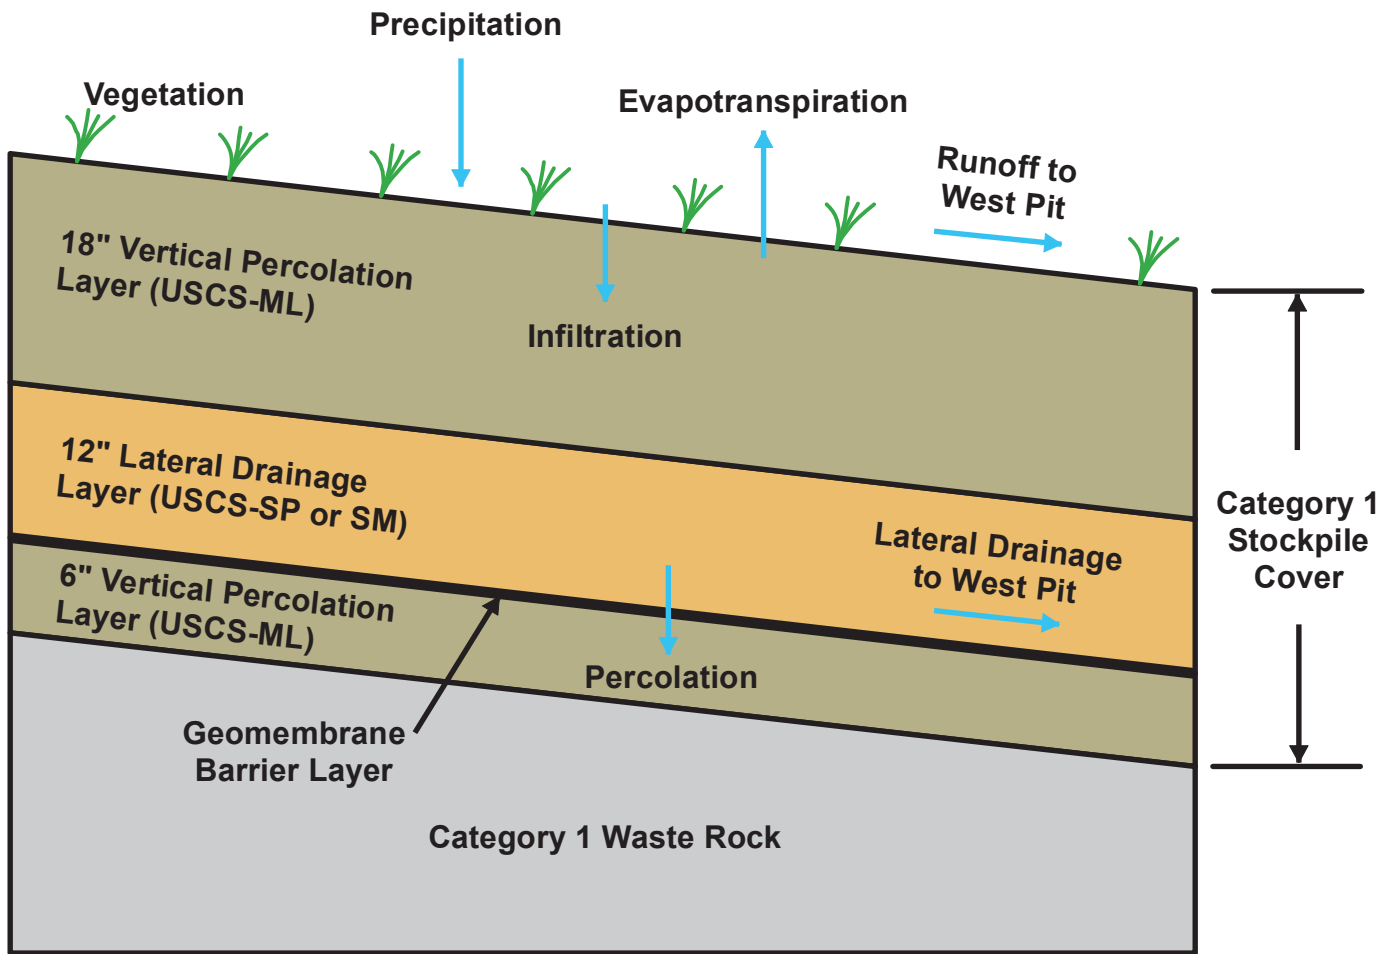

1005 The soils at the Mine Site are anticipated to be used for cover material. The cover would be
1006 designed to promote runoff with minimal erosion. To provide an adequate base for sloping of
1007 cover materials, Category 1 Stockpile side slopes would be re-shaped to no steeper than a
1008 horizontal-to-vertical ratio of 3.75H:1V, with the cover system placed on top of the re-shaped
1009 waste rock. The outermost layer would consist of local till soils (also known as “overburden” per
1010 *Minnesota Rules*, part 6132.0100, subpart 32) adequate for vegetation growth. To provide further
1011 erosion control, catch benches at least 30 ft in width would remain on the stockpile.

1012 Stockpile tops and benches would be seeded with a certain selection of grasses/forbs and a
1013 potentially different group of species for the slopes. The three groups of species designated for
1014 the top and benches would include a native, slow growth mix; a non-native, rapid growth mix;
1015 and a mix of both native and non-native species. Non-native species would be used to ensure
1016 dust control on areas that have a higher potential to erode. The species mix for the stockpile
1017 slopes would contain the same native species as the stockpile bench and flats as well as a slightly
1018 modified group of non-native species. Preference would be given to the establishment of native
1019 plant communities. The final seed mix would be determined in permitting.

1020 Upon reclamation of a portion of the Category 1 Stockpile, runoff from the top and sides of that
1021 portion of the stockpile would be classified as non-contact stormwater and would be routed
1022 through a system of ditches prior to being discharged into the natural drainage system. Ditches
1023 on the reclaimed stockpile surface would direct stormwater flows into channels that would route
1024 flows down the sides of the stockpile. The Category 1 Stockpile water containment system
1025 would continue to collect drainage from the stockpile during reclamation, with drainage treated
1026 at the WWTF. The general flow of water on the reclaimed stockpile is shown in Figure 3.2-16.

1027 Long-term maintenance of the Category 1 Stockpile would include repairing erosion and
1028 removal of woody species and trees from the stockpile cover system.

1036 **Watershed Restoration**

1037 During mining operations, stormwater runoff from reclaimed stockpile areas and natural
1038 (undisturbed) areas would be routed via dikes and ditches to stormwater sedimentation ponds.
1039 Upon completion of stockpile reclamation, these water management systems would be modified.
1040 Perimeter dikes that would no longer be needed to provide access or separation from the areas
1041 outside the Mine Site would be removed. The dike located north of the East Pit would remain in
1042 place to minimize mixing of the Partridge River flows with the East Pit water and prevent gully
1043 development on the northern side of the pit in the segments not protected by ditches. In addition,
1044 the dike located north of the Category 1 Stockpile would remain in place to allow access to
1045 groundwater monitoring locations.

1046 Surface runoff would be routed to the mine pits using a combination of existing and new ditches.
1047 Some portions of the pit rim dikes may be left in place, if needed, to prevent an uncontrolled
1048 flow to or from the pits and potential erosion (head cutting) of the pit walls.

1049 In all cases of dike removal, material from the main body of the dikes would be removed and
1050 used at the site for restoration of disturbed surfaces. To minimize disturbance of subsurface soils,
1051 any subsurface seepage control components of the dikes would remain in place. As part of the
1052 dike removal work, typical construction erosion-control measures would be used. These could
1053 include installing silt fencing on the down-slope side of disturbed areas and controlling surface
1054 water runoff. The reclaimed surface would then be scarified, topsoil would be placed, and the
1055 area would be revegetated with native species.

1056 Ditches would be filled or rerouted during reclamation to direct stormwater into the West Pit for
1057 flooding. Use of existing ditches would be maximized, but some new ditches may need to be
1058 constructed to direct stormwater runoff from the Mine Site into the East Pit or West Pit.

1059 All ponds—including the stormwater ponds, the Overburden Storage and Laydown Area process
1060 water pond, the Rail Transfer Hopper process water pond, the haul road process water ponds, and
1061 all stockpile sumps and overflow ponds—would either be filled or converted into wetlands. Once
1062 filled, the ponds would be covered with topsoil and revegetated to restore these areas. If the
1063 process water ponds were converted into wetlands, any sedimentation that occurred within the
1064 pond would be evaluated to determine if removal or covering would be necessary to prevent
1065 adverse effects to wetlands during restoration.

1066 Stormwater pond outlet control structures would remain in place as necessary to manage water
1067 resource effects. The outlet control structure on the stormwater pond located immediately north
1068 of the East Pit and the Category 1 Stockpile (and associated dike) would remain in place to
1069 minimize the mixing of the Partridge River flows with the East Pit water and prevent gully
1070 development on the northern side of the pit. The outlet control structures on the two stormwater
1071 ponds next to Dunka Road would remain in place to direct water under the road and the railroad
1072 to a tributary to the Partridge River along natural drainage paths. As a requirement of the NPDES
1073 stormwater permit and/or reclamation plan for the facility, discharges from these outlet control
1074 structures would be monitored as necessary to ensure that runoff to the Partridge River meets
1075 water quality discharge limits.

1076 **Water Management**

1077 During the reclamation phase (while the West Pit is flooding), the water from the Category 1
1078 Stockpile groundwater containment system would be pumped to the WWTF and treated. Water
1079 from the combined East Central Pit would also be pumped to the WWTF and treated. The
1080 effluent from the WWTF would be sent to the combined East Central Pit and West Pit.
1081 Treatment of the combined East Central Pit water would include removing the flushing load of
1082 constituents added as waste rock is backfilled to the combined East Central Pit, and the pit walls
1083 would be inundated. In addition, water from the Plant Site would be pumped to the West Pit to
1084 flood the pit faster. In the final years of the reclamation phase, water from the West Pit would be
1085 pumped to the WWTF, treated, and returned to the West Pit. The objective of treating the West
1086 Pit water would be to manage water quality within the pit prior to groundwater outflow from the
1087 pit lake via the surficial aquifer. The WWTF could be expanded or treatment capabilities
1088 modified if required to meet water resource objectives during this time.

1089 Once the West Pit is full (by the end of year 52), discharge of treated water from the WWTF to
1090 the West Pit would be terminated. The WWTF would be upgraded to RO or equivalent
1091 technology that would meet water quality targets and include evaporator/crystalizers to convert
1092 the RO reject concentrate to residual solids, which would be disposed of at appropriate off-site
1093 facilities. The WWTF would continue to treat water collected by the Category 1 Stockpile
1094 groundwater containment system, as well as water from the West Pit, to ensure that the discharge
1095 met applicable water quality based effluent limits. Treated water would be discharged into an
1096 existing wetland on the other side of Dunka Road then into the West Pit Overflow Creek and
1097 eventually into the Partridge Inspection, maintenance, and reporting activities would continue
1098 while the mechanical treatment systems operate during long-term closure. Surface water and
1099 groundwater would be monitored as required by relevant permits.

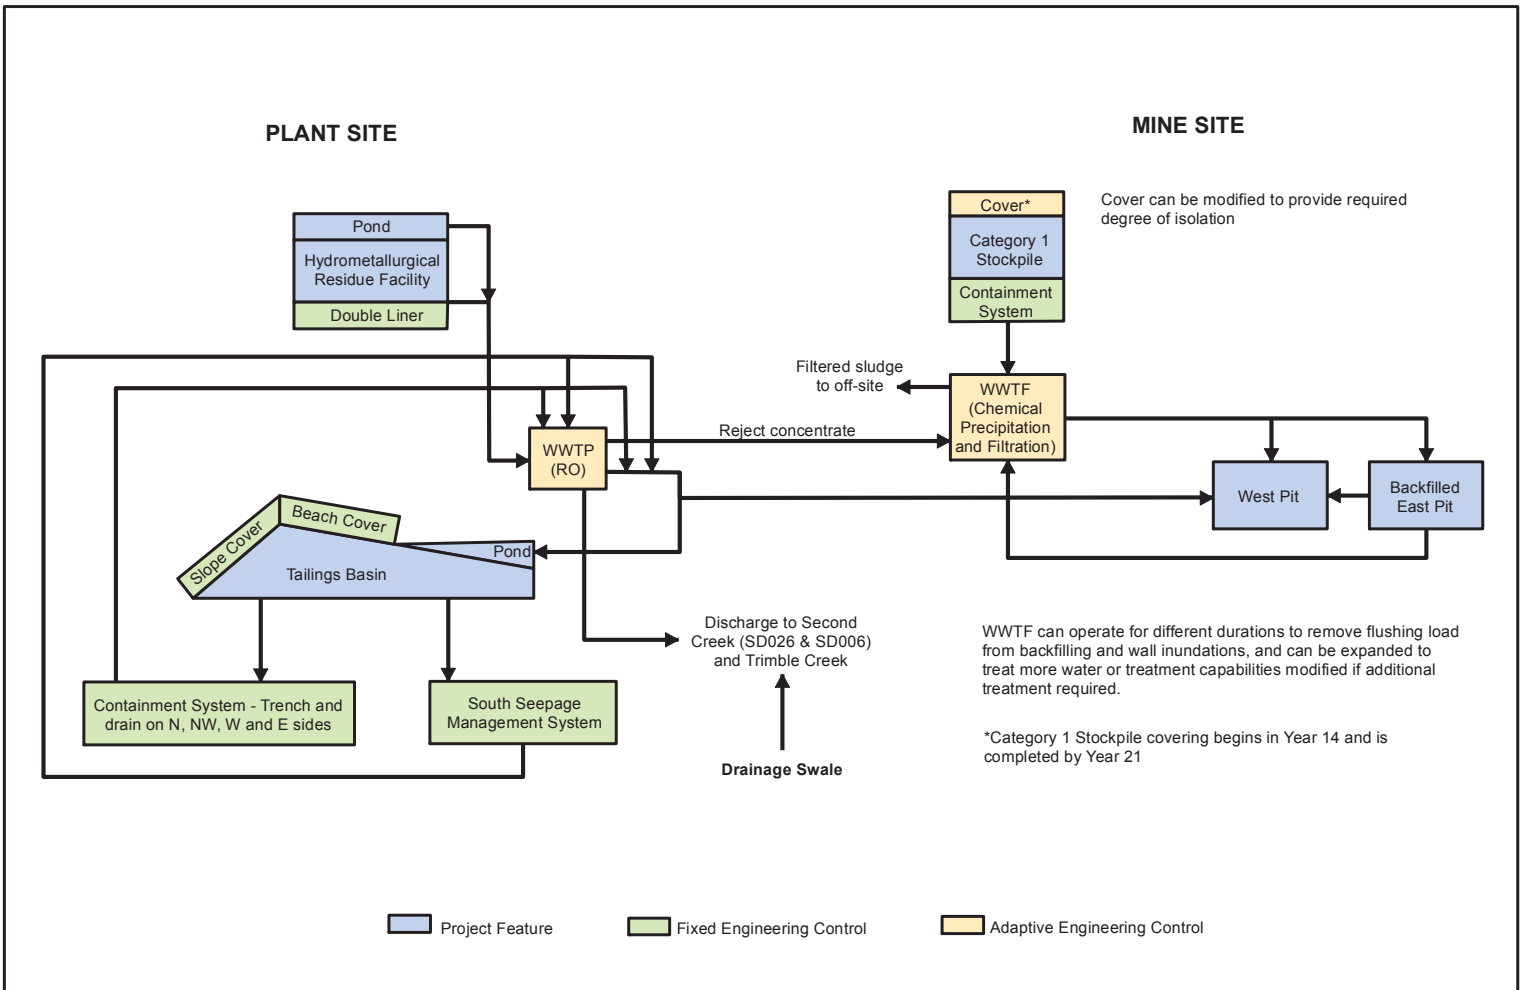

1100 These long-term closure activities would be ongoing until the various facility features were
1101 deemed environmentally acceptable, in a self-sustaining and stable condition, and until it were
1102 shown that water quality standards were being met. The objective of closure would be to provide
1103 mechanical or non-mechanical treatment for as long as necessary to meet regulatory standards at
1104 applicable groundwater and surface water compliance points. Water quality modeling performed
1105 in support of this FEIS indicates that water treatment systems would be needed indefinitely at the
1106 Mine Site and Plant Site. The water models constructed to assess the potential effects from the
1107 NorthMet Project Proposed Action were not designed to predict the duration of treatment nor do
1108 they capture all the factors that influence the duration of treatment (e.g., potential future
1109 regulatory and technological changes). Therefore, the models cannot be used to predict when
1110 treatment would end. Actual treatment requirements would be assessed on a recurring basis
1111 throughout operations, reclamation, and closure considering influent and effluent water quality
1112 and monitoring results. Those periodic assessments would be carried out to ensure continuous
1113 protection of groundwater and surface water quality and compliance with water quality-based
1114 effluent limits. The periodic assessment process would rely on monitoring results coupled with
1115 predictive modeling rather than the results of the predictive modeling alone. Regardless of the
1116 precise duration of effects or water treatment at either the Mine Site or Plant Site, there are
1117 measures available to address impacts to natural resources. PolyMet would be held accountable
1118 for maintenance and monitoring required under the permit and would not be released from
1119 financial assurance until all permit conditions have been met.

1120 When all reclamation activities required by the Permit to Mine are completed, a Request for
1121 Release per *Minnesota Rules*, part 6132.1400, would be submitted. This request would provide
1122 the Commissioner of the MDNR with detailed information on the final reclamation status of the
1123 NorthMet Project area.

1124 A summary of the water management during reclamation and long-term management is provided
1125 on Figures 3.2-17, 3.2-18, and 3.2-19.

1133 **Transition from Mechanical to Non-Mechanical Treatment**

1134 The information in this section does not reflect the NorthMet Project Proposed Action as
1135 modeled for predicted impacts in this FEIS, but provides an overview of the transitional
1136 approach from mechanical water treatment to the use of non-mechanical treatment technologies
1137 that PolyMet would evaluate during operations. PolyMet would include funds in its contingency
1138 reclamation estimate and financial assurance package to operate mechanical water treatment for
1139 as long as necessary as a part of its Permit to Mine. However, the Permit to Mine would also
1140 require PolyMet to present a plan for eventual transition from mechanical water treatment to
1141 non-mechanical water treatment.

1142 PolyMet would transition from mechanical to non-mechanical water treatment as soon as the
1143 company demonstrates that non-mechanical water treatment technologies would effectively treat
1144 water to meet water quality based effluent limits and as soon as formal approval is received from
1145 the agencies.

1146 Non-mechanical water treatment technologies need to be designed for site-specific conditions
1147 and actual site water quality. PolyMet accordingly would test non-mechanical water treatment
1148 technologies for several years during mine operations and reclamation, until an acceptable
1149 treatment performance could be achieved.

1150 Non-mechanical water treatment technologies can be evaluated in four steps: 1) collecting
1151 additional local site information (i.e., hydrology and influent water quality), 2) laboratory testing,
1152 3) pilot-scale testing, and 4) designing a system for full-scale implementation. At the Tailings
1153 Basin, this additional site-specific hydrologic information could be collected when the
1154 containment system is being constructed and throughout operations. Also, the quality of the
1155 water expected at the Tailings Basin in the long term due to PolyMet's operation would start to
1156 appear at the toe of the Tailings Basin during operations. Thus, the four steps for evaluating non-
1157 mechanical water treatment at the Tailings Basin are planned to be accomplished during
1158 operations, allowing the non-mechanical water treatment system at the Tailings Basin to be in
1159 place shortly after operations are complete and the Tailings Basin pond cover is in place.

1160 At the Mine Site, the four steps for evaluating non-mechanical treatment technologies could be
1161 completed in less than the time estimated for the West Pit to flood (e.g., before the end of year 52
1162 or 32 years after the mine stops operating). However, additional time is included in the plan
1163 because the water quality in the pit could take a few years to reach equilibrium after the West Pit
1164 is flooded. Therefore, the four steps would be undertaken during reclamation. As a result, non-
1165 mechanical water treatment technology could be implemented at the Mine Site a few years after
1166 the West Pit is flooded.

1167 The conceptual design for a non-mechanical treatment system is to treat each flow expected in
1168 the long term. The Adaptive Water Management Plan (PolyMet 2015d) outlines the purpose,
1169 design, degree of industry use, up-front preparation, timing, and duration of implementation and
1170 potential indirect impacts of these systems.

1171 PolyMet has initiated testing of non-mechanical water treatment technologies on site (in
1172 collaboration with Cliffs Erie) and will continue testing these systems and evaluating other non-
1173 mechanical water treatment technologies until they could be demonstrated to the satisfaction of
1174 the MDNR and MPCA to provide the required water treatment. Provisions would be included in
1175 the NorthMet Project financial assurance package to ensure this test work and implementation of

1176 the non-mechanical water treatment technologies could be completed, in order to achieve the
1177 long-term closure goals and eventual release from the Permit to Mine.

1178 **Post-Closure Activities**

1179 Maintenance activities that would continue throughout reclamation and post-reclamation include
1180 erosion repair, woody species and tree removal on the Category 1 Stockpile cover system, and
1181 ongoing operation and maintenance of the Category 1 Stockpile groundwater containment
1182 system and WWTF. PolyMet has committed to conduct demonstration projects during the Life of
1183 Mine and reclamation phases to establish non-mechanical water treatment systems to be used at
1184 the Mine Site. The WWTF would remain operational until water quality monitoring results
1185 demonstrate that a non-mechanical system could produce an effluent water quality, which is
1186 shown by pilot-testing and modeling, to achieve future water quality criteria at evaluation
1187 locations without the need for mechanical treatment.

1188 PolyMet would be held accountable to maintenance and monitoring required under permit and
1189 would not be released until all conditions have been met.

1190 **3.2.2.2 Transportation and Utility Corridor**

1191 The Mine Site and Plant Site would be connected by a Transportation and Utility Corridor that
1192 would contain refurbished and new infrastructure proposed to transport goods, including ore,
1193 between the Mine Site and Plant Site.

1194 **3.2.2.2.1 Location and Ownership**

1195 The Transportation and Utility Corridor would be approximately 7 to 8 miles in length, generally
1196 consisting of two alignments (railroad and Dunka Road) that deviate from one another at various
1197 points along the corridor (see Figure 3.2-20).

1198 PolyMet has acquired ownership of, or the rights to use, the land and existing infrastructure
1199 required within the Transportation and Utility Corridor. Surface owners of land intersected by
1200 the existing Dunka Road and existing and new sections of railway are listed in Table 3.2-10.

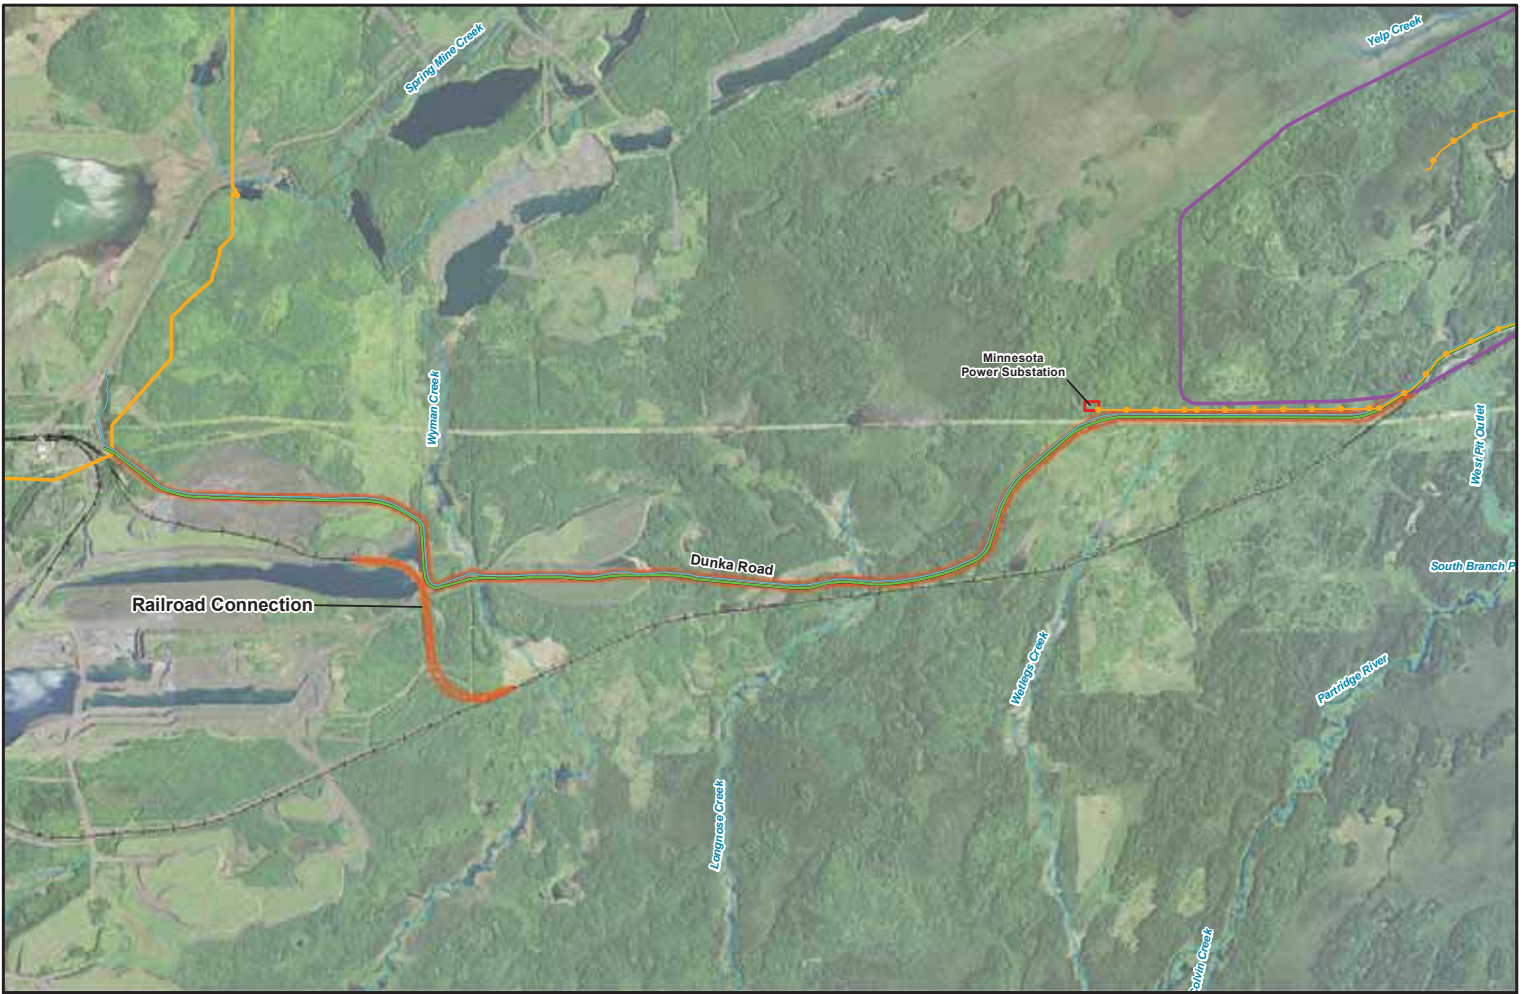

1201 **Table 3.2-10 Surface Owners along the Transportation and Utility Corridor**

Alignments	Land Surface Owner	Township and Section
Dunka Road and/or Treated Water Pipeline	State of Minnesota	Township 59 N, Range 13 W, Section 16
		Township 59N, Range 14W, Sections 13, 14, 15
	Cliffs Mining Services	Township 59N, Range 13W, Sections 1, 10, 11, 15, 18
		Township 59N, Range 14W, Section 13

DRAFT

1206 **3.2.2.2.2 Existing Conditions**

1207 The existing Cliffs Erie private railroad and Dunka Road are located within the Transportation
1208 and Utility Corridor (see Figure 3.2-20), and both would be refurbished for use as part of the
1209 NorthMet Project Proposed Action.

1210 **3.2.2.2.3 New Construction and Pre-production Development**

1211 Pre-production development along the Transportation and Utility Corridor would include the
1212 following:

- 1213 • Refurbishing the existing 8-mile portion of the Cliffs Erie private railroad located between
1214 the Mine Site and Plant Site;
- 1215 • Constructing a new rail spur (less than 1 mile in length) to connect the existing Cliffs Erie
1216 private railroad to the Rail Transfer Hopper at the Mine Site;
- 1217 • Constructing a new rail connection track (just over 1 mile in length) connecting the existing
1218 Cliffs Erie private railroad to existing railroad infrastructure at the Plant Site;
- 1219 • Upgrading an existing 7-mile segment of the private Dunka Road located between the Mine
1220 Site and Plant Site;
- 1221 • Constructing a new water pipeline approximately 7.5 miles in length along Dunka Road, to
1222 connect the Mine Site with the Plant Site; and
- 1223 • Constructing a new 2.5-mile 13.8 kV transmission line along a portion of Dunka Road to
1224 connect the Mine Site to a new Minnesota Power electrical substation.

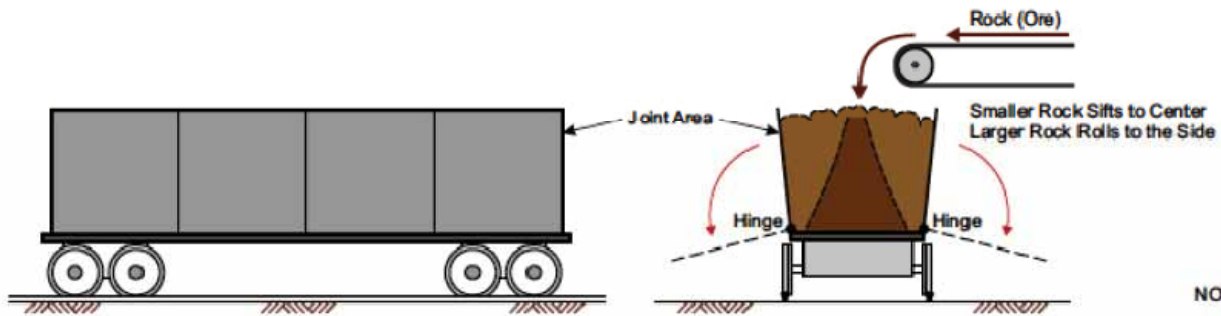

1225 **3.2.2.2.4 Use During Operations**

1226 The primary portion of the Transportation and Utility Corridor consists of Dunka Road and the
1227 Treated Water Pipeline. Dunka Road would be used to transport various materials and personnel
1228 between the Mine Site and Plant Site. The Treated Water Pipeline would be used to transport
1229 treated water from the Mine Site to the Tailings Basin at the Plant Site.

1230 The secondary portion of the Transportation and Utility Corridor is the railroad, which would
1231 generally be used to transport ore from the Mine Site to the Plant Site using three to four trains,
1232 each consisting of sixteen to twenty 100-ton, side-dumping ore cars and one 2,100-hp
1233 (approximate), six-axle diesel-electric “Gen-Set” or “Multi-Engine” locomotive.

1234 The side-dump cars have two hinged doors that act as the sides of the car and drop down when
1235 the cars are tipped at the coarse-crusher for unloading. PolyMet plans to use an existing but
1236 currently decommissioned fleet of LTVSMC side-dump ore cars. This ore car fleet currently
1237 shows wear at the hinges and joint areas, which have resulted in gaps in these areas where
1238 couplings and linkages have loosened over time. Prior to the start of operations, PolyMet would
1239 refurbish these ore cars, which would include tightening or replacement of the couplings and
1240 linkages to minimize gaps along the hinges and joint areas. Figure 3.2-21 shows the
1241 configuration of the ore cars. These side-dump ore cars are different from the bottom-dump
1242 pellet rail cars that LTVSMC used to haul taconite pellets, which were spilled along the railroad.
1243 Since these side-dump cars proposed to be used for the NorthMet Project Proposed Action would
1244 be refurbished and only used to haul ore, they would result in less spillage than from the bottom-
1245 dump cars that were used for the LTVSMC operations (PolyMet 2014a).

DRAFT

1250 **3.2.2.2.5 Reclamation and Long-term Closure**

1251 At closure, infrastructure along the Transportation and Utility Corridor would be managed in
1252 accordance with the respective usage agreements.

1253 **3.2.2.3 Plant Site**

1254 The NorthMet Project Proposed Action would include the development and operation of a Plant
1255 Site, an area located at the former LTVSMC processing plant. The Plant Site would include
1256 infrastructure required to process ore received from the Mine Site in order to recover base metals
1257 and Au/PGE, and to manage associated wastes.

1258 Operating at the average mining rate (see Section 3.2.2.1), annual production would yield about
1259 113,000 short tons of copper concentrate, 18,000 short tons of mixed nickel/cobalt hydroxide,
1260 and 500 short tons of gold and PGE precipitate. Tailings and hydrometallurgical residue would
1261 be stored in expanded existing facilities that would be progressively constructed throughout
1262 operations.

1263 The required infrastructure and the steps undertaken during processing, including the inputs and
1264 outputs, are discussed below.

1265 **3.2.2.3.1 Location and Ownership**

1266 The Plant Site is located at the site of the former LTVSMC processing plant, approximately 6
1267 miles north of the City of Hoyt Lakes (see Figure 1.1-1).

1268 PolyMet has surface ownership of the lands encompassing the Plant Site, including the existing
1269 infrastructure and tailings facilities (see Figure 3.2-1).

1270 **3.2.2.3.2 Existing Facilities**

1271 The Plant Site was previously used for the former LTVSMC taconite processing operations that
1272 ended in 2001. As shown in Figure 3.2-22, existing infrastructure at the site includes a
1273 Beneficiation Plant, access roads, railway infrastructure, maintenance facilities (shops), and a
1274 process waste facility (Tailings Basin), as well as ancillary and support infrastructure and
1275 buildings such as administration, warehouse, and storage facilities. A pump station and pipeline
1276 also connect the Plant Site to Colby Lake, located to the south.

1277 The existing LTVSMC Tailings Basin is unlined and was constructed in stages beginning in the
1278 1950s. It was configured as a combination of three adjacent cells, identified as Cell 1E, Cell 2E,
1279 and Cell 2W, and was developed by first constructing perimeter starter dams and placing tailings
1280 from the iron-ore process directly on native material. Perimeter dams were initially constructed
1281 from rock and subsequent perimeter dams were constructed of coarse tailings using upstream
1282 construction methods. The Tailings Basin operations were shut down in January 2001 and have
1283 been inactive since then except for reclamation activities consistent with an MDNR-approved
1284 closure plan and Cliffs Erie Consent Decree.

DRAFT

1288 **3.2.2.3.3 New Construction and Pre-production Development**

1289 PolyMet proposes to use some of the existing infrastructure at the Plant Site. The existing
1290 infrastructure would be refurbished and supplemented with new facilities that would be
1291 constructed and operated as part of the NorthMet Project Proposed Action.

1292 Key infrastructure at the Plant Site that would be refurbished and used includes:

1293 • Beneficiation Plant facilities such as:

1294 – Coarse-crusher building,

1295 – Fine-crusher building, and

1296 – Concentrator building, which would be refurbished to include construction of the new
1297 semi-autogenous grinding (SAG) mill inside;

1298 • Area 1 Shops;

1299 • Area 2 Shops;

1300 • Ancillary buildings (warehouses, general shops, rebuilt shop, booster pump house, potable
1301 water plant, administration building, etc.);

1302 • Ancillary infrastructure (roads, railroad tracks, plant reservoir, loadout facilities, storage
1303 yards, stormwater infrastructure, sewage treatment collection system, septic systems, etc.);
1304 and

1305 • A pump station and pipeline connecting the Plant Site to Colby Lake, located approximately
1306 4 miles to the south of the Plant Site.

1307 Flotation in the beneficiation process would occur in a new flotation building located on
1308 disturbed ground immediately to the west of the concentrator building. Dewatering, storage, and
1309 shipping would occur in new concentrate dewatering, storage, and loadout buildings located on
1310 disturbed ground near an existing heating and additive plant, which would be demolished.

1311 All equipment used in the hydrometallurgical process would be located in a new
1312 Hydrometallurgical Plant building.

1313 New tailings would be placed within new dams on top of the existing LTVSMC Tailings Basin.
1314 Hydrometallurgical residue would be placed within new dams built on top of the existing
1315 LTVSMC Emergency Basin adjacent to the existing tailings facility. Refer to the geotechnical
1316 stability section in Chapter 4.0 for more information on the existing geotechnical conditions at
1317 the Tailings Basin and Hydrometallurgical Residue Facility.

1318 CDSM is an engineering measure that would be used to stabilize the existing tailings and peat
1319 layers in the northern dams of the LTVSMC Tailings Basin prior to the use of that facility for the
1320 NorthMet tailings. It would involve mixing cement into multiple three-foot diameter columns by
1321 auguring the Tailings Basin to improve the strength of the Tailings Basin, without substantially
1322 affecting water flow or quality.

1323 A new WWTP would be built at the Plant Site to treat intercepted seepage from the Tailings
1324 Basin and treat water from the Hydrometallurgical Residue Facility, as needed.

1325 The existing LTVSMC sewage treatment system would be upgraded to include a new
1326 stabilization pond facility, which would replace the existing LTVSMC mechanical sewage
1327 treatment plant. The sewage treatment system pond facility would include a lift station, which
1328 would pump the effluent to the Tailings Basin.

1329 The layout of existing and proposed buildings and infrastructure at the Plant Site is shown on
1330 Figure 3.2-23.

1331

DRAFT

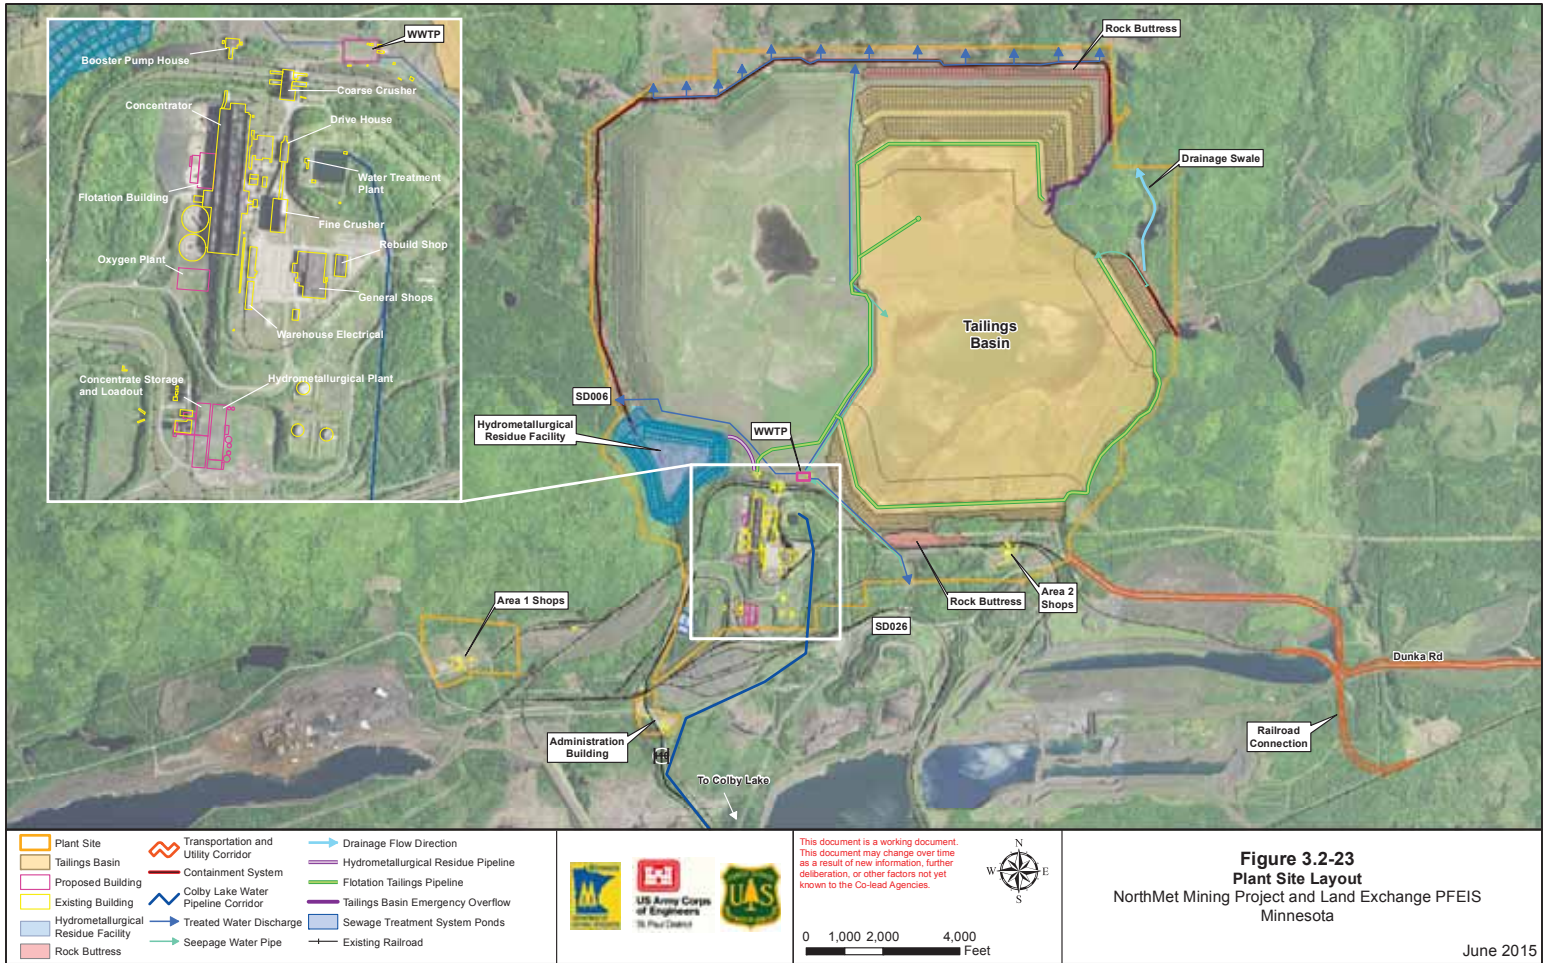

Figure 3.2-23
Plant Site Layout
NorthMet Mining Project and Land Exchange PFEIS
Minnesota

DRAFT

1334 **3.2.2.3.4 Beneficiation Process**

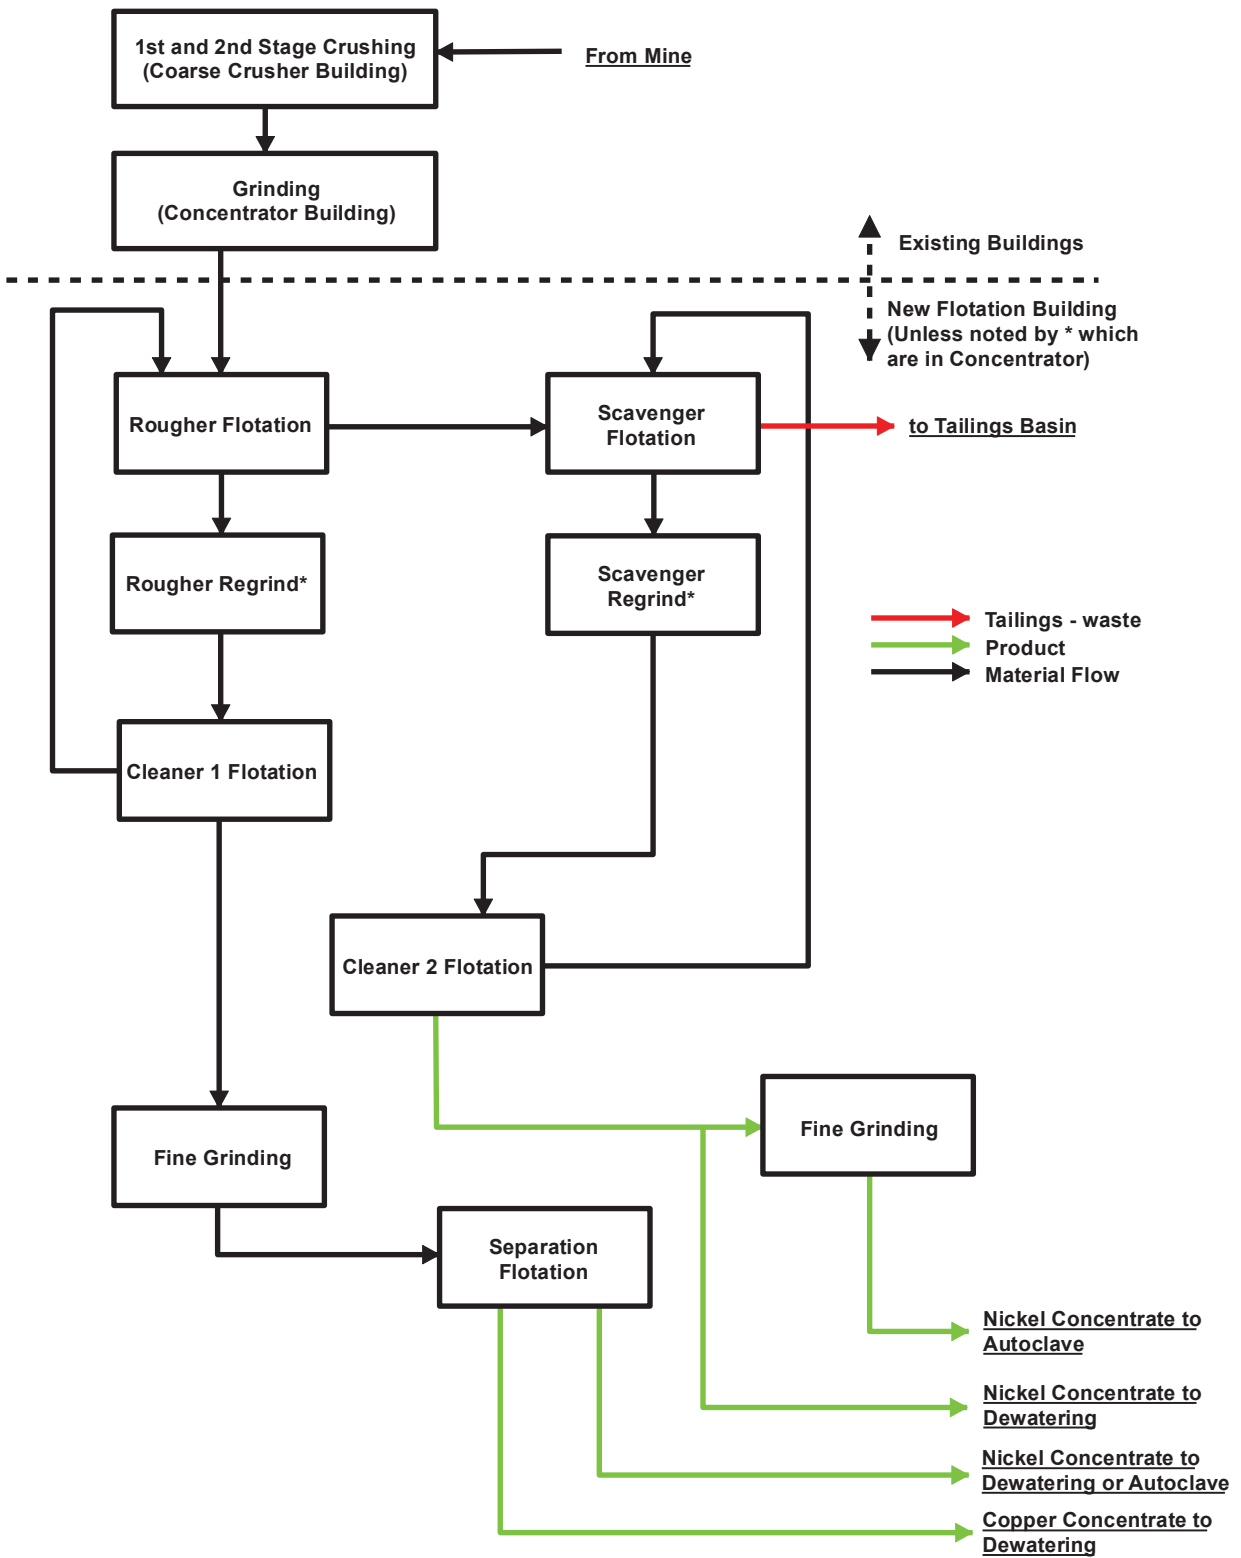

1335 Mined ore would be processed using beneficiation and hydrometallurgical technologies. The
1336 purpose of the beneficiation process would be to produce final separate concentrates of copper
1337 and differing grades of nickel. Nickel concentrates may be used as a feedstock to the
1338 Hydrometallurgical Plant that would then extract and isolate platinum-group elements, precious
1339 metals, and base metals. PolyMet expects that the Beneficiation Plant would be operational 2 to
1340 4 years before the Hydrometallurgical Plant. The decision to ship nickel concentrate produced
1341 from the beneficiation process or nickel concentrate that is further processed through the
1342 Hydrometallurgical Plant would be based on equipment maintenance schedules, customer
1343 requirements, and overall project economics.

1344 Processes at the Beneficiation Plant would include ore crushing, grinding, flotation, dewatering,
1345 storage, and shipping. Crushing and grinding would occur at the existing coarse-crusher building
1346 and concentrator building, both of which remain from operations of the former LTVSMC
1347 processing plant. Ore would be fed from the secondary crusher in the coarse-crusher building,
1348 into a SAG mill and ball mill in the concentrator building. Flotation would occur at a new
1349 flotation building located on disturbed ground immediately to the west of the concentrator
1350 building. Dewatering, storage, and shipping would occur at a new concentrate dewatering and
1351 storage building located on disturbed ground near the Heating and Additive Plant, which would
1352 be demolished. A simplified process flow diagram for the beneficiation process is shown on
1353 Figure 3.2-24.

1354

DRAFT

1358 **Ore Crushing**

1359 In ore crushing, ore as large as 48 inches in diameter would be delivered by rail from the mine to
1360 the existing coarse-crusher building, where each car would be emptied into a primary crusher at
1361 an average (calculated using the hours the primary crusher would be actually running, as it would
1362 not run continuously) feed rate of about 1,667 tons per hour. From the primary crusher, ore
1363 would move by gravity to four parallel secondary crushers. A conveyor system would move the
1364 ore, 80 percent of which would now be smaller than 4.25 inches, to the ore storage bins located
1365 in the concentrator building.

1366 The existing coarse--crusher building emission control system would be replaced with
1367 components that meet or exceed the particulate emission standard required of new sources at
1368 taconite plants. To reduce space-heating requirements, emission control system exhaust would be
1369 recycled to the buildings. The material collected would be mixed with water and added to the
1370 milling circuit. This means that the solids removed from the air stream would be recycled to the
1371 process and no solid waste management would be required and no water would be lost.

1372 **Ore Grinding**

1373 The coarse, crushed ore would be fed into a SAG mill and ball mill in the existing concentrator
1374 building. The SAG mill output would feed ball mills via cyclone feed pumps, also located in the
1375 concentrator building. The ground ore would re-circulate through the milling circuit until the
1376 particle size is small enough for flotation (80 percent would be less than 120 microns [4.7×10^{-3}
1377 inches]).

1378 The existing emission control systems in the concentrator building would be replaced with
1379 components that meet or exceeded the particulate emission standard required of new sources at
1380 taconite plants. To reduce space-heating requirements, emission control system exhaust would be
1381 recycled to the buildings. The material collected would be mixed with water and added to the
1382 milling circuit. Solids removed from the air stream would therefore be recycled to the process
1383 and no solid waste management would be required and no water would be lost. Because water
1384 would be added to the mill lines and the beneficiation process would be wet from that point on,
1385 there would be no need for particulate emission control systems downstream of the feed to the
1386 SAG mill.

1387 In the event of a power failure, all process fluids would be contained within the concentrator
1388 building and recycled to the process when power is restored. This same containment and recycle
1389 system would contain and control any minor spills.

1390 **Flotation**

1391 Once at a size of 120 microns, the ore would be processed in flotation to recover the base and
1392 precious metal sulfide minerals. Flotation would consist of rougher and scavenger flotation lines
1393 followed by cleaner stages in a new flotation building and would produce separate nickel and
1394 copper concentrates.

1395 In flotation, separation of the sulfide minerals would be achieved using a collector and frother
1396 combination. Air would be injected into each flotation cell and the cell would be mechanically
1397 agitated to create air bubbles that would pass upward through the slurry in the cell. The frother
1398 (methyl isobutyl carbinol and polyglycol ether, or MIBC/DF250), would provide strength to the
1399 bubbles, and the collector (potassium amyl xanthate [PAX]) would cause the sulfide minerals to

1400 attach to the air bubbles. The material attached to the bubbles would be concentrated and the
1401 material remaining in the slurry would be tailings.

1402 The rougher tailings would go to scavenger flotation, where collector and frother would be
1403 added, along with copper sulfate as a flotation activator. The activator would ensure that the
1404 particles that would be difficult to float (i.e., contain minor amounts of sulfide) would be
1405 recovered in the concentrate, which would reduce the total sulfur content of the tailings. The
1406 concentrate from scavenger flotation would go through scavenger regrind to cleaner 2 flotation.
1407 Cleaner 2 tailings would go back to the scavenger flotation feed, while the nickel-rich cleaner 2
1408 flotation concentrate would be sent through fine grinding 2 to the Hydrometallurgical Plant or
1409 directly to concentrate dewatering. The tailings from scavenger flotation would be sent to the
1410 Tailings Basin. Rougher flotation concentrate would be fed through rougher regrind to cleaner 1
1411 flotation. Cleaner 1 flotation tailings would go back to the rougher flotation feed, while the
1412 concentrate would be sent through fine grinding 1 to separation flotation. Separation flotation
1413 would produce a copper concentrate and two nickel concentrates. The copper concentrate would
1414 go to concentrate dewatering. The nickel concentrates would go to concentrate dewatering or to
1415 the Hydrometallurgical Plant.

1416 Lime would be added in separation flotation, which would result in a highly basic process water
1417 stream. Because this stream would be combined with other process water streams and makeup
1418 water, buildup of basicity is not expected. If there were a buildup of basicity, the basicity could
1419 be neutralized before it was combined with other process water streams.

1420 The scavenger tailings would be pumped to the Tailings Basin, where the solids would settle and
1421 be stored permanently (refer to the tailings section below). The clear water would be re-
1422 circulated to the mill process water system.

1423 In the event of a power failure, all process fluids would be contained within the flotation building
1424 and recycled to the process when power is restored. This same containment and recycle system
1425 would contain and control any minor spills.

1426 **Concentrate Dewatering and Storage – Concentrate Mode**

1427 Concentrate dewatering and storage would be used to dewater and store copper and nickel
1428 concentrates and to load those concentrates into covered rail cars. Concentrate dewatering and
1429 storage would be within the new concentrate dewatering and storage building.

1430 The copper and nickel concentrates would be delivered to separate dewatering lines, each with a
1431 filter that would reduce concentrate moisture content to approximately 8 to 10 percent. The water
1432 removed by the filter would be returned to the Beneficiation Plant.

1433 Each filtered concentrate would be conveyed to separate stockpiles within an enclosed 10,000-
1434 ton storage facility for loading into covered rail cars. The storage facility would contain about 15
1435 days of production capacity. The storage facility would have a concrete floor and provisions to
1436 wash wheeled equipment leaving the facility to prevent concentrates from being tracked out of
1437 the facility.

1438 In the event of a power failure, all process fluids would be contained within the concentrate
1439 dewatering and storage building and recycled to the process when power is restored. This same
1440 containment and recycle system would contain and control any minor spills.

1441 **Processing Parameters**

1442 Table 3.2-11 shows PolyMet’s estimates for daily production rates and size reduction through the
 1443 processing steps in the beneficiation process. The rates and sizes provided are the values
 1444 PolyMet intends to use to design plant piping and equipment.

1445 **Table 3.2-11 Design Processing Parameters**

Process	Input			Output		
	Material	Rate (stpd)	Size (inches)	Material	Rate (stpd)	Size (inches)
Ore crushing	Ore	32,000	48	Ore	32,000	4
Ore grinding	Ore	32,000	4	Ore	32,000	4.7 x 10 ⁻³
Flotation	Ore	32,000	4.7 x 10 ⁻³	Concentrate	374 to Hydrometallurgical Plant and 286 to concentrate dewatering or 660 to concentrate dewatering	Varies depending on concentrate stream and next process step
				Tailings	31,340	4.7 x 10 ⁻³
Concentrate dewatering	Concentrate	660	Varies depending on concentrate stream	Dried nickel and copper concentrates	286 copper and 374 nickel	Same as input ¹

1446 ¹ Flotation step has two fine grinding stages that produce a defined size. One nickel concentrate stream to concentrate
 1447 dewatering does not pass through a fine grinding stage, but all concentrates to the Hydrometallurgical Plant pass through a fine
 1448 grinding stage. Therefore, the average output for flotation does not coincide with the average input for concentrate dewatering.
 1449

1450 stpd = short ton(s) per day

1451 **Process Consumables**

1452 PolyMet anticipates the raw materials shown in Table 3.2-12 would be consumed by the
 1453 Beneficiation Plant processes.

1454 **Table 3.2-12 Materials Consumed by the Beneficiation Plant Process**

Consumable	Quantity	Mode of Delivery	Delivery Condition	Storage Location	Containment
Grinding Media (metal alloy balls)	10,000 tpy	Rail (9 rail cars/ mo ¹)	Bulk	Concentrator Building	None required
Flotation Collector (PAX)	1,171 tpy	Truck (2-3 trucks/mo)	Bulk bags	Reagents Building	None required
Flotation Frother (MIBC and DF250)	1,007 tpy	Tank truck (2-3 trucks/mo)	Bulk	Reagents Building	Separate 13,200-gallon storage tanks
Flotation Activators (copper sulfate)	592 tpy	Truck (1-2 trucks/mo)	Bulk bags	Reagents Building	9,200-gallon activator storage tank
Flocculant (MagnaFlox 10)	16.5 tpy	Truck (1 truck/2 mo)	1,875-lb ² bulk bags	Reagents Building	None required
Gangue Depressant (CMC)	1,073 tpy	Truck (2-3 trucks/mo)	Bulk bags	Reagents Building	None required
pH Modifier (hydrated lime)	10,279 tpy	Tank Truck (1-2 trucks/day)	Bulk	Reagents Building	Storage silo

1455 ¹ mo = month
 1456 ² lb = pound

1457 **Plant Process Water**

1458 Water needed for the milling and flotation circuits would primarily be return water from the
 1459 Tailings Basin, which would include treated Mine Site process water. As a contingency measure,
 1460 any shortfall in water requirements would be made up by raw water from Colby Lake as
 1461 necessary using an existing pump station and pipeline. Throughout operations, the average
 1462 annual makeup water drawn from Colby Lake would vary between 260 and 1,760 gallons per
 1463 minute (gpm), with an average annual demand of 760 gpm. This would be the total potential raw
 1464 water demand from both the Beneficiation Plant and the Hydrometallurgical Plant.

1465 Water collection at the Tailings Basin and Plant Site water management are discussed further in
 1466 Sections 3.2.2.3.10 and 3.2.2.3.11 below.

1467 **3.2.2.3.5 Tailings Management**

1468 The NorthMet Project Proposed Action would generate approximately 11.27 million short tons
 1469 of flotation tailings annually (approximately 10,000,000 in-place cubic yards annually). Tailings
 1470 would be placed on top of part of the unlined existing LTVSMC Tailings Basin. For the first 7
 1471 years of operation, tailings would be placed on top of Cell 2E (currently approximately 1,595 ft
 1472 above mean sea level [amsl]) or until it reached the same height as the existing Cell 1E
 1473 (approximately 1,660 ft amsl). After that, tailings would go on top of both Cells 1E and 2E
 1474 (forming a single cell) up to the same height of Cell 2W (approximately 1,735 ft amsl). A
 1475 schematic cross section of the Tailings Basin at its maximum height is provided on Figure
 1476 3.2-25.

1477 The future perimeter dams of the Tailings Basin would be raised in an upstream construction
1478 method using compacted LTVSMC bulk tailings that consist primarily of coarse tailings with
1479 limited amounts of LTVSMC fines and slimes mixed in. This material would be sourced from
1480 the existing LTVSMC Tailings Basin dams to the north and east of Cell 2W, from the southeast
1481 dam of Cell 1E, and from the south dam of Cell 2E. Upon exhaustion of LTVSMC tailings
1482 available for dam construction, off-site borrow from MDNR-approved sources would be utilized.

1483 To increase geotechnical stability, a rock buttress would be constructed around the northern dam
1484 of Cell 2E and southern dam of Cell 1E of the existing LTVSMC Tailings Basin. Rock buttress
1485 material would be from MDNR-approved sources. Material from former LTVSMC Area 5
1486 would be a likely source for the rock buttress and fill material, but other sources could also be
1487 considered. CDSM would also be used to stabilize the existing tailings and peat layers in the
1488 northern dams of the LTVSMC Tailings Basin prior to the use of that facility for the NorthMet
1489 tailings. It would involve mixing cement into multiple three-foot diameter columns by auguring
1490 the Tailings Basin to improve the strength of the Tailings Basin, without substantially affecting
1491 water flow or quality.

1492 During LTVSMC operations, fly ash, dredging spoil, and coal pile cleanup material were placed
1493 in a solid waste storage site (Coal Ash Landfill) upgradient and to the east of Cell 1E (see Figure
1494 3.2-22). The location of this landfill would be inundated by tailings in approximately year 7 of
1495 Tailings Basin operation. Therefore, the contents would be relocated to the Hydrometallurgical
1496 Residue Facility prior to that time.

1497 A bentonite-amended oxygen barrier layer (at a depth of 30 inches from the surface of the dams)
1498 on exterior sides of dams would be added as part of construction. The design also includes a mid-
1499 slope setback and construction of buttresses along the northern foot of existing LTVSMC
1500 Tailings Basin Cell 2E and southern foot of Cell 1E, using material from former LTVSMC Area
1501 5. Refer to Section 5.2.14 for more information on the proposed construction of the Tailings
1502 Basin.

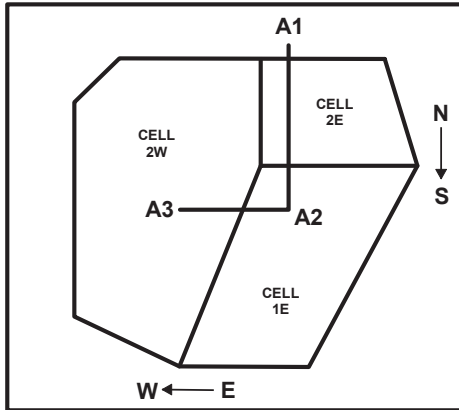

1503 The NorthMet tailings would be deposited in slurry form through a system of pumps and
1504 moveable pipelines. Tailings would be deposited over discharge beaches or underwater in the
1505 Tailings Basin pond using movable diffusers. The small and fairly uniform grind size of the
1506 tailings would allow for a fairly consistent particle-size distribution, minimizing segregation of
1507 coarse and fine portions.

1508 Tailings beaches would exist along the northern and northeastern dams of Cell 2E and the
1509 southern and eastern dams of Cell 1E, where the natural landscape is higher, thus bounding the
1510 material.

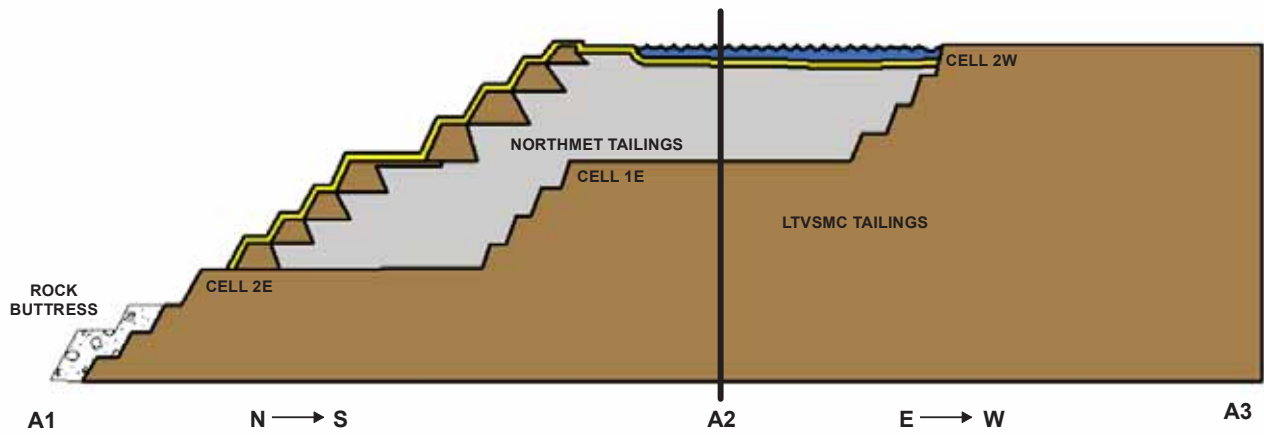

1511 The tailings would settle out of the slurry and the decanted water would be allowed to pond and
1512 would be collected using a barge pump-back system that would pump the water back for use at
1513 the Beneficiation Plant. The barge system would consist of a primary pump barge in Cell 1E, an
1514 auxiliary pump barge in Cell 2E, piping from the primary pump barge to the Beneficiation Plant,
1515 and piping from the auxiliary pump barge to Cell 1E. The auxiliary pump barge would not be
1516 needed once the cells combine to form one cell. The return water pipelines would be moved as
1517 dams are raised (up to the maximum of 1,732 ft amsl), to keep the pipeline at or near the top of
1518 the dam. The return water pipes would be fitted with a relief drain valve to allow for water to be
1519 drained back to ponds in case of shutdown during winter operations to avoid damage to the pipes
1520 from freezing or suction. Pumps would also be fitted with deicing mechanisms to avoid freezing.

- 1521 Plant Site water management, including management at the Tailings Basin, is discussed further
1522 in Sections 3.2.2.3.10 and 3.2.2.3.11 below.
- 1523 Stability modeling and the rationale for the design are discussed in Section 5.2.14. Final design is
1524 subject to permitting under the requirements of the MDNR Dam Safety Permit and Permit to
1525 Mine.

DRAFT

1528 **3.2.2.3.6 Hydrometallurgical Process**

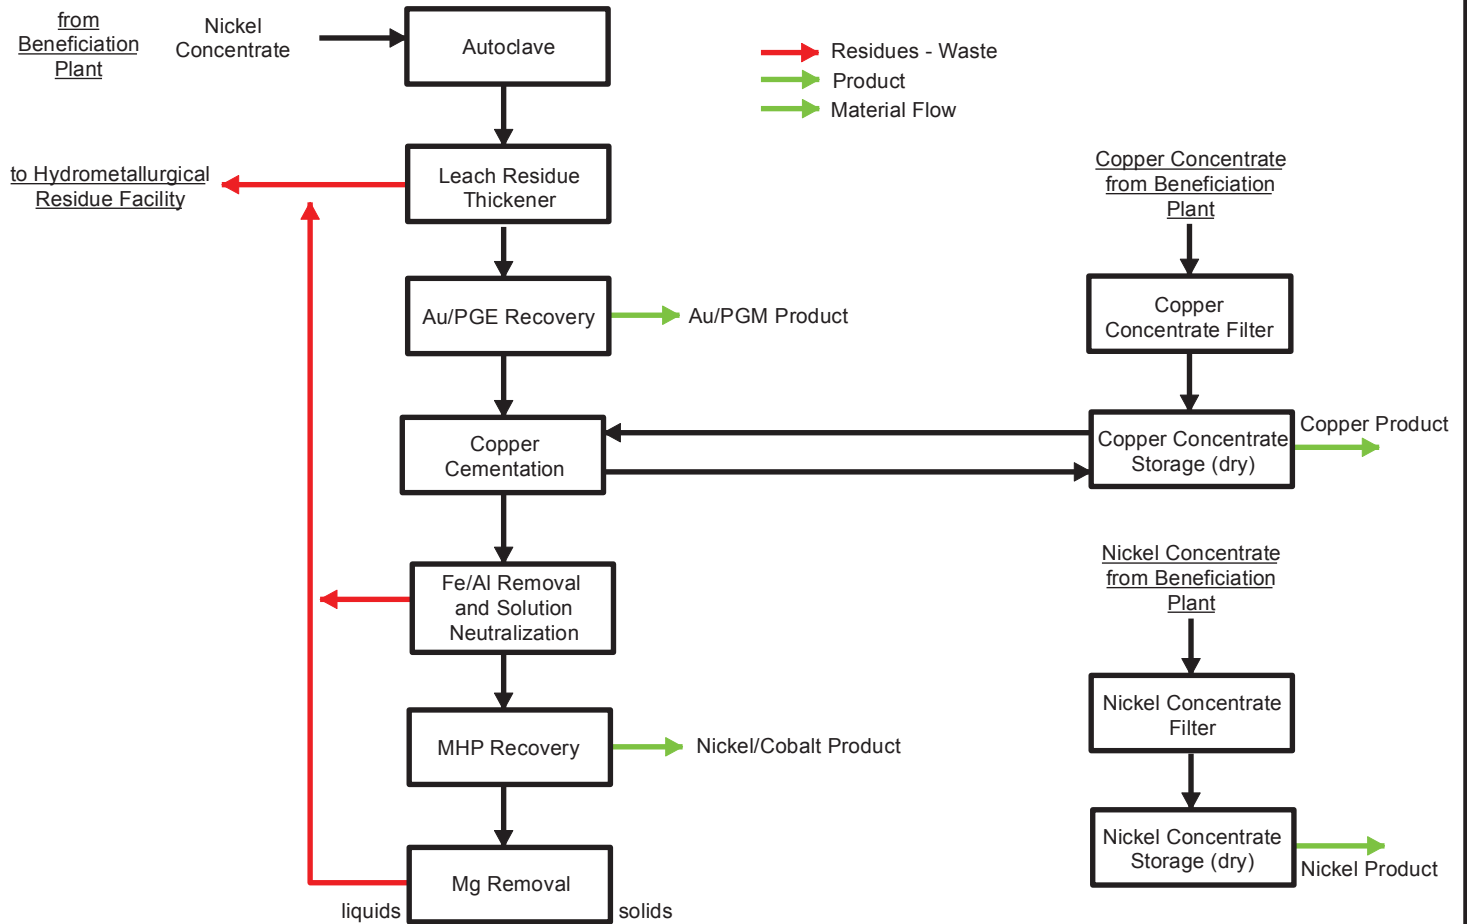

1529 Hydrometallurgical processing technology would process nickel concentrates. This process
1530 would involve high-pressure and high-temperature autoclave leaching followed by solution
1531 purification steps to extract and isolate PGEs, precious metals, and base metals. All equipment
1532 used in the hydrometallurgical process would be located in a new Hydrometallurgical Plant.
1533 Should spillage of process fluids occur, it would remain within the Hydrometallurgical Plant
1534 buildings and be returned to the appropriate process streams.

1535 Once the Hydrometallurgical Plant becomes operational, some of the concentrates produced in
1536 the Beneficiation Plant would be feedstock to the hydrometallurgical process. The feedstock
1537 would be a combination of the separate nickel concentrates produced by the Beneficiation Plant.
1538 The decision to ship nickel concentrations directly from the beneficiation process or further
1539 process the concentrates through the autoclave would be based on equipment maintenance
1540 schedules, customer requirements, and overall project economics.

1541 PolyMet expects that the autoclave would be operational 2 to 4 years after the Beneficiation
1542 Plant becomes operational. A simplified process-flow diagram for the hydrometallurgical
1543 process is shown on Figure 3.2-26.

DRAFT

1547 **Autoclave**

1548 In the autoclave, the sulfide minerals in the concentrate would be oxidized and dissolved in a
1549 solution. Gold/PGE would dissolve as soluble chloride salts. The solid residue produced would
1550 contain iron oxide, jarosite (potassium-iron sulfate), and any insoluble gangue (non-ore silicate
1551 and oxide minerals) from the concentrate. Generation of acid from the oxidation of major sulfide
1552 minerals would result in leaching of the silicate, hydroxide, and carbonate minerals present in the
1553 concentrate.

1554 Mine Site WWTF sludge (to recover metals and provide disposal of remaining solids) and
1555 hydrochloric acid (to maintain the proper chloride concentration in the solution to enable
1556 leaching of the Au/PGE) would be added to the concentrate before the autoclave. The autoclave
1557 would be injected with oxygen gas supplied by a cryogenic oxygen plant at a rate that would be
1558 controlled to ensure complete oxidation of all sulfide sulfur in the concentrate.

1559 Slurry discharging from the autoclave would be sent to the leach residue thickener where solids
1560 would be settled with the aid of a flocculant. The leach residue thickener underflow would be
1561 filtered to produce a filter cake, which would be washed, re-pulped, combined with other
1562 hydrometallurgical residues, and pumped to the Hydrometallurgical Residue Facility. The leach
1563 residue thickener overflow would go to the Au/PGE recovery.

1564 **Gold and Platinum Group Element Recovery**

1565 The product produced by Au/PGE recovery would be a filter cake made up of a mixed Au/PGE
1566 sulfide precipitate. The filter cake would be put into either bulk bags or drums for sale to a third-
1567 party refinery. The remaining solution would go to copper cementation.

1568 **Copper Cementation**

1569 Copper concentrate from dry concentrate storage would be re-pulped, and the solution from
1570 Au/PGE recovery would be combined with the re-pulped copper concentrate. Copper would
1571 precipitate mostly in the form of copper sulfide. The enriched copper concentrate would be
1572 filtered and placed back into dry concentrate storage. The remaining solution would then go to
1573 solution neutralization.

1574 **Solution Neutralization**

1575 Solution neutralization would be used to neutralize acids formed as a result of the upstream
1576 process. Solution from copper cementation would go to solution neutralization. Calcium, in the
1577 form of either limestone or lime, would be added. The result of the calcium addition would be
1578 the formation of gypsum that would be filtered to produce a gypsum filter cake. This filter cake
1579 would be washed, re-pulped, combined with other hydrometallurgical residues, and pumped to
1580 the Hydrometallurgical Residue Facility. The solution remaining after neutralization would go to
1581 iron and aluminum removal.

1582 **Iron and Aluminum Removal**

1583 Solution neutralization would feed iron and aluminum removal. Limestone, steam, and air would
1584 be added to cause the aluminum and iron to precipitate. The precipitated metals would be filtered
1585 to produce a filter cake, which would be washed, re-pulped, combined with other

1586 hydrometallurgical residues, and pumped to the Hydrometallurgical Residue Facility. The
 1587 remaining solution would be sent to mixed hydroxide product recovery.

1588 **Nickel-Cobalt Recovery (Mixed Hydroxide Product)**

1589 Copper-free solution from iron and aluminum removal would be reacted with magnesium
 1590 hydroxide to produce nickel and cobalt precipitate. The precipitated metals would be filtered to
 1591 produce a filter cake that would have an approximate composition of 97 percent nickel and
 1592 cobalt hydroxides, with the remainder as magnesium hydroxide. The high-quality mixed
 1593 hydroxide filter cake would be packaged for shipment to a third-party refiner. The remaining
 1594 solution would go to magnesium removal.

1595 **Magnesium Removal**

1596 Lime slurry would be added to the solution from the mixed hydroxide product recovery (above)
 1597 to facilitate magnesium precipitation. The resulting slurry would be pumped to the
 1598 Hydrometallurgical Residue Facility along with other residues. The solids would settle in the
 1599 Hydrometallurgical Residue Facility, to be stored permanently, while the clear water would be
 1600 reclaimed continuously to the Hydrometallurgical Plant process water system.

1601 **Process Consumables**

1602 The raw materials described below, and those summarized in Table 3.2-13, would be consumed
 1603 by the Hydrometallurgical Plant processes.

1604 **Table 3.2-13 Materials Consumed by the Hydrometallurgical Plant Process**

Consumable	Quantity	Mode of Delivery	Delivery Condition	Storage Location	Containment
Sulfuric acid	1,500 tpy	Tanker truck (2 tank cars/mo)	Bulk	Adjacent to General Shop Building	31,965-gallon storage tank with secondary containment
Hydrochloric acid	3,590 tpy	Tanker truck (3 tank cars/mo)	Bulk	Adjacent to General Shop Building	36,120-gallon storage tank with secondary containment
Liquid sulfur dioxide	1,433 tpy	Tanker truck (2 tank cars/mo)	Bulk	Adjacent to General Shop Building	30,000-gallon pressurized storage tank with secondary containment
Sodium hydrosulfide	513 tpy	Tanker truck (2-3 tankers/mo)	Bulk as a 45% solution with water	Adjacent to General Shop Building	25,750-gallon storage tank
Limestone	125,000 tpy	Rail (one 100-car train/week from April to October)	Bulk	Stockpiled on site	Berms/ditches around outdoor stockpile with water that has contacted limestone collected and added to the plant process water
Lime	4,344 tpy	Freight truck (75 loads/mo)	Bulk	Adjacent to General Shop Building	Lime silo and 21,000-gallon storage tank

Consumable	Quantity	Mode of Delivery	Delivery Condition	Storage Location	Containment
Magnesium hydroxide	4,866 tpy	Tanker truck (7 tank cars/mo ²)	60% w/w ⁴ magnesium hydroxide slurry	Adjacent to General Shop Building	Magnesium hydroxide 270,000-gallon storage tank
Caustic (NaOH)	33 tpy	Tanker truck (1 load/mo)	50% w/w solution	General Shop Building	1,300-gallon storage tank
Flocculant (MagnaFloc 342)	14 tpy	Freight truck	1,543 lb bulk bags of powder	Main Warehouse	In bags and batch mixed regularly as 0.3% w/w solution
Flocculant (MagnaFloc 351)	90 tpy	Freight truck	1,543 lb bulk bags of powder	Main Warehouse	In bags and batch mixed regularly as 0.3% w/w solution
Nitrogen (used in Hydrometallurgical Plant) ¹	19,113 tpy	NA ³	NA	NA	NA

1605 ¹ Nitrogen used in the Hydrometallurgical Plant would be produced as a byproduct in the Oxygen Plant and no shipping or
 1606 storage would be required.
 1607 ² mo = month
 1608 ³ NA = not applicable
 1609 ⁴ w/w = weight for weight

1610 ***Hydrometallurgical Process Water***

1611 The Hydrometallurgical Plant would require separate water than the Beneficiation Plant due to
 1612 the different nature of the solutions involved in the two processes. Hydrometallurgical process
 1613 water would contain substantial levels of chloride relative to the water in the milling and
 1614 flotation circuits.

1615 The hydrometallurgical system would receive recycled water collected at the Hydrometallurgical
 1616 Residue Facility (discharged water used to transport hydrometallurgical residue to the facility)
 1617 and would distribute it to various water addition points throughout the Hydrometallurgical Plant.
 1618 Makeup water would come from flotation concentrate water and raw water. Raw water demand
 1619 for ore processing is described in Table 3.2.14.

1620 Water collection at the Hydrometallurgical Residue Facility and Plant Site water management
 1621 are discussed further in Sections 3.2.2.3.10 and 3.2.2.3.11 below.

1622 ***Table 3.2-14 Plant Site Services***

Service	Source	Source Location	Needed for
Compressed air	Duty and standby arrangement of rotary screw-type compressors	General Shop Building	Provide air at a pressure of 100 psig ¹ for plant services
Instrument air	Air withdrawn from the plant air receiver to an instrument air accumulator and dried in a duty and standby arrangement of driers and air filters	General Shop Building	Provide air for instruments
Steam	Natural gas-fired boiler	Hydrometallurgical Plant	Generates heat needed for startup of the autoclaves
Diesel fuel storage	Existing Locomotive Fuel Oil facility	Area 2 Shop	Diesel for locomotives
Gasoline storage	Existing storage facility – two 6,000-gallon tanks	Adjacent to the Main Gate	Gasoline for vehicles

Service	Source	Source Location	Needed for
Raw water	Water from Colby Lake via an existing pumping station and pipeline	Stored in the existing water reservoir at the Plant Site (Plant Reservoir)	Plant fire protections systems, plant potable water systems, make-up water for grinding and flotation process water and Hydrometallurgical Plant process water
Potable water	Existing processing plant potable water treatment plant would be refurbished and reactivated	Near the Plant Reservoir	Potable water distribution system includes the Area 1 and Area 2 shops
Fire protection	Existing fire protection system would be refurbished, reactivated, and extended to new buildings	Plant Reservoir	Area 1 and Area 2 shops have independent fire protection systems
Oxygen	770 tpd ² Oxygen Plant. Plant process takes in ambient air, compresses it and separates the oxygen from nitrogen and other trace atmospheric gases. Oxygen would be transported via pipeline to plant processes and nitrogen and trace gases would be returned to the atmosphere.	Adjacent to Concentrator	Plant processes

1623 ¹ psig = Pounds per square inch gauge
 1624 ² tpd = tons per day

1625 3.2.2.3.7 Hydrometallurgical Residue Management

1626 The hydrometallurgical process would generate residues from five sources:

- 1627 • autoclave residue from the leach residue filter;
- 1628 • high-purity gypsum from the solution-neutralizing filter (depending on the market, this could
1629 become a saleable product, but is currently planned to be managed as a waste);
- 1630 • gypsum, iron, and aluminum hydroxide from the iron and aluminum filter;
- 1631 • magnesium hydroxide precipitate from the magnesium removal tank; and
- 1632 • other minor plant spillage sources.

1633 In addition to the above-listed sources, solid wastes from the Mine Site WWTF would be
 1634 recycled directly into the Hydrometallurgical Plant to recover metals, creating additional waste.
 1635 The Mine Site WWTF solids would be similar to the hydrometallurgical residue, consisting
 1636 primarily of gypsum, metal hydroxides, and calcite.

1637 If all nickel flotation concentrate were used as feedstock, the projected hydrometallurgical
 1638 residue generation rate would be 313,000 tons annually and up to total of 6,170,000 tons. The
 1639 gypsum included with residue from solution neutralization may become a saleable product;
 1640 however, it is currently proposed to be managed as part of the residue waste.

1641 These wastes would be combined and disposed of in the Hydrometallurgical Residue Facility
 1642 that would be located at the existing LTVSMC Emergency Basin, adjacent to the southern edge
 1643 of the existing tailings Cell 2W. The Hydrometallurgical Residue Facility would consist of a
 1644 double lined cell, developed incrementally as needed, expanding vertically and horizontally from
 1645 the initial construction.

1646 The first increment would be constructed over two to three construction seasons. Most of the
 1647 site-preparation activities and major earthwork would occur in the first two construction seasons.

1648 Placing the geosynthetic clay liner would occur in the third year of construction. The remaining
1649 earthwork and completion of the geomembrane liner installation for the upper elevations of the
1650 facility would occur as needed to maintain adequate capacity.

1651 The Hydrometallurgical Residue Facility would be filled by pumping the combined
1652 hydrometallurgical residue as slurry from the Hydrometallurgical Plant. A pond would be
1653 maintained within the Hydrometallurgical Residue Facility so that the solids in the slurry would
1654 settle out, while the majority of the liquid would be recovered by a pump system and returned to
1655 the plant for reuse. The residue discharge point would be relocated as needed to distribute the
1656 residue evenly throughout the Hydrometallurgical Residue Facility.

1657 During LTVSMC operations, fly ash, dredging spoil, and coal pile cleanup material were placed
1658 in a solid waste storage site (Coal Ash Landfill) upgradient and to the east of Cell 1E (see Figure
1659 3.2-22). The location of this landfill would be inundated by tailings in approximately year 7 of
1660 Tailings Basin operation. Therefore, the contents would be relocated to the Hydrometallurgical
1661 Residue Facility prior to that time.

1662 Plant Site water management, including management at the Hydrometallurgical Residue Facility,
1663 is discussed further in Sections 3.2.2.3.10 and 3.2.2.3.11 below.

1664 Stability modeling and rationale for the design are discussed in Section 5.2.14. Final design is
1665 subject to permitting under the requirements of the MDNR Dam Safety Permit and Permit to
1666 Mine.

1667 **3.2.2.3.8 Required Process Services**

1668 The NorthMet Project Proposed Action would utilize two existing service facilities: the Area 1
1669 Shop and the Area 2 Shop.

1670 The former LTVSMC Area 1 Shop is an existing fully enclosed maintenance facility built
1671 specifically to handle maintenance and repair work on large mining equipment. A heavy-duty,
1672 low-bed transporter and tractor would be used to transport some equipment (e.g., dozers and
1673 front-end loaders) to the Area 1 Shop from the Mine Site. A haul truck retriever (large-scale tow-
1674 truck) would tow haul trucks that would be unable to move on their own; otherwise, haul trucks
1675 would be driven to the Area 1 Shop. It is estimated that each haul truck would be moved to the
1676 Area 1 Shop two times per year for major repairs. To access the Area 1 Shop, mine vehicles
1677 would follow an established route utilizing existing gravel and blacktopped roads through parts
1678 of the former LTVSMC taconite mine area.

1679 Used oils and antifreeze/coolant, as well as residue from steam-cleaning equipment, would be
1680 collected and stored at the Area 1 Shop. Used oils, antifreeze/coolant, and solvents would be
1681 collected by a specialist contractor for recycling, while used filters, oily rags, and other oil-
1682 contaminated waste would be collected for proper off-site disposal in suitably licensed disposal
1683 facilities.

1684 The former LTVSMC Area 2 Shop, located about 7 miles west of the Mine Site, would be
1685 reactivated to provide office space for mining and railroad operations supervision and
1686 management, as well as change house facilities, toilets, lunch rooms, first aid facility, emergency
1687 response center and training, and meeting rooms for mining and railroad crews. The Area 2 Shop
1688 facilities would include the Locomotive Fueling Station, Locomotive Service Building, and Mine
1689 Reporting Building. The Locomotive Fueling Station, where locomotives would be fueled and

1690 lubricated, would have a roof and sides, but would be open at the ends to allow access. The
1691 concrete floor, equipped with drip trays, would collect any spilled fuel and route it to a collection
1692 sump for proper disposal in the Plant Site area. It also has a 15,000-gallon bulk fuel storage tank
1693 with containment systems.

1694 Other process inputs and services required for the Plant Site operations are summarized in
1695 Table 3.2-14.

1696 **3.2.2.3.9 Transport of Consumables and Products**

1697 A 1,500- to 2,000-hp GenSet locomotive, similar to the locomotives that would be hauling ore
1698 from the Mine Site to the Plant Site, would transfer loaded and empty cars carrying process
1699 consumables and concentrates to and from the interchange location with the Canadian National
1700 Railroad and the Plant Site. Cars carrying process consumables and concentrate would meet rail
1701 common carrier requirements.

1702 Nickel and cobalt hydroxide and precious metal precipitate products would be shipped in sealed
1703 bulk bags or sealed containers. Copper and nickel concentrates would be shipped in solid-bottom
1704 rail cars with weather-tight covers. Cars would be checked before loading and any debris would
1705 be removed and holes plugged. Loading operations would be conducted in a building via a
1706 conveyor system. Car exteriors would be inspected before leaving the buildings and any
1707 concentrate on the car exterior would be recovered and returned to storage. The concentrate is
1708 expected to be 8 percent to 10 percent moisture, which is not expected to generate dust during
1709 loading.

1710 The NorthMet Project Proposed Action would utilize the existing general shop facility
1711 previously used by LTVSMC for re-fueling, routine inspection, and maintenance of locomotives
1712 and ore cars. Locomotives needing major repair would either be sent off site or repaired by a
1713 contractor in the general shop facility.

1714 **3.2.2.3.10 Engineered Water Controls**

1715 The Plant Site would include water management features designed to control water potentially
1716 affected by sulfides and metal leachates from tailings and hydrometallurgical residue. Water
1717 contaminated with these materials would be sent to the Plant Site WWTP. Stormwater would be
1718 directed off site.

1719 The following section describes the engineered controls. The flow and management of water is
1720 discussed in Section 3.2.2.3.11. Figure 3.2-5 through Figure 3.2-8 show the water management
1721 features and infrastructure.

1722 **Tailings Basin**

1723 The Beneficiation Plant would deposit tailings into the Tailings Basin. The tailings would
1724 contain water. Water would also be discharged to the Tailings Basin pond from the Mine Site.
1725 Direct precipitation, stormwater run-off, and water collected by the Tailings Basin seepage
1726 containment systems would also be directed to the Tailings Basin. Tailings Basin water is
1727 expected to seep downward and either emerge as surface seepage near the toe of the Tailings
1728 Basin or remain in the groundwater. A portion of groundwater seepage is modeled to bypass the
1729 containment system and eventually emerge in surface waters. As shown in Figure 3.2-27, a water
1730 containment system would be installed around the western, northern, and portions of the eastern

1731 sides of the Tailings Basin dams to intercept the seepage that emerges as surface water near the
1732 toe (within several hundred ft) and greater than 90 percent of all of the seepage that remains in
1733 the ground as groundwater. The Tailings Basin containment system would consist of a cutoff
1734 wall placed through existing surficial deposits into bedrock, with a collection trench and drain
1735 pipe installed on the upgradient side on the cutoff wall. Figure 3.2-28 shows a schematic cross
1736 section of the containment system. At the Plant Site, the geologic conditions are favorable for
1737 such a containment system due to the presence of low permeability bedrock. Cross-section
1738 modeling of the containment systems performed by PolyMet and reviewed by the Co-leads
1739 provides strong evidence that the groundwater capture efficiency would be greater than 90
1740 percent.

1741 Along the eastern side of the Tailing Basin, high bedrock is predicted to eliminate most of the
1742 groundwater seepage. A containment system would be installed along the toe of slope of the Cell
1743 1E northeast dam, where seepage to groundwater may occur.

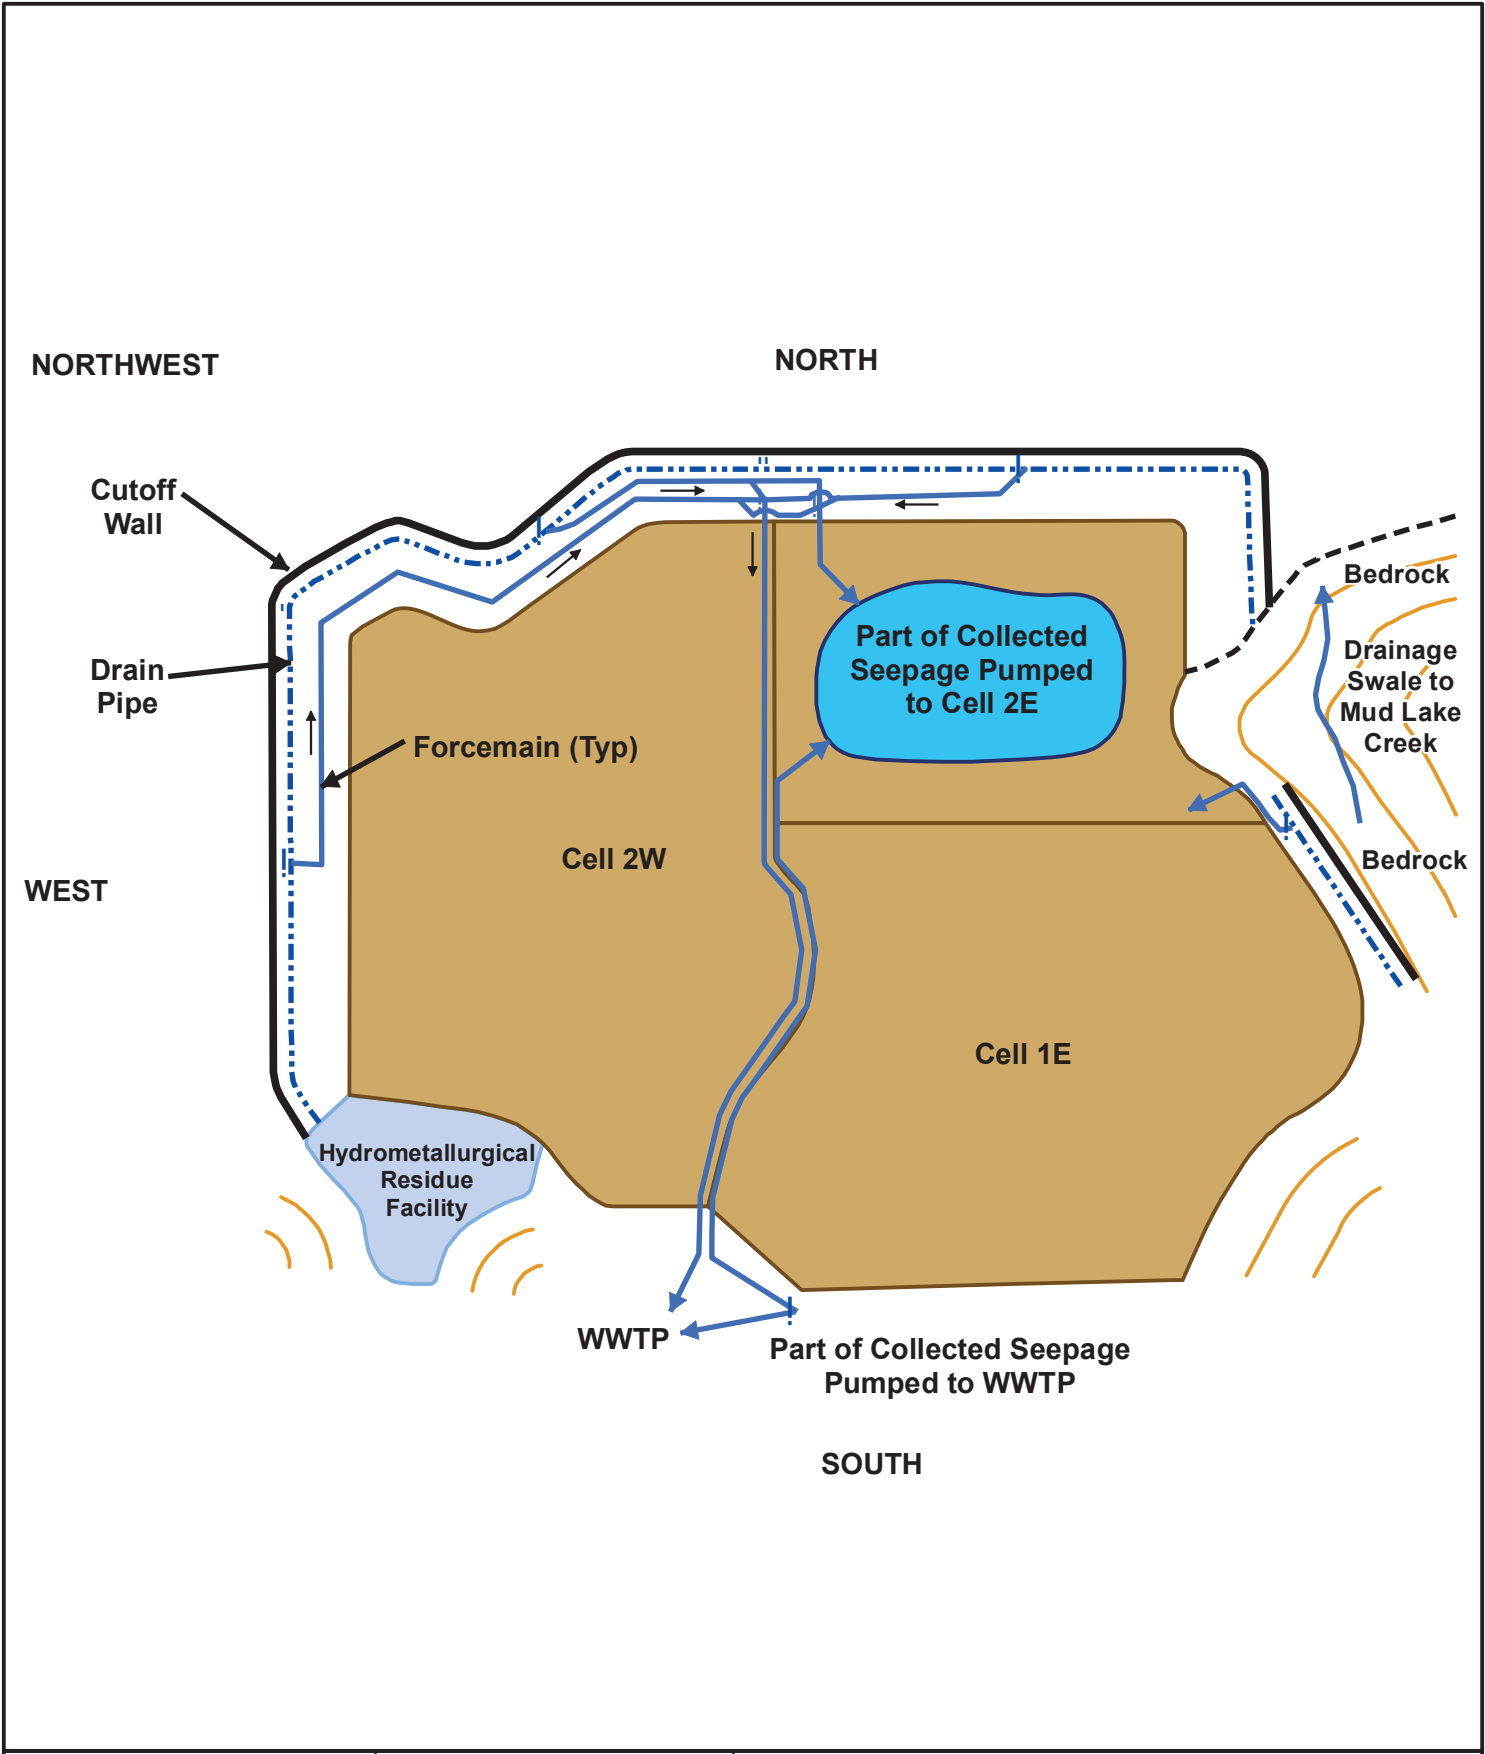

1744 Along the southern side, bedrock and surface topography create a narrow valley at the
1745 headwaters of Second Creek. Due to this topography and experience on the site, it is expected
1746 that all existing seepage from the Tailings Basin to the south emerges as surface seepage within a
1747 short distance of the embankment toe. An existing seepage management system currently
1748 captures the majority of the seepage leaving the Tailings Basin to the south. This system consists
1749 of a cutoff berm and trench placed approximately 200 to 250 ft downstream of the seepage face
1750 to collect this seepage. A seep collection sump, pump, and pipe system is being used to route this
1751 south seepage back into the Tailings Basin pond. During operations, PolyMet would pump this
1752 water to the Tailings Basin pond or to the WWTP. PolyMet and Cliffs Erie are currently working
1753 together to assess the efficiency of this seepage capture system. PolyMet has committed to
1754 collecting all of the seepage from the Tailings Basin in this area and would implement additional
1755 improvements if necessary. Improvements may include lining the existing upstream dam face
1756 with bentonite and injecting grout into the dam. A second dam could be constructed
1757 approximately 500 ft downstream of the existing dam where the geography is more constricted.
1758 This potential second dam may be earthen with a clay or concrete cutoff wall extending to
1759 bedrock.

1760 The containment system around the western, northern, and portions of the eastern sides of the
1761 Tailings Basin and the southern seepage management system are collectively referred to as the
1762 Tailings Basin seepage containment systems. Pond elevation would be controlled by pumping
1763 any excess Tailings Basin pond water to the WWTP. An emergency overflow channel would be
1764 constructed as a backup means of controlling pond elevation, but discharge from the emergency
1765 overflow to the environment is not expected. The emergency overflow would be provided for
1766 protection of the dams in the rare event that freeboard within the Tailings Basin is not sufficient
1767 to contain all stormwater. Such instances have the potential to occur in the event of a probable
1768 maximum precipitation (PMP) rainfall event or some fraction thereof. The PMP rainfall events
1769 are rare and such an event has a low likelihood of being experienced during the life of the basin.
1770 The PMP does not have an assigned return period, but it is usually assumed by hydrologists to be
1771 on the order of 1,000s of years.

1772 All groundwater and surface water seepage collected in the containment system around the
1773 Tailings Basin would be pumped back into the Tailings Basin pond or to the WWTP.

1774

DRAFT

1782 **Hydrometallurgical Residue Facility**

1783 The Hydrometallurgical Residue Facility would be double-lined to eliminate the release of
1784 residue leachate. The double liner would consist of a composite liner system utilizing a
1785 geomembrane liner above a geosynthetic clay liner, with a second liner placed above the first,
1786 separated by a leakage collection system (see Figure 3.2-30). This would substantially remove
1787 hydraulic head from the lower liner and thereby virtually eliminate leakage to groundwater from
1788 the Hydrometallurgical Residue Facility. Leakage that is collected would be pumped back to the
1789 Hydrometallurgical Residue Facility pond, which is collected and pumped back for use at the
1790 Hydrometallurgical Plant.

1791 PolyMet initiated laboratory testing to consider the chemical compatibility of the potential
1792 geosynthetic liner to be used with leakage from residue (PolyMet 2014r). Results indicated the
1793 use of a polymer-treated geosynthetic liner that is manufactured specifically in anticipation of the
1794 chemical characteristics of the pore water that would be contained within the residue. The
1795 hydraulic conductivity of the leakage collection system is not expected to degrade over time.
1796 Typical liner performance assumes a 500-year service life of the geomembrane; therefore,
1797 hydraulic conductivity of the liner is not expected to degrade over that time. Specific attributes
1798 would be determined during the geosynthetic clay layer development to achieve the desired
1799 performance before final installation.

1800 **Wastewater Treatment Plant**

1801 A WWTP would treat runoff, captured Tailings Basin seepage, and process water that could not
1802 be stored in the Tailings Basin. The WWTP would be constructed south of the Tailings Basin
1803 near the coarse-crusher and would include a RO unit or equivalently performing technology
1804 designed to meet water quality standards. The design of the WWTP could be adjusted to
1805 accommodate varying influent streams and discharge requirements.

1806 The reject concentrate stream from the WWTP would be transported to the WWTF at the Mine
1807 Site via rail tank cars, which is described in more detail below.

1808 **3.2.2.3.11 Water Management**

1809 During operations, the Tailings Basin would be the primary source for water used in the
1810 beneficiation process. The primary sources of water to the Tailings Basin would include direct
1811 precipitation, stormwater, snowmelt, flotation process water used to transport flotation tailings to
1812 the Tailings Basin, treated process water from the Mine Site, and water collected by the Tailings
1813 Basin seepage containment systems.

1814 The seepage containment systems that would be built around the Tailings Basin would result in a
1815 significant reduction in flow to four tributaries around the Tailings Basin that would require
1816 augmentation, including Unnamed Creek, Second Creek, Trimble Creek, and Mud Lake Creek.
1817 Flow to Unnamed Creek, Second Creek, and Trimble Creek would be augmented by WWTP
1818 effluent. Flow to Mud Lake Creek would be augmented by the construction of a drainage swale
1819 east of the Tailings Basin. Currently, an area east of Cell 1E drains into that cell. A drainage
1820 swale would be constructed near the east dam to reroute this watershed north to Mud Lake
1821 Creek. The primary purpose of this drainage swale would be to prevent water from pooling at the
1822 toe of the east dam; however, the swale would be constructed at the start of the NorthMet Project
1823 Proposed Action to augment flow to Mud Lake Creek.

1824 To the extent possible, water ponded at the Hydrometallurgical Residue Facility would be
1825 returned to the Hydrometallurgical Plant; however, some losses would occur through evaporation
1826 or storage within the pores of the deposited residue. The double-liner system described above
1827 would virtually eliminate liner leakage to groundwater. Leakage collected by the double-liner
1828 system would be recycled to the hydrometallurgical process.

1829 For the most part, water management within the Hydrometallurgical Plant would operate
1830 independently of water management within the Beneficiation Plant. The only exceptions would
1831 be the transfer of flotation concentrate from the Beneficiation Plant to the Hydrometallurgical
1832 Plant and the combining of filtered copper concentrate and solution from Au/PGE recovery in
1833 the copper cementation process step.

1834 The flow and management of water at the Plant Site during operation is summarized on Figure
1835 3.2-12 and Figure 3.2-13 in Section 3.2.2.1.

1836 **3.2.2.3.12 Reclamation and Long-term Closure Management**

1837 PolyMet has developed a Reclamation Plan, which would be submitted to the MDNR as part of
1838 its Permit to Mine. Reclamation Plans are also required for the Tailings Basin and the
1839 Hydrometallurgical Residue Facility. The Reclamation Plans would be finalized to provide
1840 details and a schedule for the final closure of the as-built facilities. In addition, PolyMet would
1841 also submit an annual contingency reclamation plan per *Minnesota Rules*, part 6132.1300,
1842 subpart 4, to identify activities that would be implemented if operations were to cease in that
1843 upcoming year.

1844 Similar to the Mine Site (see Section 3.2.2.1.10), where possible, the Plant Site facilities have
1845 been designed and would be operated to allow for concurrent reclamation. This would leave a
1846 smaller portion of the disturbed area requiring reclamation at closure. Under the NorthMet
1847 Project Proposed Action, concurrent reclamation at the Plant Site would include designing and
1848 constructing the dams for the Tailings Basin and Hydrometallurgical Residue Facility for long-
1849 term management of those wastes and covering the dams of the Tailings Basin with bentonite as
1850 they are constructed.

1851 At closure, PolyMet would first remove all infrastructure and facilities not approved for potential
1852 future use, followed by reclamation of disturbed lands. Reclamation objectives, which would be
1853 achieved during the closure process, would include rapidly establishing a self-sustaining plant
1854 community, controlling dust, controlling soil erosion, providing wildlife habitat, and minimizing
1855 the need for maintenance. Post-closure activities would include monitoring and maintenance of
1856 reclamation and water quality until the various facility features were deemed environmentally
1857 acceptable, in a self-sustaining and stable condition.

1858 The water quality objective of closure is to provide mechanical or non-mechanical treatment for
1859 as long as necessary to meet regulatory standards at applicable groundwater and surface water
1860 compliance points. Water quality modeling performed in support of this FEIS indicates that
1861 water treatment systems would be needed indefinitely at the Mine Site and Plant Site. The water
1862 models constructed to assess the potential effects from the NorthMet Project Proposed Action
1863 were not designed to predict the duration of treatment nor do they capture all the factors that
1864 influence the duration of treatment (e.g., potential future regulatory and technological changes).
1865 Therefore, the models cannot be used to predict when treatment would end. Actual treatment
1866 requirements would be assessed on a recurring basis throughout operations, reclamation, and

1867 closure considering influent and effluent water quality and monitoring results. Those periodic
1868 assessments would be carried out to ensure continuous protection of groundwater and surface
1869 water quality and compliance with water quality-based effluent limits. The periodic assessment
1870 process would rely on monitoring results coupled with predictive modeling rather than the results
1871 of the predictive modeling alone. Regardless of the precise duration of effects or water treatment
1872 at either the Mine Site or Plant Site, there are measures available to address impacts to natural
1873 resources. PolyMet would be held accountable for maintenance and monitoring required under
1874 the permit and would not be released from financial assurance until all permit conditions have
1875 been met.

1876 The reclamation and closure activities are discussed below.

1877 Features that would remain at the Plant Site during the post-reclamation period are shown on
1878 Figure 3.2-29.

Minnesota
June 2015

DRAFT

1882 **Building and Structure Demolition and Equipment Removal**

1883 All buildings and structures not approved for potential future use would be removed and
1884 foundations would be razed and covered with a minimum of 2 ft of soil and vegetated according
1885 to *Minnesota Rules*, parts 6132.2700 and 6132.3200. Demolition waste from structure removal
1886 would be disposed of in the existing on-site demolition landfill (SW-619) located northwest of
1887 the Area 1 Shop at the Plant Site. Concrete from demolition, with the exception of oil-stained
1888 concrete, would be crushed and used for structural fill, placed in the basements of the coarse-
1889 crusher, concentrator, and the plant reservoir, or placed in landfills as required. Oil-stained
1890 concrete requires different handling and is addressed in the Special Material Disposal section
1891 below.

1892 Most roads, parking areas, or storage pads built to access these facilities would be demolished
1893 according to the planned schedule or as approved by the MDNR Commissioner. Utility tunnels
1894 would be sealed and closed in place. Asphalt from paved surfaces would be removed and
1895 recycled and the disturbed areas would be reclaimed and vegetated according to *Minnesota*
1896 *Rules*, part 6132.2700. Railroad track and ties that were not used by common carriers would be
1897 removed and recycled. Any roads that may develop into unofficial off-road vehicle trails would
1898 require a variance from MDNR reclamation rules to allow a 15-ft-wide unpaved, unvegetated
1899 track down the centerline of the road. Such approvals would also be coordinated with the St.
1900 Louis County Mine Inspector's Office.

1901 All plant, railroad, service, and electrical equipment would be scrapped, decommissioned, or
1902 sold. PolyMet would also close on-site sewer and water systems, power lines, pipelines
1903 (including hydrometallurgical residue pipelines), and culverts according to proper regulatory
1904 requirements.

1905 **Special Material Disposal**

1906 Special materials on-site at the time of reclamation would be disposed of as follows:

- 1907 • Asbestos-containing materials (ACMs) – a detailed survey of ACMs (i.e., pipe and electrical
1908 insulation in former LTVSMC utility tunnels, siding, water-heating system insulation, lube
1909 system insulation, floor tile) has been completed of the existing LTVSMC facilities. New
1910 facilities would not have ACMs. A detailed inventory of ACM locations would be
1911 maintained as part of the NorthMet Project Proposed Action documentation. Appropriate
1912 controls would be put in place or ACMs would be removed intact, properly packaged, and
1913 disposed of in the on-site demolition landfill. ACM locations in the landfill would be noted
1914 on the property deed. Any ACMs found in utility tunnels would be sealed before the utility
1915 tunnel is closed.
- 1916 • Nuclear sources (i.e., nuclear-density gauges used to measure slurry density during
1917 processing) – these sources would be removed and properly disposed of.
- 1918 • Partially used paint, chemical, and petroleum products – these materials would be collected
1919 and properly recycled or disposed of.
- 1920 • Fluorescent and sodium halide bulbs – these would be removed from fixtures, collected, and
1921 properly disposed of.

- 1922 • Oil-stained concrete – this material would be tested to characterize the material for beneficial
1923 reuse such as structural fill. If the material does not meet the solid waste criteria for
1924 beneficial reuse, the oil-stained concrete would be removed and properly disposed of.

1925 All special materials would be properly managed and/or disposed of in accordance with local,
1926 state, and federal regulations and requirements during reclamation activities.

1927 **Product and Product Tank Disposal**

1928 The reagent suppliers, which would be under contract to PolyMet, would remove any reagents
1929 remaining during reclamation. In many cases, the suppliers of chemicals and equipment would
1930 be responsible for furnishing tanks and would therefore be required to remove and dispose of
1931 those tanks during reclamation. Those tanks for which PolyMet would be responsible would be
1932 processed for demolition as follows:

- 1933 • The tanks would be cleaned to remove remaining materials and sludge.
- 1934 • The remaining materials, sludges, and wash materials would be sent to an appropriate
1935 recycling or waste-disposal facility.
- 1936 • Large ASTs would be tested for lead paint prior to demolition and, where found, disposal and
1937 recycling would be modified to accommodate the lead content.
- 1938 • All tanks would be disassembled for disposal or recycling, as appropriate.
- 1939 • Below-grade foundations would be left in place and buried.
- 1940 • Smaller ASTs would be cleaned and removed without disassembly.

1941 **Other Reclamation Details**

1942 There would be several places where concentrate having up to 20 percent sulfur could
1943 accumulate (i.e., dry-concentrate storage bins, froth launders and sumps, concentrate thickeners,
1944 concentrate filters). Because this would be a high-value material, there would be an effort to ship
1945 as much as could be recovered. However, material remaining in the equipment and process
1946 piping would be properly disposed of in the Hydrometallurgical Residue Facility or other
1947 MPCA-approved locations.

1948 **Cover and Revegetation of the Building Area**

1949 After demolition of Plant Site buildings, these areas would be reclaimed and vegetated according
1950 to *Minnesota Rules*, part 6132.2700. All areas would be stabilized as required for stormwater
1951 management. Roads and parking lots would be reclaimed and vegetated according to *Minnesota*
1952 *Rules*, part 6132.2700. Asphalt pavement would be recycled or properly disposed of.

1953 Disturbed areas on the Plant Site would be seeded with a certain selection of grasses/forbs and a
1954 potentially different group of species for the slopes. The three groups of species would include a
1955 native, slow growth mix; a non-native, rapid growth mix; and a mix of both native and non-
1956 native species. Non-native species would be used to ensure dust control on areas that have a
1957 higher potential to erode.

1958 **Tailings Basin Reclamation**

1959 During reclamation of the Tailings Basin, fugitive dust would be controlled on the upland areas
1960 by mulching and permanent vegetation.

1961 Inactive interior beach areas would be temporarily vegetated as necessary for fugitive dust
1962 control, using oats, winter wheat, annual ryegrass, white clover, redtop, and alsike clover, or
1963 some combination of these species for various times of the year. The exterior dam faces would
1964 be permanently vegetated by a qualified reclamation contractor according to requirements of the
1965 Reclamation Seeding Plan. Upland areas would be planted with permanent vegetation and
1966 mulched to control potential fugitive dust in accordance with requirements in the Fugitive
1967 Emissions Control Plan. Upland beach areas would be planted with the same potential three
1968 mixes as that mentioned for disturbed areas on the Plant Site (native, non-native, or mixed),
1969 while the dam slopes and benches would be planted with the same mix as that mentioned for the
1970 slopes of the Category 1 Stockpile.

1971 Infiltration would be reduced through the dam faces, beaches, and pond bottom of the Tailings
1972 Basin by bentonite amendment as follows:

- 1973 • the exterior face of the dams would be reclaimed progressively, with a bentonite layer added
1974 as they are constructed, to limit oxygen diffusion;
- 1975 • exposed beaches and dam tops would be amended with a bentonite layer to limit oxygen
1976 diffusion; and
- 1977 • the pond bottom would be covered with a bentonite layer to maintain a permanent pond that
1978 would limit oxygen diffusion. Water management would include maintenance of a pond and
1979 wetland within the reclaimed Tailings Basin, stormwater management, and continued
1980 operation of the WWTP and the groundwater containment system.

1981 The pond would remain in the reclaimed Tailings Basin with a wetland around its perimeter. In
1982 general, the pond's maximum lateral extent would be maintained to be no closer than 625 ft from
1983 the interior edge of the Cell 1E/2E dams. The pond and wetland would receive surface water
1984 runoff from the crest and beaches of the basin and natural terrain adjacent to the Tailings Basin.
1985 The pond and wetland would continue to lose water via seepage, but at a reduced rate compared
1986 to operations, as a result of the bentonite amendment of the tailings surface. Water would be
1987 pumped from the Tailings Basin pond to the WWTP prior to discharge.

1988 Stormwater management would include grading to provide a gently sloping surface that would
1989 route surface water runoff to the interior of the basin, accommodate future differential settlement
1990 of the underlying tailings, and maintaining ponding of water in the reclaimed Tailings Basin
1991 pond for the development of constructed wetlands.

1992 An emergency overflow channel would be constructed to carry stormwater from the pond to the
1993 adjacent wetland in case of an extreme storm or snowmelt event after reclamation. The channel
1994 would be sized and designed to safely discharge at a flow sufficient to protect the Tailings Basin
1995 dams and would be constructed into bedrock to protect the channel from erosion and minimize
1996 maintenance requirements. A riprap delta would be installed where the channel ends to distribute
1997 the stormwater. Additional sediment control and energy dissipation structures would be
1998 incorporated at the channel discharge point if needed based on final design determinations. The
1999 conceptual location of the spillway from the combined Cell 1E and Cell 2E to the adjoining land
2000 is shown on Figure 3.2-29.

2001 The WWTP and the seepage containment systems would continue to operate during reclamation,
2002 although seepage rates would be progressively reduced. Seepage would be pumped back into the
2003 Tailings Basin pond, treated at the WWTP with discharge used for stream augmentation, as
2004 described in Sections 3.2.2.3.10 and 3.2.2.3.11), or sent to the Mine Site to aid in West Pit
2005 flooding (along with excess water from the WWTP not needed for stream augmentation). The
2006 WWTP and the seepage capture systems would be periodically inspected to ensure continuing
2007 integrity.

2008 **Hydrometallurgical Residue Facility Reclamation**

2009 Reclamation of the Hydrometallurgical Residue Facility would include removal of ponded water,
2010 removal of pore water from the residue, construction of the cover system, and establishment of
2011 vegetation and surface water runoff controls.

2012 Once the Hydrometallurgical Residue Facility becomes full, it would be dewatered by an initial
2013 decanting of ponded water and then drainage from the residue would be collected using a
2014 geocomposite drainage net and system of sidewall riser and pump systems. Ponded water
2015 remaining in the Hydrometallurgical Residue Facility would be removed and treated at the
2016 WWTP. Some water in the residue void spaces would be retained in the residue (stored water)
2017 while the other portion would drain from the residue (drainage). Drainage would be collected
2018 from the base of the cells at the geocomposite drainage system and managed as described
2019 previously for ponded water.

2020 Early in the residue dewatering process, access to the residue surface may be somewhat difficult
2021 due to its fine-grained characteristics. A temporary cover would be placed to limit infiltration of
2022 precipitation while dewatering progresses and the residue consolidates and settles. The barrier
2023 layer of the temporary cover, in addition to covering the deposited residue, would be extended
2024 over the dams to exclude rainwater infiltration back into the residue while also accommodating
2025 settlement of the temporary cover system. The settlement of the temporary cover would be
2026 monitored, and when the rate and magnitude of settlement has diminished, the final cover would
2027 be placed.

2028 The rate of drainage would decrease over time as the pore water within the hydrometallurgical
2029 residue is collected and removed. Once the entire facility is closed, the volume of water from the
2030 drainage collection systems would decline. In the long term, the volume of water requiring
2031 treatment would decline to the point that the remaining reclamation activity may consist of
2032 periodic pumping of remaining drainage into tank trucks for transportation, treatment, and
2033 disposal, as appropriate, and of inspection of the closed cells to verify integrity of the
2034 reclamation systems.

2035 The Hydrometallurgical Residue Facility area would be graded to a gently sloping surface. The
2036 cover would consist of a layer of NorthMet tailings and/or local till soil layer above the drained
2037 hydrometallurgical residue, placed to provide a suitable foundation layer for subsequent
2038 reclamation construction activity. This would be topped, if necessary, with a non-woven needle-
2039 punched geotextile fabric. Next, a geosynthetic clay barrier layer and 40-mil low-density
2040 polyethylene (LDPE) or similar agency-approved barrier layer system would be placed. Finally,
2041 additional LTVSMC tailings and/or local till soils would be placed to create a surface capable of
2042 sustaining a vegetated cover. The reclaimed Hydrometallurgical Residue Facility would be
2043 seeded with a certain selection of grasses/forbs and a potentially different group of species for

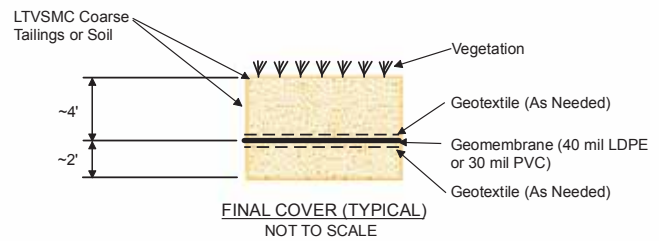

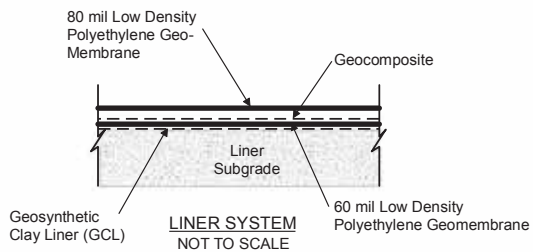

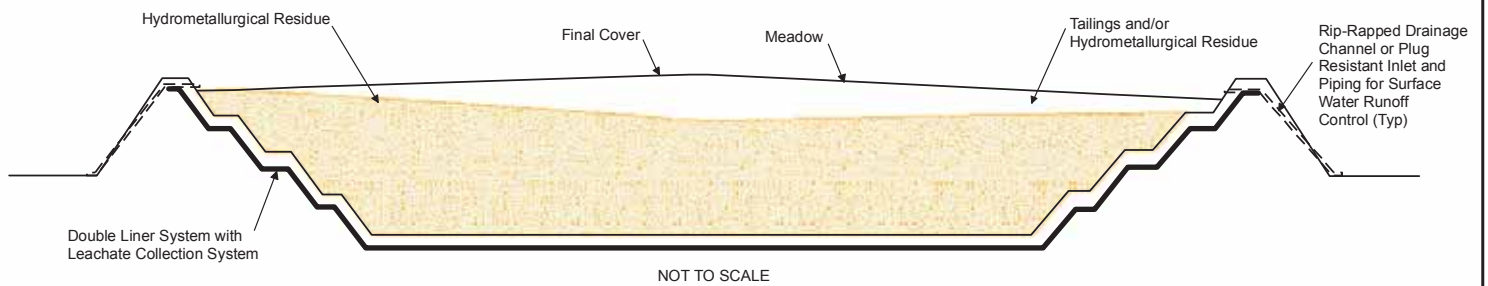

2044 the slopes. The three groups of species would include a native, slow growth mix; a non-native,
2045 rapid growth mix; and a mix of both native and non-native species. Non-native species would be
2046 used to ensure dust control on areas that have a higher potential to erode.

2047 Turf and final cover would be inspected and maintained by mowing once per year or as needed,
2048 fertilizing when visual inspection indicates poor vegetation growth, and implementing repairs. A
2049 schematic cross section of the Hydrometallurgical Residue Facility post-closure is provided on
2050 Figure 3.2-30.

2051 The cover would slope gently toward the site perimeter to accommodate natural drainage of the
2052 runoff. Final cover slopes on the Hydrometallurgical Residue Facility interior would be
2053 relatively shallow to minimize the velocity of surface water runoff flow and the associated
2054 erosion. Runoff channeled along the Hydrometallurgical Residue Facility perimeter would be
2055 routed down-slope via rip-rapped drainage swales or plug-resistant inlet structures and piping
2056 systems. Runoff from the Hydrometallurgical Residue Facility exterior dam slope (constructed of
2057 MDNR-approved material LTVSMC tailings or local till soils) would be routed to the
2058 surrounding natural drainage system.

DRAFT

2062 **Water Management**

2063 During the reclamation phase, while the Tailings Basin is being reclaimed and the West Pit is
2064 being flooded (approximately years 21-52), the seepage from the Tailings Basin would continue
2065 to be collected. A portion of this water would be sent to the WWTP and treated, and a portion of
2066 the water would bypass the WWTP, where it would be blended back with the treated portion and
2067 pumped both to the West Pit and the Tailings Basin pond. Several years after the start of
2068 reclamation, the bottom of the Tailings Basin pond bottom would be lined with bentonite (see
2069 Section 3.2.2.3.12) and the pond water would be pumped to the WWTP, treated, and returned to
2070 the pond to the extent possible. The proposed water management for approximate years 31-52 is
2071 shown in Figure 3.2-18 in Section 3.2.2.1. Water in the Tailings Basin would be withdrawn,
2072 treated, and discharged as required to maintain pond levels.

2073 At the Hydrometallurgical Residue Facility, a temporary cover would be placed to limit
2074 infiltration of precipitation while dewatering progresses and the residue consolidates and settles
2075 before the final cover is put in place. Drainage from the Hydrometallurgical Residue Facility
2076 would be pumped to the WWTP for treatment along with the Tailings Basin water. The rate of
2077 drainage would decrease over time as the pore water within the residue is collected and removed.

2078 During the long-term maintenance phase, after the Tailings Basin has been reclaimed and
2079 hydrology has stabilized, the WWTP would be upgraded to include an evaporator, and Tailings
2080 Basin seepage would be collected and discharged via the WWTP until non-mechanical treatment
2081 has been demonstrated to provide appropriate treatment. Refer to the Transition from Mechanical
2082 to Non-Mechanical Treatment section under section 3.2.2.1.10 for more information on non-
2083 mechanical treatment. The proposed long-term water management (year 52 and beyond) is
2084 shown in Figure 3.2-19 in Section 3.2.2.1. The objective of the Tailings Basin cover would be to
2085 manage the constituent load from the tailings. The objective of the WWTP would be to treat
2086 Tailings Basin seepage that is captured by the seepage capture systems to meet effluent limits.
2087 Water from the drainage collection systems of the Hydrometallurgical Residue Facility is also
2088 directed to the WWTP for treatment to meet effluent limits. In the long term, reject concentrate
2089 from the WWTP RO unit or equivalently performing technology would be evaporated and the
2090 residual solids would be disposed of off-site.

2091 The objective of closure is to provide mechanical or non-mechanical treatment for as long as
2092 necessary to meet regulatory standards at applicable groundwater and surface water compliance
2093 points. Water quality modeling performed in support of this FEIS indicates that water treatment
2094 systems would be needed indefinitely at the Mine Site and Plant Site. The water models
2095 constructed to assess the potential effects from the NorthMet Project Proposed Action were not
2096 designed to predict the duration of treatment nor do they capture all the factors that influence the
2097 duration of treatment (e.g., potential future regulatory and technological changes). Therefore, the
2098 models cannot be used to predict when treatment would end. Actual treatment requirements
2099 would be assessed on a recurring basis throughout operations, reclamation, and closure
2100 considering influent and effluent water quality and monitoring results. Those periodic
2101 assessments would be carried out to ensure continuous protection of groundwater and surface
2102 water quality and compliance with water quality-based effluent limits. The periodic assessment
2103 process would rely on monitoring results coupled with predictive modeling rather than the results
2104 of the predictive modeling alone. Regardless of the precise duration of effects or water treatment
2105 at either the Mine Site or Plant Site, there are measures available to address impacts to natural

2106 resources. PolyMet would be held accountable for maintenance and monitoring required under
2107 the permit and would not be released from financial assurance until all permit conditions have
2108 been met.

2109 **Post-reclamation Activities**

2110 Maintenance activities that would continue throughout reclamation and post-reclamation include
2111 dam slope erosion repair, woody species and tree removal on the Hydrometallurgical Residue
2112 Facility cover system, and Tailings Basin seepage capture systems operation and maintenance.
2113 PolyMet has committed to conduct demonstration projects during the Life of Mine and
2114 reclamation to establish non-mechanical water treatment systems to be used at the Plant Site.
2115 However, the WWTP would remain operational until water quality monitoring results meet
2116 permit requirements without the need for mechanical treatment.

2117 PolyMet would be held accountable to maintenance and monitoring required under permit and
2118 would not be released until all conditions have been met.

2119 **3.2.2.4 Financial Assurance**

2120 *Minnesota Rules*, part 6132.1200, require that before a Permit to Mine can be issued, financial
2121 assurance instruments covering the estimated cost of reclamation, should the mine be required to
2122 close for any reason at any time, must be submitted and approved by the MDNR. There are no
2123 applicable federal financial assurance requirements that would be incorporated into the Permit to
2124 Mine. Financial assurance could be required indefinitely and could include self-sustaining
2125 instruments as discussed in the following sections.

2126 Financial assurances for the direct wetland impact mitigation would be required until success of
2127 the mitigation sites can be assured. While this wetland mitigation would be expected to be
2128 approved and constructed in advance of any authorized wetland impacts, it is unclear whether
2129 these sites would be well enough established for financial assurances to be waived. The USACE
2130 would also consider the application of financial assurances for potential indirect wetland effects
2131 and monitoring. Both the USACE and state would require consideration of financial assurances
2132 during the permitting process.

2133 The level of engineering design and planning required to calculate detailed financial assurance
2134 amounts is not currently available, but would be evaluated in detail during the permitting
2135 process. The following sections have been prepared to outline the purpose and requirement of
2136 financial assurance, including the rules and criteria that would be used in determining financial
2137 assurance and the risk analysis involved, as well as how PolyMet would calculate financial
2138 assurance during the permitting process.

2139 **3.2.2.4.1 Cost Coverage and Estimation**

2140 Financial assurance must cover the reclamation and post-reclamation activities that would incur
2141 costs to execute required funding. These activities include (but are not limited to):

- 2142 • Implementation of corrective actions that may become necessary to address any permit non-
2143 compliance;
- 2144 • Demolition of all structures;

- 2145 • Remediation of any sites where petroleum products, reagents, additives, or other potential
2146 pollutants may have been released;
 - 2147 • Implementation of reclamation such as:
 - 2148 – Fencing the perimeters;
 - 2149 – Sloping and seeding the overburden portion of the pit walls;
 - 2150 – Constructing the East Pit outlet structure;
 - 2151 – Shaping and covering the Category 1 Stockpile;
 - 2152 – Removing culverts, dikes, ditches, and ponds, followed by grading and seeding;
 - 2153 – Constructing mitigation wetlands on the vacated stockpile locations;
 - 2154 – Closing and covering the Hydrometallurgical Residue Facility;
 - 2155 – Reseeding all areas; and
 - 2156 – Reclaiming the Tailings Basin.
 - 2157 • Long-term post-closure monitoring and maintenance including:
 - 2158 – Monitoring and maintenance of the covers, slopes and containment systems of the
2159 Category 1 Stockpile, Hydrometallurgical Residue Facility, and Tailings Basin;
 - 2160 – Treatment of East Pit water and West Pit water in the WWTF;
 - 2161 – Collecting and pumping water from the Tailings Basin to the WWTP for discharge or
2162 transfer to the Mine Site for pit flooding;
 - 2163 – Off-site disposal of pore water from Hydrometallurgical Residue Facility;
 - 2164 – Monitoring and reporting groundwater and surface water quality; and
 - 2165 – Developing and implementing non-mechanical water treatment systems.
 - 2166 • Project management and site security for the above.
- 2167 Reclamation and post-reclamation costs are required, under the Permit to Mine, to be updated on
2168 an annual basis to account for the proceeding year's activities. This requires estimating the
2169 contingency funds required for closure and post-closure activities in the event of unplanned
2170 closure during the course of the year. Revisions would capture annual changes in contingency
2171 reclamation activities and costs such as:
- 2172 • An annual increase in Mine Site provisions as mining proceeds and the amount of
2173 disturbance, size of permanent stockpile, and volume of temporary stockpiles to be backfilled
2174 increase.
 - 2175 • An increase in Tailings Basin provisions as the beach and pond areas increase.
 - 2176 • A potential decrease in Mine Site provisions as ongoing reclamation (e.g., backfilling of
2177 temporary stockpiles) is completed as contemplated in the Mining and Reclamation Plan.
2178 This is expected to occur as the facility nears reclamation.

2179 The final Reclamation Plan (to be applied at the end of mining to cover the closure process and
 2180 post-closure activities) and the Contingency Reclamation Cost Estimate (contingency for mine
 2181 closure prior to the planned 20-year Life of Mine) would be developed by PolyMet and its
 2182 consultants based on detailed engineering studies that would be finalized through the permitting
 2183 process. As required, PolyMet would ensure that the financial assurance amount is established as
 2184 a function of (but not limited to) the following three main variables:

- 2185 • extent of surface disturbance and potential releases from waste storage facilities;
- 2186 • reclamation and long-term care standards (including mechanical water treatment); and
- 2187 • reasonable assessment of the costs to execute the Contingency Reclamation Plan.

2188 PolyMet has developed preliminary cost estimate ranges that address the above items for
 2189 hypothetical closure at years 1, 11, and 20. These estimates are provided in Table 3.2-15 below.
 2190 In addition to the cost of physical closure and reclamation activities as shown in Table 3.2-15,
 2191 annual post-closure monitoring and maintenance is estimated to be in the range of \$3.5m - \$6m
 2192 per year.

2193 The cost estimates would be finalized by the MDNR during the permitting processes.

2194 **Table 3.2-15 Preliminary Cost Estimate for Closure**

	Year of Closure (end of year)			Annual Post-closure Monitoring and Maintenance
	Year 1	Year 11	Year 20	
Estimated Range	\$50m - \$90m	\$160m - \$200m	\$120m - \$170m	\$3.5m - \$6m

2195 Source: Foth 2013.

2196 **3.2.2.4.2 Financial Assurance Instruments**

2197 The financial instruments must be robust enough to address a wide variety of contingencies such
 2198 as (but not limited to):

- 2199 • Physical difficulties in implementing reclamation plans;
- 2200 • Escalating standards of closure, reclamation, and long-term monitoring;
- 2201 • Unanticipated liabilities;
- 2202 • Unplanned cessation of mining;
- 2203 • Failure of the mining company; and
- 2204 • Failure or limitations on the ability of third parties to pay reclamation costs.

2205 The financial assurance instruments for the NorthMet Project Proposed Action must:

- 2206 • Be available and made payable to the MDNR when needed;
- 2207 • Be sufficient to cover the costs estimated;
- 2208 • Be fully valid, binding, and enforceable under state and federal law;
- 2209 • Not be dischargeable through bankruptcy; and

2210 • Be approved by the MDNR.

2211 PolyMet intends to propose financial instruments based on appropriateness and compatibility
2212 with the specific activities for which assurance is being provided. It is likely that different
2213 instruments would be proposed to assure different components of the reclamation cost estimate
2214 and so would likely use more than one instrument at any point in time. For example, while
2215 insurance policies may not be appropriate for primary assurance, they could provide meaningful
2216 additional support over and above the expected costs or activities. Commonly accepted financial
2217 assurance instruments, such as the following, would be proposed:

- 2218 • Surety bonds;
- 2219 • Irrevocable letters of credit;
- 2220 • Cash and cash equivalents;
- 2221 • Trust funds;
- 2222 • Insurance policies; or
- 2223 • A combination thereof.

2224 **3.2.2.4.3 Cessation of Financial Assurance**

2225 PolyMet may cancel financial assurance only upon approval by the MDNR after it is replaced by
2226 an alternative mechanism or after being released (in whole or in part) from financial assurance.

2227 MDNR would release PolyMet from the responsibility to maintain financial assurance when the
2228 MDNR determines, through inspection of the mining area, that:

- 2229 • All reclamation activities have been completed in accordance with the Permit to Mine;
- 2230 • Conditions necessitating post-reclamation monitoring and maintenance no longer exist and
2231 are not likely to recur; and
- 2232 • Corrective actions have been successfully completed and monitoring of those corrective
2233 actions are no longer needed.

2234 **3.2.3 NorthMet Project Alternatives**

2235 Both federal and state law require agencies to consider reasonable alternatives as part of their
2236 respective responsibilities. The purpose of the alternatives process is to allow for the
2237 identification and consideration of other reasonable alternative means to achieve the project
2238 Purpose and Need and that could also improve environmental and/or socioeconomic benefits.
2239 Alternatives offer decision makers and the public options to the proposal and include a no action
2240 alternative that considers the effects that would occur if the project is not approved.

2241 This section describes the process by which the Co-lead Agencies identified, screened, and
2242 determined alternatives to the NorthMet Project Proposed Action that would be carried forward
2243 for analysis in this FEIS.

2244 **3.2.3.1 Process Overview**

2245 NEPA and the CEQ regulations (40 CFR 1500-1508) require that a “range of alternatives” must
2246 be considered in the EIS. NEPA does not prescribe any minimum number of alternatives, other
2247 than that the no action alternative must be included (40 CFR 1502.14) (CEQ 1981).

2248 Under MEPA, the MEQB statutes and rules (*Minnesota Statutes*, chapter 116D, sections 04 and
2249 045; and Minnesota Rules, part 4410, subpart 0200 through 7500) require that an EIS consider at
2250 least one alternative from each of the following categories (State of Minnesota 2009):

- 2251 • Alternative sites;
- 2252 • Alternative technologies;
- 2253 • Modified designs or layouts;
- 2254 • Modified scale or magnitude; and
- 2255 • Alternatives incorporating reasonable mitigation measures.

2256 Under both NEPA and the CEQ regulations, and MEQB Rules for MEPA, alternatives may
2257 include a number of individual mitigation measures that collectively constitute a major change to
2258 the proposed action and would provide decision makers a meaningful choice. Single resource-
2259 specific mitigation measures do not normally require a separate alternative to be considered and
2260 evaluated in an EIS.

2261 **3.2.3.1.1 Identification**

2262 Alternatives may be identified at any time throughout the EIS process, including during the
2263 scoping process, which is used to identify issues that trigger the analysis of effects and the
2264 development of potential alternatives. Alternatives may also be identified by either the proponent
2265 or the Co-lead Agencies at any other time during the process as a result of gaining new
2266 information regarding the project’s effects or for other reasons.

2267 Alternatives to the NorthMet Project Proposed Action were identified in accordance with the
2268 requirements of NEPA and the CEQ regulations and Forest Service NEPA regulations at 36 CFR
2269 220.5e(1) and MEQB Rules for MEPA. Alternatives identified and considered for the NorthMet
2270 Project Proposed Action are described in Section 3.2.3.2 through Section 3.2.3.5 below.

2271 **3.2.3.1.2 Screening**

2272 Once identified, alternatives for the NorthMet Project Proposed Action were screened against the
2273 following criteria to determine if they warranted further evaluation:

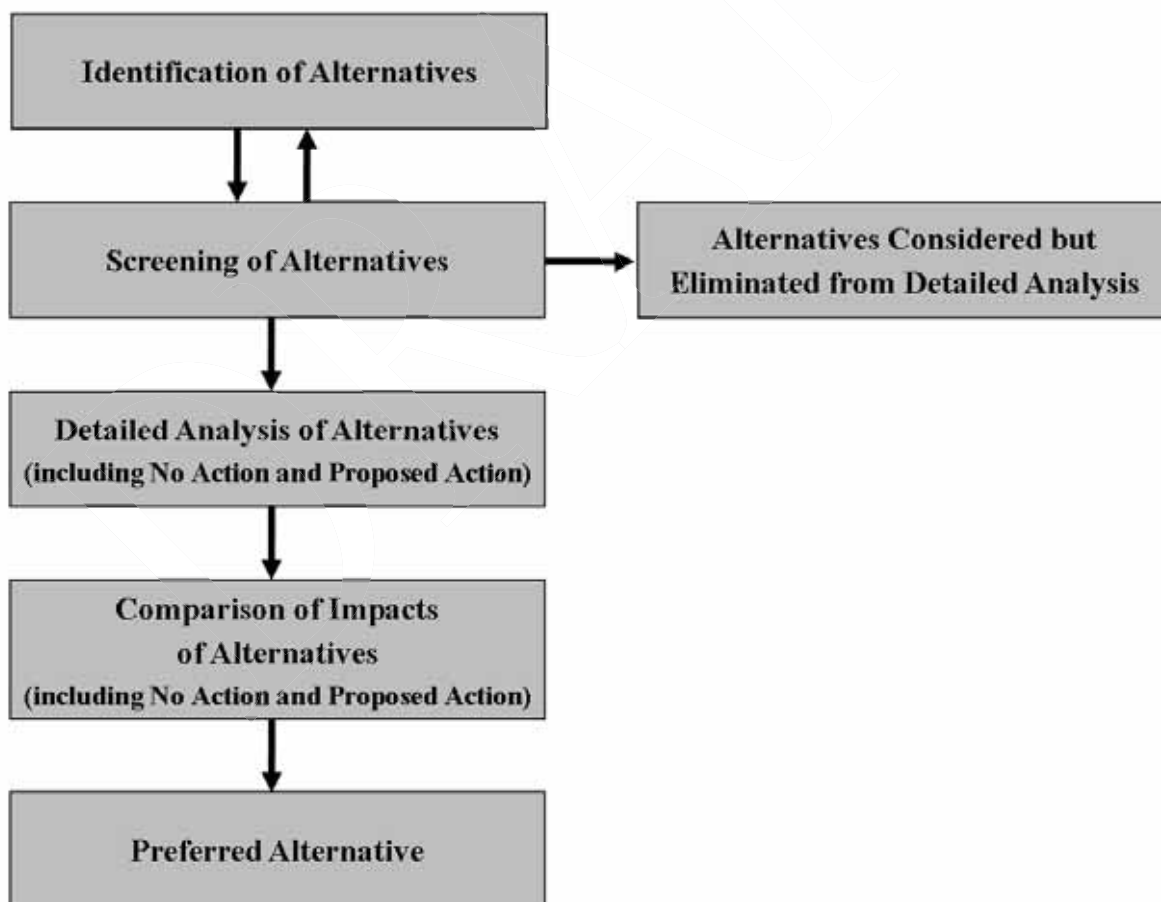

- 2274 • Purpose and Need – Each alternative was assessed as to whether it would meet the Purpose
2275 and Need for the project.
- 2276 • Technical feasibility – Each alternative was assessed as to whether it could be implemented
2277 using currently available technology based on the current level of knowledge.
- 2278 • Economic feasibility – Each alternative was assessed as to whether it could meet economic
2279 and financial requirements to construct and operate the proposed project, including whether
2280 the cost of implementing the alternative would be economically feasible to meet the Purpose
2281 and Need.

2282 • Availability – Each alternative was assessed as to whether surface rights, mineral rights,
2283 technologies, and other resources required are currently available.

2284 • Environmental or socioeconomic benefits – Each alternative was assessed to determine if it
2285 offered substantial environmental or socioeconomic benefits over other alternatives,
2286 including the NorthMet Project Proposed Action.

2287 Some alternatives needed to be screened more than others to inform a conclusive decision on
2288 whether or not to analyze them in detail in this FEIS. This process was iterative in that
2289 alternatives continued to be screened as they passed through initial filters and as the project
2290 evolved.

2291 Alternatives that did not meet the screening criteria were not considered reasonable and were
2292 eliminated from detailed analysis in this FEIS. Alternatives that met the screening criteria were
2293 fully analyzed and compared equally in the EIS. The general screening and assessment process
2294 applied to alternatives identified for the NorthMet Project Proposed Action is shown in Figure
2295 3.2-31. The process ultimately informs decision-makers during the identification of an agency-
2296 preferred alternative in a DEIS (or SDEIS), if one exists, and in this FEIS unless another law
2297 prohibits the expression of such a preference (40 CFR 1502.14(e)). MEPA does not require
2298 identification of a preferred alternative.

2299

2300

Figure 3.2-31 Alternative Assessment Process

2301 **3.2.3.1.3 NorthMet Project Alternatives Analyzed in this FEIS**

2302 As discussed in the following sections (after the No Action Alternative section below), the
2303 NorthMet Project Proposed Action incorporates activities and environmental impact mitigation
2304 measures that have been evaluated and developed through the EIS process.

2305 The alternatives and mitigation measures identified and considered were either incorporated into
2306 the NorthMet Project Proposed Action as they offered benefits to the outcomes of the project, or
2307 they were eliminated from detailed evaluation because they did not offer measurable or
2308 substantial environmental benefits over other alternatives (including the NorthMet Project
2309 Proposed Action), they were not reasonable (i.e., weren't economically or technically feasible in
2310 accordance with CEQ guidelines), or would not meet the Purpose and Need.

2311 As a result of screening and analysis, the NorthMet Project No Action Alternative (i.e., the
2312 NorthMet Project Proposed Action would not occur) is the only alternative to the NorthMet
2313 Project Proposed Action evaluated in detail in this FEIS. Tailings Basin closure cap alternatives
2314 were reconsidered, and underground mining and backfilling the West Pit with Category 1 waste
2315 rock were considered in more detail, but remained eliminated.

2316 **3.2.3.2 NorthMet Project No Action Alternative**

2317 Under the NorthMet Project No Action Alternative, the NorthMet Project Proposed Action
2318 would not occur. The consideration of a No Action Alternative is required to be evaluated in this
2319 FEIS in accordance with NEPA and MEPA.

2320 If the NorthMet Project Proposed Action is not approved, the Mine Site would be returned to
2321 pre-exploration conditions under the requirements of exploration approvals to reclaim surface
2322 disturbance associated with exploratory and development drilling activities. Other existing
2323 surface uses would be allowed to continue consistent with the Forest Plan.

2324 No further upgrades or new segments would be constructed along the existing power
2325 transmission line, railroad, or Dunka Road, which would continue to be used by their private
2326 owners.

2327 At the brownfield Plant Site, Cliffs Erie would continue to complete closure and reclamation
2328 activities as specified under state permits and plans and the Cliffs Erie Consent Decree. This
2329 would include completing activities for the localized affected areas under the Minnesota
2330 Voluntary Investigation and Cleanup (VIC) Program, removal of the former Plant Site building,
2331 and management of seepage at the Tailings Basin embankment.

2332 **3.2.3.3 Development of the NorthMet Project Proposed Action and Alternatives**

2333 The NorthMet Project Proposed Action and alternatives were developed during project scoping
2334 in 2005. Potential effects were analyzed and discussed in the 2009 DEIS (MDNR and USACE
2335 2009). Following public and agency comment on the DEIS, evolving MPCA water quality
2336 guidance, project refinements made by PolyMet, and the addition of the Land Exchange
2337 Proposed Action, the Co-lead Agencies decided to prepare an SDEIS before this FEIS.

2338 **3.2.3.3.1 Summary of Alternatives Analysis from the FSDD**

2339 The MEPA scoping process for the NorthMet Project Proposed Action began with the June 2005
2340 publication of a Scoping Environmental Assessment Worksheet (EAW) and a Draft Scoping

2341 Decision Document. The NEPA scoping process began in July 2005 with the publication by the
2342 U.S. Army Corps of Engineers (USACE) of a Notice of Intent to prepare an EIS for the
2343 NorthMet Project Proposed Action. The agencies engaged in public review and comment of
2344 these documents, including identification of potential project alternatives.

2345 On October 25, 2005, after consideration of potential project alternatives and environmental
2346 effects, the agencies published a Final Scoping Decision Document (FSDD) that describes
2347 various alternatives in each of the categories required by Minnesota law – alternative sites,
2348 alternative technologies, modified designs or layouts, modified scale or magnitude, and
2349 alternatives incorporating mitigation measures (see Section 3.2.3.1). As discussed below, the
2350 scoping document explains why some of these alternatives were eliminated from further
2351 consideration, while others were carried forward for more detailed study in the 2009 DEIS.

2352 **Site Alternatives** – The FSDD explains that, because the mineralization dictates the location of
2353 the Mine Site, an alternative site would not meet the NorthMet Project Proposed Action’s
2354 Purpose and Need and should be eliminated from further consideration. An alternative Plant Site
2355 was likewise eliminated from further consideration because the re-use of an existing facility
2356 would have fewer environmental effects than other greenfield sites. Two alternative waste rock
2357 disposal sites and one alternative Tailings Basin site were carried forward for further
2358 consideration in the DEIS.

2359 **Technology Alternatives** – Two alternative technologies were carried forward for the NorthMet
2360 Project Proposed Action. It was decided that alternative hydrometallurgical technologies would
2361 not be evaluated, concluding that there were no known alternatives that would have significant
2362 environmental benefits over the NorthMet Project Proposed Action.

2363 An underground mining alternative was also evaluated, noting that “If the cost of developing an
2364 underground mining alternative were so high that [PolyMet] could not develop the project, this
2365 alternative would not meet the Purpose and Need of the project.” (MDNR 2005)

2366 **Modified Designs or Layouts** – The Co-lead Agencies eliminated alternative designs for the
2367 Transportation and Utility Corridor and the Plant Site, neither of which offered environmental
2368 benefits greater than those offered by the NorthMet Project Proposed Action. With respect to the
2369 Mine Site, the agencies considered a number of different design and layout modifications,
2370 including using two mine pits instead of three, chemical modification of reactive waste rock piles
2371 and co-disposal of reactive waste rock on a lined Tailings Basin, pre-treatment of certain types of
2372 wastewater, and use of reactive wastewater as make-up water for the Plant Site. Each of these
2373 alternatives, along with several technical design reports, was slated for further consideration as
2374 possible alternatives in the DEIS.

2375 **Scale or Magnitude Alternatives** – The FSDD evaluated the possibility of changing the scope
2376 (size) of the NorthMet Project Proposed Action, but concluded that the return on investment for a
2377 smaller scale project was infeasible. Accordingly, the FSDD concluded that a reduced scale
2378 would not meet the Purpose and Need for the project.

2379 **Alternatives Incorporating Mitigation Measures** – In addition to alternatives to the NorthMet
2380 Project Proposed Action, the FSDD also included alternatives that incorporated reasonable
2381 mitigation measures. The first of these is proposed monitoring programs for waste rock
2382 stockpiles and the Tailings Basin. The second mitigation measure included a lined tailings
2383 storage facility within the Tailings Basin and continued testing to determine tailings reactivity.

2384 Both of these mitigation measures were carried forward for additional consideration in the DEIS.
2385 Because these measures amounted to only minor changes to the NorthMet Project Proposed
2386 Action, they were not carried forward as full alternatives. Instead, they were evaluated as part of
2387 the NorthMet Project Proposed Action.

2388 **3.2.3.3.2 Summary of Alternatives Analysis from the 2009 DEIS**

2389 Following the publication of the FSDD in 2005, PolyMet provided a project description to the
2390 Co-lead Agencies. Over the next three years, PolyMet continued to gather data and consult with
2391 the Co-Lead Agencies, which led to several modifications to the NorthMet Project Proposed
2392 Action. Among these modifications was the incorporation of certain mitigation measures, as well
2393 as the two mine pit alternatives, into the NorthMet Project Proposed Action. In addition to the
2394 NorthMet Project No Action Alternative, the DEIS analyzed the following alternatives to the
2395 NorthMet Project Proposed Action:

2396 **Mine Site Alternative** – The Mine Site Alternative consisted of modifications to the Mine Site
2397 design or layout intended to reduce potential effects on surface water and groundwater. The
2398 Mine Site Alternative proposed, among other things, sub-aqueous disposal of the most reactive
2399 waste rock and lined, temporary stockpiles for this waste rock.

2400 **Tailings Basin Alternative** – The Tailings Basin Alternative included various modifications to
2401 the Tailings Basin intended to increase geotechnical stability and capture seepage from the
2402 Tailings Basin. The Tailings Basin Alternative resulted from the comprehensive mitigation
2403 planning effort by the Co-lead Agencies, and included input from all Cooperating Agencies and
2404 consulting tribes. The DEIS evaluated 27 individual mitigation measures (DEIS Table 3.2-2)
2405 developed from this effort and 11 combinations of individual mitigation measures that were
2406 considered (MDNR and USACE 2009, Table 3.2-3) before selecting the Tailings Basin
2407 Alternative.

2408 **Alternatives Considered but Eliminated from Detailed Analysis in the EIS** – On the basis of
2409 analysis performed in connection with the 2009 DEIS, several of the alternatives identified in the
2410 FSDD were eliminated from further consideration. These included 1) alternative waste rock
2411 disposal sites; 2) the underground mining alternative, which was found to have costs so high that
2412 it failed to meet the Purpose and Need of the project; and 3) pretreatment of runoff and use as
2413 make-up water at the Mine Site.

2414 **3.2.3.3.3 Refinement of the Proposed Action after the 2009 DEIS**

2415 The main refinements to the NorthMet Project Proposed Action from the DEIS and the SDEIS
2416 involve improved waste and water management at both the Mine Site and Plant Site. These
2417 measures were identified in part in the Mine Site Alternative and Tailings Basin Alternative, as
2418 described in the DEIS, and later combined to form a Co-lead Draft Alternative which PolyMet
2419 subsequently incorporated into the NorthMet Project Proposed Action (refer to Section 2.3.2 for
2420 more information). Concurrent impact assessment and modeling identified additional project
2421 refinements and mitigation measures. PolyMet also incorporated these changes into the
2422 NorthMet Project Proposed Action analyzed in the SDEIS.

2423 The development of the NorthMet Project Proposed Action, including consideration and
2424 incorporation of alternatives is shown in Figure 3.2-32. The evolution of the NorthMet Project
2425 Proposed Action from the DEIS to the SDEIS is summarized in Table 3.2-16. The general

2426 method, rate, volume, and duration of mining, transportation, and processing of ore did not
2427 change substantially from that proposed in the DEIS. It should be noted that Table 3.2-16 is only
2428 for comparison purposes and shows only features that changed from the NorthMet Project
2429 Proposed Action as found in the DEIS to the SDEIS NorthMet Project Proposed Action and does
2430 not represent a complete summary of the current NorthMet Project Proposed Action.

2431 A number of other alternatives were eliminated from further consideration because they did not
2432 meet the screening criteria as discussed above. These alternatives are detailed below in Table
2433 3.2-17.

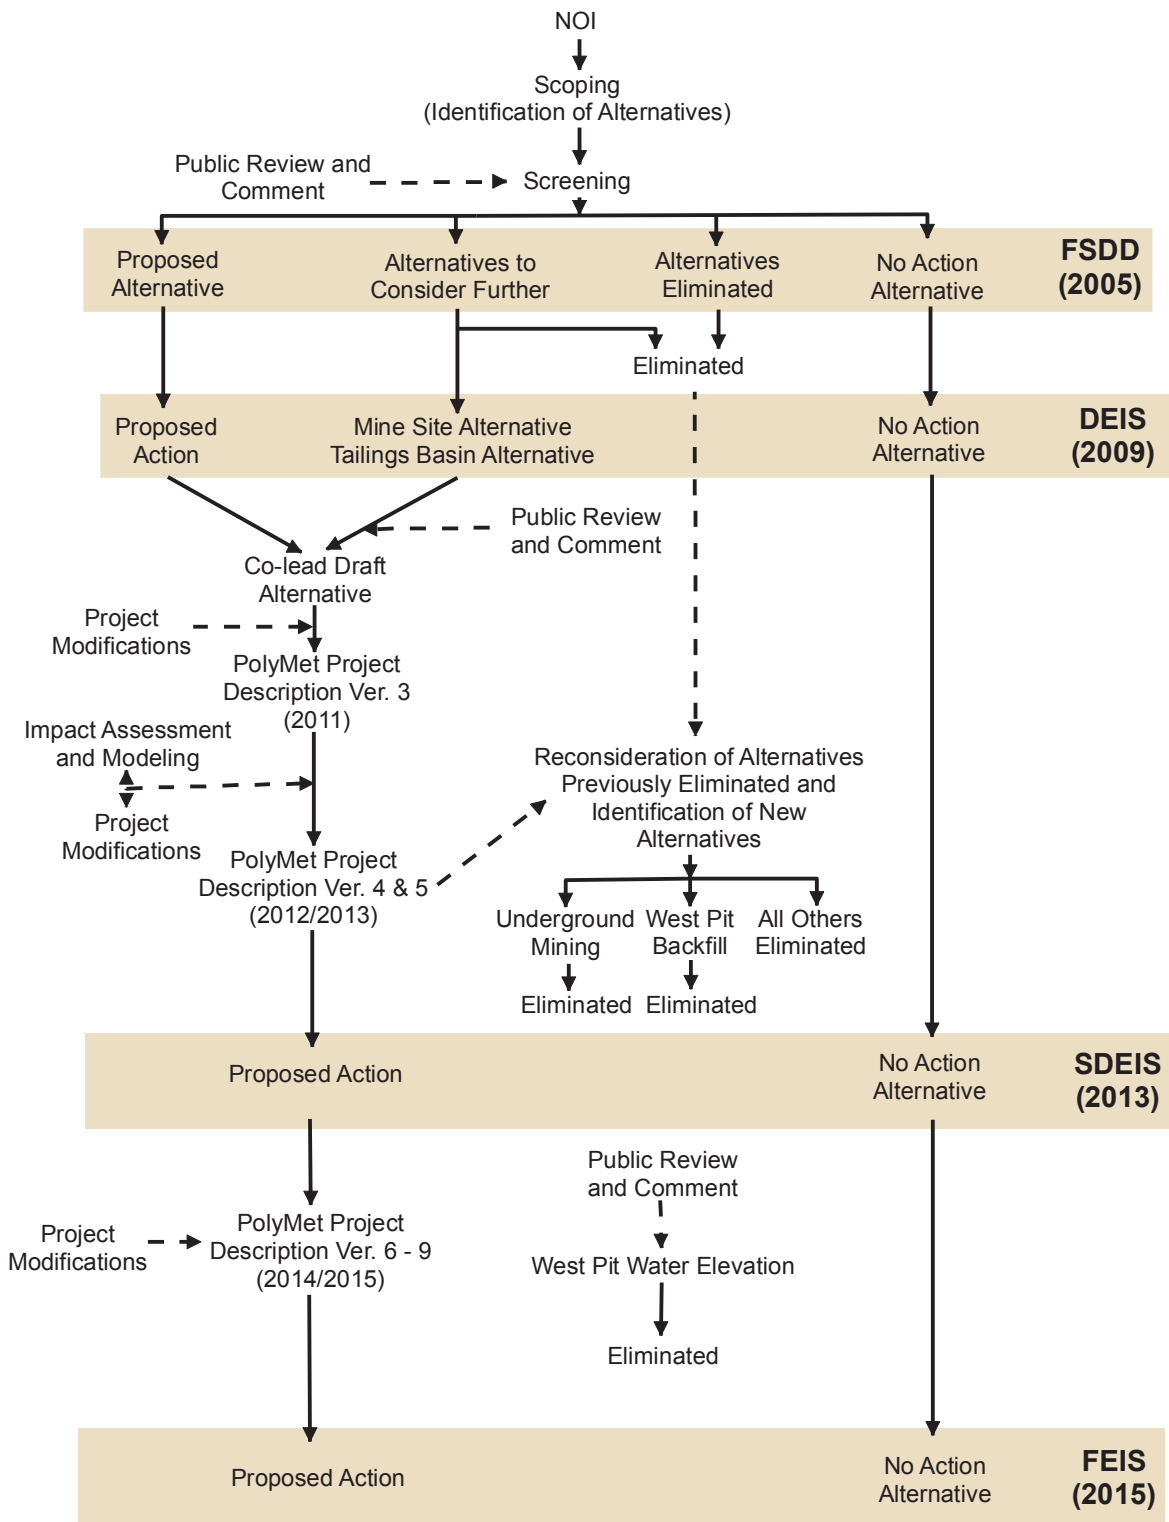

2434 **3.2.3.3.4 Refinement of the Proposed Action after the 2013 SDEIS**

2435 The NorthMet Project Proposed Action has been modified since the SDEIS has been published
2436 (PolyMet 2015a). These modifications include:

- 2437 • Modifying the ore grinding circuit to include a SAG mill, which would replace an existing
2438 rod mill and ball mill circuit at the Plant Site;
- 2439 • Relocating the Coal Ash Landfill from its current location on the east side of Tailings Basin
2440 Cell 1E to the Hydrometallurgical Residue Facility;
- 2441 • Extending the Tailings Basin containment system to a portion of the east side of Tailings
2442 Basin Cell 1E to collect potential seepage in this area;
- 2443 • Modifying the stream augmentation plan such that only treated water would be discharged to
2444 the three Embarrass River tributaries (Trimble Creek, Unnamed Creek, and Mud Lake Creek)
2445 and Second Creek;
- 2446 • Refurbishment of existing rail cars to reduce potential for ore spillage;
- 2447 • Clarifying that the design of the sewage treatment system would include refurbishing the
2448 existing collection system and replacing the existing LTVSMC mechanical sewage treatment
2449 plant with a stabilization pond facility, which would discharge to the Tailings Basin; and
- 2450 • Incorporating CDSM as an engineering measure to stabilize the existing tailings and peat
2451 layers in the northern dams of the LTVSMC Tailings Basin prior to the use of that facility for
2452 the NorthMet tailings.

2453 These measures have been identified as potential improvements or mitigation measures to be
2454 incorporated into the NorthMet Project Proposed Action.

DRAFT

This document is a working document. This document may change over time as a result of new information, further deliberation, or other factors not yet known to the Co-lead Agencies.

DRAFT

2459 **3.2.3.4 *Post-DEIS Reconsideration of Previously Eliminated Alternatives***

2460 In response to Cooperating Agency comments and the evolution of the NorthMet Project
2461 Proposed Action since the DEIS, the Co-lead Agencies reviewed previously identified
2462 alternatives against the current NorthMet Project Proposed Action to determine whether any of
2463 them should be reconsidered.

2464 Some alternatives considered include various wet and dry cover options for the Tailings Basin at
2465 closure. Many specific mitigation measures were identified and considered individually and in
2466 combination. One particular combination of mitigation measures was identified and carried
2467 forward in the DEIS as the Tailings Basin Alternative. In preparing the SDEIS, a
2468 multidisciplinary Co-lead Agency workgroup evaluated and compared three wet and three dry
2469 cover options to address several modified water management and geotechnical stability
2470 requirements. Of these, the recommended option involved a wet cover with bentonite amended
2471 beach, side slopes, and pond. PolyMet adopted this recommended wet cap option as part of the
2472 NorthMet Project Proposed Action.

2473 In response to a change in applicability of water quality impact criteria, PolyMet further revised
2474 the NorthMet Project Proposed Action to include collection of substantially all Tailings Basin
2475 surface and groundwater seepage from the existing LTVSMC Tailings Basin and the proposed
2476 NorthMet Tailings Basin by a vertical hydraulic barrier constructed from the ground surface
2477 down to the top of bedrock. PolyMet also proposed enhanced mechanical water treatment using
2478 RO or equivalent technology that would meet water quality targets, which would remove
2479 substantially all of the constituents in the captured seepage. This combination of the wet cap
2480 option along with collection and treatment engineering controls were shown in modeling to meet
2481 water quality evaluation criteria with a few exceptions (see Section 5.2.2). Additionally, PolyMet
2482 enhanced the design of the proposed Tailings Basin rock buttress, and it was shown in modeling
2483 to provide adequate geotechnical stability (see Section 5.2.14). The other wet and dry cap
2484 options did not offer meaningful environmental benefits, and, in fact, seepage from the dry caps
2485 was predicted under the current model design to result in substantially higher concentrations
2486 which would make the future transition from mechanical (RO or equivalent technology that
2487 would meet water quality targets) to non-mechanical water treatment more difficult during post-
2488 closure (ERM 2010).

2489 As addressed below, the Underground Mining Alternative and backfilling the West Pit with
2490 Category 1 waste rock were considered further, again in response to Cooperating Agencies and
2491 stakeholder comments received on the DEIS. However, following further analysis, these remain
2492 eliminated from full analysis in this FEIS.

2493 Other alternatives were either incorporated (at least in part) to the NorthMet Project Proposed
2494 Action and are therefore no longer relevant, or remain eliminated as the changes to the NorthMet
2495 Project Proposed Action would not affect the rationale previously used to eliminate them.

2496 The outcomes of reconsideration of previously eliminated alternatives are shown in Table 3.2-17.
2497 The types of alternatives considered against the MEPA-required alternative types are shown in
2498 Table 3.2-18.

2499 In response to comments received on the SDEIS, the NorthMet Project Proposed Action was
2500 refined to include some additional engineering design or mitigation measures (Section 3.2.3.3.4).
2501 Co-lead Agency analysis of these refinements indicated that they would further improve the

2502 environmental performance of the NorthMet Project Proposed Action and therefore did not
 2503 trigger reconsideration of alternatives previously eliminated.

2504 **Table 3.2-17 Previous NorthMet Project Alternatives Screened for this FEIS**

Reference ¹	Alternative	Previous Screening Outcome	SDEIS Screening Outcome (remains applicable for this FEIS)
	DEIS Proposed Action	Analyzed in the DEIS	Partially incorporated into the SDEIS NorthMet Project Proposed Action, with improved waste rock and water management and further refined through identification of improved mitigation measures such as the full bentonite amendment cover for the Tailings Basin.
	DEIS Mine Site Alternative		
	DEIS Tailings Basin Alternative		
TB1	Wet Tailings Basin cover at closure using a bentonite beach, side slope and pond amendment	Analyzed since the DEIS	
E18	Use of low sulfur waste rock as construction material	Eliminated in the DEIS	Partially incorporated into the SDEIS NorthMet Project Proposed Action. Category 1 Waste Rock may be used if approved by the MDNR in circumstances where contact water is controlled and treated.
E7	Underground mining the NorthMet Deposit (Underground Mining Alternative)	Eliminated in the DEIS	Continues to be eliminated. Reconsidered but not economically feasible. Refer to Underground Mining Alternative in Section 3.2.3.4.1 and Appendix B for more information.
E20	Disposal of waste rock and/or tailings in the West Pit (West Pit Backfill)	Eliminated in the DEIS	Continues to be eliminated. Reconsidered but would not offer substantial environmental benefit. Refer to West Pit Backfill Alternative in Section 3.2.3.4.2.
E3	Alternative mine pit location	Eliminated in FSDD	Continues to be eliminated. No changes to the NorthMet Project Proposed Action design affect these alternatives.
E12, E13	Alternative ore transport (conveyors vs. trucks)		
E21	Smaller mine and ore processing facility		
E4	Alternative Processing Plant site location		
E8	Other hydrometallurgical technologies		
E10	Process the Category 3 and 4 lean ore and waste rock through the Processing Plant		
E9	Concentrate-only operations mode		

Reference ¹	Alternative	Previous Screening Outcome	SDEIS Screening Outcome (remains applicable for this FEIS)
E11	Alternative designs and layouts for the ore processing plant		
E1	Off-site, non-reactive waste rock disposal	Eliminated in the DEIS	
E2	Off-site, subaqueous in-pit disposal of reactive waste rock		
E6	Off-site, subaqueous in-pit co-disposal of reactive waste rock/tailings/ overburden		
E5	Off-site, subaqueous in-pit tailings disposal		
E14	Co-disposal of reactive waste rock and tailings on a lined Tailing Basin		
E17	Use of Mine Site reactive runoff as make-up water for the Processing Plant with a single wastewater treatment at the Processing Plant		
E15	Pretreatment of Mine Site reactive runoff and discharge to Babbitt or Hoyt Lakes POTW		
E16	Pretreatment of Tailings Basin process water and discharge to the City of Hoyt Lakes POTW		
E19	Use non-contact stormwater from detention pond at Mine Site as process water		
TB2	Wet Tailings Basin cover at closure using a bentonite side slope and pond amendment	Analyzed since the DEIS	These alternatives were reconsidered and continue to be eliminated since they do not afford meaningful environmental benefits compared to the enhanced engineering controls (seepage collection and RO mechanical water treatment) built into the NorthMet Project Proposed Action. Further, dry cap seepage is predicted to result in substantially higher concentrations, under current model design, which would make the future transition from mechanical (RO) to non-mechanical water treatment more difficult during post-closure.
TB3	Wet Tailings Basin cover at closure using a bentonite beach and pond amendment		
TB4	Dry Tailings Basin cover at closure using a surface bentonite amendment		
TB5	Dry Tailings Basin cover at closure using a geomembrane		
TB6	Dry Tailings Basin cover at closure using a geosynthetic clay liner		

2505 ¹ “E” alternatives are from Table 3.2-4 in the DEIS; “TB” options are from ERM 2010.

2506 POTW = Publicly Owned Treatment Works

2507 Per MEPA rules, projects must consider five types of alternatives and determine which activities
 2508 would address those alternatives. Table 3.2-18 below identifies which alternatives considered
 2509 addressed the five MEPA alternative types.

2510 **Table 3.2-18 MEPA Alternatives Types Considered for the NorthMet Project Proposed**
 2511 **Action**

Project Activity ¹	Alternative Sites	Alternative Technology	Modified Designs or Layouts	Modified Scale or Magnitude	Alternatives Incorporating Mitigation Measures
Mining	E3	E7, E13		E21	
Waste Rock Management	E1,E2, E6		E10, E14, E18, E20		DEIS Mine Site Alternative
Mine Site Processing Plant Water Management			E15, E17, E19		
Transportation and Utility Corridor		E12			
Processing and Plant Site Water Management	E4	E8, E9	E11, E16		
Tailings Management	E15, E5		TB1,TB2, TB3, TB4, TB5, TB6		DEIS Tailings Basin Alternative

2512 ¹ For further information see Table 3.2-17.

2513 **3.2.3.4.1 Underground Mining Alternative**

2514 The Underground Mining Alternative was considered but eliminated as alternative E7 in Table
 2515 3.2-4 of the DEIS (MDNR and USACE 2009). It was eliminated from further consideration in
 2516 the DEIS as it was determined that it would not offer substantial environmental or
 2517 socioeconomic benefits compared to the NorthMet Project Proposed Action. The DEIS further
 2518 concluded that the significantly lower rate of ore production required for an underground mining
 2519 alternative would not meet the Purpose and Need of the project.

2520 The Underground Mining Alternative was reconsidered for the SDEIS due to a high level of
 2521 interest from Cooperating Agencies and stakeholders and because it was identified in the Land
 2522 Exchange Scoping Report (USFS 2011a) as requiring further assessment. This alternative would
 2523 involve mining the NorthMet Deposit as defined by the proposed open pit boundary. While the
 2524 mineralized zone extends beyond the proposed open pit boundary, the geology outside of the
 2525 open pit has not been characterized enough to support a mine plan and is beyond the boundaries
 2526 of the NorthMet Project area, so it is not reasonable to include for consideration for the
 2527 Underground Mining Alternative.

2528 An underground mine, within the proposed open pit boundary (shell), would result in a smaller
 2529 surface footprint, thus offering environmental benefits over the NorthMet Project Proposed
 2530 Action through reduced effects on wetlands, vegetation, and wildlife habitat. An underground
 2531 mine would also have lower production rates compared to the proposed open pit, resulting in less
 2532 fugitive air emissions, and less waste rock and processing waste (tailings and hydrometallurgical
 2533 residue), thus reducing the scale and duration of potential water quality effects. A smaller mining

2534 operation would also reduce the scale and duration of mining and the associated socioeconomic
2535 benefits.

2536 PolyMet conducted an Economic Assessment of Conceptual Underground Mining Option for the
2537 NorthMet Project Proposed Action that concluded underground mining would not be
2538 economically feasible given the specific characteristics of the NorthMet Deposit (Foth 2012).
2539 That is, the tonnage/volume and grade (amount of metals) of rock would not generate enough
2540 revenue to pay for all costs associated with underground mining. The assessment used metal
2541 prices calculated in June 2012 that are consistent with the National Instrument 43-101 reporting
2542 standard used for public disclosure of information relating to mineral properties on stock
2543 exchanges supervised by the Canadian Securities Administrators. Certified mining engineers
2544 with the MDNR reviewed PolyMet's Economic Assessment of Conceptual Underground Mining
2545 Option and agreed with the statements made, as well as agreed that the outcome is consistent
2546 with early studies of the NorthMet Deposit, general rules for assessment of economic viability,
2547 and similar mining operations elsewhere.

2548 The Co-lead Agencies prepared a position paper that concludes that the Underground Mining
2549 Alternative is not considered to be a reasonable alternative because it would not be economically
2550 viable and therefore it would also not meet the Purpose and Need (MDNR et al. 2013a). For
2551 these reasons, and for the reasons stated in the DEIS and SDEIS, the Underground Mining
2552 Alternative remains eliminated from further evaluation in this FEIS.

2553 The PolyMet Economic Assessment of Conceptual Underground Mining Option is attached to
2554 the Co-lead position paper: Underground Mining Alternative Assessment for the NorthMet
2555 Mining Project and Land Exchange Environmental Impact Statement (MDNR et al. 2013a)
2556 provided in Appendix B.

2557 **3.2.3.4.2 West Pit Backfill**

2558 The option to utilize the West Pit for mining and processing waste disposal was considered but
2559 eliminated as alternative E20 in Table 3.2-4 of the DEIS (MDNR and USACE 2009). It was
2560 eliminated from further consideration in the DEIS as it was determined that it would not offer
2561 substantial environmental or socioeconomic benefits as compared to the NorthMet Project
2562 Proposed Action (MDNR et al. 2013b). Furthermore, the DEIS noted that there are additional
2563 mineral resources in the West Pit that would effectively be lost if the pit was used for waste rock
2564 and/or tailings disposal. The option to backfill the West Pit with Category 1 waste rock that
2565 would otherwise be permanently stored in the Category 1 Stockpile under the SDEIS NorthMet
2566 Project Proposed Action was raised by the Bands as a potential mitigation option to minimize
2567 surface footprint effects including wetlands, improve surface water and groundwater quality
2568 outcomes, potentially eliminate a managed West Pit overflow, and reduce project costs.

2569 In response to the Bands' request, the Co-lead Agencies reconsidered the option to backfill the
2570 West Pit against the same screening criteria used for all potential alternatives (see Section
2571 3.2.3.1). Further consideration concluded that the West Pit would have sufficient capacity to
2572 accept all of the Category 1 Stockpile material, but for safety and operational reasons under the
2573 proposed mine plan, the West Pit would not be available for backfilling until the end of mining,
2574 still including a pit lake approximately 105 ft deep. Therefore, the full Category 1 Stockpile
2575 would still be required for the 20 year Life of Mine. As such, throughout operations of the mine,
2576 compared to the NorthMet Project Proposed Action, there would be no change to:

- 2577 • the temporal surface footprint effects of the Category 1 Stockpile,
2578 • off-site mitigation requirements for affected wetlands, and
2579 • water management requirements associated with the Category 1 Stockpile until it is removed
2580 and backfilled into the West Pit.

2581 After mining is completed:

- 2582 • Removal of the Category 1 Stockpile would allow for reclamation of the affected surface
2583 footprint, including potential to recreate wetland areas and restore function, and, as noted
2584 above, the prior effect would have been offset through mitigation required for the initial
2585 effect. The generation of wetland credits in this area has the potential to be used on a
2586 contingency basis, but compensatory credit would not be considered up front.
- 2587 • The volume of material in the Category 1 Stockpile would not be enough to fill the West Pit
2588 so there would still be some pit lake.
- 2589 • Backfilling would affect the water quality in the West Pit by increasing constituent loads, so
2590 additional mechanical treatment of water in the West Pit may be required for a certain
2591 timeframe following backfilling. However, there would be no effect on surface water quality
2592 discharged to the environment because mechanical treatment of water from the West Pit
2593 would still be required in the long term.
- 2594 • Moving the waste rock from the stockpile into the West Pit would result in prolonged dust,
2595 air, and noise emissions, but these would be unlikely to exceed the respective maximum
2596 years modeled during operations.
- 2597 • While there may be potential for additional jobs required for backfilling, they would be
2598 unlikely to offer substantial socioeconomic benefits.
- 2599 • Removal of the Category 1 Stockpile would improve visual aesthetics.
- 2600 • Backfilling the West Pit would encumber private mineral resources that are deeper than the
2601 proposed West Pit. Such an encumbrance is in conflict with the terms of PolyMet's current
2602 private mineral leases. The PolyMet lease agreements could be renegotiated, which might
2603 involve monetary compensation for the mineral owners if minerals are encumbered.
- 2604 • The cost of physically backfilling the West Pit and other associated costs, including those for
2605 additional mechanical water treatment (required to treat increased constituent loads) and
2606 financial assurance requirements, could affect the ability of PolyMet to secure financing.

2607 Based on the above, the opportunity to reclaim wetlands and vegetation at the Category 1
2608 Stockpile footprint area would be the only measurable environmental benefit offered by
2609 backfilling the Category 1 Stockpile into the West Pit. However, because of the temporal effect
2610 that the stockpile would have, those effects would be required to be mitigated regardless of
2611 future backfilling or not. Furthermore, the potential environmental benefit is moot or outweighed
2612 because encumbrance is not allowed in PolyMet's private mineral leases and because the costs
2613 associated with backfilling, additional water treatment (rates), and encumbrance compensation
2614 determined in revised lease agreements may affect the ability of PolyMet to secure financing
2615 (MDNR et al. 2013b). As such, the option to backfill the West Pit was eliminated from further
2616 consideration in the SDEIS and remains so in this FEIS.

2617 **3.2.3.5 Identification of New Alternatives**

2618 Since receiving PolyMet's NorthMet Project Proposed Action analyzed in the SDEIS, the Co-
2619 lead Agencies considered whether any other alternatives beyond those previously proposed
2620 should be carried forward for detailed analysis. No reasonable alternatives were identified that
2621 would potentially offer substantial environmental benefits compared to the NorthMet Project
2622 Proposed Action.

2623 **3.2.3.6 Post Closure Pumping of the West Pit**

2624 One additional potential alternative (or mitigation measure) was considered in response to public
2625 comments received on the SDEIS (MDNR et al. 2014). Perpetual pumping of the West Pit post
2626 closure to eliminate potential seepage of West Pit water into surficial and bedrock groundwater
2627 flowpaths to the Partridge River was screened in the manner outlined in Section 3.2.3.1.2. The
2628 screening assessment indicated that perpetual pumping would meet the Purpose and Need, would
2629 be technically and economically feasible, and would meet the availability criteria; however, it
2630 would not offer a significant environmental benefit compared to the NorthMet Project Proposed
2631 Action.

2632 Under the perpetual pumping alternative, the water quality of the West Pit lake would likely be
2633 worse, resulting in additional treatment needs compared to the NorthMet Project Proposed
2634 Action. With the proposed engineering controls, the water quality model predicts the NorthMet
2635 Project Proposed Action would not exceed evaluation criteria. The NorthMet Project Proposed
2636 Action would allow for pilot testing of non-mechanical treatment of West Pit lake overflow as a
2637 long-term water quality treatment option. Additional loading to the West Pit lake would impede
2638 transition to non-mechanical treatment. Finally, under the perpetual pumping approach some
2639 wetland effects would become permanent, as wetlands near the West Pit would only be
2640 temporarily affected under the NorthMet Project Proposed Action. For these reasons, the Post
2641 Closure Pumping of the West Pit Alternative remains eliminated from further evaluation in this
2642 FEIS.

2645 **3.3 LAND EXCHANGE DETAILED DESCRIPTION**

2646 **3.3.1 Overview**

2647 The Land Exchange Proposed Action would involve exchange of a single 6,650.2-acre (GLO)
2648 tract of federal land (encompassing most of the NorthMet Project Mine Site) for up to
2649 approximately 6,722.5 acres (GLO) of privately owned, non-federal lands located within five
2650 different tracts throughout the proclamation boundary of the Superior National Forest within St.
2651 Louis, Lake, and Cook counties of northeastern Minnesota. Appraisal reports completed in 2013
2652 indicate that the Land Exchange Proposed Action would meet federal value requirements if all
2653 five non-federal land tracts (6,722.5 (GLO) acres) offered by PolyMet would be exchanged for
2654 6,650.2 (GLO) acres of federal land. If the ROD approves the Land Exchange Proposed Action,
2655 a current appraisal, approved by the USFS, would be required to verify equal value. Appraisals
2656 must conform to Uniform Appraisal Standards for Federal Land Acquisitions and the Uniform
2657 Standards of Professional Appraisal Practice of the Appraisal Foundation. The final proposed
2658 configuration of land would be determined after the market value of the parcels is determined by

2659 appraisals and the environmental analysis has been completed. This information would be
2660 presented in the ROD.

2661 Several alternatives to the Land Exchange Proposed Action were identified and screened through
2662 scoping in 2010. The following alternatives are evaluated in detail in this SDEIS:

- 2663 • Land Exchange No Action Alternative, under which no land exchange would occur; and
- 2664 • Land Exchange Alternative B, under which a smaller amount of federal lands would be
2665 exchanged for the NorthMet mine activities instead of the 6,650.2 acres (GLO) of federal
2666 lands proposed.

2667 A summary of the Land Exchange Proposed Action, Land Exchange Alternative B, and the No
2668 Action Alternative is provided in Table 3.3-1.

2669 The Land Exchange Proposed Action is a connected action to the NorthMet Project Proposed
2670 Action.

2671 **Table 3.3-1 Summary of the Land Exchange Proposed Action Alternatives**

Project Component	Location and Existing Land Use	Land Exchange Proposed Action	Land Exchange Alternative B	No Action Alternative
Federal land	Undeveloped federal land located between the Northshore Mine and the LTVSMC railroad Land is allocated under General Forest –Longer Rotation and General Forest Management Area in the Forest Plan	Exchange 6,650.2 acres (GLO) of federal lands to private ownership (PolyMet)	Exchange a smaller amount of federal lands (4,887.3 acres (GLO)) to private ownership (PolyMet)	No Land Exchange Current public land would remain under USFS management
Non-federal land	Predominantly forest and wetland habitat Interspersed with federal land within the proclamation boundary of the Superior National Forest St. Louis, Lake, and Cook counties	Exchange consists of up to 6,722.5 acres (GLO) from private to federal ownership Consists of up to five non-federal land tracts of land	Exchange consists of 4,651.5 acres (GLO) of non-federal lands in one tract (Tract 1) from non-federal to federal ownership	No Land Exchange Current non-federal lands would remain under non-federal ownership

2672 **3.3.1.1 Development of Land Exchange Proposal**

2673 The boundaries of the federal tract were proposed by the USFS so that any federal lands that
2674 PolyMet proposed to surface mine at the NorthMet Project Mine Site would be conveyed to
2675 PolyMet. In addition, all federal lands within the same Township to the west of the NorthMet
2676 Project Mine Site and north of the LTVSMC Railroad Grade were proposed for exchange. The

2677 additional lands were included to avoid intermingled and inefficient ownership patterns that
2678 would result by retaining isolated federal lands without legal access immediately south of the
2679 Superior National Forest Proclamation Boundary. The additional proposed lands are also
2680 impacted by past and ongoing mining activities including being subject to special use permits.
2681 The recommendation for the boundaries of the federal lands was based on the following
2682 standards and guidelines in the Forest Plan.

2683 As stated in G-LA-3 (Forest Plan, page 2-52), the following National Forest System land is
2684 generally not needed for other resource management objectives and is potentially available for
2685 conveyance through exchange or other means (not listed in order of importance).

2686 (a) Land inside or adjacent to communities or intensively developed private land, and chiefly
2687 valuable for non-National Forest System purposes.

2688 (b) Parcels that would serve a greater public need in state, county, city, or other federal agency
2689 ownership.

2690 (c) Inaccessible parcels isolated from other National Forest System land and intermingled with
2691 private land.

2692 (d) Parcels that would reduce the need for landline maintenance and corner monumentation,
2693 result in more logical and efficient management, and improve land ownership pattern.

2694 (e) Tracts that would be difficult or expensive to manage due to ROW problems, complex
2695 special use permits, or tracts with significant property boundary issues.

2696 (f) On a case-by-case basis, land beneath or adjacent to resorts and summer home groups,
2697 currently under special use permits, may be considered for conveyance.

2698 Specifically, the federal lands proposed for exchange appear to meet criteria a, c, d, and e.

2699 PolyMet initially proposed two non-federal tracts for exchange: Hay Lake (Tract 1) and
2700 McFarland Lake (Tract 5). Both parcels were intended to meet land adjustment standards and
2701 guidelines for acquisition in the Forest Plan (D-LA-1, Forest Plan, page 2-51). That guidance is
2702 intended to achieve the following Desired Condition:

2703 The amount and spatial arrangement of National Forest System land within the
2704 proclamation boundary of the Forest are sufficient to protect resource values and
2705 interests, improve management effectiveness, eliminate conflicts, and reduce the costs of
2706 administering landline and managing resources.

2707 Standards and Guidelines to achieve this Desired Condition provide that land acquisitions would
2708 generally be guided by the following criteria (G-LA-2, Forest Plan, pages 51-52):

2709 • Priority 1 (a, b, and c are not listed in order of importance)

2710 1(a) Land needed for habitat for federally listed endangered, threatened, proposed, or
2711 candidate species or for RFSS.

2712 1(b) Land needed to protect significant historical and cultural resources, when these
2713 resources are threatened or when management may be enhanced by public ownership.

2714 1(c) Land needed to protect and manage administratively or Congressionally designated,
2715 unique, proposed, or recommended areas.

- 2716 • Priority 2 (a thru f are not listed in order of importance)
- 2717 – Key tracts that would promote more effective management and would meet specific
- 2718 needs for management, such as:
- 2719 2(a) Land that enhances recreation opportunities, public access, and aesthetic values.
- 2720 2(b) Land needed to enhance or promote watershed restoration or watershed improvements
- 2721 that affect the management of National Forest System land riparian areas.
- 2722 2(c) Environmentally sensitive and/or ecologically rare lands and habitats.
- 2723 2(d) Wetlands.
- 2724 2(e) Land and associated riparian ecosystems on water frontage such as lakes and major
- 2725 streams.
- 2726 2(f) Land needed to achieve ownership patterns that would lower resource management
- 2727 costs.
- 2728 • Priority 3
- 2729 3(a) All other land desirable for inclusion in the National Forest System.
- 2730 A feasibility analysis, completed by the USFS in November 2009, assessed the potential for a
- 2731 land exchange between the USFS and PolyMet. The feasibility analysis evaluated the federal
- 2732 tract that was proposed by the USFS and the two non-federal tracts that were proposed by
- 2733 PolyMet for conformance with the Forest Plan, which included current and future uses of the
- 2734 properties. A preliminary monetary valuation indicated that additional parcels might be needed
- 2735 to bring the market value of the non-federal land to within 25 percent of the market value of the
- 2736 federal land as required by 36 CFR 254.12. The analysis also recommended supplementing the
- 2737 exchange with additional non-federal parcels that would increase the amount of wetlands coming
- 2738 into federal ownership to achieve a quantitative balance (no net loss) of wetland acres as a means
- 2739 of complying with EO 11990.
- 2740 PolyMet ought additional lands that could be offered to the USFS that met the standards and
- 2741 guidelines for land adjustment in the Forest Plan. In particular, for non-federal parcels to be
- 2742 offered by PolyMet, the following goals were emphasized: adding wetlands, increasing
- 2743 connectivity between existing USFS ownership, and increasing boundary management
- 2744 efficiencies. Tracts 2, 3, and 4 were added subsequent to the feasibility analysis and prior to
- 2745 public scoping. Initial screening of the non-federal lands suggested the following relationship of
- 2746 the lands to standards and guidelines in the Forest Plan.
- 2747 • Hay Lake (Tract 1) is a large, contiguous parcel with public access that offers a large
- 2748 percentage of highly functioning wetland habitat and wild rice resources. This parcel meets
- 2749 criteria 1(b), 2(a), (b), (c), (d), (e), and (f) for land acquisition in G-LA-2.
- 2750 • McFarland Lake (Tract 5) meets criteria 1(c), 2(a), (e), and (f) for land acquisition in G-LA-2
- 2751 because it protects a lake that includes a popular entry point to the BWCAW.
- 2752 • Lake County Lands (Tract 2), Wolf Lands (Tract 3), and Hunting Club (Tract 4) meet criteria
- 2753 2(a), (d), and (f) for land acquisition in G-LA-2.
- 2754 All of the non-federal lands adjoin current USFS ownership and simplify management by
- 2755 consolidating land ownership patterns.

2756 **3.3.2 Land Exchange Proposed Action**

2757 The Land Exchange Proposed Action would occur between the United States, through the USFS
2758 as the manager of the federal lands, and PolyMet, as the owner of the non-federal lands. The key
2759 characteristics of the Land Exchange Proposed Action are highlighted in Table 3.3-2, shown on
2760 Figure 3.3-1, and discussed in the following sections.

2761 As previously indicated, GLO acres represent the acreages associated with the legal descriptions
2762 of the parcels based on original surveys performed by GLO surveyors between 1858 and 1907.
2763 As such, GLO acreages are being used as part of the project description and would also be used
2764 to define the real estate transaction if the Land Exchange Proposed Action was approved. The
2765 analysis of effects presented in the subsequent Chapters is based upon GIS data. GIS values
2766 indicate the size of the Land Exchange Proposed Action parcels as computed geometrically using
2767 mapping software, which may be different than the GLO legal acreage. Unless noted as GLO
2768 acres, all values shown in the document are derived from GIS data.

2769 **Table 3.3-2 Legal Description and Acreage of Parcels Included in the Land Exchange**
2770 **Proposed Action**

Tract	Parcel Name	Legal Description (4 th P.M.)	Total Acres ¹ (GLO)	Total Acres ¹ (GIS, for Analysis Purposes)
Federal lands		T.60N., R.13W (Secs. 33-35) T.59N, R.13W (Secs. 1-6) T.59N, R.12W (Sec. 6) T.59N, R.13W (Secs. 7-12) T.59N, R.12W (Sec. 7) T.59N, R.13W (Secs. 17, 18)	6,650.2	6,495.4
Non-federal lands			6,722.5	7,075.0
Tract 1	Hay Lake Lands	T.59N, R.16W (Secs. 9, 16, 19, 20-22, 27-33)	4,651.5	4,926.3
Tract 2	Lake County North	T.57N, R.12W (Secs. 5, 6)	199.5	265.0
	Lake County South	T.56N, R.9W (Sec. 17)	120.0	116.9
Tract 3	Wolf Lands 1	T.57N, R.11W (Sec. 8)	120.0	125.8
	Wolf Lands 2	T.58N, R.10W (Secs. 10, 14, 15, 22, 23)	760.0	767.9
	Wolf Lands 3	T.59N, R.9W (Secs. 30, 31)	279.4	277.4
	Wolf Lands 4	T.59N, R.9W (Secs. 7, 8, 17, 18)	400.0	404.7
Tract 4	Hunting Club Lands	T.66N, R.17W (Sec. 7)	160.0	160.2
Tract 5	McFarland Lake Lands	T.64N, R.3W (Sec. 9)	32.1	30.8

2771 ¹ GLO acreages are being used as part of the project description and would also be used to define the real estate transaction if the
2772 Land Exchange Proposed Action is approved. The analysis of effects presented in the subsequent Chapters is based upon GIS
2773 data.

DRAFT

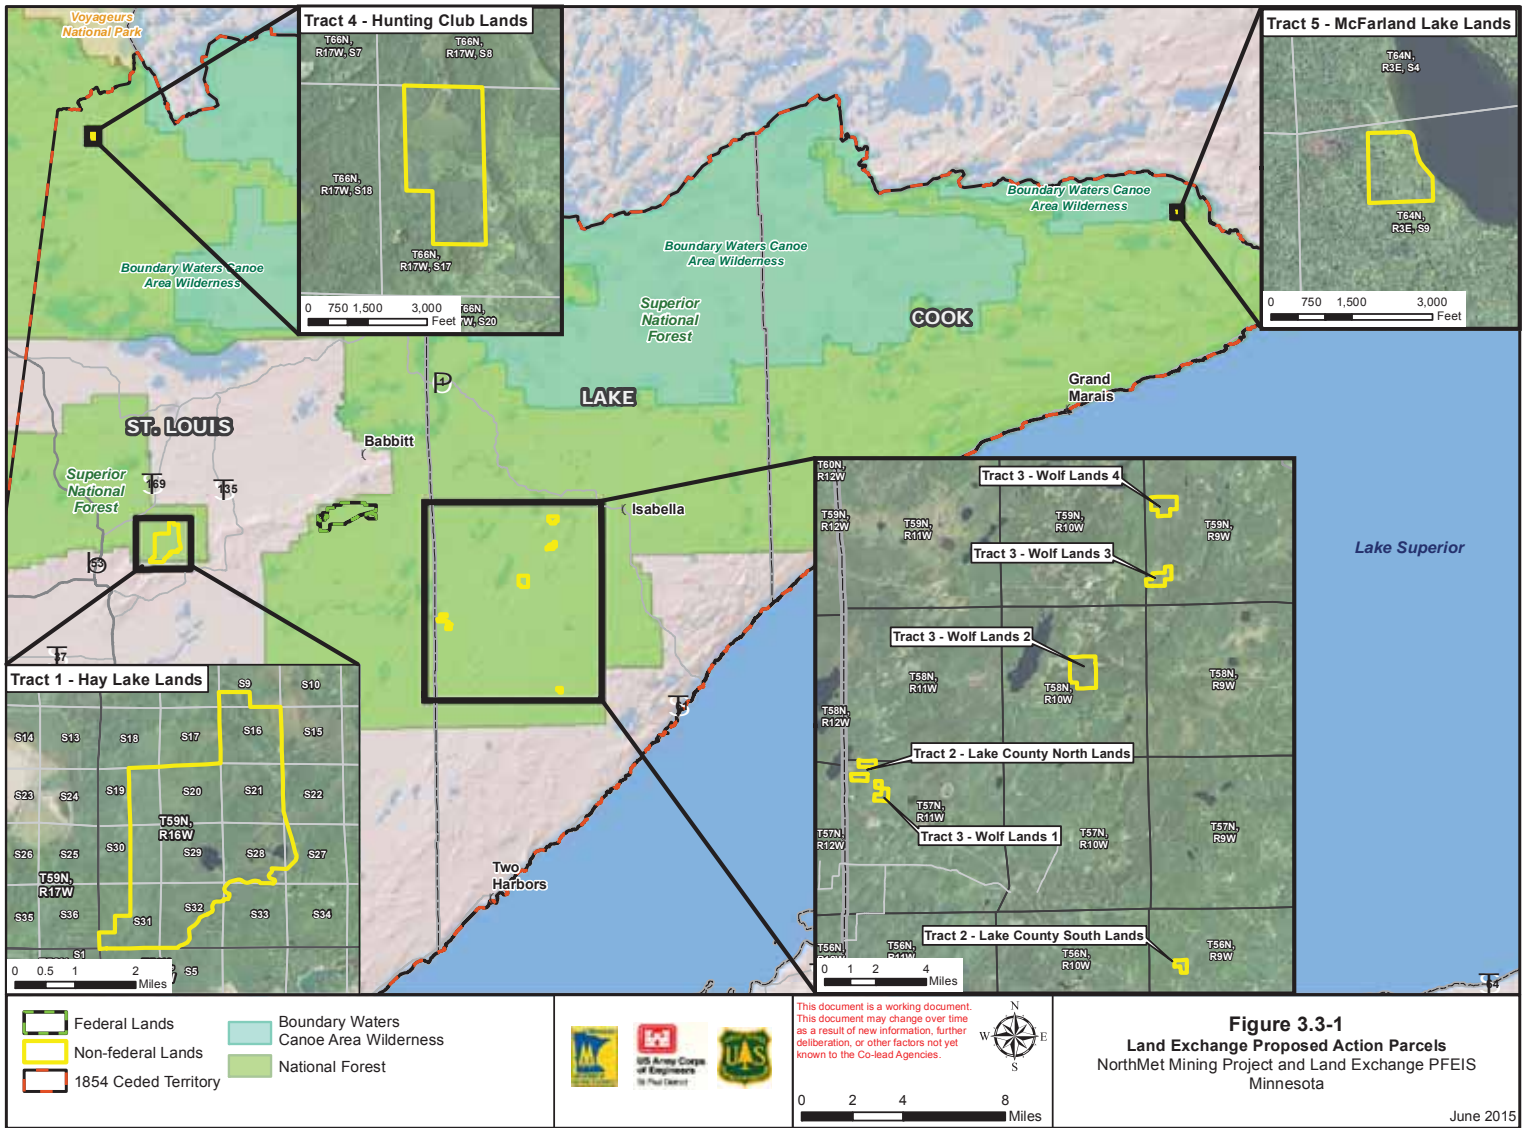

Figure 3.3-1
Land Exchange Proposed Action Parcels
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

DRAFT

2777 **3.3.2.1 Federal Lands Proposed for Exchange**

2778 The federal lands proposed for the Land Exchange Proposed Action are a single contiguous area
2779 of 6,650.2 acres (GLO) of land located within the western/central part of the Superior National
2780 Forest, approximately 6 miles south of Babbitt in St. Louis County, Minnesota. The federal lands
2781 are located in Township 59 North, Range 12 West, Sections 6 and 7; Township 59 North, Range
2782 13 West, Sections 1-12, 17, and 18; and Township 60 North, Range 13 West, Sections 33, 34,
2783 and 35 (see Table 3.3-2 and Figures 3.3-1 and 3.3-2).

2784 The federal lands encompass much of the One Hundred Mile Swamp (see Section 4.3.3 and
2785 Figure 4.3.3-1), a large black spruce, tamarack, and cedar wetland, and also contain Mud Lake.
2786 Yelp Creek and the Partridge River flow through the property.

2787 The federal lands are located adjacent to historic mining projects on the Mesabi Iron Range and
2788 are mostly surrounded by privately held land used for mining and other industrial purposes;
2789 portions of the east and southwest areas of the federal lands are bordered by Superior National
2790 Forest lands. The federal lands lie immediately south of the Superior National Forest
2791 proclamation boundary and are bounded on the south by the former LTVSMC railroad and
2792 Dunka Road, which are NorthMet Project area features. Access to the federal lands is primarily
2793 via Dunka Road, which is privately owned, and the former LTVSMC railroad by permission of
2794 private landowners. Privately owned properties to the north and west of the federal lands have
2795 been extensively affected over the years by surface mining, including mine pits, waste rock
2796 stockpiles, Tailings Basins, processing facilities, railroad grades, and other general mining
2797 activities. There is a 115-acre block of privately owned land located within the northwestern
2798 portion of the federal lands that is not part of the Land Exchange Proposed Action.

2799 A land exchange is a change of ownership of land; once an exchange occurs, the federal land
2800 then becomes private land, allowing the private landowner to use the land in accordance with
2801 necessary local, state, and federal permits and approvals. Any future work on the exchanged
2802 lands, which could include mining on these lands, would require the necessary permits and/or
2803 approvals from state and federal agencies. Most mineral rights within the federal lands are
2804 privately held. The United States owns 181 acres of mineral rights on lands that are not part of
2805 the NorthMet Project Proposed Action mine pits. The USFS would reserve ownership of these
2806 181 acres of mineral rights. These mineral rights are located near the eastern boundary of the
2807 federal lands north of Dunka Road and near the southeast corner of the federal lands south of
2808 Dunka Road (see Figure 3.2-3).

2809 Lands conveyed from federal ownership would no longer be under federal control and therefore
2810 would not be managed under the Forest Plan and/or be influenced by the authority (the Weeks
2811 Act) under which the United States acquired them. While the federal lands, if transferred to
2812 PolyMet, would still be located within the proclamation boundary of the Superior National
2813 Forest, they would be private lands and no longer managed by the USFS.

2814 **3.3.2.2 Non-federal Lands Proposed for Exchange**

2815 The Land Exchange Proposed Action includes up to five tracts of non-federal lands in St. Louis,
2816 Lake, and Cook counties that contain 6,722.5 acres (GLO) (see Table 3.3-2); however, the final
2817 exchange, if approved, could include fewer than 6,722.5 acres (GLO) of non-federal land
2818 depending on the results of the environmental analysis and real estate appraisals. Appraisal
2819 reports completed in 2013 indicate that the Land Exchange Proposed Action would meet federal

2820 value requirements if all five non-federal land tracts (6,722.5 (GLO) acres) offered by PolyMet
2821 would be exchanged for 6,650.2 (GLO) acres of federal land. If the ROD approves the Land
2822 Exchange Proposed Action, a current appraisal, approved by the USFS, would be required to
2823 verify equal value. Appraisals must conform to Uniform Appraisal Standards for Federal Land
2824 Acquisitions and the Uniform Standards of Professional Appraisal Practice of the Appraisal
2825 Foundation. The final proposed configuration of land would be determined after the market value
2826 of the parcels is determined by appraisals and would be presented in the final ROD. As shown in
2827 Figure 3.3-1, all of the lands proposed for exchange are located within the 1854 Ceded Territory
2828 of northeastern Minnesota.

2829 PolyMet currently owns a portion of the non-federal lands proposed for exchange; however, all
2830 rights, titles, and interests of the remaining non-federal lands proposed for exchange have been
2831 assigned to PolyMet. All of the non-federal lands except Tract 4 have severed mineral and
2832 surface ownership.

2833 There are no activities proposed on the non-federal lands as part of the Land Exchange Proposed
2834 Action. The non-federal lands would be incorporated with adjacent federal ownership and
2835 managed in accordance with the Forest Plan for that particular management area. Management
2836 areas provide context within which the USFS makes implementation decisions (described
2837 through desired conditions, objectives, standards, and guidelines) for an area of common
2838 direction. Management Areas on the Superior National Forest are mapped and described in
2839 Chapter 3 of the Forest Plan. The majority (86 percent) of the non-federal lands would be
2840 allocated to the General Forest Management Area, with the balance of the lands allocated to
2841 General Forest – Longer Rotation (7 percent), candidate Research Natural Areas (cRNAs) (4
2842 percent), and Riparian Emphasis Areas (3 percent). More information on Management Areas is
2843 presented in Chapters 4 and 5. Details of the tracts are summarized below.

2844 **3.3.2.2.1 Tract 1 – Hay Lake Lands**

2845 Tract 1 – Hay Lake Lands (Tract 1) is the largest tract of non-federal lands consisting of 4,651.5
2846 acres (GLO) within St. Louis County. Tract 1 consists of a single area of land located within the
2847 southeastern portion of the Superior National Forest (Laurentian Ranger District) proclamation
2848 boundary west of and adjoining County Road (CR) 715 and north of the town of Biwabik (see
2849 Figures 3.3-1 and 3.3-3). Access to the tract is available along its eastern edge via CR 715,
2850 although access to the interior is generally limited by vegetation.

2851 PolyMet is the owner of Tract 1, with the tract subject to a mortgage in favor of Iron Range
2852 Resources and Rehabilitation Board (IRRRB), which would have to be satisfied at closing of the
2853 Land Exchange Proposed Action.

2854 **3.3.2.2.2 Tract 2 – Lake County Lands**

2855 Tract 2 – Lake County Lands (Tract 2) consists of 319.5 acres (GLO) of land made up of four
2856 distinct parcels of lands within Lake County, Minnesota, formerly owned by Lake County (see
2857 Figures 3.3-1 and 3.3-3). The three northern parcels are referred to as Lake County North and the
2858 southern parcel is referred to as Lake County South. Tract 2 includes various 40-acre parcels
2859 within the Superior National Forest (Laurentian and Tofte Ranger Districts) proclamation
2860 boundary southeast of Seven Beaver Lake that are mostly surrounded by lands managed by the
2861 Superior National Forest and other wetland habitats.

2862 The Tract 2 parcels are tax forfeit lands being purchased in the name of Lake-Forest Enterprise,
2863 Inc. on a land contract from Lake County. There is an assignment on file with Andresen and
2864 Butterworth, PA which assigns all rights, title, and interest in these lands to PolyMet.

2865 **3.3.2.2.3 Tract 3 – Wolf Lands**

2866 Tract 3 – Wolf Lands (Tract 3) consists of 1,559.4 acres (GLO) of land made up of four distinct
2867 parcels of land within Lake County, Minnesota (see Figures 3.3-1, 3.3-3, and 3.3-4). Tract 3
2868 lands are located within the Laurentian and Tofte Ranger Districts, west and southwest of
2869 Isabella and are referred to as Wolf Lands 1, Wolf Lands 2, Wolf Lands 3, and Wolf Lands 4.

2870 The Tract 3 parcels are being purchased in the name of Lake-Forest Enterprise, Inc., through
2871 options from Wolf Lands, Inc. There is an assignment on file with Andresen and Butterworth,
2872 PA which assigns all right, title, and interest in these lands to PolyMet.

2873 **3.3.2.2.4 Tract 4 – Hunting Club Lands**

2874 Tract 4 – Hunting Club Lands (Tract 4) is a single parcel of 160.0 acres (GLO) of land within St.
2875 Louis County, surrounded by Superior National Forest-managed lands and is within the LaCroix
2876 Ranger District, approximately 5 miles southwest of Crane Lake (see Figures 3.3-1 and 3.3-4).
2877 Two small, unnamed lakes are partially included in the tract, as well as a high percentage of
2878 wetland habitat.

2879 PolyMet is the owner of Tract 4 and the parcel is not subject to any financing.

2880 **3.3.2.2.5 Tract 5 – McFarland Lake Lands**

2881 Tract 5 – McFarland Lake Lands (Tract 5) is a single parcel of land, 32.1 acres (GLO) in size
2882 within the Gunflint Ranger District in northeastern Cook County (see Figures 3.3-1 and 3.3-4).

2883 The tract is adjacent to Superior National Forest ownership and includes lakefront property on
2884 McFarland Lake, an entry point to the BWCAW. Access to the property is available by water
2885 from a landing off CR 16 (Arrowhead Trail), approximately 10 miles north of Hovland. The tract
2886 is not developed apart from a 20- by 40-ft wood-frame bunkhouse and outhouse that would be
2887 removed prior to finalizing the real estate transaction of the Land Exchange Proposed Action.

2888 PolyMet is the owner of Tract 5, with the tract subject to a mortgage in favor of the IRRRB,
2889 which would have to be satisfied at closing of the Land Exchange Proposed Action.

2890 **3.3.3 Land Exchange Proposed Action Alternatives**

2891 The Land Exchange Proposed Action and alternatives were developed initially through scoping
2892 (refer to Chapter 2 for more information). Public comments received in response to the scoping
2893 of the Land Exchange Proposed Action provided suggestions for alternative methods for
2894 achieving the Purpose and Need for the Land Exchange. Some of these alternatives were
2895 determined to be outside the scope of the Purpose and Need (see Section 1.3.2.2). In addition, the
2896 alternatives were determined to have been duplicative of the alternatives considered in detail or
2897 determined to be components that would cause unnecessary environmental harm.

2898 Two alternatives to the Land Exchange Proposed Action: the Land Exchange No Action
2899 Alternative and Land Exchange Alternative B are evaluated in detail in the SDEIS. The ROD
2900 from the USFS will contain the rationale for the selected alternative and how the public interest

2901 is served under 36 CFR 254.3(b). As stated in Section 1.4.3, factors that must be considered
2902 include: the opportunity to achieve better management of federal lands and resources, to meet the
2903 needs of state and local residents and their economies, and to secure important objectives,
2904 including but not limited to: protection of fish and wildlife habitats, cultural resources,
2905 watersheds, and wilderness and aesthetic values; enhancement of recreation opportunities and
2906 public access; consolidation of lands and/or interests in lands, such as mineral and timber
2907 interests, for more logical and efficient management and development; consolidation of split
2908 estates; expansion of communities; accommodation of existing or planned land use
2909 authorizations; promotion of multiple-use values; implementations of applicable Forest Land and
2910 Resource Management Plans; and fulfillment of public needs. See 36 CFR 254.3(b) and
2911 254.4(c)(4). Table 7.3.5-1 of this FEIS presents a comparison of how the alternatives address
2912 these factors.

2913 Other alternatives considered were eliminated from further analysis for one or more of the
2914 following reasons:

- 2915 • Did not meet Land Exchange Purpose and Need;
- 2916 • Did not comply with laws relating to federal land exchanges; or
- 2917 • In the case of one suggested alternative to limit the federal land exchanged, the suggestion
2918 was modified to form Land Exchange Alternative B.

2919 The alternatives that are evaluated in the SDEIS are both discussed below.

2920 **3.3.3.1 Land Exchange No Action Alternative**

2921 As stated previously, NEPA requires that the No Action Alternative be evaluated; in this case,
2922 this alternative means that the Land Exchange Proposed Action would not take place. For the
2923 purposes of analysis, the environmental effects resulting from taking no action are compared to
2924 the effects of permitting the Land Exchange Proposed Action and alternatives to the Land
2925 Exchange Proposed Action. Under the Land Exchange No Action Alternative, no lands would be
2926 exchanged and the NorthMet Project Proposed Action would not proceed.

2927 The federal government would not convey federal lands to PolyMet and the USFS would
2928 continue managing these lands as has been done in the past. The level of development and
2929 acceptable activities would be regulated by USFS and Superior National Forest policies.
2930 Management would include vegetation management, mineral exploration, recreation, wildlife,
2931 watershed, and other uses identified in the Forest Plan. These lands are in General Forest –
2932 Longer Rotation and the General Forest Management Areas. Furthermore, the federal
2933 government would not acquire the five tracts of non-federal lands and the lands would remain as
2934 private lands under the Land Exchange No Action Alternative.

2935 **3.3.3.2 Land Exchange Alternative B**

2936 Land Exchange Alternative B was derived from the Mine Site Exchange Only Alternative (refer
2937 to Section 3.3.3.3) that was developed to address concerns raised during scoping. This alternative
2938 would convey fewer acres of federal lands for fewer acres of non-federal land.

2939 An issue that was raised through scoping for the proposed land exchange was that the USFS did
2940 not need to exchange the entire tract of federal lands included in the Land Exchange Proposed

2941 Action to accommodate the proposed Mine Site and development. Commenters noted that not all
2942 of the acres proposed for exchange would be needed for developing the NorthMet Project Mine
2943 Site. Commenters stated that if there would be a land exchange, the USFS should exchange only
2944 the minimum amount of National Forest System lands needed for the Mine Site. The Land
2945 Exchange Alternative B addresses this issue by only including lands necessary for the Mine Site
2946 with less emphasis on minimizing the amount of USFS landlines and consolidating National
2947 Forest System lands ownership patterns. Compared to the Land Exchange Proposed Action,
2948 approximately 1,835.2 fewer acres (GLO) of National Forest System lands would be exchanged
2949 as part of Land Exchange Alternative B.

2950 Land exchanges are based on equal value; consequently, because there would be fewer federal
2951 acres available to be conveyed, there would be fewer acres of private land that would be
2952 acquired. The federal government would convey 4,833.7 acres (GLO) of federal lands to
2953 PolyMet, and the USFS would no longer manage these lands. The federal government would
2954 acquire 4,651.5 acres (GLO) of non-federal lands in one parcel, Tract 1. Tract 1 was selected for
2955 this alternative for the following reasons:

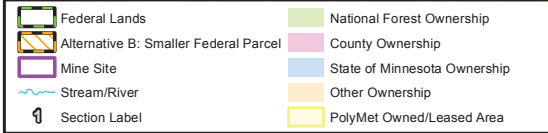

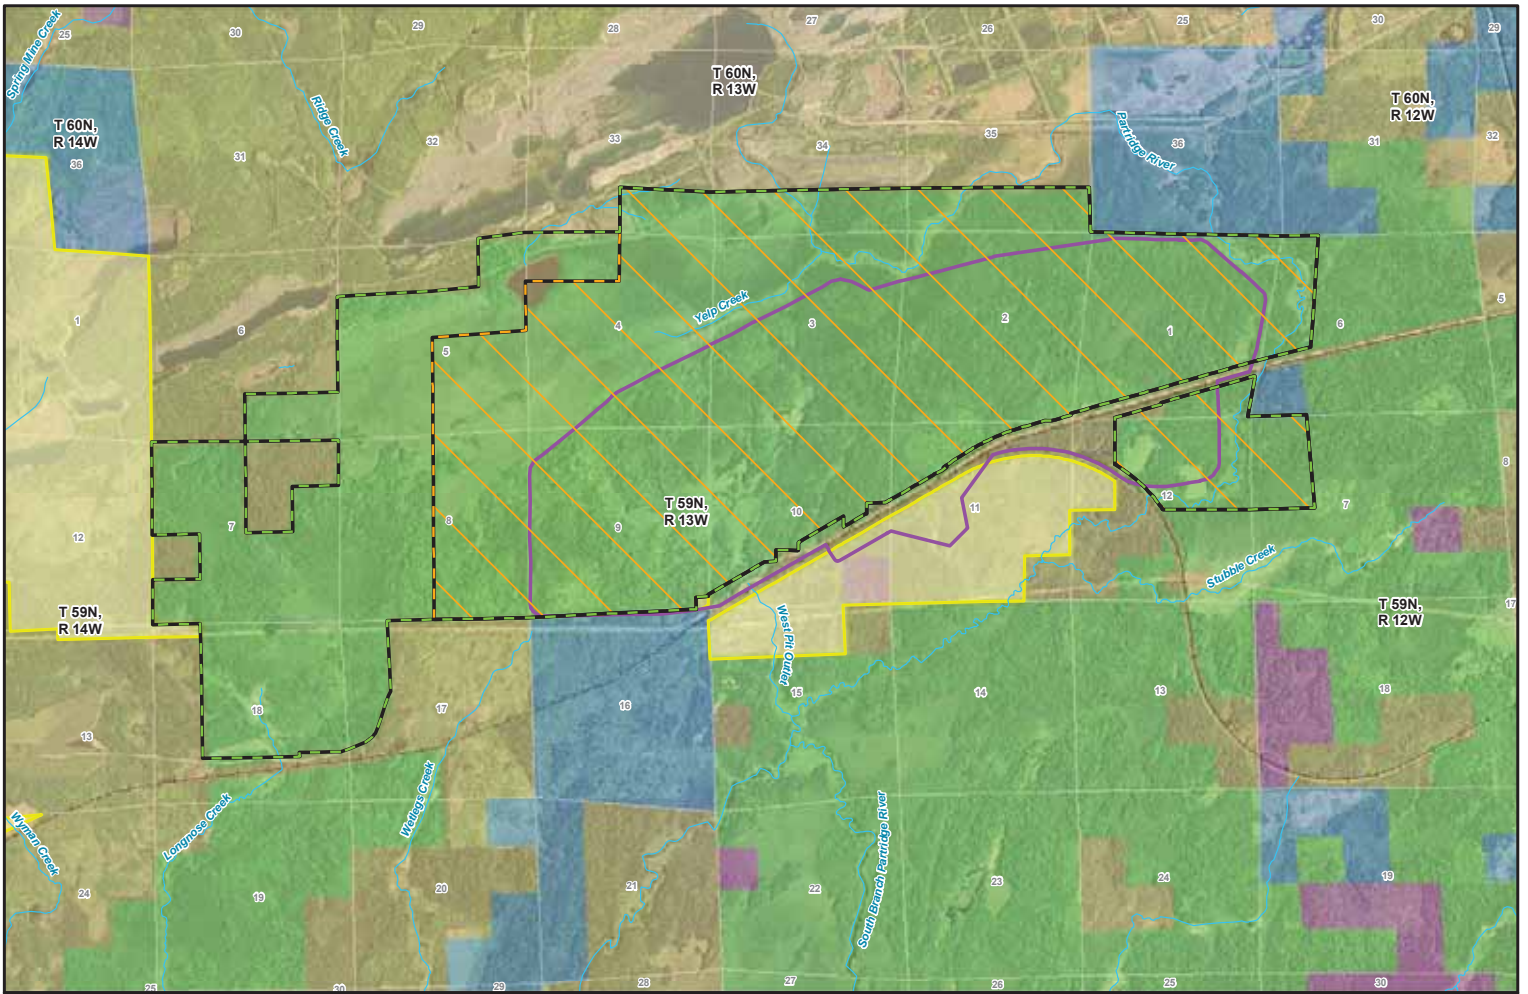

- 2956 • it would be almost equal in size to the smaller federal parcel;
- 2957 • it would provide wetlands; and
- 2958 • it is likely that Tract 1 would have a higher per-acre value than the smaller federal parcel
2959 because of its access to a county road and its potential for waterfront properties.

2960 The configuration of the smaller federal parcel is considered the smallest the boundary can be
2961 while still meeting the underlying Purpose and Need for the Land Exchange
2962 (see Figure 3.3-2). Under this alternative, approximately 1,750 acres to the west of the Mine Site
2963 would remain under federal ownership. This remaining federal tract would become an isolated
2964 piece of federal land with limited or difficult access through private property (see Figure 3.3-2).
2965 As with the Land Exchange Proposed Action, the USFS would reserve ownership of 181 acres of
2966 mineral rights on scattered parcels in the federal lands. These minerals are located outside of the
2967 NorthMet Project Proposed Action mine pits.

2968 Appraisal reports completed in 2013 indicate that the Land Exchange Alternative B would meet
2969 the federal value requirements if non-federal Tract 1 (4,651.5 [GLO] acres), would be exchanged
2970 for a smaller federal parcel of 4,887.3 (GLO) acres. If the ROD approves the Land Exchange, a
2971 current appraisal, approved by the USFS, would be required to verify equal value. Appraisals
2972 must conform to Uniform Appraisal Standards for Federal Land Acquisitions and the Uniform
2973 Standards of Professional Appraisal Practice of the Appraisal Foundation.

2974 The environmental consequences of Land Exchange Alternative B are evaluated in Chapters 5
2975 and 6 of this SDEIS.

2983 **3.3.3.3 Alternatives Considered but Eliminated from Detailed Analysis**

2984 The following alternatives were considered by the interdisciplinary team, but have been
2985 eliminated from further consideration because the proposals could not be acted upon at this time,
2986 were represented in the alternatives analyzed in detail, or did not meet the Purpose and Need.

2987 **3.3.3.3.1 Direct Purchase Alternative**

2988 This alternative, as called for in USFS guidance (FSH 5409.13, Section 33.41a), would involve
2989 the USFS directly purchasing the non-federal parcels—i.e., the privately owned parcels
2990 identified for exchange to help meet USFS management objectives. The direct purchase
2991 alternative would not resolve the conflict between the United States and the proposed
2992 development of the private mineral estate at the federal parcel. For this reason, this alternative
2993 would not meet the Purpose and Need of the proposed Land Exchange, and thus it was
2994 eliminated from further consideration.

2995 **3.3.3.3.2 Single Contiguous Non-federal Parcel**

2996 PolyMet’s proposed assemblage of land for the exchange was based on the standards and
2997 guidelines for land adjustment in the Forest Plan. The acquisition of a single contiguous non-
2998 federal parcel was not one of the priority criteria. Instead, the Forest Plan defines the desired
2999 condition for land adjustment in terms of the overall amount and spatial arrangement of National
3000 Forest System lands within the proclamation boundary. Moreover, PolyMet was not able to
3001 identify any single large tracts of land for sale. Therefore, this alternative was eliminated from
3002 further consideration.

3003 **3.3.3.3.3 Other Non-federal Lands**

3004 The exchange of the federal lands for multiple non-federal parcels that have wetlands and habitat
3005 more similar to the federal lands than the proposed non-federal lands was eliminated from
3006 detailed consideration for several reasons. The Land Exchange Proposed Action was developed
3007 to match “like acres” with “like acres” (i.e., those with similar wetland and habitat types) to the
3008 extent possible with lands that were available for acquisition and that met Forest Plan standards
3009 and guidelines for land adjustment. Without identifying specific lands, this alternative is
3010 theoretical only and would not meaningfully add to the range of alternatives considered.
3011 Therefore, this alternative was eliminated from detailed analysis.

3012 **3.3.3.3.4 Mine Site Exchange-Only**

3013 The Mine Site exchange-only alternative would have conveyed fewer acres of federal lands to
3014 address comments raised during the scoping period. Under this alternative, the federal
3015 government would have conveyed only the federal land (that is, 2,719 of the 3,015 acres) that
3016 would actually be used for the NorthMet Project Proposed Action.

3017 The Mine Site proposal identifies the minimum area physically needed for mine features.
3018 However, environmental assessment of the NorthMet Project Proposed Action identified the
3019 potential for air quality effects at the Mine Site boundary. A larger land exchange area would
3020 mitigate potential air quality issues; consequently, this alternative was eliminated from further
3021 consideration because it would not provide an adequate buffer. It was modified to Land
3022 Exchange Alternative B described in Section 3.3.3.2 and further evaluated in the SDEIS.

3023 **3.3.3.3.5 Full Exchange with Restrictions**

3024 Consistent with the Land Exchange Proposed Action, under this alternative, the federal
3025 government would have conveyed the entire federal tract (6,650 acres (GLO)), but would have
3026 placed use restrictions on a portion of the conveyed lands. This alternative was initially
3027 developed by the USFS during the 2009 Feasibility Analysis for the Land Exchange to
3028 compensate for a wetland imbalance when only the non-federal Tract 1 and Tract 5 were being
3029 proposed by the applicant as part of the Land Exchange Proposed Action. This imbalance has
3030 since been resolved through the addition of Tracts 2, 3, and 4 to the Land Exchange Proposed
3031 Action. Furthermore, this alternative is not substantially different from Alternative B, where the
3032 smaller federal parcel exchange would be protective of the One Hundred Mile
3033 Swamp. Therefore, this alternative was eliminated from detailed analysis as it would have had
3034 substantially similar effects to alternatives already analyzed.

3035 **3.3.3.3.6 Underground Mining Alternative**

3036 The potential for an underground mine to be developed on federal lands (through permitting)
3037 instead of the proposed surface mining was raised by public comment through both the Land
3038 Exchange scoping process and the comment periods for both the DEIS and SDEIS. Commenters
3039 suggested that a land exchange would not be needed if underground mining was proposed for the
3040 NorthMet Deposit.

3041 Underground mining was eliminated as an alternative to the NorthMet Project Proposed Action
3042 because it was found to be economically infeasible (refer to Section 3.2.3.4 and Appendix B).
3043 Consequently, it is not a reasonable alternative to the Land Exchange Proposed Action.

1 **4.0 AFFECTED ENVIRONMENT**

2 **4.1 INTRODUCTION**

3 Pursuant to the requirements of NEPA regulations at 40 CFR 1502.15 and *Minnesota Rules*, part
4 4410.2300, Chapter 4 describes the affected environment of the NorthMet Project Proposed
5 Action and Land Exchange Proposed Action. The information within this chapter provides
6 context to the analyses of the environmental consequences addressed in Chapter 5. Resource
7 topics were identified through scoping for both the NorthMet Project Proposed Action and Land
8 Exchange Proposed Action, development of the DEIS and SDEIS, and public comments. Refer
9 to Chapter 2 for more information on the EIS development process. The discussion of the
10 affected environment is limited to those resources that may be subject to potential environmental
11 effects from either the NorthMet Project Proposed Action or Land Exchange Proposed Action.

12 Table 4.1-1 lists the structure of Chapter 4 with respect to the NorthMet Project Proposed Action
13 and Land Exchange Proposed Action. Section 4.2 describes the existing conditions for the
14 natural and human environment that may be affected, directly or indirectly, by the NorthMet
15 Project Proposed Action. Section 4.3 describes the existing conditions of the same natural and
16 human environment resources as in Section 4.2, but specific to the areas that may be affected,
17 directly or indirectly, by the Land Exchange Proposed Action or Land Exchange Alternative B.

18 As previously indicated, the land exchange acreages used in the Project Description section are
19 described in GLO acreages, while the acreages used in the Affected Environment and
20 Environmental Consequences sections are described in GIS acreages. GLO acres represent the
21 acreages associated with the legal descriptions of the parcels based on original surveys
22 performed by GLO surveyors between 1858 and 1907. As such, GLO acreages are being used as
23 part of the project description and would also be used to define the real estate transaction if the
24 Land Exchange Proposed Action were approved. The affected environment presented in Section
25 4.3 is based upon GIS data. GIS values indicate the size of the federal and non-federal parcels as
26 computed geometrically using mapping software, which may be different than the GLO legal
27 acreage. Unless noted as GLO acres, all values shown are derived from GIS data.

28 The proposed lands to be exchanged are described in below in Section 4.3; however, the final
29 proposed configuration of land would be determined after the market value of the parcels is
30 determined by appraisals and the environmental analysis has been completed. This information
31 will be presented in the ROD.

33 **Table 4.1-1** *Resource Topic Areas Discussed in Chapter 4*

Resource Topic	NorthMet Project Proposed Action	Land Exchange Proposed Action
Land Use	4.2.1	4.3.1
Water Resources	4.2.2	4.3.2
Wetlands	4.2.3	4.3.3
Vegetation	4.2.4	4.3.4
Wildlife	4.2.5	4.3.5
Aquatic Species	4.2.6	4.3.6
Air Quality	4.2.7	4.3.7
Noise and Vibration	4.2.8	4.3.8
Cultural Resources	4.2.9	4.3.9
Socioeconomics	4.2.10	4.3.10
Recreation and Visual Resources	4.2.11	4.3.11
Wilderness and Special Designation Areas	4.2.12	4.3.12
Hazardous Materials	4.2.13	4.3.13
Geotechnical Stability	4.2.14	4.3.14

DRAFT

1 **4.2 NORTHMET PROJECT**

2 **4.2.1 Land Use**

3 This section describes the lands that may be affected by the NorthMet Project Proposed Action.
 4 Local, federal, and tribal management frameworks regulate the use of the lands. The Mine Site,
 5 Transportation and Utility Corridor, Plant Site, and non-federal lands fall within the 1854 Ceded
 6 Territory. The Mine Site and a portion of the Transportation and Utility Corridor fall within the
 7 Superior National Forest and are managed by the Forest Plan.

8 The Plant Site and existing LTVSMC Tailings Basin are located in a brownfield area dominated
 9 by the existing facilities and infrastructure of the former LTVSMC processing plant. In 2002,
 10 Cliffs Erie conducted a Phase I Environmental Site Assessment (Phase I ESA) of the former
 11 LTVSMC processing plant and identified 62 potential AOCs. The Legacy Contamination
 12 discussion in Section 4.2.1.4.2 elaborates on the status of AOCs.

13 **4.2.1.1 Regulatory Considerations**

14 The lands that may experience direct or indirect effects from the NorthMet Project Proposed
 15 Action (as well as the non-federal lands evaluated in Section 4.3.1) are located within the
 16 following jurisdictions:

- 17 • The cities of Babbitt and Hoyt Lakes;
- 18 • The 1854 Treaty Authority (including the 1854 Ceded Territories Conservation Code);
- 19 • Fond du Lac Tribal Conservation Codes for 1854 Ceded Territories;
- 20 • St. Louis, Lake, and Cook counties; and
- 21 • Superior National Forest.

22 County and municipal land use controls are described in Section 4.2.1.1.1; federal and tribal
 23 management frameworks are described in Section 4.2.1.1.2. Table 4.2.1-1 summarizes the
 24 relationship between these land use controls and project components.

25 **Table 4.2.1-1 Land Use Controls Affecting the NorthMet Project Proposed Action**

	Mine Site	Plant Site	Transportation and Utility Corridor
City of Hoyt Lakes Zoning Ordinance		X	X
City of Babbitt Zoning Ordinance	X		X
City of Babbitt Comprehensive Land Use Plan	X		X
St. Louis County Comprehensive Land Use Plan	X	X	X
Land and Resource Management Plan for Superior National Forest	X		X
1854 Treaty Authority	X	X	X

26 **4.2.1.1.1 Local Land Use Management**

27 Land use is regulated by municipal or county zoning ordinance, while comprehensive land use
28 plans provide additional guidance for future development (League of Minnesota Cities 2011). A
29 zoning designation identifies a list of allowed uses. If a proposed activity is one of these allowed
30 uses, then it can be developed “as of right.” If a potential use is not specifically allowed, the
31 zoning ordinance will indicate that a variance or some similar action is required. The lands
32 potentially directly affected by the NorthMet Project Proposed Action are in areas currently
33 zoned for mining and/or industrial use. Some of these areas have already been affected by
34 historic mining activity.

35 The federal lands are within the Partridge River Watershed, which is a tributary of the Upper St.
36 Louis River. While St. Louis County Comprehensive Land Use Plan does not apply to federal
37 lands, it would if the lands were acquired by PolyMet through the Land Exchange Proposed
38 Action or Land Exchange Alternative B. In addition, other non-federal lands within the
39 watershed are covered by the Comprehensive Land Use Plan’s guidance. The Plan emphasizes
40 active management of development in the watershed to promote preservation and improvement
41 of water quality, recreational opportunities, ecological health, and archaeological resources (St.
42 Louis County 2013).

43 **4.2.1.1.2 Federal and Tribal Land Use Management**

44 The Mine Site, Transportation and Utility Corridor, Plant Site, and non-federal lands are within
45 the territory ceded by the 1854 Treaty between the U.S. Government and the Chippewa of Lake
46 Superior. Hunting, fishing, gathering, and other traditional uses under the 1854 Treaty are
47 exercised on public lands within this territory, and on private lands with the permission of the
48 land owner.

49 In addition, a portion of the Mine Site and Transportation and Utility Corridor are within the
50 Superior National Forest. As such, they are governed by the Forest Plan. The Forest Plan uses
51 the management area framework to define the management approach for the Superior National
52 Forest. The Forest Plan provides direction on desired conditions for forestry resources, mineral
53 resources and extractive activity, vegetative communities, wildlife management, public
54 recreation opportunities, and visual character, among other characteristics (USFS 2004b).

55 **4.2.1.2 Mine Site**

56 The federal lands, comprising 6,495.4 acres, are located in St. Louis County, approximately 70
57 miles north of the City of Duluth, 20 miles south of the BWCAW, 6 miles south of the City of
58 Babbitt, and less than 2 miles south of the Northshore Mine. The federal lands are bounded on
59 the south by the Transportation and Utility Corridor.

60 Except for an area south of the Transportation and Utility Corridor (see Section 4.2.1.3 below),
61 the Mine Site is contained within the federal lands on part of the Superior National Forest and
62 within the municipal limits of the City of Babbitt (see Figure 4.2.1-1). Most of the Mine Site and
63 adjoining federal lands are part of the General Forest – Longer Rotation Management Area,
64 while the remainder is within the General Forest Management Area (see Figure 4.3.1-1).

65 The General Forest – Longer Rotation Management Area is characterized by a diverse array of
66 land and resource management uses, goods and services (including commercial goods), scenic

67 quality, developed and dispersed recreation opportunities, and habitat for wildlife and fish.
68 Roads open to public travel in this management area provide access to resources and road
69 recreation opportunities. Non-motorized recreation opportunities also exist. The USFS allows
70 exploration, development, and production of mineral resources on National Forest lands used for
71 timber production under conditions where the activities “are conducted in an environmentally
72 sound manner so that they may contribute to economic growth and national defense” (USFS
73 2004b).

74 The characteristics and use of the General Forest Management Area are similar to the General
75 Forest – Longer Rotation Management Area, except that timber harvests are more frequent, more
76 uniform in age, and more extensive. The General Forest Management Area has the highest
77 amount of young forest and the largest sized timber harvest units.

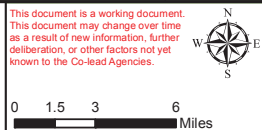

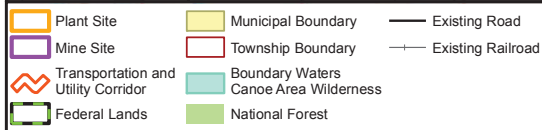

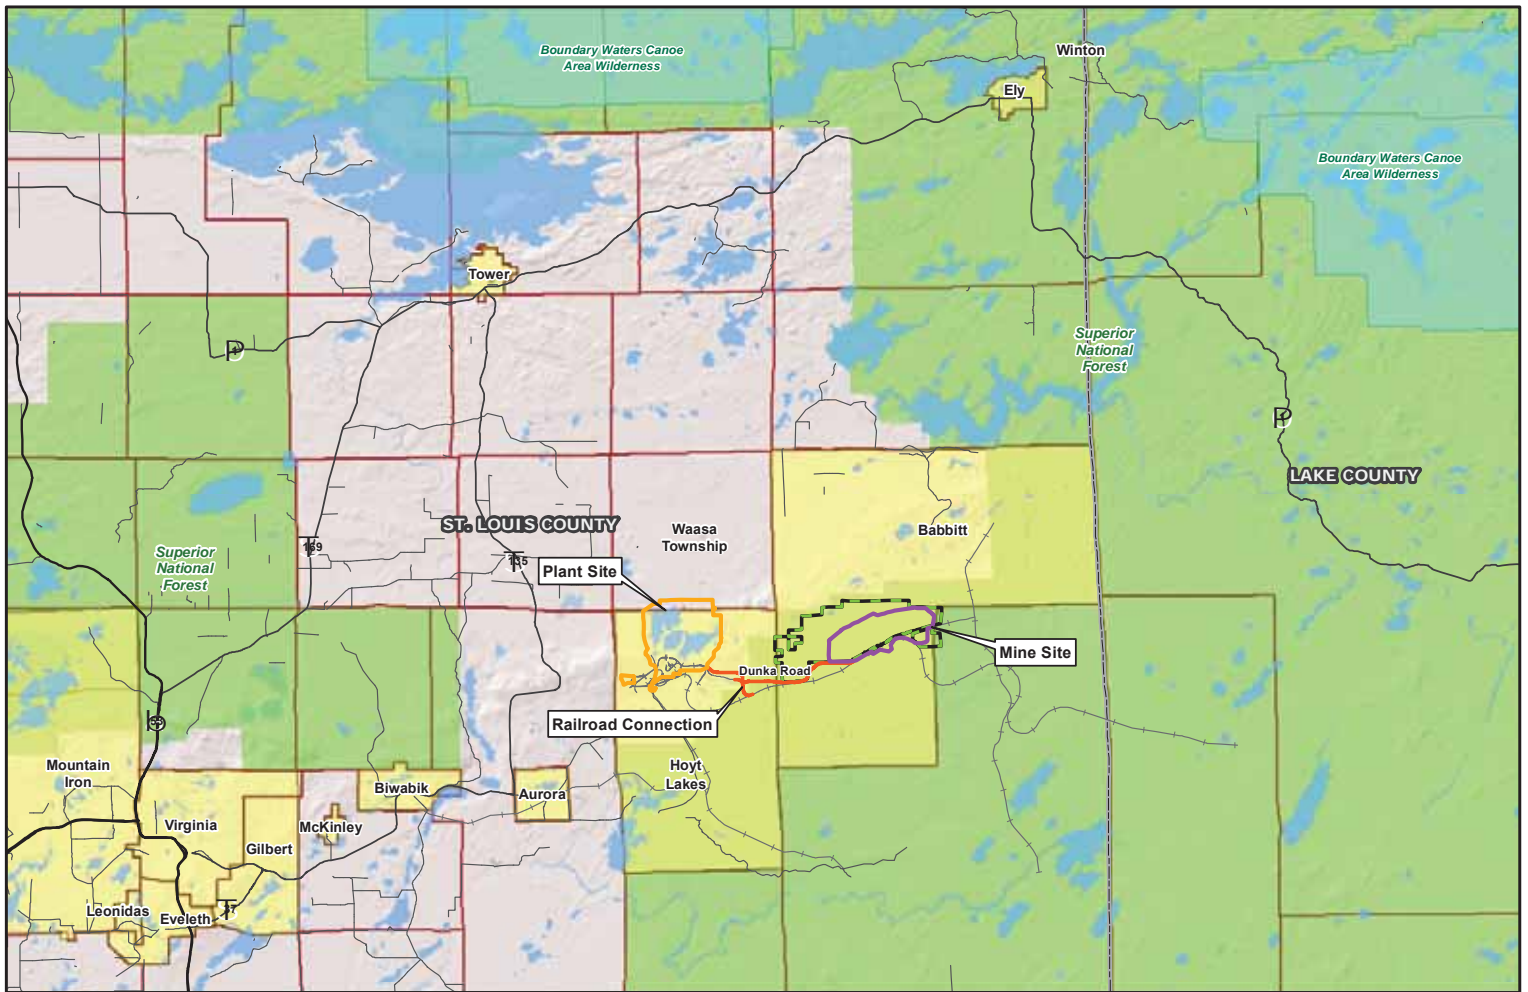

Figure 4.2.1-1
Area Municipalities
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

81 Federal lands designated for the Mine Site have been subject to mineral exploration since 1969.
82 As of 2011 (the most recent year for which data were available), this exploration included 123
83 exploration drill sites, soil borings, and the construction of approximately 0.5 mile of temporary
84 road access. Final reclamation of the closed portions of the temporary access roads has been
85 completed (USFS 2011a). There is no known existing contamination by hazardous materials at
86 the Mine Site.

87 The federal lands are a part of the territory ceded by the Chippewa of Lake Superior to the
88 United States in 1854 (1854 Treaty Authority 2006). The Chippewa reserve rights to hunt, fish,
89 and gather on public lands (and on private land with permission) in the 1854 Ceded Territory.
90 Tribal harvest levels and other activities are governed by either individual tribal entities (in the
91 case of the Fond du Lac Band) or the 1854 General Codes and subsequent Amendments under
92 the 1854 Treaty Authority (in the case of the Grand Portage and Bois Forte Bands [MDNR
93 2011o]).

94 The City of Babbitt's zoning ordinance classifies the Mine Site area as a Mineral Mining district.
95 This allows for existing and potential mineral mining, processing, and tailings and waste
96 disposal, as well as accessory and support activities needed for the proper operation of mining
97 activities outside the limits of open pit and ore formations. The zoning ordinance falls within the
98 city's broader Comprehensive Land Use Plan, which was revised in 2014 (Arrowhead 2014).
99 The draft plan includes goals and objectives in support of mining-related economic development
100 opportunities.

101 Use of the area surrounding the Mine Site is varied. The area to the north/northwest of the Mine
102 Site is within the City of Babbitt Mineral Mining district. The district includes part of the Plant
103 Site and the Transportation and Utility Corridor, and the Northshore Mine (City of Babbitt
104 1996). The area to the east of the Mine Site is Superior National Forest land that is within the
105 General Forest – Longer Rotation Management Area. The area to the south of the federal lands is
106 within the City of Babbitt's Mineral Mining district and is a mix of private use (railroad and
107 buffer area), Superior National Forest land within the General Forest Management Area, and
108 state-owned lands.

109 **4.2.1.3 Transportation and Utility Corridor**

110 The Transportation and Utility Corridor connects the Plant Site and Mine Site, and includes
111 Dunka Road, and a railroad connection.. The corridor traverses an area that straddles the
112 boundary between the City of Babbitt and City of Hoyt Lakes (see Figure 4.2.1-1). The corridor
113 passes through private, state, and Superior National Forest lands, some of which were previously
114 mined. The private lands are within the City of Babbitt Mineral Mining zoning district and the
115 City of Hoyt Lakes Mineral Mining district. The Superior National Forest areas are within the
116 General Forest – Longer Rotation Management Area.

117 Dunka Road is a private road, with segments owned and leased by Cliffs Erie, PolyMet, and
118 Minnesota Power. It serves as the access point for USFS Roads 125, 108, and 109, which are
119 used for forest maintenance in the area of the Mine Site. Dunka Road also provides access to an
120 existing electrical transmission line that runs parallel to and south of the road. The railroad is
121 privately owned and in operating condition, but has not been extensively used since operations at
122 LTVSMC ceased in 2001.

123 The Transportation and Utility Corridor crosses over Wyman, Longnose, and Wetlegs Creeks,
124 which drain to the Partridge River, a tributary of the Upper St. Louis River (see Figure 3.2-1). It
125 therefore also falls within the jurisdiction of the St. Louis County Comprehensive Land Use Plan
126 in the management of the St. Louis River Watershed (see Section 4.2.1.1 above).

127 **4.2.1.4 Plant Site**

128 **4.2.1.4.1 Summary of Land Use Conditions**

129 The Plant Site is west of the Mine Site, in an area dominated by the existing facilities and
130 infrastructure of the former LTVSMC processing plant and Tailings Basin, along with additional
131 acreage purchased for the purpose of plant upgrade and buffer zones. The site is characterized by
132 historical heavy industrial use, with extensive mechanical facilities, rail lines, mine workings,
133 tailings storage, and closed pits. The majority of the Plant Site is located within the incorporated
134 limits of the City of Hoyt Lakes and governed by the City of Hoyt Lakes Zoning Ordinance, last
135 updated in 2010 (Hoyt Lakes Planning Commission 2010). The City does not have a
136 comprehensive land use plan. The Hoyt Lakes portion of the Plant Site is in the City's Mineral
137 Mining district, which identifies areas of existing and potential mineral mining, processing,
138 tailings and waste disposal, and related activities, outside of the boundaries of the open mine pit
139 and ore formations themselves.

140 The northern section of the Tailings Basin within the Plant Site is located within unincorporated
141 Waasa Township (see Figure 4.2.1-1) and governed by the St. Louis County Comprehensive
142 Land Use Plan. This area of the county is zoned for industrial use (the IND-4 zoning district; St.
143 Louis County 2011). This district designates land for mining and quarrying, manufacturing,
144 mineral exploration and evaluation, and a number of other related activities.

145 The Plant Site is accessible by Dunka Road from the east and from County Road 666 from the
146 south. The Plant Site drains to the Partridge and Embarrass rivers, tributaries of the Upper St.
147 Louis River. It therefore is within the jurisdiction of the St. Louis County Comprehensive Land
148 Use Plan in the management of the St. Louis River Watershed (see Section 4.2.1.1 above).

149 The NorthMet Project Proposed Action includes the use of an existing water pipeline which runs
150 from the northernmost section of Colby Lake northward to the Plant Site. The pipeline corridor is
151 within the City of Hoyt Lakes Mineral Mining district. Colby Lake is an in-stream lake within
152 the Partridge River. The corridor therefore is within the jurisdiction of the St. Louis County
153 Comprehensive Land Use Plan in the management of the St. Louis River Watershed.

154 **4.2.1.4.2 Legacy Contamination**

155 In 2002, Cliffs Erie commissioned a Phase I ESA of the former LTVSMC processing plant and
156 improvements (NTS 2002), which identified 62 potential AOCs. Designation as an AOC means
157 that these areas require further investigation, but does not necessarily mean that contamination
158 occurred in the past or is currently present.

159 As shown in Table 4.2.1-2, PolyMet would assume responsibility for 29 of the 62 AOCs upon
160 acquiring the property from Cliffs Erie (Barr 2007e). Of the 29 AOCs to be acquired, four have
161 been closed or received a no further action letter from the MPCA; one is a permitted former
162 landfill under post-closure monitoring pursuant to the Minnesota solid waste landfill
163 requirements; and 14 require further investigation, including AOC #8, another closed permitted

164 landfill, which requires further investigation to assess a groundwater plume. Table 4.2.1-2
165 summarizes the potential issues and status of these AOCs. PolyMet intends to continue the VIC
166 program initiated by LTVSMC and continued by Cliffs Erie, and would investigate and
167 remediate as necessary these AOCs on a schedule approved by the MPCA.

168 All historic and any potentially operational AOCs not already addressed by the start of mine
169 closure would be investigated and remediated as necessary. The MDNR has indicated that any
170 associated cleanup costs for the legacy AOCs would be included in the financial assurance
171 requirements for any Permit to Mine issued to PolyMet for the NorthMet Project Proposed
172 Action (Watkins, Pers. Comm., April 13, 2009).

173 The status of the remaining 33 AOCs for which PolyMet does not have any responsibility are as
174 follows:

- 175 • Eleven sites have been closed through the VIC program;
- 176 • Five sites have been closed through the Petroleum Remediation Program;
- 177 • Four sites have completed initial investigations, sampling plans in place, and are awaiting
178 MPCA review;
- 179 • Nine sites have not yet been investigated;
- 180 • One site has a status that is unknown or not readily available;
- 181 • One site has a limited no action determination;
- 182 • One site is being managed through the NPDES program; and
- 183 • One site would likely require additional remediation (i.e., Pellet Plant).

184 Table 4.2.1-3 summarizes the potential issues and status of these AOCs.

185 Additionally, the LTVSMC Tailings Basin seeps are being managed under the Cliffs Erie
186 Consent Order using short-term measures until long-term mitigation measures are determined.

187 **Table 4.2.1-2 NorthMet Project Proposed Action Area of Concern Summary List for Voluntary Investigation and Cleanup**
 188 **Program**

AOOC	Location	Site Description	Identified Potential Issues	Status
1	Area 1	Area 1 Shops and Reporting	Domestic septic systems and drain field.	No actions have been taken with regard to this site.
6	Area 1	Oily Waste Disposal Area	Waste from general shop area floor drains.	No actions have been taken with regard to this site.
7	Area 1	Bull Gear Disposal Area	One time 1970s disposal of heavy lubricant.	No actions have been taken with regard to this site.
8	Area 1	Private Landfill	Permitted industrial waste landfill that operated until 1993. Identified presence of groundwater plume.	The closed LTVSMC Private Landfill exists within the site of active permitted Industrial Waste Landfill (SW-619). Monitoring activities for the closed LTVSMC Private Landfill are incorporated into the active SW-619 permit (held by Cliffs Erie). Work plan submitted to MPCA to define the extent of the facility's groundwater plume, assess the stability of the groundwater, and assess the ability of the gas vents to aid in the remediation of the groundwater plume.
9	Area 1	Area 1 RR Panel Yard	Railroad tie disposal area co-mingled with scrap metal, wood, and demolition debris.	Scrap and trash were disposed. Some items remain to be removed. A SAP was submitted to the MPCA and was implemented. A historic release was identified. Further recommendations for cleanup are ongoing to the MPCA.
10	Area 1	Area 1 Airport	Some areas of soil staining.	No actions have been taken with regard to this site.
11	Area 1	Stoker Coal Ash Disposal	Disposal area until 1980s with marginal cover.	No actions have been taken with regard to this site.
12	Area 1	Mill Rejects Area	Solid waste from concentrator building.	Site closed; No Further Action required.
13	Area 2/2E/3	2001 Storage Area	Some areas of soil staining.	No actions have been taken with regard to this site.
14	Area 2/2E/3	Large Equipment Paint Area	Buildup of blasting sand.	No actions have been taken with regard to this site.
24	Area 5	Area 5 Reporting	Scrap and salvage area with some stained soils.	Site closed through the VIC program in letter dated 7/30/08.
25	Area 5	Area 5 Loading Pocket & Storage	Some areas of stained soils along rail siding.	Site closed through the VIC program in letter dated 7/30/08.
35	Plant Site	Dunka WWTP Sludge Staging Area	Little evidence of any residue remaining.	Water treatment plant sludge residue removed.

AO	Location	Site Description	Identified Potential Issues	Status
36	Plant Site	Coal Ash Landfill	Cover appears to be in good condition.	Permitted Landfill. Closed and subject to post-closure monitoring.
37	Plant Site	Line 9 Area 5 Petroleum Contaminated Soil	Permitted petroleum land application site with 25,000 cubic yards of soils.	The MPCA sent a closure letter for this site on February 24, 2006.
38	Plant Site	Area 2 Shops	Contains a locomotive fueling station and a septic system.	<i>Petroleum impacted soil excavation has been completed. Additional evaluation of non-petroleum contamination needed.</i>
40	Plant Site	Heavy Duty Garage	Formerly used for equipment maintenance.	Building and one UST removed. Site reuse planned. Further investigation at PolyMet closure. <i>No actions have been taken with regard to this site.</i>
42	Plant Site	Bunker C Tank Farm	Large ASTs which previously contained #4 and #6 fuel oil.	<i>Petroleum Remediation closed the site January 2012. Contamination remains at the site.</i>
43	Plant Site	Administration Building	One heating oil UST was abandoned in place.	Facility still in use. Further investigation at PolyMet closure. <i>No additional actions have been taken with regard to this site.</i>
44	Plant Site	Main Gate Vehicle Fueling Area	Contains several AST used for fueling trucks.	Facility still in use. Further investigation at PolyMet closure. <i>No additional actions have been taken with regard to this site.</i>
46	Plant Site	Plant Site Proper/General Shops	Former taconite processing area – no specific issues identified.	Reuse planned. Further investigation at PolyMet closure. <i>No additional actions have been taken with regard to this site.</i>
47	Tailings Basin	Tailings Basin Reporting	Septic system remains.	Two USTs removed. <i>No additional actions have been taken with regard to this site.</i>
48	Tailings Basin	Transformers	Several transformers present, but records indicate that they do not contain PCBs.	No actions have been taken with regard to this site.
49	Tailings Basin	Coarse Crusher Petroleum Contaminated Soil Stockpile	Contained floor sweepings (containing oil).	All contaminated soil was removed in 1990s.
50	Tailings Basin	Emergency Basin	Received water from process sumps in the Concentrator during power outages and emergency conditions, and storm water outfall.	A SAP was submitted to the MPCA and was implemented. <i>MPCA VIC program is waiting for an investigation report summarizing the work.</i>
51	Tailings Basin	Salvage and Scrap Areas	Some areas of soil staining.	No actions have been taken with regard to this site.
52	Tailings Basin	Cell 2W Salvage Area	Several small stained soil areas as well as the remnants of a mobile AST.	No actions have been taken with regard to this site.
53	Tailings Basin	Cell 2W Hornfels waste rock	Sulfide waste rock disposed under a MPCA/MDNR approved plan.	NPDES monitoring ongoing.

Preliminary Final Environmental Impact Statement (PFEIS)
NorthMet Mining Project and Land Exchange

AOC	Location	Site Description	Identified Potential Issues	Status
59	Colby Lake	Colby Lake Pumping Station	One transformer remaining.	One heating oil AST removed in 1970. Reuse planned, further investigation at PolyMet closure. <i>No additional actions have been taken with regard to this site.</i>

189 Sources: NTS 2002; Scott 2009h; Pers. Comm., 2011; Pers. Comm., 2014.

190 Italic text in Table 4.2.1-2 indicates that the “Identified Potential Issues” and “Status” have been updated since the SDEIS.

194 **Table 4.2.1-3 Non-NorthMet Project Areas of Concern Status**

AOC	Responsible Party	Site Description	Issues	Status
2	Mesabi Nugget	Area 1 petroleum contaminated soil	Petroleum contaminated soil.	<i>SAP submitted and approved. MPCA waiting for results report.</i>
3	Mesabi Nugget	Sludge site	Sludge contaminated soil.	<i>No actions have been taken with regard to this site.</i>
4	Mesabi Nugget	1004 storage area	Soil staining and debris.	<i>Workplan submitted November 2013. MPCA waiting for results report.</i>
5	Mesabi Nugget	Roofing disposal site	Roofing debris.	<i>Workplan submitted November 2013. MPCA waiting for results report.</i>
15	Cliffs Erie	Railroad storage area	Debris.	<i>No action to date.</i>
16	Cliffs Erie	Area 2 vibratory loading pocket		<i>Limited No Action Determination for Soil sent May 20, 2008.</i>
17	Cliffs Erie	Area 2 truck fueling		<i>Petroleum release L#16490 closed.</i>
18	Cliffs Erie	Area 2 superpocket		<i>Petroleum release evaluated and L#16490 closed.</i>
19	Mesabi Nugget	Area 2WX reporting		<i>Site closed through the VIC program in letter dated 7/31/08.</i>
20	Mesabi Nugget	Area 2WX shovel salvage		<i>Site closed through the VIC program in letter dated 7/31/08.</i>
21	Mesabi Nugget	Area 2WX truck fueling		<i>Site closed through the VIC program.</i>
22	Mesabi Nugget	Area 2WX vibratory loading pocket		<i>Site closed through the VIC program in letter dated 7/31/08.</i>
23	Mesabi Nugget	Area 2WX superpocket		<i>Site closed through the VIC program.</i>
26	Mesabi Nugget	Area 6 truck fueling		<i>Site closed through the VIC program.</i>
27	Mesabi Nugget	Area 6 misfired blast		<i>Site closed through the VIC program.</i>
28	Mesabi Nugget	Area 9S former Aurora dump site	Debris.	<i>No actions to date.</i>
29	Mesabi Nugget	Stockpile #9021	Debris related to Aurora dump site.	<i>Workplan has been approved. MPCA is waiting for investigation report.</i>
30	Mesabi Nugget	Pre-taconite plant	Debris.	<i>Closed in VIC and Petroleum Remediation programs.</i>
31	Mesabi Nugget	Area 9N vibratory loading pocket	Septic tank and drain field.	<i>Unknown.</i>
32	Duluth Metals	Dunka shops and reporting	Demolition debris, closed leak site.	<i>No actions have been taken with regard to this site.</i>
33	Duluth Metals	North loading pocket – Dunka	Abandoned wells and septic	<i>No actions have been taken with regard to this site.</i>

Preliminary Final Environmental Impact Statement (PFEIS)
NorthMet Mining Project and Land Exchange

AOC	Responsible Party	Site Description	Issues	Status
34	Duluth Metals	South loading pocket – Dunka	Abandoned wells and septic system.	<i>No actions have been taken with regard to this site.</i>
39	Cliffs Erie	Knox Railroad fueling station		<i>Petroleum contaminated soil excavated and soil to land treatment area. Site is closed.</i>
41	Cliffs Erie	Oxygen plant		<i>Closed in VIC and Petroleum Remediation programs.</i>
45	Cliffs Erie	Pellet storage area and load-out	Soil staining and petroleum residue.	No action to date.
54	Cliffs Erie	Taconite Harbor marine fueling ASTs		<i>Approximately 2500 cubic yards of petroleum contaminated soil excavated and disposed. L#12252 closed.</i>
55	Cliffs Erie	Taconite Harbor oil track		<i>Petroleum contaminated soil removed from tracks. L#12252 closed.</i>
56	Cliffs Erie	Coal ash landfill - Taconite Harbor		Managed through <i>Solid Waste and/or</i> NPDES permit, no VIC action.
57	Cliffs Erie	Murphy City	Soil staining, well and septic system.	<i>Closed petroleum L#6423. No VIC action to date.</i>
58	Cliffs Erie	Rail lubricators	Stained soil.	No action to date.
60	Cliffs Erie	Brick recycling area		Site closed through the VIC program.
61	Cliffs Erie	PCB ditch investigation (pellet plant)		Site closed through the VIC program.
62	Cliffs Erie	Pellet plant	Soil staining and debris.	<i>No actions have been taken with regard to this site.</i>

201 Cliffs Erie received a permit (SW-625) in 2006 from the MPCA to locate two individual land
202 treatment sites within Cell 2W of the existing LTVSMC Tailings Basin. This facility is being
203 used to land farm petroleum-contaminated (i.e., diesel fuel) soils excavated from AOCs #38
204 (Area 2 Shops) and #39 (Knox Railroad fueling station).

205 In May 2009, Cliffs Erie conducted a detailed assessment of both surface and groundwater
206 quality at the existing LTVSMC Tailings Basin, including testing for volatile organic compounds
207 (VOCs), SVOCs, PCBs, and other parameters to determine if there was any organic
208 contamination that could be transported off site via stormwater runoff or groundwater seepage.
209 The laboratory analyses showed no evidence of organic contamination leaving the site (Cliffs
210 Erie 2009). Based on the investigations and laboratory analyses to date, which include sampling
211 at seven monitoring wells, 14 surface discharges, 12 internal waste streams, and six downstream
212 surface water monitoring stations, and visual observation and limited field analyses at 33 seeps at
213 or near the existing LTVSMC Tailings Basin, no off-site contamination has been documented.
214 The extent of on-site contamination from the legacy sites appears to be limited to localized soils
215 and groundwater.

1 **4.2.2 Water Resources**

2 This section describes the existing groundwater and surface water hydrology and water quality
3 within the Partridge River and Embarrass River watersheds because these watersheds are
4 expected to be affected by the NorthMet Project Proposed Action. The Partridge River and
5 Embarrass River are headwaters to the St. Louis River. The Mine Site, Transportation and Utility
6 Corridor, the former LTVSMC processing plant, and a small portion of the existing LTVSMC
7 Tailings Basin drain to the Partridge River Watershed (see Section 4.2.2.2), while most of the
8 Tailings Basin and the Emergency Basin drain to the Embarrass River Watershed (see Section
9 4.2.2.3).

10 The presence of perennial streams and watershed divides at both the Mine Site and Plant Site
11 constrains the hydrologic effects of the NorthMet Project Proposed Action to the Partridge River
12 and Embarrass River watersheds. There are two hydrologic barriers between the Mine Site and
13 the Rainy River watershed (which is hydrologically connected to the BWCAW), including:

- 14 • High ground north of the Partridge River that creates a watershed divide separating the Lake
15 Superior Basin and Rainy River Watershed, and prevents surface water from passing
16 between the two. This major watershed divide is included in the National Atlas, as well as
17 USGS and MDNR data sets.
- 18 • Yelp Creek and the Partridge River encircle the northern, eastern, and southern sides of the
19 Mine Site. These streams are thought to be a hydrologic “sink” for groundwater and surface
20 water originating at the Mine Site. Surface runoff or groundwater seepage leaving the Mine
21 Site would follow a gradient into Yelp Creek or the Partridge River, as opposed to continuing
22 towards the watershed divide. The position of One Hundred Mile Swamp as continuous
23 across this boundary does not equate to a hydrologic connection.

24 **4.2.2.1 Regional Setting**

25 **4.2.2.1.1 Meteorological Conditions**

26 The NorthMet Project area is located near the headwaters of the Partridge River and Embarrass
27 River watersheds at an approximate elevation of 1,600 ft amsl. Meteorological data are available
28 for the NorthMet Project area from two weather stations operated by the National Weather
29 Service. The Babbitt 2SE weather station is located approximately 5 miles from the Mine Site
30 and has 39 years of records. The Hoyt Lakes 5N weather station is located approximately 1 mile
31 from the Plant Site and has 27 years of records (see Figure 4.2.2-1).

32 Table 4.2.2-1 shows the monthly and annual average air temperature and precipitation for the
33 two National Weather Service stations. Precipitation averages approximately 28 inches annually.
34 Snowfall in the NorthMet Project area typically occurs between October and April. Estimates of
35 annual average evaporation for northern Minnesota range from 18 inches (Siegel and Ericson
36 1980) to 22 inches (SCS 1975).

DRAFT

45 **4.2.2.1.2 Water Resource Use Classifications**

46 A key element of water quality management is “use classification,” which identifies beneficial
47 uses for which a waterbody must be protected. The State of Minnesota has adopted a framework
48 that identifies a broad range of potential uses, including:

- 49 • Domestic consumption – Class 1;
- 50 • Aquatic life and recreation – Class 2;
- 51 • Industrial consumption – Class 3;
- 52 • Agriculture and wildlife – Class 4;
- 53 • Aesthetics and navigation – Class 5;
- 54 • Other uses – Class 6; and
- 55 • Limited resource value – Class 7.

56 These classes can be further divided into subclasses with letter designations. The use
57 classifications are not intended to imply a priority rank to the uses.

58 **Groundwater**

59 Following *Minnesota Rules* 7060.0200, it is the policy of the State of Minnesota to consider the
60 actual or potential use of groundwater for potable water supply as constituting the highest
61 priority use and, as such, to provide maximum protection to all underground waters. Therefore,
62 all groundwater is considered to have one beneficial use, domestic consumption (Class 1).

63 The MDNR has water allocation priorities defined under statute 103G.261 as follows:

64 (a) The commissioner shall adopt rules for allocation of waters based on the following priorities
65 for the consumptive appropriation and use of water:

66 (1) first priority, domestic water supply, excluding industrial and commercial uses of
67 municipal water supply, and use for power production that meets the contingency planning
68 provisions of section 103G.285, subdivision 6;

69 (2) second priority, a use of water that involves consumption of less than 10,000 gallons of
70 water per day;

71 (3) third priority, agricultural irrigation and processing of agricultural products involving
72 consumption in excess of 10,000 gallons per day;

73 (4) fourth priority, power production in excess of the use provided for in the contingency
74 plan developed under section 103G.285, subdivision 6;

75 (5) fifth priority, uses other than agricultural irrigation, processing of agricultural products,
76 and power production, involving consumption in excess of 10,000 gallons per day; and

77 (6) sixth priority, nonessential uses.

78 (b) For the purposes of this section, "consumption" means water withdrawn from a supply that is
79 lost for immediate further use in the area.

80 (c) Appropriation and use of surface water from streams during periods of flood flows and high
81 water levels must be encouraged subject to consideration of the purposes for use, quantities to be
82 used, and the number of persons appropriating water.

83 (d) Appropriation and use of surface water from lakes of less than 500 acres in surface area must
84 be discouraged.

85 (e) The treatment and reuse of water for non-consumptive uses shall be encouraged.

86 Principal groundwater resources in the NorthMet Project area are contained in bedrock geologic
87 units and overlying surficial glacial deposits, which are also referred to as unconsolidated
88 deposits. The water table is primarily located within the unconsolidated deposits; however, it is
89 also likely located within the bedrock in areas of local bedrock highs. This means that saturated
90 conditions exist within the unconsolidated deposits and in the underlying bedrock. Recharge to
91 the bedrock is by infiltration of precipitation in outcrop areas and leakage from the overlying
92 surficial aquifer (Siegel and Ericson 1980).

93 **Surface Water**

94 All surface waters in Minnesota are classified and protected for multiple beneficial uses.
95 *Minnesota Rules* 7050.0470 lists individual waters and their associated use classifications.
96 However, only a limited subset of all waters are actually listed, which include trout waters,
97 surface waters protected for drinking water use, outstanding resource value waters, and Class 7
98 limited-resource-value waters. All of the remaining surface waters of the State, which include
99 most of the waters of the State, are considered “unlisted waters.” These unlisted surface waters
100 are uniformly classified as Class 2B (cold or warm water sport or commercial fishing),
101 3C (industrial cooling and materials transport), 4A (irrigation use), 4B (livestock and wildlife
102 use), 5 (aesthetics and navigation), and 6 (other uses) waters.

103 In the NorthMet Project area, most of the rivers and streams are unlisted. The two listed
104 waterbodies in the NorthMet Project area are Colby Lake and Wyman Creek. Colby Lake, which
105 is used for domestic consumption by the City of Hoyt Lakes, is designated as Classes 1B (treated
106 with simple chlorination for domestic consumption) and 2Bd (cool or warm water sportfish and
107 drinking water) waters as well as the other default Classes 3C, 4A, 4B, 5, and 6. Wyman Creek,
108 which is a designated trout stream, is designated as Classes 1B as well as 2A (aquatic life and
109 recreation), 3B (industrial consumption-moderate treatment), as well as the other default classes
110 3C, 4A, 4B, 5, and 6 (*Minnesota Rules*, part 7050.0470).

111 All NorthMet Project area waters are also designated Outstanding International Resource Waters
112 (*Minnesota Rules*, parts 7050.0460 and 7052.0300), which prohibits any new or expanded point
113 source discharges of bioaccumulative substances of immediate concern (i.e., mercury) unless a
114 nondegradation demonstration is completed and approved by the MPCA.

115 In addition to the above water use classifications for establishment of state water quality
116 standards (*Minnesota Rules*, Chapters 7050 and 7052), certain waters of the state are also
117 classified by the MDNR as Public Waters. Public Waters are all water basins, wetlands, and
118 watercourses that meet the criteria set forth in Minnesota Statutes, section 103G.005, subdivision
119 15, and that are identified on Public Water Inventory maps authorized by Minnesota Statutes,
120 section 103G.201 (see Figure 4.2.2-2). Any proposed activity that alters the course, current, or
121 cross section of a mapped Public Water is subject to a variety of state regulations (*Minnesota*

122 *Rules*, Chapter 6115), depending on the proposed activity. The Public Waters program does not
123 regulate water quality.

124 **Impaired Waters**

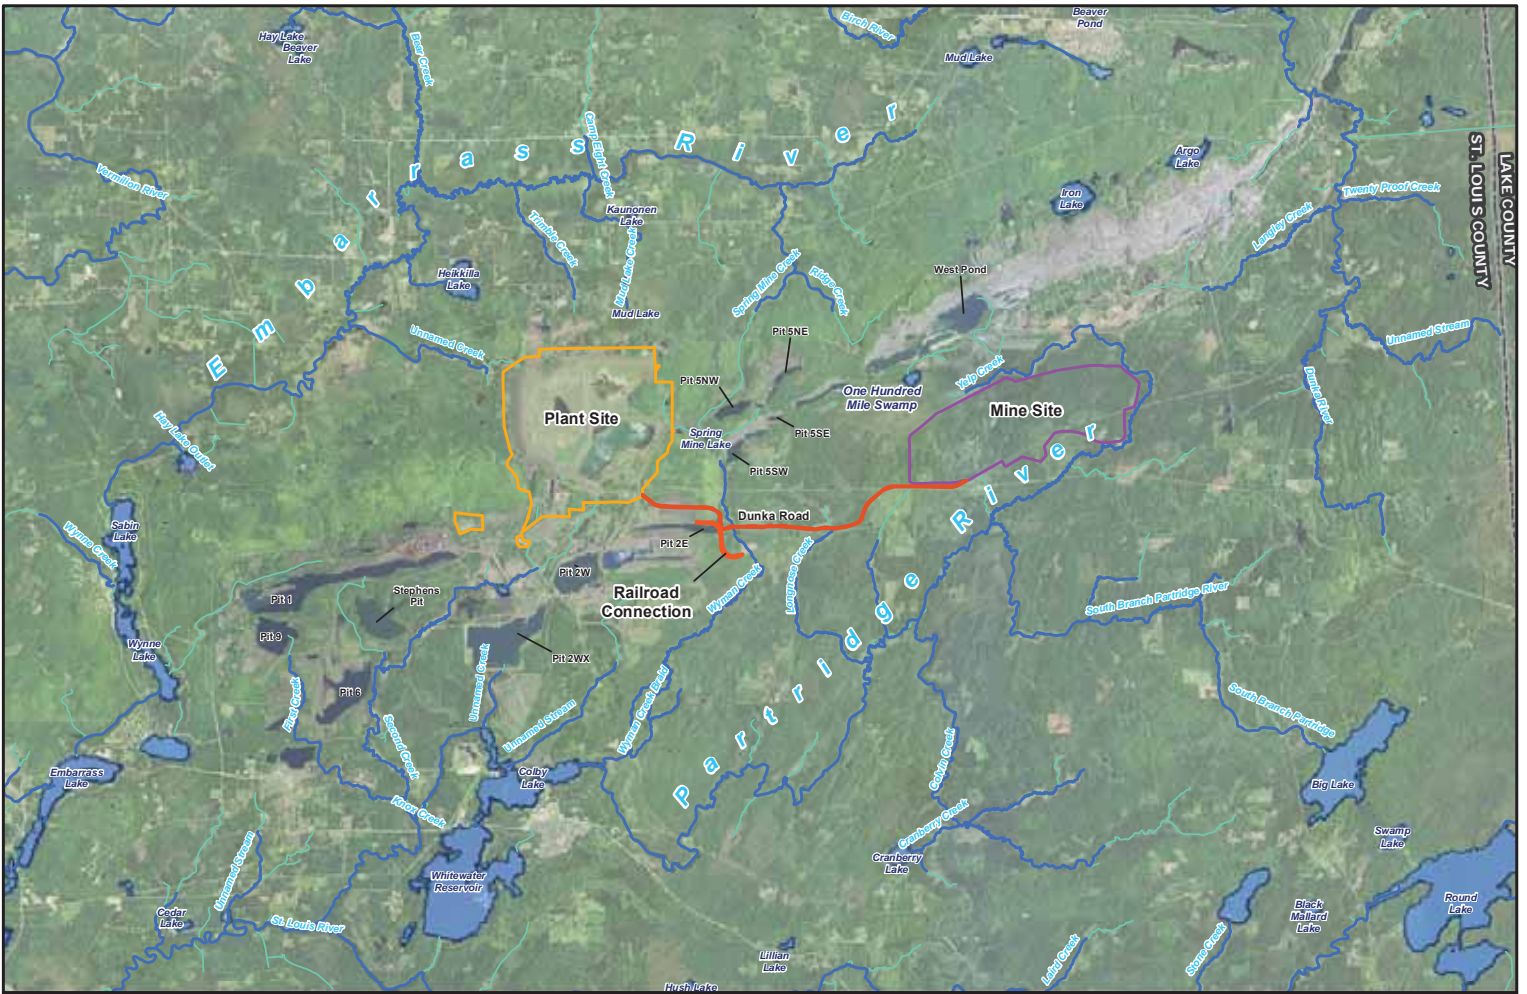

125 The federal CWA requires states to adopt water quality standards to protect waters from
126 pollution. These standards, which are typically based on the beneficial use classifications
127 described above, define how much of a pollutant can be in the water and still meet beneficial
128 uses, such as drinking water, fishing, and swimming. Water quality standards are the
129 fundamental tools used to assess the quality of all surface waters. States must monitor and assess
130 the water quality of their waters to identify those that are “impaired” (i.e., not fully supporting
131 their beneficial uses).

132 Section 303(d) of the CWA requires states to publish and update a list of impaired waters for
133 which a Total Maximum Daily Load (TMDL) Study is needed. This list, known as the “303(d)
134 List” or “TMDL List” is updated every two years via assessment of water quality data and an
135 extensive public participation process. The final 2012 TMDL List (MPCA 2012n) was
136 developed by the MPCA and approved by the USEPA in July 2013. If the extent of the violations
137 of standards for any water exceeds the guidelines described in the Guidance Manual (MPCA
138 2014), those surface waters are considered to be “impaired.” The goal of the MPCA is to protect
139 high-quality waters and improve the quality of impaired waters so water quality standards are
140 met and beneficial uses are maintained and restored, where these uses are attainable.

141 Table 4.2.2-2 shows the waters within the Embarrass River and Partridge River watersheds that
142 are on the final 2012 TMDL List (see Figure 4.2.2-1).

DRAFT

147 **Table 4.2.2-2 Impaired Waters within the Embarrass River and Partridge River Watersheds**

Water Name	Affected Designated Use	Pollutant/Stressor	TMDL Target Date
Embarrass River: headwaters to Embarrass Lake	Aquatic Life	Fishes Bioassessments	2015
Sabin/Wynne Lake (MDNR designated as one Lake)	Aquatic Consumption	Mercury in fish tissue	2025
Embarrass Lake	Aquatic Consumption	Mercury in fish tissue	2015
Esquagama Lake	Aquatic Consumption	Mercury in fish tissue	2025
Wyman Creek: headwaters to Colby Lake	Aquatic Life	Fishes Bioassessments	2015
Colby Lake or Whitewater Reservoir ¹	Aquatic Consumption	Mercury in fish tissue	2025
St. Louis River: Partridge River To Embarrass River	Aquatic Consumption	Mercury in fish tissue	2025
Spring Mine Creek: from Ridge Creek to Embarrass River	Aquatic Life	Fishes Bioassessments; Aquatic Macroinvertebrates Bioassessments	2015

148 Note:

149 ¹ Both Colby Lake and Whitewater Reservoir are included on the 2012 Inventory of All Impaired Waters List; however, only
 150 Colby Lake is on the final 2012 TMDL List. Whitewater Reservoir has a USEPA Category of 4A, meaning fish tissue levels
 151 are low enough that it is included under the Statewide Mercury TMDL and no further TMDL is needed.

152 The “mercury in fish tissue” pollutant listed in Table 4.2.2-2 indicates that the mercury content
 153 in sampled fish tissue from these waters was found to be above the state’s human health chronic
 154 standard. See Section 4.2.6.4 for additional information about mercury in water and fish. The
 155 pollutants listed in the table as “Fishes Bioassessments” or “Aquatic Macroinvertebrates
 156 Bioassessments” reflect an impaired fish and/or benthic macroinvertebrate population, based on
 157 Index of Biological Integrity (IBI) monitoring and assessment, without a specific cause, or
 158 stressor, yet being identified. (The MPCA has developed fish and invertebrate IBI scores to
 159 assess the aquatic life use of rivers and streams in Minnesota. Monitoring the aquatic
 160 community, via biological and chemical monitoring, is a direct way to assess aquatic life use
 161 support. The aquatic community integrates the cumulative effect of pollutants, habitat alteration,
 162 and hydrological modification of a waterbody over time. The IBI incorporates multiple attributes
 163 of the aquatic community, called metrics, which are used to create a cumulative IBI score for
 164 each sample location. The MPCA has developed assessment thresholds or biocriteria for aquatic
 165 use. In general, an IBI score above the assessment threshold indicates aquatic life use support,
 166 while a score below indicates non-support (MPCA 2014). When stressors become known
 167 through further investigations and studies, the TMDL can be completed and consideration can be
 168 given to permit conditions for individual projects, as warranted.

169 **4.2.2.1.3 Wild Rice**

170 Wild rice is an important resource in terms of its economic and environmental values, as well as
 171 having significant cultural value to the native Ojibwe people, which includes the Bands. This
 172 section provides baseline information on the importance of wild rice, its habitat requirements,
 173 and presence within the NorthMet Project area. Section 4.2.9 discusses the cultural importance of
 174 wild rice to the tribes in further detail.

175 ***Importance of Wild Rice***

176 The Ojibwe people have a special cultural and spiritual tie to natural wild rice. Their migration
177 story describes how they undertook a westward migration from eastern North America, which
178 tribal prophets had foretold would continue until the Ojibwe people found “the food that grows
179 on water” (Benton-Banai 1988). That food was wild rice, known as manoomin, and it is revered
180 to this day by the Ojibwe as a special gift from the Creator. Natural wild rice remains a mainstay
181 of traditional foods for the Ojibwe community and offers significant nutritional value. The
182 tradition of hand harvesting natural wild rice continues to this day among both tribal and non-
183 tribal cultures. It is estimated that more than 3,000 tribal members participate in wild rice
184 harvesting statewide along with about 1,500 non-tribal individuals (MDNR 2008c).

185 Wild rice also represents an important food source for both migrating and resident wildlife. Wild
186 rice has been listed as one of the 10 most important sources of food for ducks throughout the
187 United States and Canada. In Minnesota, research conducted at Chippewa National Forest found
188 that natural wild rice was the most important food for mallards during the fall, although many
189 other species of duck also use beds of wild rice. The stems of wild rice provide nesting material
190 for several species and critical brood cover for waterfowl. The entire wild rice plant provides
191 food during the summer for herbivores. In addition, rice worms and other insect larvae feed
192 heavily on natural wild rice. These insects provide a rich source of food for various birds. In the
193 spring, decaying rice straw supports a diverse community of invertebrates and thus provides an
194 important source of food for a variety of wetland wildlife. As a result, many species of wildlife
195 use wild rice lakes and streams for reproduction and foraging areas, including 17 species listed in
196 the MDNR Comprehensive Wildlife Conservation Strategy (MDNR 2006d) as Species of
197 Greatest Conservation Need (SGCN).

198 In addition to its importance for wildlife, natural wild rice has other ecological values. Emergent
199 aquatic plants like wild rice protect shorelines from erosion, provide habitat for fish, and
200 temporarily sequester nutrients during the growing season, thereby reducing the potential for
201 stream and lake eutrophication and turbidity.

202 Natural wild rice is an important component of tribal and local economies in Minnesota. In 2007,
203 nearly 0.3 million pounds of unprocessed natural wild rice were purchased from the Leech Lake
204 Band of Ojibwe-licensed harvesters generating more than \$400,000 of income for tribal
205 members (MDNR 2008c).

206 Minnesota was the world’s first producer of cultivated wild rice in the 1950s and remains one of
207 the world’s leading producers of cultivated wild rice, producing 4 to 6 million pounds annually
208 (MCWRC 2012). Cultivated wild rice, which depends on natural wild rice to an important degree
209 in maintaining genetic diversity, plays an important role Minnesota’s economy (MDNR 2015e).

210 ***Preferred Habitat and Life Cycle***

211 The historic range of natural wild rice is believed to have encompassed all of Minnesota (Moyle
212 1945), although it was most common in areas of glacial moraines in central and northern
213 Minnesota. Based on a recent inventory, natural wild rice is still found in 55 counties in
214 Minnesota (MDNR 2008c).

215 The distribution and abundance of natural wild rice is dependent on its habitat requirements,
216 which include the following (MDNR 2008c):

- 217 • Surface water hydrology – some moving water, with rivers, flowages, and lakes with inlets
218 and outlets being optimal areas for growth;
 - 219 • Seasonal water depths – water levels that are relatively stable or decline gradually during the
220 growing season are preferred, with optimal depths of 0.5 to 3.0 ft of water;
 - 221 • Substrate – although wild rice may occur in a variety of lake bottoms, the most consistently
222 productive stands are those with soft, organic sediments;
 - 223 • Water clarity – clear to moderately colored (stained) water is preferred as darkly stained
224 water can limit sunlight penetration and hinder early plant development; and
 - 225 • Water chemistry – wild rice grows within a wide range of chemical parameters; however,
226 productivity is highest in water with a pH of 6.0 to 8.0 and alkalinity greater than 40 mg/L.
227 Wild rice stands require nitrogen and phosphorus, although excess levels of some nutrients,
228 especially phosphorus, can adversely affect productivity. Wild rice is an annual plant that
229 develops in the spring from a seed that drops off the plant to bottom sediments during the
230 previous fall. The seed requires a dormancy period of 3 to 4 months in 35°F or colder water
231 before germinating in the spring when water temperatures reach 40°F. The plant goes
232 through several distinct growth phases during its lifecycle. During the submerged leaf stage
233 in late May to early June, a cluster of underwater leaves forms. The floating leaf stage
234 typically begins in mid-June as floating leaves develop and lay flat on the water surface. This
235 stage is when wild rice is most susceptible to being uprooted by rapidly rising water levels or
236 waves generated by high winds.
- 237 Aerial shoots typically begin to develop by the end of June and grow to a height of 2 to 8 ft
238 above the water surface by August. Wild rice begins to flower in late July and the seeds develop
239 in August and September. The wild rice seeds on the same plant mature across a staggered time
240 period, ensuring that some seeds survive environmental conditions to perpetuate the stand. Some
241 seeds may remain dormant in the bottom sediment for many years to several decades if
242 conditions are not suitable for germination, allowing wild rice populations to survive through
243 time periods with less than optimal conditions and reduced productivity. The time period from
244 germination to dropping of mature seeds typically requires about 110 to 130 days, depending
245 upon environmental conditions. Even under ideal growing conditions, wild rice stands undergo
246 approximately 3- to 5-year cycles in which productivity varies. A typical cycle includes a highly
247 productive year followed by a low productive year, which is followed by a gradual recovery.
- 248 Two primary factors that can impact wild rice productivity are changes in hydrology and water
249 quality. Wild rice typically occurs in shallow water and is sensitive to varying water levels,
250 especially during the floating leaf stage in early summer when abruptly rising water levels can
251 uproot the plant. Wild rice will stop growing or become less productive if water becomes too
252 deep (Dore 1969). A recent survey of wild rice harvesters (Norrgard et al. 2007) identified water
253 level as the highest management priority. MDNR wildlife managers have hired trappers to
254 remove beavers from some wild rice lakes to protect wild rice from rising water levels resulting
255 from beaver dam activity.

256 **Regulations Applying to Waters that Contain Wild Rice**

257 *Minnesota Rule 7050.0224* identifies a Class 4A water quality standard of 10 mg/L for sulfate
258 concentrations “...applicable to water used for the production of wild rice during periods when
259 the rice may be susceptible to damage by high sulfate levels.” The MPCA has developed draft
260 staff recommendation that the 10 mg/L sulfate standard is applicable to portions of the Partridge
261 River and Embarrass River used for the production of wild rice (MPCA 2012a). The MPCA is
262 overseeing a variety of studies relating to sulfate and wild rice, with the goal of informing
263 decisions about state water quality standards. All information provided was considered when the
264 MPCA made their recommendation. Should the application of the standard change, it would be
265 addressed at that time.

266 **Presence of Wild Rice within the NorthMet Project Area**

267 Prior to the NorthMet Project Proposed Action, the existing number, location, extent, and health
268 of wild rice stands within the Partridge River and Embarrass River were unknown. As part of
269 development of the EIS, PolyMet conducted a review of available historic and cultural
270 information, including the report *Natural Wild Rice in Minnesota* (MDNR 2008c), United States
271 Geological Survey (USGS) topographic maps, and a wild rice list provided by the 1854 Treaty
272 Authority. PolyMet also analyzed historic (2004 to 2008) infrared aerial photographs and
273 consulted with persons and groups knowledgeable about wild rice to identify potential wild rice
274 locations along the Partridge River and Embarrass River, including Wyman Creek, a tributary of
275 the Partridge River; Spring Mine Creek, a tributary of the Embarrass River; and downstream on
276 the St. Louis River. They also surveyed Hay Lake and Little Rice Lake, which are not in the
277 Embarrass River or Partridge River watersheds, but were included as potential control sites for
278 future monitoring of wild rice presence and health. Based on this analysis, field surveys were
279 conducted in potential wild rice areas during August and September 2009 using a protocol
280 adapted from the 1854 Treaty Authority. The location and both qualitative and quantitative
281 estimates of density and crop acreage were recorded. Qualitative estimates recorded approximate
282 stand density using a density factor with a scale of 1 (low density) to 5 (high density), similar to
283 a method used by the 1854 Treaty Authority. Quantitative estimates of wild rice density and
284 coverage were determined by sampling representative grids. Sulfate monitoring was also
285 conducted during the wild rice survey (Barr 2011a; Barr 2012a; 2013l). The 2009 survey was
286 followed by additional surveys in 2010, 2011, and 2012.

287 Results of the 2009, 2010, and 2011 sulfate monitoring are shown in Figure 4.2.2-3. Wild rice
288 survey and water quality monitoring results for each waterbody are provided in Table 4.2.2-3
289 (Barr 2010a; Barr 2011a; Barr 2012a; Barr 2013l; Barr 2013p).

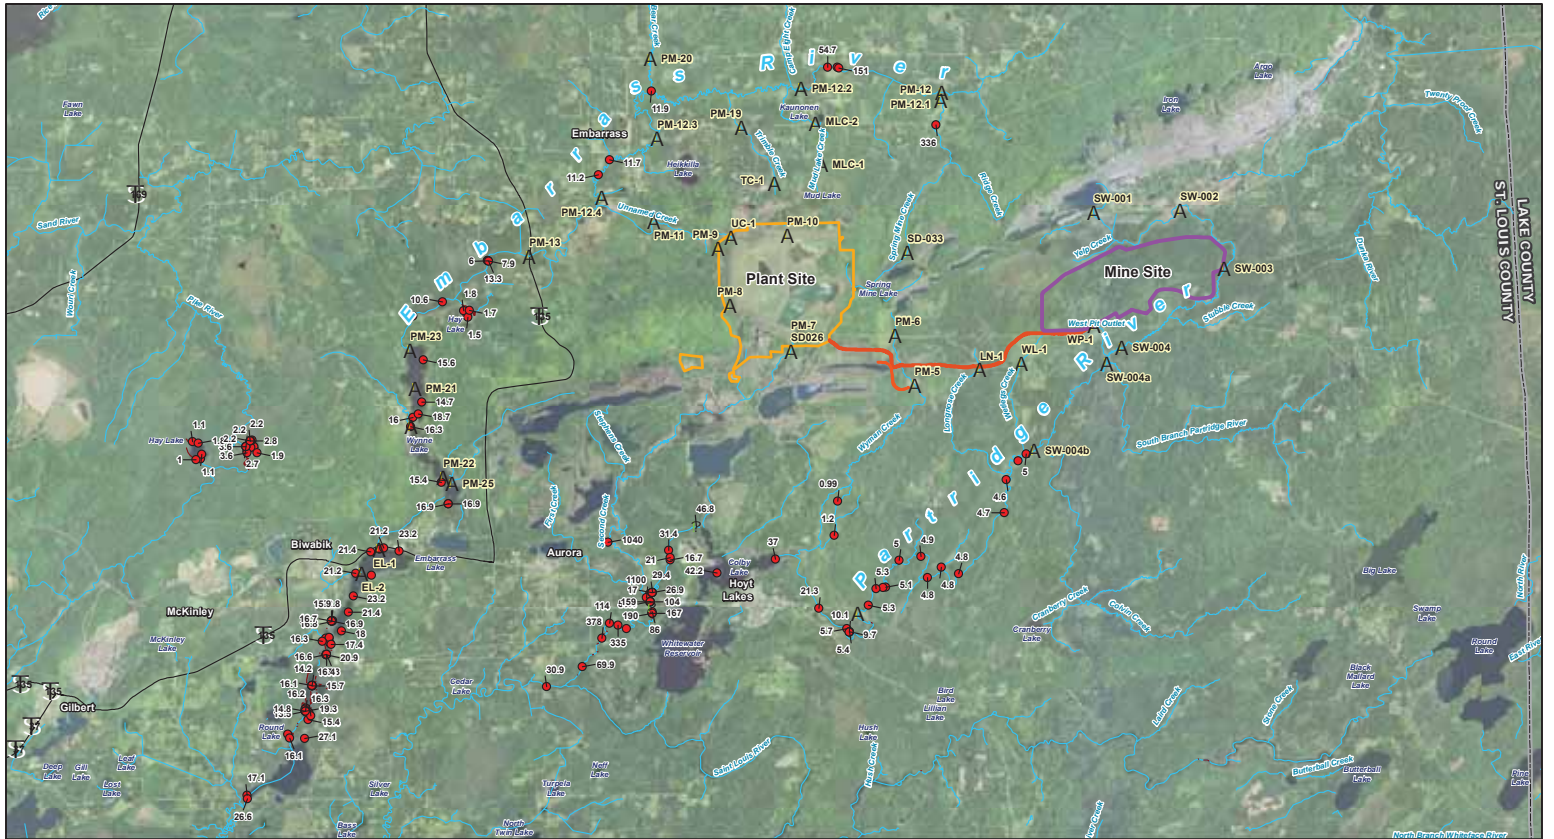

290 Waterbodies at least partially surveyed during these surveys include the upper Embarrass River
291 and its tributaries (Spring Mine, Trimble, and Unnamed creeks), the Embarrass River chain of
292 lakes (including Sabin, Wynne, Embarrass, Lower Embarrass, Unnamed, Cedar Island, Fourth
293 and Esquagama lakes), the lower Embarrass River, the upper Partridge River, Colby Lake, the
294 lower Partridge River and tributaries to the Partridge River (including Wyman and Second
295 Creeks). The results over the 4 years of surveys indicate some variability in the location and
296 density of observed wild rice and in associated water column sulfate concentrations between
297 survey years. The 2012 survey showed generally fewer and less dense stands of wild rice than
298 were observed in the 2009 to 2011 surveys.

299 To date within the NorthMet Project area, MPCA has reached a draft staff recommendation
300 regarding waters used for the production of wild rice (MPCA 2012b). These waters include:

- 301 • Embarrass Lake;
- 302 • the northernmost tip of Wynne Lake (Embarrass River inlet);
- 303 • the segment of the Embarrass River from MN Highway 135 bridge to the inlet of Sabin Lake;
- 304 • the portion of Upper Partridge River from river mile approximately 22 just upstream of the
305 railroad bridge near Allen Junction to the inlet to Colby Lake;
- 306 • the portion of Lower Partridge River from the outlet of Colby Lake to its confluence with the
307 St. Louis River; and
- 308 • the portion of Second Creek from First Creek to the confluence with Partridge River.

314 Notes:

315 ¹ 'Yes' indicates that wild rice was observed in at least one of the survey years. Simply finding wild rice in a survey is not the
316 same as being designated a water used for the production of wild rice.

317 ² Informal observational scale of relative wild rice density (1 – low density to 5 – high density)

318 ³ Range of water column sulfate concentration taken at time of wild rice survey. Samples were only taken when and where wild
319 rice was observed. Values rounded to nearest 1 mg/L. Sample sizes were low resulting in relatively large variability within
320 some individual waterbodies.

321 Surveys of the St. Louis River from Brookston to Lake Superior were conducted in 2009 and
322 from the NorthMet Project area to the St. Louis Estuary in 2010. Wild rice was identified on the
323 St. Louis River for a short distance downstream from its confluence with the Partridge River.
324 The most dense stand (density factor of 2) was located just upstream of Highway 100, and a few
325 sparse stands were also located approximately 500 and 1,000 ft further downstream (see Figure
326 4.2.2-3). Sulfate concentrations in 2010 in the St. Louis River near Highway 100 averaged
327 17.7 mg/L.

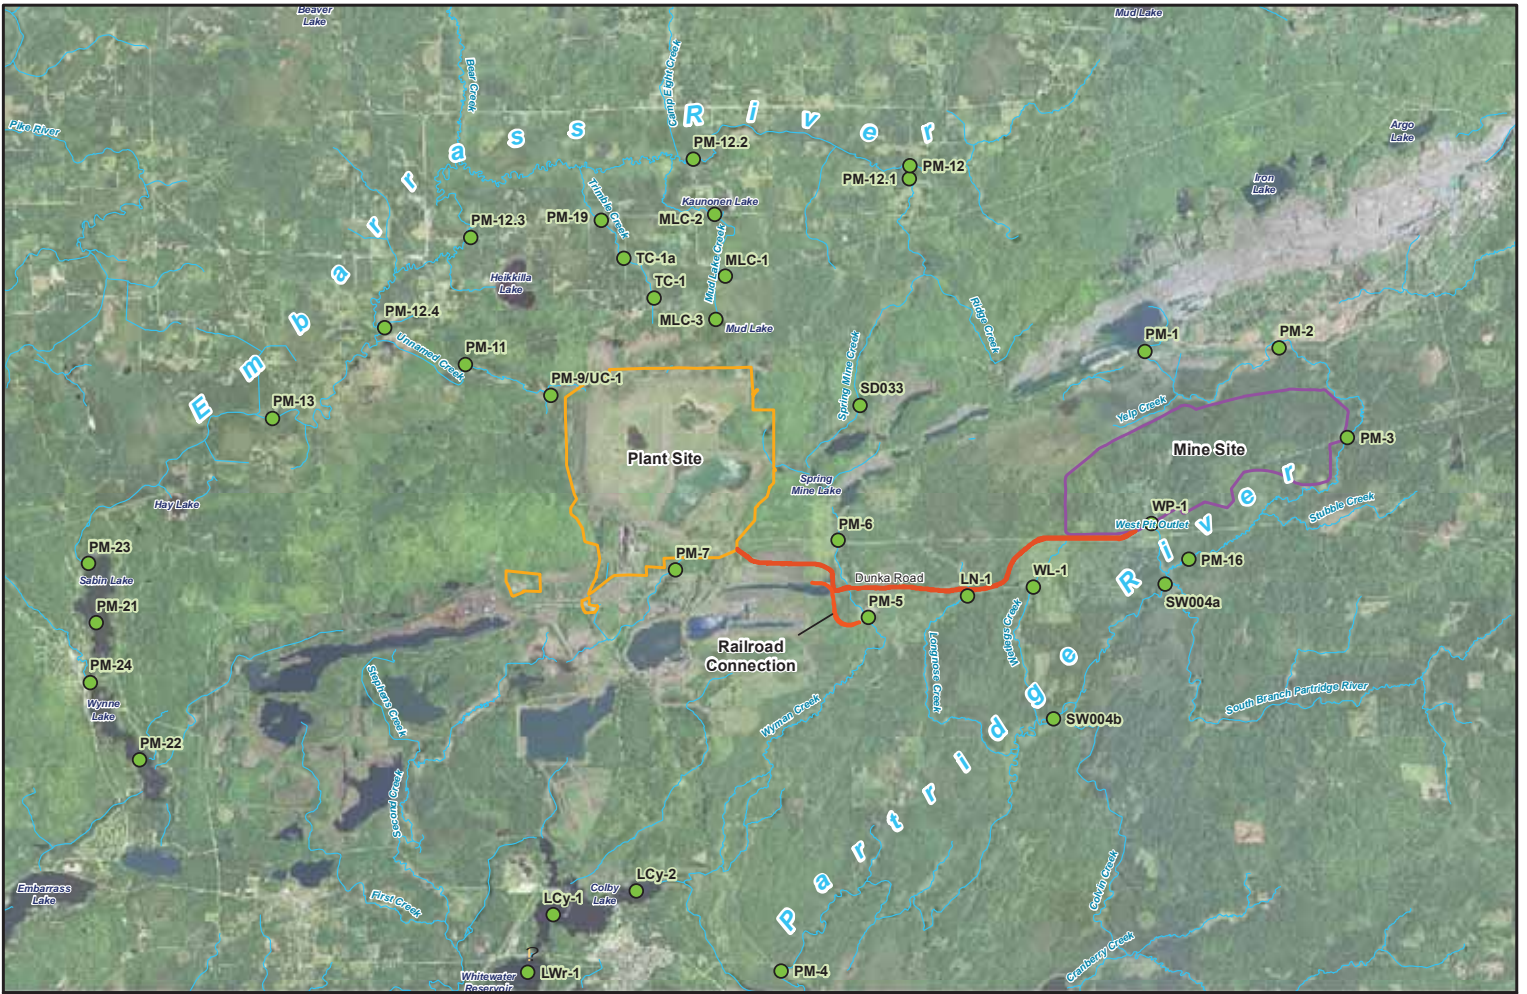

328 4.2.2.1.4 Mercury

329 Based on sampling done for the NorthMet Project Proposed Action from 2004 to 2013, total
330 mercury concentrations in the Upper Partridge River average about 3.3 ng/L (Barr 2014m). At
331 monitoring station SW-005, total mercury concentrations range from below the analytical
332 detection limit to a maximum of 18.4 ng/L, with an average concentration of 4.3 ng/L. In Colby

333 Lake, total mercury concentrations are between 4.6 and 8.7 ng/L, averaging 6.0 ng/L. Total
334 mercury concentrations are similar in the Embarrass River, averaging 5.1 ng/L at monitoring
335 station PM-12 and 4.3 ng/L at monitoring station PM-13 from 2004 to 2013 (see Table 4.2.2-4).
336 Methylmercury concentrations in the Partridge River at SW-005 average 0.41 ng/L (see Table
337 4.2.2-14) and in the Embarrass River average 0.53 ng/L at PM-12 and 0.38 ng/L at PM-13 over
338 the same period (see Table 4.2.2-30). In addition, mercury monitoring has occurred at other
339 locations in and near the existing LTVSMC Tailings Basin (see Table 4.2.2-4 and Figure
340 4.2.2-4). Generally, mercury concentrations are consistent with baseline levels, averaging less
341 than 2.0 ng/L. Sample locations in and near the existing LTVSMC Tailings Basin were well
342 below average concentrations in precipitation (approximately 13 ng/L; PolyMet 2015m).

343 A QA/QC review was conducted to assess the monitoring performance which includes
344 monitoring for mercury. This review was performed in accordance with Barr Engineering
345 Standard Operating Procedure for data validation, which is based on *The National Functional*
346 *Guidelines for Inorganic and Organic Data Review* (USEPA 2004b and 005b). Both laboratory
347 and field sampling procedures were examined in the review of the data for the respective
348 sampling events. Field sampling procedures were examined utilizing field blank and equipment
349 blank analysis and blind field duplicate data. Laboratory procedures were evaluated by
350 examining recommended holding times and preservation, laboratory blank analyses, laboratory
351 control samples and laboratory control sample duplicates, duplicate analysis, matrix spikes and
352 matrix spike duplicates, and laboratory duplicate data.

358 Notes:

359 ¹ See Figures 4.2.2-1, 4.2.2-4, 4.2.2-10, 4.2.2-12, and 4.2.2-13.

360 ² Minnesota Class 2B Lake Superior standard for mercury.

361 ³ Estimated average total mercury concentration in precipitation in Northern Minnesota, based on annual average mercury
362 concentration from the National Atmospheric Deposition Program for the Fernberg Road Monitoring Site, 2010-2011
363 (PolyMet 2015m).

364 ⁴ Where non-detects occur, the mean was calculated using half the detection limit.

365 ⁵ Dissolved mercury concentrations are presented in the table for PM-20, as only dissolved samples were collected and analyzed
366 for this sample location.

367 The MDNR has additionally conducted numerous research studies regionally and in the St. Louis
368 River watershed specifically. The river and its tributaries frequently have Hg concentrations that
369 exceed the 1.3 ng/L standard, especially in the weeks following major storm events. The vast
370 majority of the Hg carried in the river is bound to dissolved organic carbon that is derived from
371 wetland areas and riparian soils (summarized in Berndt et al. 2014).

372 4.2.2.2 Partridge River Watershed

373 This section describes the baseline hydrology and water quality for the groundwater and surface
374 water within the Partridge River Watershed portion of the NorthMet Project area. This includes
375 all of the Mine Site and the Transportation and Utility Corridor, as well as the former LTVSMC
376 processing plant and a small portion of the Tailings Basin.

377 **4.2.2.2.1 Groundwater Resources**

378 This section describes the geology and hydrogeology of the NorthMet Project area and the
379 groundwater resources at the Mine Site that could be affected by the NorthMet Project Proposed
380 Action. Since the publication of the DEIS, additional groundwater monitoring wells were
381 installed and data collected to better describe the groundwater resources at the Mine Site.

382 In total, 24 monitoring wells were installed in surficial aquifer and nine in bedrock (see Figure
383 4.2.2-8). Six or more groundwater samples have been collected for chemical analysis from each
384 of those wells, except one surficial aquifer well that was dry after the first sampling (so it only
385 provided a single sample) and three bedrock wells that were also sampled once only. A statistical
386 analysis indicated that the total number of groundwater quality samples was sufficient to satisfy
387 the USEPA's request that an uncertainty range around the estimate of average concentration for
388 each solute could be identified such that there was a less than 5 percent probability that the actual
389 average would be outside of this range (Barr 2012p).

390 This section describes available baseline data on the hydraulic properties of the rocks and
391 sediments at the Mine Site, the rationale for assessing its adequacy, and a summary of specific
392 values for Mine Site baseline aquifer characteristics.

393 **Geology of the Mine Site**

394 The shallow materials present at the Mine Site include a relatively thin (0 to approximately 59 ft
395 thick) layer(s) of glacial till and wetland deposits. The till has been described at a regional scale
396 as an unsorted sandy loam mixture with pebbles, cobbles, and boulders (Jennings and Reynolds
397 2005). Soil borings collected from within the Mine Site are generally consistent with this
398 description, indicating that the till is a heterogeneous and laterally discontinuous zone with a
399 composition ranging from very dense clay to well-sorted sand. In some of the borings, multiple
400 layers of till were encountered, separated by intervals of sand and gravel. However, such sands
401 and gravels apparently do not form laterally extensive bodies (PolyMet 4u2015m).

402 The NorthMet Deposit itself is below the till in the layered mafic intrusive rocks of the Partridge
403 River intrusion, which are part of the Duluth Complex. The north edge of the Duluth Complex
404 within the Mine Site contacts rock formations comprising the Virginia formation, which hosts
405 large taconite iron ore mines (see Figure 3.2-10).

406 More than 10 copper-nickel-PGE zones of mineralization have been identified along the northern
407 margin of the Duluth Complex. Those deposits consist of disseminated copper-nickel-iron
408 sulfides, with minor local massive sulfides, hosted in layered heterogeneous troctolitic
409 (plagioclase and olivine with minor pyroxene) rocks that are forming the basal unit of the Duluth
410 Complex. Extensive drilling within the Partridge River intrusion (over 1,100 drill holes) has
411 identified seven layered troctolitic igneous rock units dipping southeast within the NorthMet
412 Deposit (see Figure 3.2-10). Unit 1, which hosts much of the NorthMet economic sulfide
413 mineralization, is the oldest and lower-most layer.

414 The footwall rocks below the NorthMet Deposit consist of Paleoproterozoic sedimentary rocks.
415 The youngest of these sedimentary rocks is the Virginia Formation, which directly underlies the
416 intrusive Unit 1 across all of the NorthMet Project area (i.e., the Duluth Complex contacts only
417 the Virginia Formation – it does not contact the older sedimentary formations). The Virginia
418 Formation consisting of a thinly bedded sequence of argillite and greywacke outcrops just north

419 of West Pit. During mining operations, it would be exposed along the northern wall of the East
420 Pit.

421 Underlying the Virginia Formation is the Biwabik Iron Formation, which is the source of
422 taconite iron ore. That formation also hosts an important water resource tapped by residential and
423 community wells in the region. Current drilling and interpolation of geology between drill holes
424 indicates that the mine pits at their final phase of development would retain an approximate 130
425 to 150 ft separation between their bottoms and the Biwabik Formation (PolyMet 2014q). The
426 oldest of the sedimentary rocks present in the proposed mining area is the Pokegama Quartzite.
427 These sedimentary rocks are underlain by Archean granite of the Giants Range batholith.

428 **Hydrogeology of the Mine Site Surficial Deposits and Bedrock Units**

429 A highly heterogeneous formation of glacial till is thought to have hydraulic conductivities
430 ranging widely, from 0.003 to 3 ft/day. Wetland deposits are on average considerably more
431 permeable than the till.

432 The Biwabik Iron Formation has a relatively high permeability, whereas the Virginia Formation
433 and Duluth Complex are much less permeable (Siegel and Ericson 1980). PolyMet conducted
434 several aquifer tests to characterize the hydraulic conductivity and specific storage values for the
435 bedrock units underlying the Mine Site (see Table 4.2.2-5). No hydraulic testing of the Biwabik
436 Iron Formation was done within the NorthMet Project area. However, the tests conducted outside
437 the NorthMet Project area (see Table 4.2.2-5) and the ongoing use of the Biwabik Iron
438 Formation as a source of water in the region document that it is characterized by the highest
439 hydraulic conductivity, followed by the Virginia Formation, with the Duluth Complex having
440 conductivity at least one order of magnitude lower.

441 Hydraulic characteristics of these various geologic units in the Mine Site were determined from
442 the following series of aquifer pumping tests (PolyMet 4u2015m):

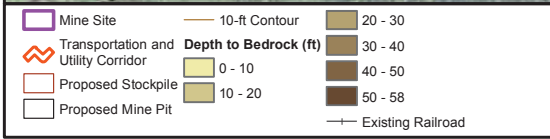

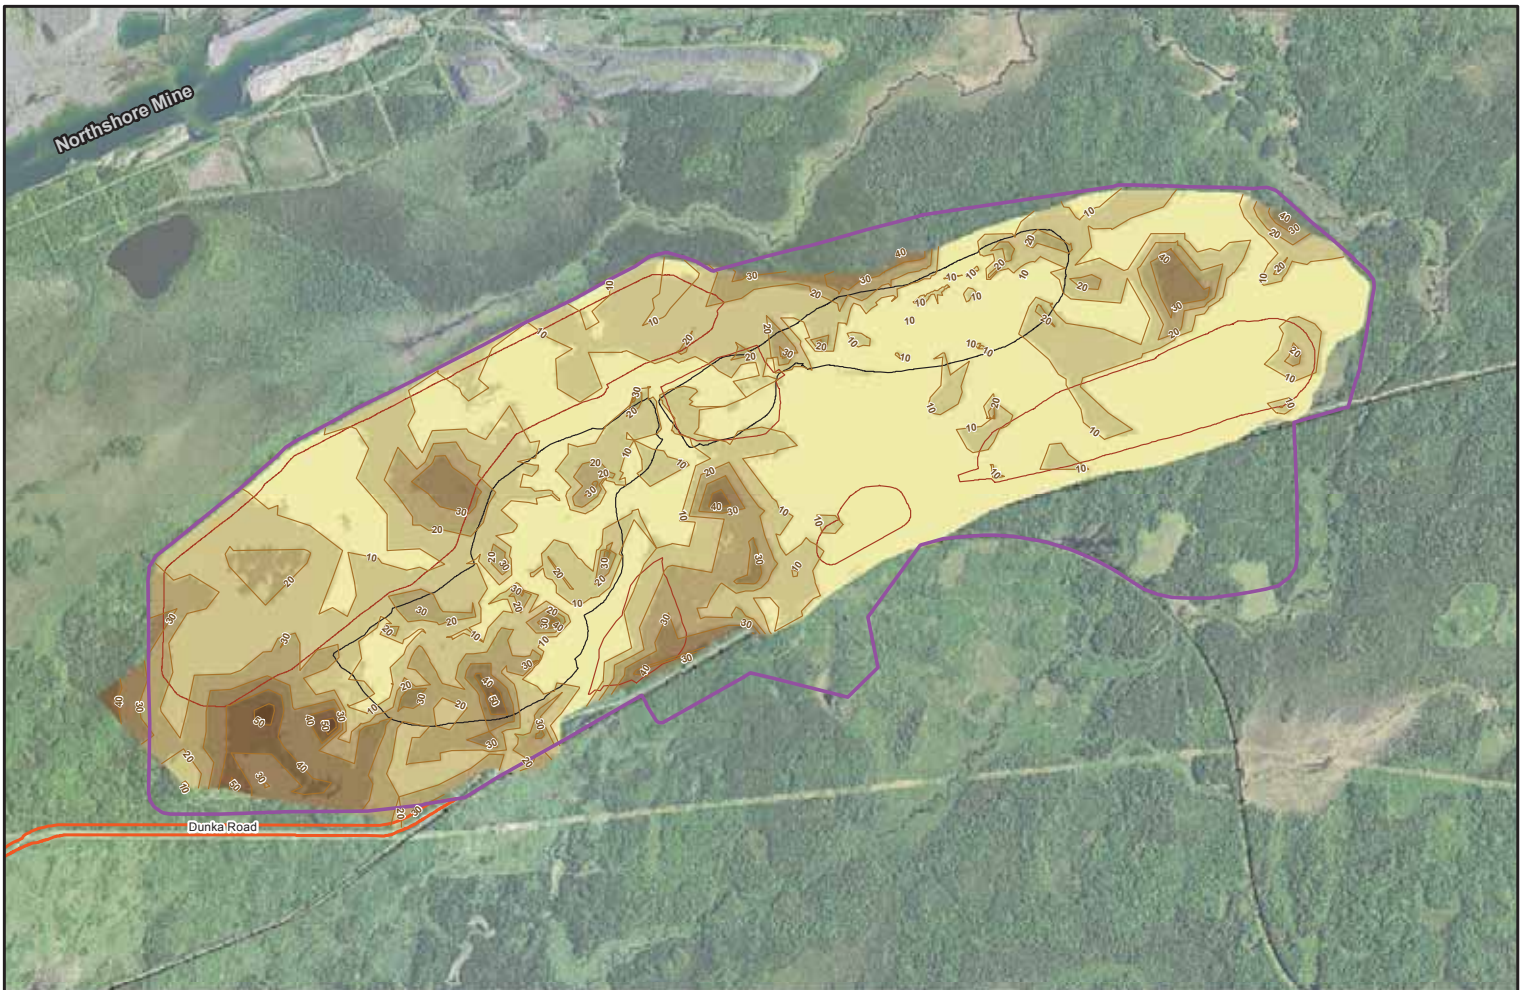

- 443 • Ten pump tests conducted using borings in the surficial aquifer (including three borings that
444 were turned into permanent monitoring wells; see PolyMet 4u2015m);
- 445 • Ten aquifer performance tests conducted using bore holes completed in the Duluth Complex
446 bedrock (PolyMet 2015m);
- 447 • Four aquifer pump tests conducted on the Virginia Formation bedrock (conducted using
448 wells P1 through P4, with monitoring in six observation wells, Ob-1, Ob-2, Ob-3, Ob-3a,
449 Ob-4, and Ob-5, plus a water supply well; see PolyMet 2015m);
- 450 • One long-term (30-day) pump test conducted using bedrock well P-2, with water levels
451 monitored in wetland piezometers located north of the pumping well (PolyMet 2015m); and
- 452 • Specific capacity tests conducted using P-3 and P-4, which are open exclusively in the
453 Virginia Formation (PolyMet 2015m).

454 A range of specific storage values for the bedrock (i.e., 2.3×10^{-5} to 5.5×10^{-7} ft⁻¹) was
455 determined using the aquifer tests' time-drawdown data collected from the observation wells.
456 The specific capacity tests conducted using two wells indicated that the upper portion of the
457 Virginia Formation is more permeable than its lower portion (Barr 2007a). This is attributed to
458 the higher density of fractures and joints in the bedrock closer to the surface. Overall,
459 groundwater flow within the bedrock is thought to be primarily through fractures and other

460 secondary porosity features as the rocks have low primary hydraulic conductivity. Groundwater
461 in the shallow bedrock is thought to be hydraulically connected with the overlying surficial
462 deposits, resulting in similar flow directions, both in bedrock and surficial deposits (Barr 2007c).
463 Figure 4.2.2-5 shows the depth to bedrock at the Mine Site.

 471 and Ericson 1980; PolyMet 2015m.

472 ft/day = feet per day

473 Concerns have been raised that fractures, including faults and fracture zones, may exist that
 474 could permit transmission of groundwater through the bedrock over considerable distances. Such
 475 fractures have been identified elsewhere on the Canadian Shield. Foose and Cooper (1978; 1981)
 476 appear to have provided the only published work specifically looking at the presence of
 477 fracturing and faulting in the Duluth Complex. They identified numerous faults and fractures in
 478 their surface mapping of the Harris Lake area (which is about 36 miles for the NorthMet Project
 479 area), as is commonly found in the surface exposures of crystalline bedrock. However, they
 480 described the most extensive faults as being largely filled with gouge. They also concluded that
 481 most of the faults and fractures formed early and at depth, during emplacement of the Duluth
 482 Complex, and were not related to post-emplacement deformation, which would have more likely
 483 resulted in open fractures that could facilitate groundwater flow.

484 Evidence of several high-angle faults, consisting of brecciated intervals and fault gouge
 485 mineralization, was noted in the exploration cores from the NorthMet Project area (PolyMet
 486 2007b). While correlations between boreholes could only be approximated, the faults appear to
 487 be normal and generally trend to the northeast across the site and have downward offset to the
 488 southeast, which would be consistent with generation and activation of rift during the Mid-
 489 Continent Rift event. There have been no other tectonic events in the Lake Superior region that
 490 might have generated more recent fractures and faults or reactivated preexisting ones that would
 491 serve as significant zones of groundwater transmission. Numerous lineaments have been mapped
 492 over northeastern Minnesota, but these have been associated with glacial deposition and not
 493 fracturing in the underlying bedrock (Morey 1981; Heutmaker and Morey 1982). One
 494 exploration borehole at the Minnamax prospect encountered groundwater at a depth of 1,390 ft
 495 in the Duluth Complex that had artesian flow for a period of 6 days (Barr 1976). However, none
 496 of the other 12 exploration borings completed on the prospect encountered similar conditions,
 497 indicating little to no hydrogeological interconnection of bedrock fracture or fault zones across
 498 the area of that prospect. No similar artesian flows were encountered in any of the exploration

499 boreholes or other boreholes completed within the NorthMet Project area. Increased groundwater
500 flow may occur through shallow bedrock that is more fractured and possibly more weathered
501 than deeper bedrock. However, such flow is likely limited by glacial scouring and removal of the
502 highly weathered and fractured upper zone of bedrock.

503 Over 14,000 rock quality designation (RQD) measurements for the Duluth Complex were taken
504 using rock cores obtained from hundreds of Mine Site boreholes (“RQD” is a measure of fracture
505 density in a segment of rock drill core, where 100 percent indicates no breaks and 0 percent
506 indicates that all pieces of core within a core run are less than 10 centimeters long). The collected
507 RQD data provide strong evidence that the upper 10 to 15 meters of bedrock tend to be more
508 fractured and have higher hydraulic conductivity than deeper bedrock (Barr 2014b).

509 The overlying surficial deposits at the Mine Site are poorly sorted and range from very dense
510 clay to well-sorted sand with boulders and cobbles (Barr 2006b; Golder 2007). Hydraulic testing
511 indicates that these deposits may contain layers of relatively low hydraulic conductivity. Testing
512 shallow wells, however, documented a much higher average hydraulic conductivity than
513 underlying bedrock (see Table 4.2.2-5). Shallow borings and test trenches at the Mine Site
514 encountered bedrock at depths ranging from 3.5 to 17 ft below ground surface (bgs).

515 The site exploration drilling database, drilling logs, and electrical resistivity data were used to
516 develop an estimated depth-to-bedrock isopach map (Golder 2007). The picture presented on that
517 map is consistent with the more limited boring and trenching data. These data indicate that
518 surficial deposits at the Mine Site are less than 20 ft thick over more than 75 percent of the area,
519 and less than 30 ft in thick over 92 percent of the area. The isopach contouring indicates the
520 presence of local depressions in the bedrock surface where surficial deposits may be up to 50 ft
521 thick. However, no major bodies of highly permeable outwash sands and gravel have been
522 reported that might serve as groundwater conduits through the surficial deposits.

523 The Mine Site is covered by extensive wetlands, many of which have only minimal hydraulic
524 connection to the underlying groundwater. This interpretation is based on well logs, soil borings,
525 available soil mapping, and the results of wetland characterization field investigations. In
526 particular, a 2010 field survey focused on identifying the fraction of wetlands in the NorthMet
527 Project area that were “ombrotrophic bogs.” These bogs form when sphagnum peat accumulation
528 rises above the groundwater table, which reduces inputs of minerals and nutrients from
529 groundwater. Thus, ombrophobic bogs are wetlands almost entirely fed (with water and
530 minerals) from direct precipitation; they have little hydraulic connection to underlying
531 groundwater (Eggers 2011a).

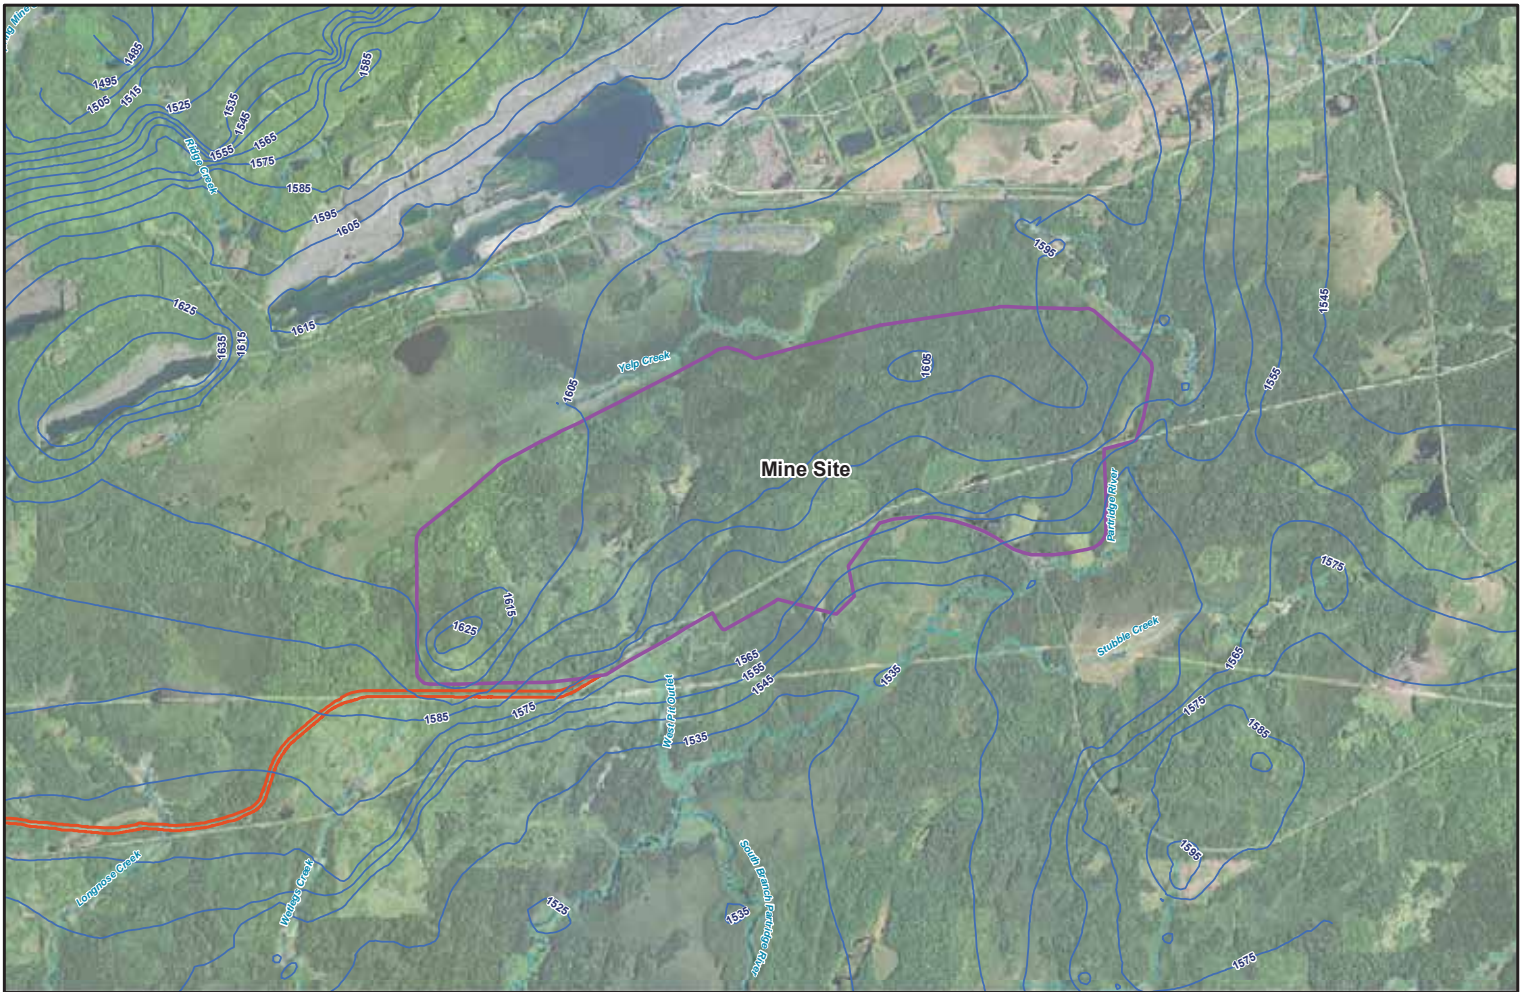

532 Prior to conducting the analysis of how changes in groundwater and surface water hydrology
533 may potentially affect the wetlands, bog wetlands within and surrounding the Mine Site were
534 reclassified as either ombrotrophic or minerotrophic (i.e., wetlands fed by precipitation,
535 groundwater, streams, and/or springs). This reclassification was carried out consistent with
536 guidelines provided by the USACE (Eggers 2011a; PolyMet 2015b). The field survey (that was
537 conducted along a representative cross section through the NorthMet Project area) recorded those
538 parameters that distinguish the ombrotrophic bogs from the more hydraulically connected
539 wetlands. The survey recorded vegetation species, percent areal cover of Sphagnum mosses
540 (high sphagnum cover is associated with bogs), pH, and specific conductivity (ombrotrophic
541 bogs tend to have lower pH and conductivity than hydraulically connected wetlands). The survey
542 results indicated that approximately 90 percent of the wetlands within the Mine Site are

543 ombrotrophic (PolyMet 2015b). The other wetland communities at the Mine Site include shrub
544 swamps, coniferous swamps, shallow marsh, wet/sedge meadows, open bogs, and hardwood
545 swamps, which may receive some portion of their hydrology from groundwater.

546 Water table elevations document that groundwater at the Mine Site generally flows south to
547 southeast, toward the Partridge River, which is the major discharge point for the area (see Figure
548 4.2.2-6). MDNR well records within the NorthMet Project area indicate that water table levels
549 vary seasonally between 3 and 10 ft bgs. At the Mine Site, depth to groundwater is generally less
550 than 5 ft bgs (Barr 2006a). Three nested well pairs at the Mine Site (MW-6S/MW-6D,
551 MW-08S/MW-08D, and MW-10S/MW-10D) allow for evaluation of vertical hydraulic gradients
552 in the surficial deposits. For the nested pairs at MW-6 and MW-8, the vertical hydraulic
553 gradients are small (approximately 0.02 ft/ft) and indicate either upward or downward
554 groundwater flow. At MW-10, the vertical gradient is larger (approximately 0.1 ft/ft) and
555 indicates downward groundwater flow (PolyMet 2015m).

556 Groundwater elevations measured by PolyMet in Mine Site bedrock boreholes show the
557 hydraulic gradients within bedrock are similar to that of the overlying surficial deposits,
558 indicating hydraulic connection between the surficial deposits and bedrock units (PolyMet
559 2015m). The Regional Copper-Nickel Study (Siegel and Ericson 1980) concluded that recharge
560 to the bedrock is from direct precipitation where bedrock outcrops at the surface, and from
561 seepage through surficial deposits where the top of bedrock is buried (Siegel and Ericson 1980).
562 This study also reported that the upper 200 to 300 ft of the Duluth Complex formation appeared
563 to be fractured and jointed more extensively than at greater depths, so that the upper portion of
564 the bedrock should have greater hydraulic conductivity. More detailed analyses indicate that the
565 hydraulic connection between surficial deposits and the underlying bedrock, although present, is
566 weak. Water-table monitoring during a 30-day pumping test at bedrock well P-2 showed only a
567 small amount of drawdown in the nearest deep wetland piezometer, and no detectable drawdown
568 at other water table or deep wetland piezometers (PolyMet 2015m; Barr 2007a).

DRAFT

572 Because of the shallow water table and the generally thin layer of surficial deposits, flowpaths
573 within the surficial deposits are generally thought to be short, with groundwater recharge areas
574 located not far from the discharge areas. The water table is generally a “subdued replica” of the
575 topographic surface, and as a result, groundwater divides generally coincide with surface water
576 drainage divides (PolyMet 2015m, Section 4.3.3.1). Groundwater flow in the surficial aquifer is
577 affected by bedrock outcrops, which cause deviations in the local groundwater flow directions
578 (Siegel and Ericson 1980). However, because the bedrock is hydraulically connected with the
579 overlying surficial deposits, groundwater in the bedrock flows in a similar direction as
580 groundwater in the overlying surficial deposits (PolyMet 2014m, Section 4.3.3.2). Topographic
581 divides are expected to approximate the locations of flow divides in bedrock groundwater.

582 As recognized in other studies (MDNR 2004; Siegel and Ericson 1980), aquifer testing (see
583 Table 4.2.2-5) showed that the ability of the surficial deposits to transmit water was highly
584 variable and depended upon location and thickness of those deposits. No data were available
585 regarding the storage parameters for the surficial deposits.

586 **Baseline Groundwater Quality**

587 Baseline groundwater quality at the Mine Site is characterized using the data collected by
588 PolyMet (PolyMet 2013i) at the following locations (see Figure 4.2.2-7):

- 589 • Three older monitoring wells in the surficial aquifer (MW-05-02, MW-05-08, and
590 MW-05-09), sampled from 2005 through 2013;
- 591 • Twenty-one newer wells installed in the surficial aquifer in 2011 and 2012 (MW-1, MW-2,
592 MW-3, MW-4, MW-5, MW-6S, MW6D, MW7, MW-8S, MW-8D, MW-9, MW-10S, MW-
593 10D, MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, MW-17, and MW-18), sampled
594 from 2011 through 2013;
- 595 • Five observation wells in the upper 100 ft of the bedrock (ob-1 through ob-5), sampled from
596 2006 through 2013 (two of those wells are completed in the Duluth Complex and three in the
597 Virginia Formation); and
- 598 • Four bedrock wells (P-1, P-2, P-3, and P-4) completed to depths ranging from 485 to 610 ft
599 below grade, which were sampled during aquifer testing in 2005 and 2006.

600 These samples were subject to standard quality controls (e.g., trip blanks, field blanks, laboratory
601 control and laboratory control duplicates, matrix spike, and matrix spike duplicates, and
602 assessment of holding times) and were acceptable for use in the SDEIS and FEIS (PolyMet
603 2014u; Section 4.5.2.1.3). A statistical analysis of the samples from these wells through the end
604 of 2013 was used to estimate baseline groundwater quality in the bedrock unit and surficial
605 deposits, which subsequently was used as input into the Mine Site water quality model. Baseline
606 groundwater quality results are summarized in Table 4.2.2-6.

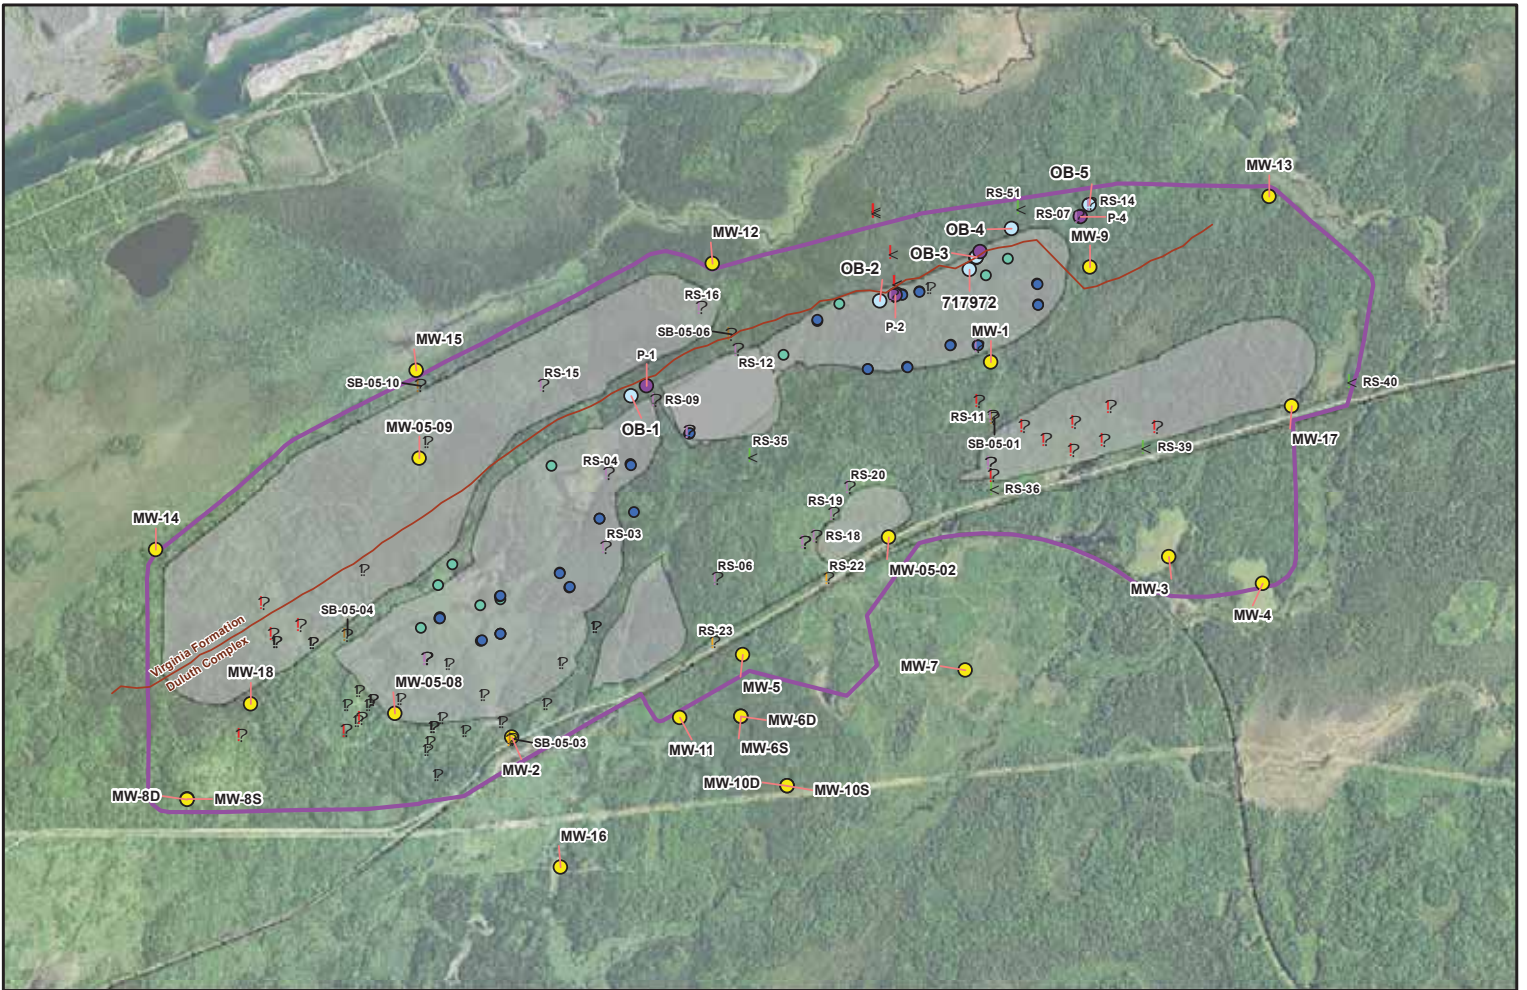

607 **Surficial Deposits**

608 Water samples collected from the 24 wells completed in surficial deposits at the Mine Site
609 indicate that shallow groundwater generally meets evaluation criteria for all solutes except for
610 aluminum (total and dissolved), beryllium (total), iron (total and dissolved), and manganese
611 (total and dissolved) (see Table 4.2.2-6). Overall pH levels tended toward basic (mean of 7.0).
612 The metals exceeding groundwater evaluation criteria (see Section 5.2.2.1) probably reflect

613 natural conditions; there is no record of any historic activities at the Mine Site that could have
614 caused elevated concentrations of these constituents.

615 These results are generally consistent with the findings presented in the Regional Copper-Nickel
616 Study, which identified concentrations of total cadmium, iron, manganese, and nickel at
617 concentrations above the groundwater evaluation criteria (see Table 4.2.2-6, with data from
618 Siegel and Ericson 1980). Results from the analysis of water samples collected from the existing
619 USGS and USFS wells completed in the surficial deposits indicate that dissolved concentrations
620 in some locations were at or higher than the groundwater evaluation criteria for aluminum,
621 cadmium, cobalt, iron, manganese, and nickel (see Table 4.2.2-6). Siegel and Ericson (1980)
622 noted that higher concentrations of copper, cobalt, nickel, and sulfate are potentially correlated
623 with proximity to the mineralized contact zone between the Duluth Complex and older rocks, as
624 is the case with the NorthMet Project area, and is probably related to the oxidation of sulfide
625 minerals. The pHs measured in the initial groundwater samples from a few wells were near or
626 slightly above 10; but pHs tended to be lower in later samples and decreased to below 10 in all
627 wells, suggesting that cement or other reagents used for well installation and completion may
628 have temporarily increased pH in the vicinity of these wells.

Notes:

<= less than indicated reporting limit. Values in bold exceeds evaluation criteria.

¹ Where non-detects occur, the mean was calculated using half the detection limit. Results of field duplicates were averaged.

² Below detection limit.

³ Barr 2014d data (2005-2013) is from the following wells: MW-05-02, MW-05-08, MW-05-09, MW-1, MW-2, MW-3, MW-4, MW-5, MW-6S, MW-6D, MW-7, MW-8S, MW-8D, MW-9, MW-10S, MW-10D, MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, MW-17, and MW-18.

⁴ May reflect contamination (as cited in Siegel and Ericson 1980).

640 **Bedrock**

641 Groundwater samples have been collected from nine bedrock (i.e., Duluth Complex and Virginia
642 Formation) monitoring wells (i.e., pumping wells P1 through P4 and observation wells Ob1
643 through Ob5), one water supply well, and two exploratory boreholes at the Mine Site. The
644 average water quality in the bedrock at the Mine Site was generally found to meet groundwater
645 evaluation criteria except for aluminum, beryllium, iron, manganese, and thallium (see Table
646 4.2.2-6). The pH of the bedrock water samples from the Duluth Complex tended toward basic
647 (i.e., greater than 7.0 to 9.0), while samples from the Virginia Formation were, with one
648 exception, more acidic (i.e., less than 7.0). Sample pHs were near or slightly above 10 in a few
649 wells; but pHs tended to be lower in later samples, suggesting that cement or other reagents used
650 for well installation and completion may have increased pH in the vicinity of these wells.

651 Occasional exceedances of water quality standards were detected for arsenic and nickel.
652 Ammonia was detected in nine samples, which is unusual because ammonia is not typically
653 found in bedrock. The presence of ammonia in at least two of these samples is attributed to either
654 collection or laboratory error (Barr 2006a). Nitrite or nitrate (both are the forms of nitrogen to
655 which ammonia converts) was found in four samples. This result is not unprecedented as the
656 MPCA study in northeastern Minnesota reported that nitrate was detected in two of the 20
657 collected samples (MPCA 1999a).

658 **Groundwater Use**

659 No domestic wells exist between the Mine Site and the Partridge River. However, there are
660 several MDNR water appropriation permits in effect for mine pit dewatering that affect the Mine
661 Site, including the Northshore Mine permit (Permit 1982-2097). The permit authorizes
662 Northshore Mining Company to withdraw up to 36,000 gpm (80 cubic ft per second [cfs]), of
663 which a maximum of 13,000 gpm (29 cfs) can be discharged to the Partridge River, a maximum
664 of 12,000 gpm (27 cfs) can be discharged to Langley Creek, and a maximum of 11,000 gpm
665 (25 cfs) can be discharged to Unnamed Creek.

666 **4.2.2.2.2 Surface Water**

667 This section describes the existing surface water resources for the Mine Site that could be
668 affected by the NorthMet Project Proposed Action. These resources include the Upper Partridge
669 River, the Upper Partridge River tributary streams, Colby Lake, Second Creek, Whitewater
670 Reservoir, and the Lower Partridge River below Colby Lake downstream to its confluence with
671 the St. Louis River. For purposes of this FEIS, the Partridge River upstream of Colby Lake is
672 referred to as the Upper Partridge River, while the segment downstream of Colby Lake is
673 referred to as the Lower Partridge River (see Figure 4.2.2-1). For this FEIS, new XP-SWMM
674 model predictions were made to estimate Partridge River flow parameters without effects of
675 discharge from the Northshore Mine, and additional surface water quality data has been collected
676 at many locations. These new data are summarized to better describe existing conditions as
677 inputs for modeling potential surface water impacts.

678 **Upper Partridge River**

679 This section describes the baseline surface water hydrology and water quality of the mainstem of
680 the Partridge River upstream of Colby Lake.

681 ***Upper Partridge River Hydrology***

682 The Partridge River forms just south of the Northshore Mine, although historically its source was
683 further upstream. It flows approximately 32 river miles to its confluence with the St. Louis River,
684 draining a total of approximately 161 square miles, as measured at Aurora, Minnesota,
685 approximately 3 miles from the St. Louis River confluence (see Figure 4.2.2-1). The Upper
686 Partridge River refers to the segment of the Partridge River upstream of Colby Lake. The Upper
687 Partridge River Watershed is primarily a mix of upland forest (39 percent), lowlands and aquatic
688 environments (27 percent), shrubland (22 percent), and cropland/grassland (2 percent), with
689 some development (10 percent). There are several active and inactive mines within the watershed
690 including the active Northshore Mine in the headwaters area, as well as the inactive and former
691 LTVSMC mine. About 5 miles of the Partridge River run around the northern and eastern
692 perimeter of the proposed NorthMet Mine Site. Seeps from the southern portion of the existing
693 LTVSMC Tailings Basin (south side of Cell 1E) naturally flow to Second Creek, a tributary of
694 the Partridge River in the Lower Partridge Watershed (see Figure 4.2.2-1); however, a portion of
695 the seeps is presently being captured and pumped back to the Tailings Basin under the Consent
696 Decree between the MPCA and Cliffs Erie. The Partridge River varies from sluggish marshy
697 reaches, to large open ponds, to boulder rapids.

698 Flow data is most valuable when there is a long term of record because the data are less likely to
699 be skewed by dry or wet climate in an atypical year or two (Robson 2000). Data from four USGS
700 gaging stations within the Partridge River Watershed (see Figure 4.2.2-1) are available, but the
701 three that reflect flow from the NorthMet Project area have all been impacted by mining
702 operations (see Table 4.2.2-7). The Partridge River above Colby Lake (USGS Station
703 #04015475) is the gaging station that best represents flows from the NorthMet Project area
704 because it is the most upstream station that captures all flow from the proposed Mine Site, with
705 data available for the period from September 1978 through October 1988. The use of these flow
706 data, although about 25 years old, is reasonable as there has not been any substantial land cover
707 or other changes in the watershed over the intervening years that would raise into question the
708 applicability of these data. PolyMet also assessed a similar watershed in the region, the
709 Kawishiwi River, using a flow record from October 1971 to September 2010 to determine if
710 there were long-term trends in flow in this geographic area. No discernable trend in flow was
711 detected, reinforcing that the use of the existing data for Partridge River above Colby Lake is
712 reasonable (PolyMet 2015m). A recently installed flow gage at the Dunka Road is closer to the
713 Mine Site, crossing near its southeast corner (monitoring location SW-003); however, the short
714 period of record is insufficient for use in the FEIS.

715 The available flow records indicate that streamflow is generally very low from late fall through
716 the winter, rising sharply during spring snowmelt, and receding during the summer, except for
717 occasional heavy storms. This pattern of significantly reduced summer streamflow is
718 characteristic of streams draining extensive bogs (Brooks 1992). Natural flow is very low during
719 the winter because of the relatively thin surficial deposit over the bedrock, and because little
720 groundwater recharge occurs since most precipitation falls as snow and is not available for
721 infiltration or runoff until it melts (Siegel and Ericson 1980). The discharge statistics for the
722 USGS Station above Colby Lake (USGS Station #04015475) are presented in Table 4.2.2-7. The
723 modeled XP-SWMM flows at seven locations (SW-002, SW-003, SW-004, SW-004a, SW-004b,
724 SW-005, and SW-006) on the Partridge River (see Figure 4.2.2-8) are presented in Table 4.2.2-8.

725 The Northshore Mine is located at the headwaters of the Partridge River (see Figure 4.2.2-8).
726 Discharges from Northshore to the headwaters of the Partridge River have occurred sporadically
727 since 1956, with limited pumping records available prior to 1988, when record keeping became
728 required by the State. These discharges from the Peter Mitchell Pit can have an impact on the
729 flow regime of the Upper Partridge River, particularly in the winter during low-flow conditions
730 (see Section 6.2.2).

731 Following closure of the Northshore Mine, discharge to the Partridge River Watershed would
732 cease as the Northshore pit is allowed to flood with water. After the Northshore pit lake is
733 flooded, it would discharge towards the Dunka River, effectively removing the Northshore pit
734 watershed from the Partridge River Watershed. Discharge from the Northshore Mine is planned
735 to end in approximately 2070 (PolyMet 2015m).

736 For the DEIS, an XP-SWMM hydrologic/hydraulic model of the Partridge River was developed
737 to estimate flows upstream of the USGS Station #04015475. The model was calibrated to gage
738 data from 1984 and 1985 and validated against the 1978-1987 observed flow record. These data
739 were considered reliable for making flow estimations because they do not include contributions
740 from Northshore. No correction was made in the DEIS model calibration for Northshore Mine
741 discharge, as dewatering data were not available at the time (PolyMet 2015m).

742 In an effort to account for the Northshore Mine discharge in this FEIS, different methods were
743 evaluated. The method chosen was to recalculate the scale factors used to calibrate the
744 XP-SWMM model to data from the USGS gage data, using data collected when the Northshore
745 Mine was not discharging water into the Partridge River (October 1986 to September 1988). A
746 more detailed description of the XP-SWMM model calibration can be found in the Mine Site
747 Water Modeling Data Package (PolyMet 2015m).

 762 Modeling Data Package (PolyMet 2015m).

763 ² Based on existing conditions Partridge River Tributary Areas listed in Table 1-18 of the Mine Site Water Modeling Data
 764 Package (PolyMet 2015m).

765 ³ Annual instantaneous peak with a 10-year recurrence interval.

766 ⁴ Mean Julian date of each annual 1-day maximum or minimum flow.

767 ⁵ Mean value of the 7-day minimum flow divided by the mean annual flow of that year.

768 ⁶ The number of times per year the mean daily flow increases above the 75th-percentile of all recorded/simulated mean daily
 769 flows.

770 ⁷ The number of times per year the mean daily flow falls below the 25th-percentile of all recorded/simulated mean daily flows.

771 Upper Partridge River Groundwater Baseflow

772 Estimating the groundwater contribution to flow in the Upper Partridge River is necessary for
 773 modeling future impacts because groundwater and surface water quality are different. The flow
 774 contribution from groundwater is referred to as groundwater baseflow and represents a relatively
 775 constant source of water to the river.

776 Both PolyMet and the MDNR evaluated Partridge River groundwater baseflow. The MDNR
 777 directly measured low flows at several locations along the Partridge River during the winters of
 778 2008, 2010, and 2011; however, these flow measurements were likely affected by discharges
 779 from the Northshore Mine and were not indicative of groundwater baseflows only.

780 PolyMet used data from USGS gaging station #04015475, from periods when the Northshore
 781 Mine was not discharging water (January and February 1985, and October 1986 to September
 782 1988), to determine the average 30-day winter low flow. This 30-day low-flow value was
 783 assumed to be the groundwater baseflow at that location and was used in XP-SWMM to estimate
 784 groundwater baseflow at several locations in the Upper Partridge River. Estimated low flows in
 785 the Upper Partridge River are presented in Table 4.2.2-9.

786 The only other available gaging data that could be used for estimation of baseflow are from a
 787 station installed in 2011 at SW-003 on the Partridge River. However, interpretation of
 788 groundwater baseflow at SW-003 is not reliable for use in the GoldSim modeling of groundwater
 789 baseflow (discussion of modeling is provided in Section 5.2.2) due to the complicating effects of

790 Peter Mitchell Pit (Northshore) pumped discharges, seepage from the Northshore West Pond,
791 and complex storage and release mechanisms in the wetlands that receive these flows.

792 **Table 4.2.2-9 Modeled 30-Day Low Flow**

Station	XP-SWMM Modeled 30-day Low Flow (cfs) ¹
SW-002	0.4
SW-003	0.5
SW-004	0.9
SW-004a	2.4
SW-004b	3.8
SW-005	4.9

793 Source: XP-SWMM Data: PolyMet 2015m.

794 Note:

795 ¹ XP-SWMM model was calibrated to flow-flow conditions when there was no dewatering from Northshore Mine.

796 **Upper Partridge River Stream Geomorphology**

797 A Level I Rosgen Geomorphic Survey (Rosgen 1996) was conducted for the Partridge River
798 from its headwaters to Colby Lake, a distance of about 28 miles (Barr 2005). A Level I Survey is
799 a physical classification of a stream channel to determine its geomorphic characteristics based on
800 the relationship of its physical geometry and hydraulic characteristics. The purpose of a
801 geomorphic survey is to evaluate the stability of a stream under existing conditions, to determine
802 its sensitivity to hydrologic change, and to indicate how restoration may be approached if a
803 portion of the stream becomes unstable. This survey is included in this FEIS because it assesses
804 erosion and/or channel widening caused by changes in flow that may occur from current or
805 future mine water discharge, and is thus helpful in assessing project-specific or cumulative
806 effects. This broad level characterization was performed using 2003 aerial photography, USGS
807 7.5 minute quadrangles with a 10-ft contour interval, available ground photographs, and two site
808 visits.

809 The survey results indicated that approximately 54 percent of the Partridge River is a Type C
810 channel, 31 percent is a Type E channel, and 13 percent is a Type B channel. Type C channels
811 are characterized as moderately sinuous (meandering), having a mild slope and a well-developed
812 floodplain, and being fairly shallow relative to their width. Type E channels are similar to Type
813 C, except that they tend to be more sinuous and deeper relative to their width. Type B channels
814 are steeper, straighter, and have less floodplain available than Type C or E channels. Type B
815 channels tend to be less sensitive to impact than Type C or E channels and are dominated by
816 boulder material on the Partridge River.

817 The Rosgen field survey found the Partridge River to be stable, with no evidence of erosion
818 except in its headwaters (see Figure 4.2.2-8). In general, the Partridge River has well vegetated
819 stream banks for nearly its entire length, and a very well-developed floodplain for all but the
820 Type B reaches. There are many beaver dams along the entire length of the Partridge River,
821 particularly at the head of rapids sections, which create wide pools. Because its steep reaches are
822 well-armored and the flatter reaches tend to have well vegetated shorelines, the Partridge River is
823 considered to be a robust stream. The limited erosion and/or channel widening found in the
824 headwaters may be attributable to pit dewatering discharges from the Northshore Mine, which

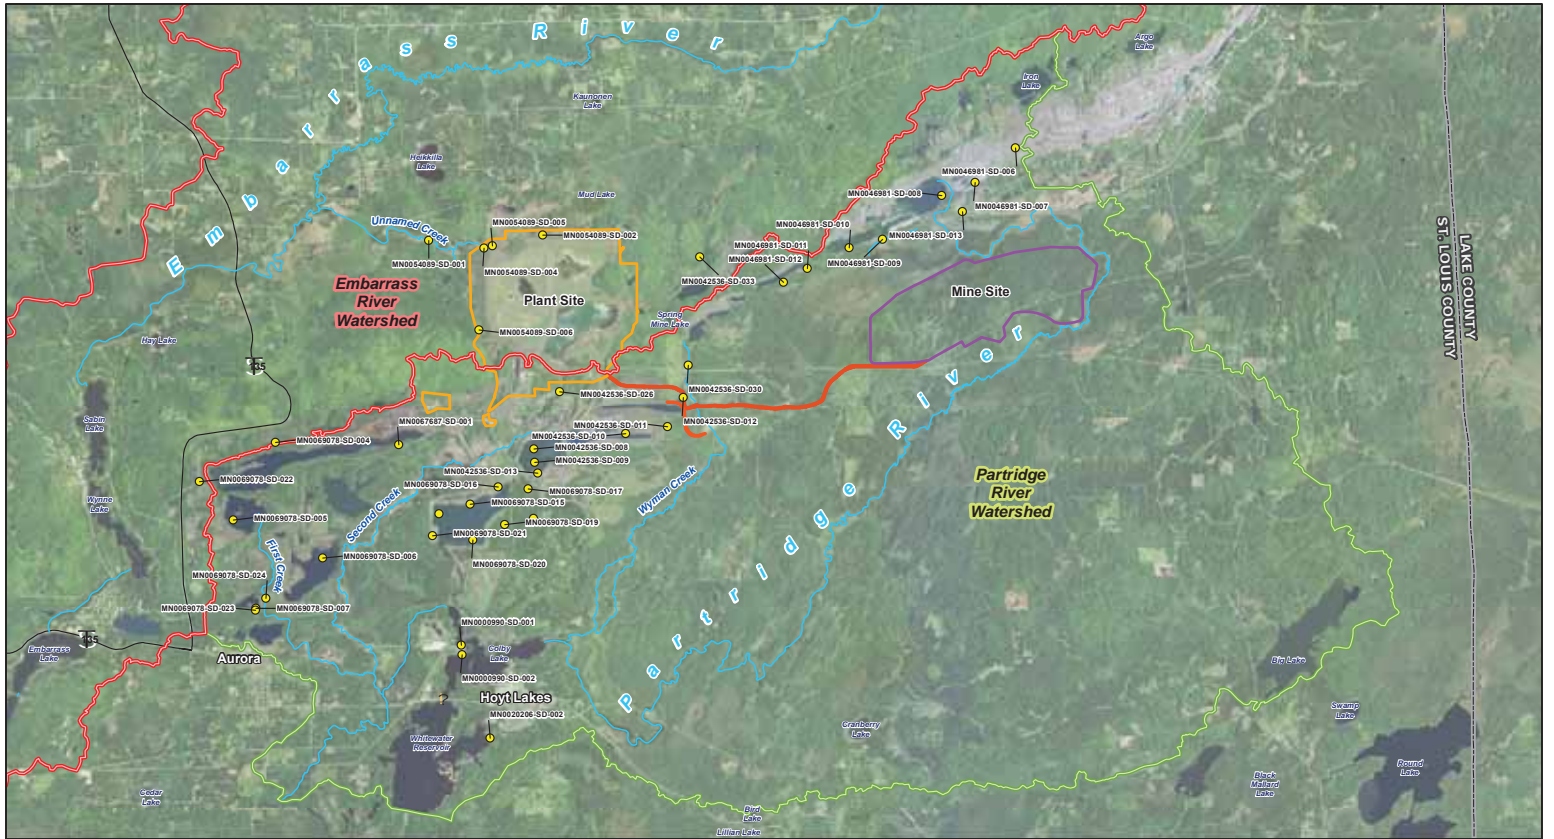

825 has a maximum permitted discharge rate of 29 cfs, and the historic straightening of the river
826 channel for construction of a railroad (Barr 2005).

827 Two additional Rosgen surveys were conducted on Unnamed Creek and two stream reaches in
828 the upper Partridge River. A Level I Rosgen Geomorphic Survey (Rosgen 1996) was conducted
829 on Unnamed Creek in November 2011 using survey-grade GPS and ground photographs. The
830 survey results indicated that Unnamed Creek is consistent with Type C and E channels with no
831 evidence of erosion, downcutting, or channel widening at any of the surveyed locations and well-
832 developed floodplains, substantial bank vegetation, and cobbles in the steeper riffle sections.
833 Water levels in Unnamed Creek are likely controlled by beaver dams in the surrounding
834 wetlands as the baseflow to the creek from groundwater is low. Unnamed Creek is likely to
835 withstand moderate changes in hydrology with no degradation as it has well-developed
836 floodplains and substantial bank vegetation (Barr 2013o).

837 A level II Rosgen Classification was conducted for two stream reaches on the upper Partridge
838 River in July (East Reach) and August 2009 (West Reach). A Level II classification (Rosgen
839 1996) consists of a survey of the channel profile and cross-sections of the channel and floodplain
840 as well as sampling of the stream bed material. The survey results indicated that both reaches are
841 consistent with Type E channels with no evidence of erosion, downcutting, or channel widening
842 at either of the surveyed reaches; both reaches have well-developed floodplains and vigorous
843 bank vegetation. As with Unnamed Creek, the water levels in both reaches are likely controlled
844 by beaver dams in the surrounding wetlands as the baseflow to the reaches from groundwater is
845 low. These reaches are likely to withstand moderate changes in hydrology with no degradation as
846 they have well-developed floodplains and substantial bank vegetation (Barr 2013q).

847 ***Partridge River Surface Water Withdrawals and Discharges***

848 There are several mines, the City of Hoyt Lakes WWTP, and Minnesota Power's Laskin Energy
849 Center (a power plant) that have withdrawn or discharged water in the past, and/or are currently
850 withdrawing or discharging water that affects flows in the Partridge River (see Figure 4.2.2-9).
851 Table 4.2.2-10 summarizes the NPDES/SDS discharges to and surface water withdrawals from
852 the Partridge River and its tributaries. Most of these outfalls do not discharge continuously, and
853 many, although still "active" in terms of permit status, have not discharged for many years
854 (i.e., various mine pit dewatering discharges).

860 Notes:

861 Most of these outfalls do not discharge continuously, and many, although still “active” in terms of permit status, have not
862 discharged for many years (i.e., various mine pit dewatering discharges). The actual total discharge to the river is far less than the
863 sum of the average flows.

864 ¹ Permit remains active for closure purposes only; no active dewatering occurring. Pit 6 (SD006) filled with water and has
865 groundwater outflow to Second Creek.

866 ² Permit remains active for closure purposes only; no active dewatering occurring. Pit 3 (SD012) filled with water and has
867 passive outflow to Wyman Creek averaging 1.1 cfs. Pit 5S (SD030) filled with water and has unmeasured passive outflow to
868 Wyman Creek. Pit 2W filled with water and has outflow to Second Creek averaging approximately 8 cfs.

869 ³ Historically used for pellet plant makeup water; no present active pumping. Represents instantaneous peak withdrawal, permit
870 also includes a maximum average withdrawal rate of 26.7 cfs for any continuous 60-day period or up to 33.4 cfs with prior
871 written commissioner’s approval

872 ⁴ Includes a maximum 4.2 cfs consumptive use for evaporative losses.

873 ⁵ Represents instantaneous peak withdrawal, permit also includes an annual maximum withdrawal rate of 2.3 cfs.

874 Although mine discharges have occurred at least periodically in the NorthMet Project area since
 875 1956 when the Northshore Mine began operations, there are few readily available mine pumping
 876 records prior to 1988 when the state began requiring water appropriation permit holders to report
 877 this information. Pumping records for the Northshore Mine from 1976 to approximately 1986 are
 878 available and show an annual average discharge of between 6.8 and 15.1 cfs. Since 1988, the
 879 highest reported average monthly discharge from the Northshore Mine to the Partridge River was
 880 34 cfs (Barr 2008f). However, monthly averages obscure the nature of the Northshore Mine
 881 discharges to the Partridge River, which are sporadic. They can have a considerable impact on
 882 the flow regime of the Upper Partridge River, particularly in the winter during low-flow
 883 conditions.

884 In addition, former LTVSMC Pits 3 and 5S are currently overflowing into Wyman Creek
 885 (MPCA 2014d), which flows south into the Partridge River (RS74A Barr 2008a). Average
 886 monthly outflow from Pit 3 (SD012), as reported to the MPCA for permit compliance during
 887 2009 through 2011, was about 0.7 cfs. Average winter outflow was 0.1 cfs. There are no
 888 discharge records for outflow from Pit 5S (SD-030) because the outflow is dispersed through a
 889 wide area of broken rock. The number and volume of these combined discharges, when
 890 compared to average and especially low flow in the Partridge River, indicate that the Northshore
 891 Mine and former LTVSMC pit discharges have the potential to significantly affect flows. Lack
 892 of historical information regarding actual dates of discharge complicates interpreting the flow
 893 record.

894 ***Upper Partridge River Water Quality***

895 Recent water quality data (collected by PolyMet in 2004, 2006, 2007, 2008, 2010, 2011, 2012,
 896 and 2013) and historic water quality data (back to 1956) are available for various constituents in
 897 various locations along the Partridge River, which are summarized in Table 4.2.2-11. Most of
 898 these water quality data represent grab samples and the frequency of sampling does not allow a
 899 detailed assessment of water quality trends, seasonal effects, or relationship to flow.
 900 Nevertheless, collectively, the data can be used to generally characterize water quality in the
 901 watershed and draw some comparisons with surface water quality standards.

904 Sources: Barr 2007h; Barr 2008f; Barr 2007i; Siegel and Ericson 1980; Barr 2009c; Barr 2014d.

905 In general, ambient water quality is similar across the watershed, although a few parameters
 906 (e.g., aluminum and copper) appear to reflect a slightly increasing trend downstream (see Table
 907 4.2.2-12). Comparing 1970s data from the Regional Copper-Nickel Study with recent (post-
 908 2000) PolyMet data collected at three monitoring stations common to both data sets (SW-002,
 909 SW-003, and SW-005) shows that some parameters appear to have decreased in concentration
 910 (e.g., sulfate at SW-003 and SW-005), but the water sampled at these stations in the 2000s is
 911 generally similar to the quality measured in the 1970s. Although a few individual samples
 912 exceeded surface water quality evaluation criteria, overall instream water quality meets state
 913 water quality standards. The only consistent exceedance of water quality standards was dissolved
 914 oxygen near the headwaters of the Partridge River (SW-002, Figure 4.2.2-3). Sufficient
 915 information is not available to interpret this exceedance, but the dissolved oxygen exceedances
 916 are localized and are not found at other upstream or downstream locations. The Upper Partridge
 917 River is not listed as an impaired waterbody on the 303(d) list. At SW-005, mean sulfate
 918 concentrations exceed the 10 mg/L wild rice standard that is applicable in this location.

919 There are limited water quality data available from the mainstem of the Partridge River that
 920 predate the operation of the Northshore Mine beginning in 1956 that can be used to characterize
 921 relatively “undisturbed” conditions. There are six samples that were collected during the
 922 Regional Copper-Nickel Study in 1976 and 1979 along the South Branch of the Partridge River
 923 at USGS Gaging Station #04015455 (see Figure 4.2.2-1). These samples were unaffected by
 924 mining and most potential significant sources of contamination, thus they can provide some
 925 insights on “undisturbed condition” water quality in the Partridge River for several key
 926 parameters (see Table 4.2.2-13). As these few samples indicate, water quality generally met
 927 evaluation criteria for the parameters monitored, except aluminum. In addition, mercury cannot
 928 be assessed due to the high detection limit (500 ng/L) used in the 1970s samples.

Mercury	ng/L	1.3	2	<500	<500

945 Source: MPCA 2013a.

946 Note:

947 ¹ Based on water quality monitoring data from 1976 and 1979.

948 PolyMet averaged available ambient water quality data from 2004 to 2013 to document existing
 949 conditions against which to evaluate impacts from the NorthMet Project Proposed Action at
 950 several locations, as shown in Figure 4.2.2-7, along the Partridge River (see Table 4.2.2-14).
 951 Average existing water quality concentrations were below evaluation criteria for most
 952 parameters listed in Table 4.2.2-14. At SW-005, where the standard applies, the wild rice sulfate
 953 standard is exceeded. The aluminum evaluation criterion is exceeded at SW-004, SW-004b, and
 954 SW-005; the thallium evaluation criterion is exceeded at SW-001; and the mercury evaluation
 955 criterion is exceeded at all sites.

956

Source: Barr 2014d.

Notes:

Values in bold indicates an exceedance of surface water quality standard, based on the average value of all samples. Means calculated using non-detects at half the detection limit.

¹ MPCA has listed the Partridge River downstream from river mile approximately 22 just upstream of the railroad bridge near Allen Junction as Wild Rice water, so the 10 mg/L sulfate standard is only applicable to that portion of the Upper Partridge River (SW-005).

² Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L.

³ Excludes single outlier value of 0.56 µg/L from values included in Barr 2014d.

⁴ Excludes single outlier value of 1,550 µg/L from values included in Barr 2014d.

⁵ Excludes single outlier value of 0.06 µg/L from values included in Barr 2014d.

⁶ Section 5.2.2 includes a detailed discussion of evaluation criteria.

⁷ Excludes single outlier value of 1.27 µg/L from values included in Barr 2014d.

⁸ Excludes single outlier value of 1.45 µg/L from values included in Barr 2014d.

⁹ Excludes single outlier value of 1.41 µg/L from values included in Barr 2014d.

¹⁰ Excludes single outlier value of 2.03 µg/L from values included in Barr 2014d.

¹¹ Excludes single outlier value of 12.3 µg/L from values included in Barr 2014d.

973 **Upper Partridge River Tributary Streams**

974 The NorthMet Project Proposed Action could affect four small streams that are tributaries to the
975 Partridge River, including the following (see Figure 4.2.2-1):

- 976 • Wetlegs Creek – which would be crossed by the Transportation and Utility Corridor that
977 links the Mine Site with the Plant Site.
- 978 • Longnose Creek – which would also be crossed by the Transportation and Utility Corridor
979 that links the Mine Site with the Plant Site.
- 980 • Wyman Creek – which would also be crossed by the Transportation and Utility Corridor that
981 links the Mine Site with the Plant Site.
- 982 • West Pit Outlet Creek – which would receive discharge from the WWTF after closure.

983 No baseline flow data collection or hydrologic modeling was conducted for Wetlegs, Longnose,
984 and Wyman creeks as the NorthMet Project Proposed Action is not expected to affect the
985 hydrology of these streams. PolyMet used the calibrated XP-SWMM model to estimate selected
986 flow volumes for West Pit Outlet Creek. The XP-SWMM model estimates an average annual
987 flow of 1.2 cfs at the approximate location of the WWTF discharge under existing conditions.

988 In terms of surface water quality, Wetlegs Creek, Longnose Creek, and the West Pit Outlet Creek
989 drain relatively undisturbed watersheds; whereas Wyman Creek drains an area previously mined
990 by LTVSMC, including Area 3 and Area 5S Pits. Water quality data for various constituents
991 from the two locations on Wyman Creek was collected in 2004, 2011, and 2012 at PM-5, and
992 again in 2013 at both locations. Data collection from Wetlegs Creek, Longnose Creek, and the
993 West Pit Outlet Creek was initiated in spring 2011, with monthly sampling through the end of
994 2013 (PolyMet 2015m). Water quality data for the four streams are summarized in Table
995 4.2.2-15. These constituents are generally within the range documented for the main branch of
996 the Partridge River. Parameters with mean concentrations higher than recorded for the Partridge
997 River include iron for Longnose Creek, Wetlegs Creek, and the West Pit Outlet Creek; copper
998 and nickel for Wetlegs Creek and the West Pit Outlet Creek; and manganese and vanadium for
999 all four streams. As with the Partridge River, background concentrations of mercury exceed the
1000 1.3 ng/L standard. Collectively, these data can be used to characterize existing background water
1001 quality for these streams.

1002

1003 **Table 4.2.2-15 Mean Water Quality Data for Longnose Creek, Wetlegs Creek, Wyman Creek, and West Pit Outlet Creek**

1005 Notes:

1006 Values in bold indicate an exceedance of surface water quality standard.

1007 ¹ Based on nine samples collected in 2011, seven samples collected in 2012, and eight samples collected in 2013; Source: Large Table 10, Barr 2014d.

1008 ² Based on eight samples collected in 2011, seven samples collected in 2012, and eight samples collected in 2013; Source: Large Table 10, Barr 2014d.

1009 ³ Wyman Creek PM-5 based on four samples collected in 2004, eight samples collected in 2011, nine samples collected in 2012, and 12 samples collected in 2013; PM-6 based on four samples collected in 2004 and one sample collected in 2013.

1010 ⁴ Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L.

1011 ⁵ Values in parentheses indicate Secondary Maximum Contaminant Levels (sMCLs).

1012 ⁶ See Section 5.2.2 for a detailed discussion of the evaluation criteria. West Pit Outlet Stream averages based on four samples collected in 2011, four samples collected in 2012, and seven samples collected in 2013.

1015

1016 **Colby Lake and Whitewater Reservoir**

1017 This section describes the baseline surface water hydrology and water quality of Colby Lake and
1018 Whitewater Reservoir.

1019 **Colby Lake and Whitewater Reservoir Hydrology**

1020 Colby Lake is located approximately 8 miles southwest from the Mine Site and about 4 miles
1021 south of the Plant Site on the Partridge River. It is located approximately 17 river miles
1022 downstream from SW-004a (PolyMet 2015m, Appendix C). It has a surface area of
1023 approximately 539 acres and a maximum depth of approximately 30 ft (see Figure 4.2.2-1). The
1024 outlet control of Colby Lake is at an elevation of approximately 1,439 ft amsl. The outflow from
1025 the lake stops when water levels drop below this level.

1026 Around 1955, in order to ensure a reliable source of water, Erie Mining Company (precursor to
1027 LTVSMC) constructed Whitewater Reservoir and the Diversion Works, which connects Colby
1028 Lake and Whitewater Reservoir. This diversion works separates the two waterbodies and allows
1029 water to be exchanged between the two. Formerly known as Partridge Lake, this impoundment
1030 increased the surface area and depth of the original lake and subjected it to greater annual water
1031 level fluctuations. Whitewater Reservoir has a surface area of approximately 1,210 acres and a
1032 maximum depth of approximately 73 ft. Water losses due to seepage through the northwest and
1033 south dikes can be 15 cfs or more and drain to the Partridge River downstream of Colby Lake
1034 (MDNR 2004). The City of Hoyt Lakes WWTP discharges an annual average of 0.39 cfs of
1035 treated wastewater effluent into Whitewater Reservoir (see Table 4.2.2-10 and Figure 4.2.2-10).

1036 The Diversion Works contain three 8-ft gates that can be opened to allow the release of water
1037 from Colby Lake to Whitewater Reservoir during high flows in the Partridge River. The
1038 Diversion Works also contain three high-volume pumps to move water from Whitewater
1039 Reservoir back to Colby Lake during low water levels. During operation of the former LTVSMC
1040 processing plant, water would typically flow through the Diversion Works gates from Colby
1041 Lake to Whitewater Reservoir during the spring runoff and then be pumped back into Colby
1042 Lake when needed. Historically, this system was not used as much as expected. When water
1043 levels in Colby Lake fall below 1,439.0 ft amsl due to low inflows, the MDNR water
1044 appropriation permit (1949-0135) limits withdrawals of water from Colby Lake to the rate that
1045 water can be pumped from Whitewater Reservoir to replace the water withdrawn.

1046 After closure of the LTVSMC mine and processing plant in 2001, Minnesota Power purchased
1047 the Diversion Works and most of LTVSMC's riparian land around Whitewater Reservoir. This
1048 land currently is leased as lake-front property. The water appropriation permit is currently jointly
1049 held by Minnesota Power and Cliffs Erie. An agreement has been reached whereby PolyMet
1050 would replace Cliffs Erie as the co-permittee. This would enable PolyMet to withdraw water
1051 from Colby Lake for use as process makeup water, subject to MDNR approval at the time of
1052 permitting.

1053 In the 5-year period after LTVSMC stopped its water withdrawals (January 2001 to December
1054 2006) under relatively natural flows (i.e., discharges from the Northshore Mine were only
1055 occurring sporadically; see Table 4-5 in Section 4.4.1.2.1 of the Mine Site Water Modeling Data
1056 Package (PolyMet 2015m)), water levels in Colby Lake were higher with less fluctuation than
1057 when LTVSMC was withdrawing water for its mining operations (see Table 4.2.2-16). Over the

1058 same period, Whitewater Reservoir also experienced smaller fluctuations and higher average
1059 water levels (see Table 4.2.2-17).

1063 **Table 4.2.2-16 Comparison of Colby Lake Elevations over Time**

Time Period	Represent	Source	Max Annual Fluctuation ¹	% Time below elevation 1,439.0
1937–1954	Pre-mining	Actual measurements	4.6 ft	5.0
1955–1992	During mining ² (with LTVSMC withdrawals)	Actual measurements	4.1 ft	24.1
1978–1988	During mining ² (with LTVSMC withdrawals)	Actual predictions	2.7 ft	17
2001–2006	During mining ² (without LTVSMC withdrawals)	Actual measurements	3.7 ft	7.5
2007–2013	During mining ² (without LTVSMC withdrawals)	Actual measurements	3.6 ft	0

1064 Source: MDNR 2015c.

1065 Notes:

1066 ¹ Maximum annual fluctuation is the maximum difference between annual maximum and minimum water elevations for any
1067 single year during the indicated time period.

1068 ² Includes effects of Northshore Mining operations from 1955 to present.

1069 ³ Data for 2013 are incomplete.

1070 **Table 4.2.2-17 Comparison of Whitewater Reservoir Elevations over Time**

Time Period	Represent	Source	Max Annual Fluctuation ¹	Average Water Elevation
1937–1954 ⁽³⁾	Pre-mining	Actual measurements	2.0 ft	Not Applicable
1955–1980	During mining ² (with LTVSMC withdrawals)	Actual measurements	14.3 ft	1,437.7 ft
2002–2008	During mining (without LTVSMC withdrawals)	Actual measurements	4.5 ft	1,438.0 ft
2009–2013 ⁴	During mining (without LTVSMC withdrawals)	Actual measurements	4.2 ft	1,438.1 ft

1071 Source: Actual measurements taken from MDNR 2015d No data was available between 1980 and 2001.

1072 Notes:

1073 ¹ Maximum annual fluctuation is the maximum difference between annual maximum and minimum water elevations for any
1074 single year during the indicated time period.

1075 ² Includes effects of Northshore Mining operations from 1955 to present.

1076 ³ Pre-1955 data is for Partridge Lake. Construction of Whitewater Reservoir, which raised the elevation of Partridge Lake, was
1077 not completed until 1955.

1078 ⁴ Data for 2013 are incomplete.

1079 Colby Lake is currently used as a potable water source for the City of Hoyt Lakes, which is
1080 permitted to withdraw a maximum annual average of 0.5 cfs with an instantaneous peak rate of
1081 2.3 cfs. Colby Lake is also used as a cooling water source for Minnesota Power’s Laskin Energy
1082 Center coal-fired power plant. The power plant discharges the once-through, non-contact cooling
1083 water (MN0000990 SD-001) to the downstream portion of the lake, but there is up to a 4.2 cfs
1084 evaporative loss of water from the cooling tower (see Table 4.2.2-10).

1085 ***Colby Lake Water Quality***

1086 Water quality in Colby Lake is affected by inflow from the Upper Partridge River Watershed,
1087 (including Northshore Mine discharges), inflow from other tributaries draining directly to Colby
1088 Lake such as Wyman Creek (including Pits 3 and 5S overflow via Wyman Creek, as well as two
1089 permitted discharges from Minnesota Power's Laskin Energy Center (i.e., cooling water
1090 discharge and a clarified ash pond discharge), pumping from Whitewater Reservoir during low
1091 flows, and stormwater runoff from the City of Hoyt Lakes.

1092 Water quality data are available for Colby Lake from various sources from 1976 to 2013
1093 (PolyMet 2015m). The most recent monitoring data (November 2008, April through September
1094 2010, and June through December 2013) showed elevated concentrations of aluminum, iron,
1095 mercury, and manganese (see Table 4.2.2-18). Two exceedances of arsenic and a single
1096 exceedance of thallium were observed, although average concentrations of both parameters met
1097 surface water quality standards. Colby Lake is on the Minnesota 303(d) TMDL List because of
1098 mercury concentrations in fish tissue, but is not included in Minnesota's regional mercury
1099 TMDL because the mercury concentrations in the fish are considered too high to be returned to
1100 Minnesota's mercury water quality standard using solely the state-wide TMDL approach. Similar
1101 to other lakes in Minnesota, the main source of mercury is atmospheric deposition. A TMDL
1102 study of Colby Lake is needed to determine what additional actions are required to reduce the
1103 mercury concentration in fish, but has not yet been performed.

1104 Sulfate concentrations in Colby Lake from the most recent monitoring data (from 2008, 2010,
1105 and 2013) range from 6.6 to 60.7 mg/L with a mean of 27.2 mg/L. This is higher than the
1106 concentrations in the Partridge River at SW-005 (mean sulfate concentration of 10.1 mg/L for
1107 data from the early-2000s, see Table 4.2.2-12). In addition to what is provided by inflow from
1108 the Partridge River, it is interpreted that there are significant other sources of sulfate loading to
1109 Colby Lake.

1110

1113 Notes:

1114 ¹ Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L, which approximates the hardness concentration in

1115 Colby Lake.

1116 ² Values in parentheses indicate sMCLs.

1117 ***Whitewater Reservoir Water Quality***

1118 As a result of the Minnesota Statewide Mercury TMDL study, which was approved by the
 1119 USEPA on April 3, 2008, Whitewater Reservoir was placed on the 2012 inventory of all
 1120 impaired waters because of mercury concentrations in fish tissue. However, the mercury fish
 1121 tissue levels are low enough that compliance with applicable standards would be achieved under
 1122 the statewide TMDL. Therefore, it is not included on the final 2012 TMDL List, and does not
 1123 need its own TMDL.

1124 The City of Hoyt Lakes WWTP discharges an annual average of 0.39 cfs of treated secondary
 1125 effluent into Whitewater Reservoir (Barr 2008f; Figure 4.2.2-10). The WWTP discharge most
 1126 likely affects the water quality of Whitewater Reservoir by the addition of nutrients such as
 1127 phosphorus and nitrogen.

1128 Limited water quality data are available for Whitewater Reservoir (see Table 4.2.2-19). Based on
 1129 the most recent data collected by PolyMet in 2010, Whitewater Reservoir has significantly lower
 1130 concentrations of aluminum, iron, and manganese than Colby Lake. It appears that all
 1131 constituents meet applicable water quality standards, but sampling for a full suite of metals has
 1132 not been done.

1133 ***Table 4.2.2-19 Summary of Whitewater Reservoir 2010 Water Quality Data***

1136 ¹ Values in parentheses indicate sMCLs.

1137 ***Lower Partridge River***

1138 This section describes the baseline surface water hydrology and water quality of the Lower
 1139 Partridge River downstream of Colby Lake.

1140 ***Lower Partridge River Hydrology***

1141 Downstream of Colby Lake, the Partridge River flows approximately four more miles before
 1142 reaching its confluence with the St. Louis River. Second Creek (also known as Knox Creek) is a
 1143 tributary of the Partridge River in this segment and until recently was receiving an annual

1144 average of 1.2 cfs of surface seepage from the existing LTVSMC Tailings Basin (see Figure
1145 4.2.2-11 for locations of Seeps 32 and 33) (Barr 2008a). A portion of this seepage is now being
1146 pumped back into the Tailings Basin, as required by the May 2010 Consent Decree between
1147 Cliffs Erie and MPCA. Second Creek is currently receiving seepage from Pit 6. Dewatering
1148 flows from Pit 1, as part of the Mesabi Nugget Project (see Table 4.2.2-10, Mesabi Nugget,
1149 SD-001) is discharged to Second Creek (see Figure 4.2.2-12) at a rate up to 9 cfs seasonally
1150 (September 1 to March 30) as per their reissued permit. Cliffs Erie is discharging Pit 2/2W water
1151 to Second Creek at a rate up to 9.4 cfs.

1152 ***Lower Partridge River Water Quality***

1153 Water quality conditions in the Lower Partridge River, from the outlet of Colby Lake to its
1154 confluence with the St. Louis River, result from a mix of Colby Lake outflow, Second Creek
1155 inflow and local runoff. Colby Lake and Second Creek (First Creek is a tributary to Second
1156 Creek) water quality is affected by local runoff from the former LTVSMC processing plant
1157 operations.

1158 Periodic dewatering discharges from Pit 9 (see Figure 4.2.2-2) previously drained to First Creek,
1159 but this pit has been abandoned long enough for static water levels to develop. Seepage from Pit
1160 6 currently flows to Second Creek. This seepage has very high sulfate concentrations (greater
1161 than 1,000 mg/L). This input of sulfate raises the sulfate concentration in the mainstem of the
1162 Partridge River from an average of about 27.2 mg/L as it flows from Colby Lake (see Table
1163 4.2.2-18) to over 160 mg/L downstream of the confluence of Second Creek (Barr 2011a). A
1164 summary of existing water quality at several locations follows.

1165 Water quality monitoring as part of the MPCA-issued NPDES Permit MN0042536 (SD026), as
1166 shown in Figure 4.2.2-11, shows that Seeps 32 and 33 were generally consistent with surface
1167 water standards (Barr 2011h). Table 4.2.2-20 summarizes the surface water quality monitoring
1168 data for Station SD-026 from 2011 to 2013. Surface water quality data from 2011 onwards are
1169 representative of existing conditions at the site, as they post-date the installation of the
1170 containment system in 2010 that limits flow to Second Creek on the southern side of the Tailings
1171 Basin (PolyMet 2015m). The MPCA will evaluate information relative to water quality standards
1172 during the NPDES/SDS permitting process as part of its analysis to determine which pollutants
1173 in the discharge would have a reasonable potential to cause or contribute to violation of a water
1174 quality standard.

1181 Source: NTS 2009; PolyMet 2015m.

1182 Notes:

1183 < = less than indicated reporting limit.

1184 Water quality data for SD026 collected for PolyMet were supplemented by data from the MPCA website collected as part of the
 1185 NPDES reporting requirements. Where samples were duplicated due to the inclusion of PolyMet data in the MPCA database, the
 1186 duplicates were removed and the PolyMet data was used in the event of any inconsistencies.

1187 ¹ Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L,
 1188 which approximates the hardness concentration in Colby Lake.
 1189

1190 Limited Lower Partridge River water quality data have also been collected at CR110 (see Figure
 1191 4.2.2-1, location 4016000). Table 4.2.2-21 summarizes water quality data from 2008 and 2009
 1192 for this location. In general, the concentration of hardness and associated solutes such as
 1193 calcium, magnesium, and potassium, average two to four times higher in the Lower Partridge
 1194 River than in the Upper Partridge River at location SW-005. A similar relationship also exists for
 1195 selected metals such as boron, copper, and nickel, where average concentrations for Lower
 1196 Partridge River are at least two times those at SW-005. Zinc appears to be an exception, where
 1197 Lower Partridge River values appear to average about a third of those at SW-005.

1198 Concentrations of sulfate are of special concern because the MPCA staff has recommended that
1199 this entire reach of the river from the outlet of Colby Lake to its confluence with the St. Louis
1200 River be considered as water used for the production of wild rice (MPCA 2012b). Based on the
1201 2008-2009 data, sulfate concentration in the Lower Partridge River averages about 164 mg/L.

1202 **Table 4.2.2-21 Summary of Surface Water Quality Monitoring Data for Station CR110**

1204 Notes:

1205 ¹ Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L,
1206 which approximates the hardness concentration in Colby Lake.

1207 ² Station CR110 is noted as location MNSW12 in the source file.

1208 4.2.2.3 Embarrass River Watershed

1209 This section describes the baseline hydrology and water quality for the groundwater and surface
1210 water within the Embarrass River Watershed portion of the NorthMet Project area. Most of the
1211 Tailings Basin and the Emergency Basin is located within the Embarrass River Watershed.

1212 **4.2.2.3.1 Groundwater Resources**

1213 ***Geology and Hydrogeology***

1214 Bedrock at the Plant Site and Tailings Basin is Precambrian crystalline and metamorphic rock.
1215 The uppermost bedrock unit that encompasses most of the area represents Giants Range
1216 batholith. However, there are two elevated exposures of bedrock (abutting the southeastern
1217 corner of Cell 1E at the Tailings Basin) that consist of schist of sedimentary and volcanic origin.
1218 Considering the results of hydraulic testing of bedrock boreholes along the perimeter of the
1219 Tailings Basin, bedrock is interpreted to have a significantly lower hydraulic conductivity than
1220 the overlying surficial deposits (Barr 2014b). This interpretation is supported by analogy to the
1221 bedrock of the Mine Site (Duluth Complex), where hydraulic testing has shown bedrock to have
1222 a significantly lower hydraulic conductivity than the surficial deposits. The Giants Range granite
1223 is mechanically similar to the Duluth Complex, which is documented to have decreasing
1224 hydraulic conductivity with depth. Assuming relatively similar stress, weathering, and erosional
1225 histories, it is likely that the Giants Range granite also exhibits decreasing hydraulic conductivity
1226 with depth.

1227 Jennings and Reynolds (2005) mapped the surficial deposits around and beneath the Tailings
1228 Basin as Rainy Lobe Till, which serves as a shallow, unconfined aquifer. This is generally a
1229 boulder-rich till with high clay content. However, data from 12 monitoring wells installed north
1230 and west of the Tailings Basin indicate the dominating presence in this area of sands with
1231 varying amounts of silt and gravel. In a separate geotechnical study of the LTVSMC tailings,
1232 several soil borings into the surficial deposits identified the presence of layers of clay and sand,
1233 plus cobbles and boulders that prevented recovery of an intact sample (Pint and Dehler 2008).

1234 The thickness of unconsolidated deposits (depth to bedrock) along the western, northwestern,
1235 and northern sides of the Tailings Basin toe ranges from 3.5 to 42.5 ft as reported in site boring
1236 logs (Barr 2014b). The average thickness of unconsolidated deposits along these toes is 19.5 ft.
1237 No substantial surficial deposits are present along the southern and much of the eastern sides of
1238 the Tailings Basin where the basin abuts against bedrock outcrops. However, an accumulation of
1239 surficial deposits is present adjacent to the East Embankment on the eastern side of the Tailings
1240 Basin. The area farther northwest of the Tailings Basin is believed to be one of the few areas in
1241 the region with significant quantities of outwash (sand and gravel) ranging in thickness from 0 ft
1242 to greater than 150 ft (Olcott and Siegel 1979) (see Figure 4.2.2-13).

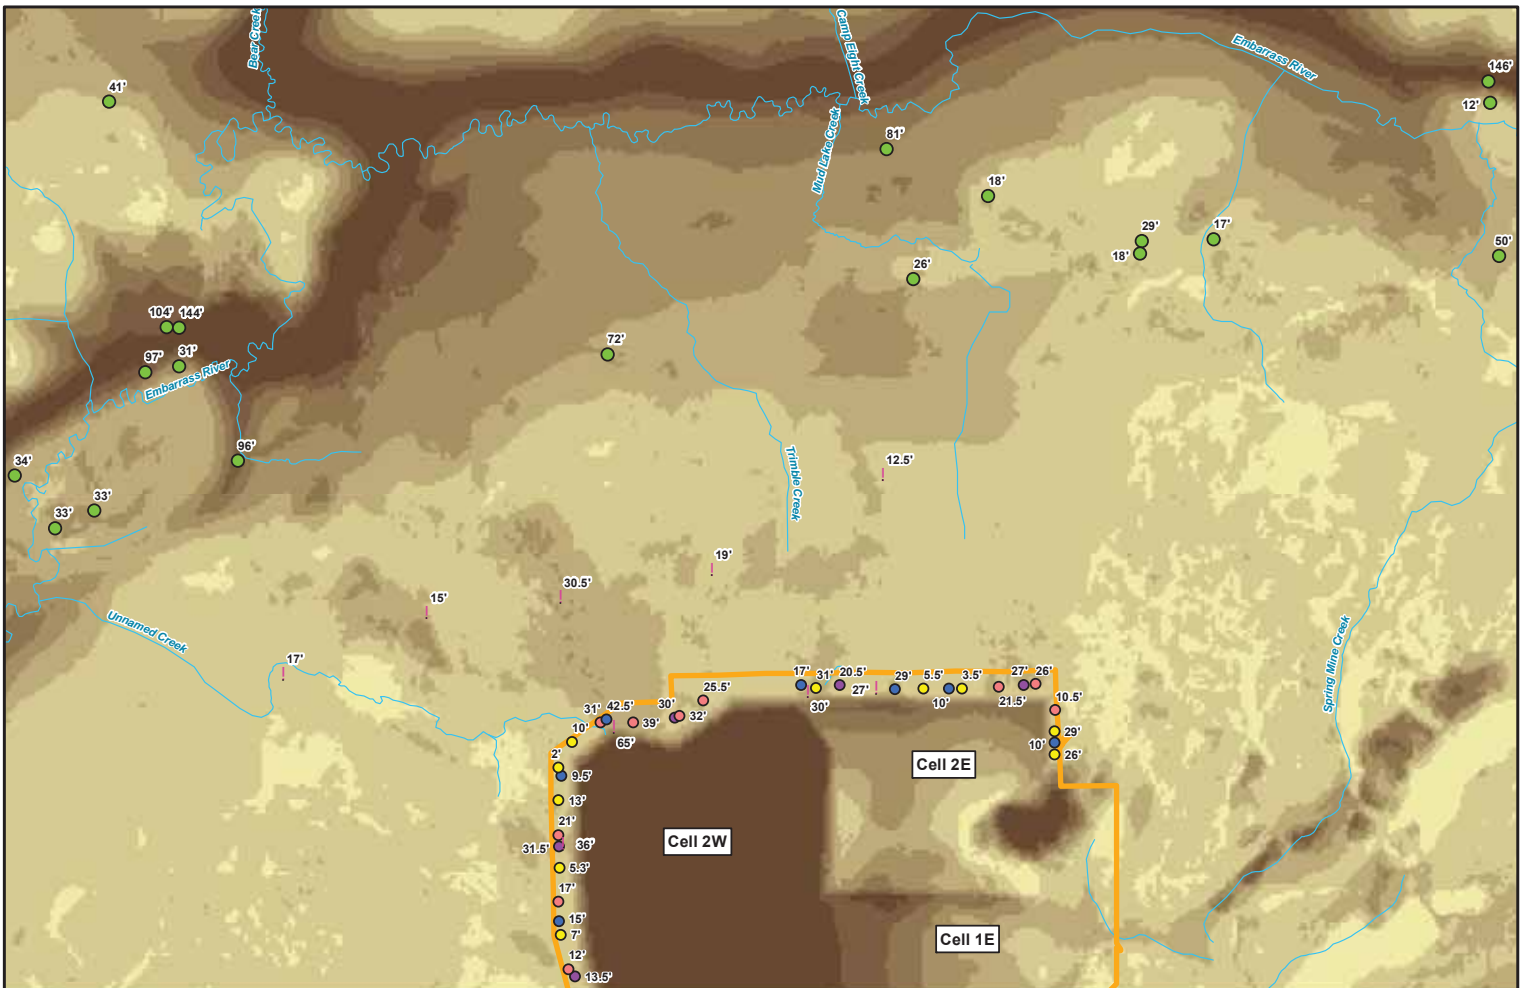

1243 The surficial till is often overlain by wetland/peat deposits. Peat deposits were encountered in
1244 some borings, ranging in thickness from less than a foot to several feet, but they are relatively
1245 few and discontinuous. Most of the area between the Tailings Basin and the Embarrass River is
1246 covered by extensive wetlands and minor surface water features. Unlike the ombrotrophic bogs
1247 at the Mine Site, where sphagnum peat has elevated the bog and reduced connection between the
1248 surface water and water table, and which describe approximately 50 percent of the wetlands
1249 across the Mine Site (Eggers 2011a), these wetlands between the Tailings Basin and Embarrass
1250 River are assumed to represent surficial expressions of the water table (Barr 2012a) and reflect,
1251 at least in part, the increase in groundwater and surface water level and flow from LTVSMC
1252 tailings seepage.

1253 Regionally, groundwater flows primarily northward toward the Embarrass River, although
1254 groundwater in some portions of the Tailings Basin flows to the south to form the headwaters of

1255 Second Creek, a tributary of the Partridge River (see Figure 4.2.2-6). Water level data collected
1256 from monitoring wells north of the Tailings Basin show an average gradient of 0.0039 ft/ft.
1257 Recent hydrologic investigations indicate that the total groundwater flow through the aquifer
1258 downgradient of the Tailings Basin and toward the west, northwest, and north, is approximately
1259 194 gpm (see Table 5.2.2-39). Recharge to the surficial aquifer in the areas west, northwest and
1260 north of the Tailings Basin is estimated to be about 0.75 in/yr (PolyMet 2015j). In the area
1261 around the Tailings Basin, groundwater flows radially away from it to the west, northwest, and
1262 north. There is currently east-to-west groundwater flow towards and under the Tailings Basin
1263 from surficial deposits along the embankment on the eastern side of the Tailings Basin.

1264 The existing LTVSMC Tailings Basin consists of three cells. Cell 2W is the largest (1,450 acres)
1265 and highest (average fill height of 200 ft) and has been closed and re-vegetated. Cell 1E is
1266 located east of Cell 2W and covers approximately 980 acres with an average fill height of 60 ft.
1267 Cell 2E, which is located east of Cell 2W and north of Cell 1E, covers approximately 620 acres,
1268 and has an average fill height of 60 ft, although it is at a lower elevation than Cell 1E.

DRAFT

1271 During the LTVSMC operations, the LTVSMC Tailings Basin was built up over time and a
1272 groundwater mound formed beneath the basin due to seepage from tailings ponds located within
1273 the various cells. Surface seeps initially occurred on the southern, western, and northern sides of
1274 the Tailings Basin; however, most surface seeps have dried out since January 2001, when
1275 LTVSMC terminated depositing tailings in the basin, so that only a few surface seeps (e.g., seeps
1276 32 and 33, which drain to the south of the existing LTVSMC Tailings Basin and toward Second
1277 Creek) remain active (see Figure 4.2.2-11).

1278 The east side of the Tailings Basin is bounded by low-permeability bedrock uplands, except for
1279 surficial deposits adjacent to the East Embankment. Groundwater flow to the east and south of
1280 the Tailings Basin is minimal. Most groundwater flows from beneath the Tailings Basin into the
1281 surrounding surficial deposits to the west, northwest, and north towards the Embarrass River.
1282 Recent seepage from the existing LTVSMC Tailings Basin towards the Embarrass River was
1283 estimated to be approximately 2,590 gpm (PolyMet 2015j; see Table 5.2.2-38). This seepage rate
1284 exceeds the capacity of the surficial aquifer to transmit groundwater, resulting in upwelling to
1285 the surface of an estimated 2,381 gpm of tailing water (see Table 5.2.2-39). This upwelling and
1286 historic surface seepage from the LTVSMC tailings created or expanded wetlands immediately
1287 downgradient of the existing LTVSMC Tailings Basin, and inundated these same wetlands (see
1288 Section 4.2.3). These hydrologic effects on wetlands diminish to the north.

1289 Groundwater elevations across the surficial aquifer north of the existing LTVSMC Tailings
1290 Basin were determined from several years of water-level measurements in 15 wells (see Figure
1291 4.2.2-14). These include eight wells that are adjacent to (or within) the existing LTVSMC
1292 Tailings Basin (GW-001 through GW-008), which were installed as part of the NPDES permit
1293 and monitored as far back as 2001. Seven other wells located farther from the existing LTVSMC
1294 Tailings Basin (GW-009 through GW-015) were installed in 2009 and 2010 by PolyMet to
1295 support hydraulic characterization of the NorthMet Project Proposed Action (PolyMet 2015j).
1296 The water table within the Tailings Basin showed a systematic decrease following cessation of
1297 the LTVSMC operations in 2001 as the tailings drained, with water levels stabilizing since 2007.
1298 Following the cessation of the LTVSMC mine operations, the remaining surface water within
1299 Cell 2W was either drained into Cell 1E or infiltrated into the underlying tailings, such that no
1300 pond remains. Cells 1E and 2E still impound water, but at lower levels than during the active
1301 LTVSMC operations. Water levels measured in the Pond and the piezometer located within the
1302 cells indicate that these cells may have been approaching steady-state conditions prior to the seep
1303 pump-backs that are part of the Cliffs Erie Consent Decree.

1304 Although water levels were monitored starting in 2001, assessment of the existing conditions and
1305 the project effects for this FEIS primarily rely on water-level data collected for 2007 through
1306 July 2013 (PolyMet 2015j). Monitoring data shows that the water table slopes to the west,
1307 northwest, and north, producing flow from the LTVSMC tailings toward the Embarrass River
1308 (see Figure 4.2.2-9 and Figure 4.2.2-15). The fluctuations at individual wells since 2007 have
1309 been small. The maximum range in the wells adjacent to the tailings has been 3.8 ft (both
1310 GW-005 and GW-008 had this range), and in the farther downgradient wells, the range in water
1311 levels at individual wells ranged from 0.33 to 4.67 ft (well GW-011; Figure 4.2.2-7).

1312 Baseline groundwater elevations, depths to bedrock, and surface water drainage locations have
1313 been used to identify three flowpaths (West, Northwest, and North) that represent the most direct
1314 paths between Tailings Basin facilities and evaluation locations (i.e., property boundaries and
1315 surface waters of the state) (PolyMet 2015j). Groundwater flow at the East Embankment is

1316 toward the west (under the Tailing Basin), while flow to the east is negligible because of the
1317 presence of bedrock outcrops. Groundwater flow toward the south is also negligible because
1318 surficial deposits are present there only as thin and laterally discontinuous bodies; tailings water
1319 at the South Toe seeps out to ground surface and a portion of that is pumped back to the Tailings
1320 Basin.

DRAFT

1326 Hydraulic characteristics of the surficial deposits and shallow bedrock in the Tailings Basin area
1327 are derived from the following sources:

- 1328 • Eight single-well pumping tests conducted in monitoring wells in the surficial deposits (Barr
1329 2009e).
- 1330 • Multiple slug tests performed in standpipe piezometers located in the surficial deposits of
1331 Cell 2W (Pint and Dehler 2008).
- 1332 • Slug tests performed in 10 standpipe piezometers installed in surficial deposits, typically
1333 right above bedrock, around the perimeter of Tailings Basin, as well as in four accessible
1334 wells that were installed in 2008 (PolyMet 2015l, Attachment F).
- 1335 • Packer tests performed in five of the 12 bedrock borings completed along the northern,
1336 northwestern, and western perimeters of the Tailings Basin. In total, 10 tests were performed
1337 at one to three depth intervals of each tested boring. Drilling of those bedrock borings
1338 produced rock cores and RQD data (PolyMet 2015l, Attachment F).

1339 Estimated hydraulic properties of the native units found near the Tailings Basin vary by several
1340 orders of magnitude (Barr 2008c). Estimated hydraulic conductivities range from approximately
1341 0.0002 ft/day for the Giants Range bedrock to approximately 70 ft/day for the glacial till (Barr
1342 2009f). Single well pumping tests conducted in eight of the monitoring wells located within the
1343 glacial till found an average permeability of 14 ft/day within a range of 0.4 to 65 ft/day (Barr
1344 2009e), while slug tests performed in standpipe piezometers located in the glacial till
1345 downgradient of Cell 2W found an average permeability of only 1.5 ft/day within a range of 0.25
1346 to 2.1 ft/day (Pint and Dehler 2008). The hydraulic conductivity of the LTVSMC tailings ranges
1347 from approximately 0.003 ft/day for the slimes to approximately 7 ft/day for the coarse tailings.

1348 Slug tests performed in standpipe piezometers completed in glacial till in different parts of the
1349 Plant Site showed hydraulic conductivity ranging from 0.15 to 130 ft/day, with geometric mean
1350 of 4.41 ft/day. Those values for glacial till are considered to be the best representation of in situ
1351 conditions in glacial till (PolyMet 2015l, Attachment F).

1352 Geometric mean of hydraulic conductivity values obtained from the packer tests performed in
1353 the bedrock borings is 0.14 ft/day. This value is judged to be the best estimate characterizing the
1354 top 20 ft of bedrock around the Plant Site; it is similar to a geometric mean of hydraulic
1355 conductivity values quoted in the Iron Range literature for the Giants Range Granite (Barr
1356 2014b).

1357 It was observed that a density of fractures often decreases with an increasing core depth,
1358 indicating hydraulic conductivity decreasing with depth.

1359 **Groundwater Quality**

1360 Characterization of groundwater quality at the Plant Site is based on the analyses of water
1361 collected from the following wells installed in surficial deposits:

- 1362 • Eight groundwater monitoring wells (i.e., wells GW-001 through GW-008) monitored since
1363 at least 1999 (see Figure 4.2.2-14). GW-002 is considered a baseline well for the Tailings
1364 Basin, as it is located distant from the Tailings Basin groundwater flowpaths. Wells GW-003,
1365 GW-004, and GW-005 located within Cell 2W were intended to monitor the high sulfide
1366 Virginia Formation hornfels waste rock that was placed in this cell in 1993. The remaining

- 1367 wells—GW-001, GW-006, GW-007, and GW-008—are located at or very near the toe of the
1368 Tailings Basin embankment.
- 1369 • Seven additional wells installed and monitored since 2009:
 - 1370 – one at the toe of the Tailings Basin (GW-012);
 - 1371 – three downgradient of the Tailings Basin (GW-009, GW-010, and GW-011);
 - 1372 – Three new downgradient wells installed in July 2010, after issuance of the 2009 DEIS
1373 (GW-013, GW-014, and GW-015) (PolyMet 2015j); and
 - 1374 • Twenty-nine residential wells identified to be present downgradient of the Tailings Basin at
1375 distances ranging between 1.6 and 3.8 miles north of the Plant Site. These wells are
1376 completed in unconsolidated deposits and in bedrock. Fifteen of those wells were sampled
1377 (see Figure 4.2.2-16).

DRAFT

1381 The discussion of groundwater quality in the Plant Site area groups the available wells into three
1382 categories:

- 1383 • Natural background wells (GW-002, GW-011, GW-013, and GW-015). These best
1384 approximate groundwater quality unaffected by the LTVSMC tailings. Low chloride
1385 concentrations measured in those wells indicate that groundwater around those wells have
1386 not been affected appreciably by Tailings Basin seepage. Table 4.2.2-22 presents solute
1387 concentrations measured in the background wells. It also shows the concentrations reported
1388 in the studies of regional background water quality conducted by the MPCA and the USGS
1389 (MPCA 1999; Siegel and Ericson 1980);
- 1390 • Tailings Basin toe wells (GW-001, GW-006, GW-007, GW-008, and GW-012). These wells
1391 are located at the toe of the Tailings Basin. Analytical results from some of these wells have
1392 been used (in conjunction with a few surface seeps) to estimate the composition of LTVSMC
1393 Tailings Basin seepage. Table 4.2.2-23 presents the range for solute concentrations measured
1394 in these wells and the remaining Cell 2E Pond.
- 1395 • Downgradient wells. This group consists of two types of wells:
 - 1396 – Tailings Basin downgradient wells (GW-009, GW-010, GW-014, and GW-016). These
1397 wells are located downgradient of and to the north and northwest of the Tailings Basin,
1398 beyond its toe. Table 4.2.2-24 presents ranges for solute concentrations in these wells.
 - 1399 – Residential wells. Figure 4.2.2-16 shows the locations of the 29 residential wells
1400 identified to be present between the Tailings Basin and Embarrass River, and it also
1401 shows the 15 that were sampled. Table 4.2.2-24 presents ranges for solute concentrations
1402 in these sampled wells.

1403 **Natural Background Wells**

1404 In the period since release of the 2009 DEIS, an updated review of available groundwater quality
1405 data allowed a conclusion that natural water quality in the Tailings Basin area was reflected by
1406 wells GW-002, GW-011, GW-013, and GW-015. These four wells were selected as unaffected
1407 natural background baseline wells primarily because of their low chloride concentrations
1408 (ranging from below detection up to 4.8 mg/L), which are consistent with regional values for
1409 background chloride concentrations, and clearly distinct from chloride concentrations in
1410 discharge from the existing LTVSMC tailings (approximately 30 mg/L; PolyMet 2015j). Also,
1411 concentrations of ammonia (as nitrogen), calcium, fluoride, magnesium, sodium, potassium,
1412 sulfate, as well as TDS (total dissolved solids) and hardness are lower in these wells than in the
1413 Tailings Basin toe wells and downgradient wells discussed below.

1414 Baseline concentrations of some constituents in groundwater of the Tailings Basin area exceed
1415 the groundwater evaluation criteria (see Table 4.2.2-22). For example, at well GW-002,
1416 groundwater within the surficial aquifer has elevated concentrations (i.e., at or higher than the
1417 groundwater evaluation criteria) of aluminum, iron, and manganese. The manganese levels were
1418 within the range of baseline concentrations found by MPCA in northeastern Minnesota (MPCA
1419 1999a) and in the Regional Copper-Nickel Study (Siegel and Ericson 1980), but the aluminum
1420 and iron values were above the range of concentrations found in these two studies. In addition,
1421 beryllium did not meet the groundwater criterion. However, interpretation of the beryllium
1422 concentrations is complicated because the detection limits exceeded the evaluation criteria.

1423 Beryllium was detected in some groundwater samples at concentrations above the evaluation
1424 criteria.

1425 Aluminum, iron, and manganese concentrations are heavily influenced by natural processes,
1426 particularly chemically reducing conditions and the presence of dissolved organic acids, both of
1427 which can arise in aquifer zones enriched in natural organic matter. Further, the analyses of
1428 “total” groundwater concentrations included an unknown amount of fine particulates that were
1429 then digested in sample preparation and contributed to the reported concentrations. Reported
1430 total concentrations could thus be influenced by the high values for elements common in clays
1431 and other fine particulates, including aluminum, iron, and manganese. Consequently, the
1432 dissolved concentrations are generally considered more representative of groundwater quality
1433 than total concentrations. Very few dissolved concentrations measured in the collected samples
1434 are exceeding the criteria. All other parameters met the groundwater evaluation criteria.

1435 **Table 4.2.2-22 Summary of Natural Background Groundwater Quality Monitoring Data for**
1436 **the Tailings Basin Area and Two Larger Regional Areas**

1437 Sources: Barr 2014d; NTS 2009; MPCA 1999a; Siegel and Ericson 1980.

1438 Notes:

1439 Groundwater evaluation criteria: The maximum allowed concentrations (or for some less toxic substances, the maximum
1440 recommended concentrations) of various constituents in groundwater. The specific thresholds are either the USEPA primary
1441 Maximum Contaminant Levels (MCLs), the MDH Health Risk Limits (HRLs), or the USEPA sMCLs (sMCLs are used to set
1442 thresholds for aluminum, iron, and manganese). These thresholds are considered when determining whether alternatives
1443 considered in this FEIS are expected to have a significant environmental effect.

1444 Bold (e.g., **0.014**) indicates exceeds evaluation criteria.

1445 ¹ Where non-detects occur, the mean was calculated using half the detection limit.

1446 ² Below detection limit. Detection limit is greater than water quality standard.

1447 ³ pH: s.u. stands for Standard Unit.

1448

1449

1450 **Tailings Basin Toe Wells**

1451 Ponds remain within Cells 1E and 2E of the existing LTVSMC Tailings Basin. No pond is
1452 present in Cell 2W. Table 4.2.2-23 summarizes the results of surface water quality monitoring of
1453 the Cell 2E pond (mean values for data collected from 2001 to 2004) and groundwater quality
1454 monitoring at monitoring wells located along the northern, northwestern, and western toes of the
1455 Tailings Basin (GW-001, GW-006, GW-007, GW-008, and GW012). The existing LTVSMC
1456 Tailings Basin is a disposal facility and is not a natural surface waterbody or a point of
1457 compliance pursuant to Cliffs Erie’s NPDES/SDS permit. Therefore, comparison of these data
1458 with surface or groundwater evaluation criteria is not appropriate; however, these criteria are
1459 listed for informational purposes.

1463 Notes:

1464 Bold (e.g., **0.014**) indicates exceeds evaluation criteria.

1465 ¹ Where non-detects occur, the mean was calculated using half the detection limit.

1466 Comparing the existing Cell 2E pond water quality with water quality at the toe of the Tailings
1467 Basin helps define the effect passage through the existing LTVSMC tailings has on seepage
1468 water quality. Such comparison shows that passage through the LTVSMC tailings apparently
1469 reduces the average concentrations of arsenic, fluoride, and molybdenum, although it is difficult
1470 to determine to what extent these reductions are simply attributable to the effects of dilution. The
1471 concentrations of several other parameters, such as calcium, manganese, nickel, and TDS,
1472 increase as they seep from the tailings pond to the toe of the Tailings Basin.

1473 The limited amount of pond water quality data generally show fluoride concentrations that are
1474 elevated relative to the groundwater evaluation criteria. This could be attributable to the historic
1475 use of wet scrubbers for emission control at the former LTVSMC furnaces. These scrubbers
1476 removed highly soluble hydrogen fluoride gas (Jiang n.d.) resulting in elevated fluoride
1477 concentrations in the scrubber water, which was disposed of in the Tailings Basin.

1478 Groundwater quality monitoring at several wells completed in the surficial aquifer at or near the
1479 toe of the Tailings Basin found the pH tending neutral or toward slightly basic (mean of 7.3), and
1480 elevated concentrations of several parameters (see Table 4.2.2-23). As with the baseline wells,
1481 these wells exhibited elevated aluminum, iron, and manganese concentrations, but also exhibited
1482 elevated sulfate, fluoride, molybdenum, and TDS concentrations that are higher than in the
1483 baseline wells (see Table 4.2.2-22). Considering these results, NTS (2009) concluded that
1484 groundwater has been impacted by the Tailings Basin. NTS noted, however, that there does not

1485 appear to be an overall trend, either increasing or decreasing, in the concentration of the
1486 monitored constituents.

1487 ***Tailings Basin Downgradient Wells and Residential Wells***

1488 PolyMet conducted between 2 and 15 rounds of groundwater sampling during the 2009 through
1489 2013 period at three monitoring wells (GW-009, GW-010, and GW-014) located approximately
1490 1 mile north of the Tailings Basin (see Figure 4.2.2-14), and a single round of sampling at 15
1491 residential wells located between 1.6 miles and 3.8 miles north of the Tailings Basin (see Figure
1492 4.2.2-16). Water quality in the three affected downgradient monitoring wells and the 15
1493 residential wells is summarized in Tables 4.2.2-24 and 4.2.2-25, respectively (Barr 2014d). As
1494 with the baseline wells, the three downgradient monitoring wells also exhibited elevated
1495 aluminum and iron concentrations that are higher than those found at the toe of the Tailings
1496 Basin.

1497 Samples collected from the residential wells (located farther from the Tailings Basin) showed
1498 manganese concentrations that exceeded the groundwater evaluation criteria (i.e., sMCL). High
1499 manganese concentrations can naturally occur at some locations under a range of conditions. The
1500 measured concentrations are within the range found in the Regional Copper-Nickel Study. One
1501 well had aluminum concentrations slightly above the evaluation criterion and four wells had pH
1502 concentrations below the minimum of the criterion's range (pH below 6.5), but again, these
1503 values are within the neutral range found in the Regional Copper-Nickel Study.

1504 The samples from the residential wells (Barr 2009d) and the downgradient wells sampled for the
1505 NorthMet Project Proposed Action (compared in Table 4.2.2-24) include analyses for total
1506 (unfiltered) and dissolved (filtered) concentrations for manganese and aluminum, so the
1507 maximum reported concentrations of these constituents probably includes the effect of sediment
1508 included in the samples. Residential wells have had more time and pumping to flush out
1509 sediment and, therefore, samples from them would be expected to have little if any sediment and
1510 lower unfiltered analytical results than samples from a monitoring well at the same location.

1511 Comparisons of the groundwater quality data between different groups of wells indicate a
1512 general pattern of decreasing concentrations of ammonia, calcium, chloride, fluoride,
1513 magnesium, sodium, potassium, sulfate, hardness, pH, and TDS from the Tailings Basin wells
1514 (the highest), to downgradient wells, to residential and natural background wells (the lowest).
1515 Concentrations of those general parameters are similar between the residential and background
1516 wells.

1517 Concentrations of metals (both total and dissolved) do not show any clear pattern of increasing
1518 or decreasing concentrations between the well groups. Two exceptions are boron and
1519 molybdenum showing, again, a trend of decreasing concentrations from the Tailings Basin wells
1520 to downgradient wells, to residential and background wells.

1521 The MPCA conducted a desktop review of the residential well and monitoring well results
1522 (which, in part, included the consideration of chemical tracers). This review concluded that it is
1523 not clear whether elevated concentrations in some of the residential wells were caused by the
1524 Tailings Basin or reflect natural or localized background concentrations. However, the results for
1525 residential wells are similar to the results for natural background wells. That similarity suggests
1526 that the residential wells may not be impacted by the Tailings Basin.

1540 ***Legacy Groundwater Quality Issues***

1541 In 2002, Cliffs Erie commissioned a Phase I ESA of the former LTVSMC property and
1542 improvements (NTS 2002). This study identified 62 potential AOCs. Designation as an AOC
1543 does not necessarily mean that contamination occurred in the past or is currently present, but
1544 simply that these are areas requiring further investigation. The AOCs are discussed further in
1545 Section 4.2.1.

1546 In May 2009, Cliffs Erie conducted a detailed assessment of both surface and groundwater
1547 quality at the existing LTVSMC Tailings Basin that included testing for VOCs, SVOCs, PCBs,
1548 and other parameters to determine if there was any organic contamination that could be
1549 transported off-site via stormwater runoff or groundwater seepage. The laboratory analyses
1550 showed no evidence of organic contamination leaving the site (Cliffs Erie 2009). The
1551 investigations conducted to date and the results of laboratory analyses (which includes sampling
1552 at seven monitoring wells, 14 surface discharges, 12 internal waste streams, and six downstream
1553 surface water monitoring stations, and visual observation and limited field analyses at 33 seeps at

1554 or near the existing LTVSMC Tailings Basin) indicate that these pollutants have not migrated off
 1555 site.

1556 As noted above, groundwater quality monitoring at several wells completed in the surficial
 1557 deposits at or near the toe of the Tailings Basin found elevated aluminum, iron, and manganese
 1558 concentrations, similar to the baseline wells (see Table 4.2.2-23), but also exhibited elevated
 1559 sulfate, fluoride, molybdenum, and TDS concentrations relative to the baseline wells (see Table
 1560 4.2.2-22). Considering these results, NTS (2009) concluded that groundwater had been impacted
 1561 by the Tailings Basin. NTS noted, however, that there did not appear to be an overall trend,
 1562 either increasing or decreasing, in the concentration of the monitored constituents.

1563 ***Baseline Groundwater Quality in the Bedrock***

1564 No bedrock groundwater samples have been collected from the Plant Site/Tailings Basin area.
 1565 Although some of the residential wells are drilled into bedrock, the well completion records
 1566 indicate that these wells were not constructed as monitoring wells to separate the bedrock
 1567 groundwater from the surficial aquifer. Siegel and Ericson (1980) report that iron and manganese
 1568 concentrations of up to 500 µg/L are common in the Giants Range batholith.

1569 ***Groundwater Use***

1570 There are 29 known residential wells between the Tailings Basin and the Embarrass River, with
 1571 the closest located approximately 1.6 miles from the toe of Cell 2E. Characteristics of the wells
 1572 are presented in Table 4.2.2-25. Table 4.2.2-26 and Figure 4.2.2-16 shows the locations of all the
 1573 identified wells and which of those wells were sampled. Analytical results for groundwater
 1574 samples collected from these 15 residential wells are summarized in Table 4.2.2-25.

1580 4.2.2.3.2 Surface Water Resources

1581 This section describes the existing surface water resources in the Embarrass River Watershed
 1582 that could be affected by the NorthMet Project Proposed Action. These resources include the
 1583 Embarrass River, several small streams draining the Tailings Basin that are tributaries of the
 1584 Embarrass River (i.e., Mud Lake Creek, Trimble Creek, and Unnamed Creek—see Figure
 1585 4.2.2-4), and the Embarrass River chain of lakes. Note that Mud Lake Creek is an unofficial
 1586 name given the Unnamed Creek that flows north from the northeast corner of the Tailings Basin.
 1587 It was given this name because of Mud Lake near the headwaters of the stream, and to
 1588 distinguish it from the other Unnamed Creek that flows northwest from the northwest corner of
 1589 the Tailing Basin. It is referred to as Mud Lake Creek throughout the FEIS.

1590 Since publication of the DEIS, additional surface water quality data has been collected at many
 1591 locations within the Embarrass River Watershed. These new data have been summarized below
 1592 to better describe existing conditions. The surface water hydrology of the Embarrass River and
 1593 its tributaries was not evaluated using the XP-SWMM model. Rather, it was estimated using a
 1594 spreadsheet model that extrapolates flows from a USGS gaging station on a catchment area
 1595 basis.

1596 *Embarrass River*

1597 This section describes the baseline surface water hydrology and water quality of the mainstem of
 1598 the Upper Embarrass River, several streams that receive drainage from the Tailings Basin and
 1599 are tributaries of the Embarrass River, and the Lower Embarrass River as it flows through an
 1600 area referred to as the chain of lakes.

1601 *Embarrass River Hydrology*

1602 The Embarrass River originates just south of the City of Babbitt and flows southwest
 1603 approximately 23 miles to its confluence with the St. Louis River, draining 171 square miles as
 1604 measured at McKinley, near the confluence with the St. Louis River. The Embarrass River
 1605 Watershed is dominated by upland forests (44 percent), lowland forest and aquatic environments
 1606 (23 percent), crop/grassland (8 percent), and scrub/shrub (21 percent), with little development

1607 (4 percent). Most of the Tailings Basin seepage drains to the Embarrass River via three tributary
 1608 streams.

1609 There were two USGS gaging stations located within the Embarrass River Watershed
 1610 (#04017000 located about three miles northwest of the Tailings Basin and #04018000 located
 1611 about 7 miles southwest of the Tailings Basin). Table 4.2.2-27 provides flow data for the nearest
 1612 gaging station at the Embarrass River Watershed (Station #04017000; see Figure 4.2.2-17 for
 1613 location).

1614 **Table 4.2.2-27 Monthly Statistical Flow Data for USGS Embarrass Gaging Stations**

1615 Source: Siegel and Ericson 2008.

1616 Flow characteristics for different reaches of the Embarrass River and selected tributaries were
 1617 estimated by extrapolating flows from USGS gaging station 04017000 (located just downstream
 1618 of PM-12.3) on a catchment area basis. A summary of the flow results for different stations on
 1619 Embarrass River, Mud Lake Creek, Trimble Creek, and Unnamed Creek is provided in Table
 1620 4.2.2-28. Flow contributed by the Tailings Basin seepage is separated from the flows derived
 1621 using the unit-area basis in the table to provide greater clarity of water origins. Tailings Basin
 1622 flows presented in the last column of Table 5.2.2-14 can be added to the annual flow
 1623 characteristics presented in the table to determine the appropriate flow volume.

DRAFT

1638 Overflow and seepage from several former mining facilities, including the Area 5 NW Pit
 1639 upstream of the Tailings Basin, contribute to the flow farther downstream in the Embarrass
 1640 River, as shown in Table 4.2.2-29 and Figure 4.2.2-9. Based on measurements between 2012 and
 1641 2014, an average of approximately 1.2 cfs overflows from Pit 5NW to Spring Mine Creek where
 1642 it flows north about 5 miles before joining the Embarrass River just downstream of monitoring
 1643 station PM-12 (see Figure 4.2.2-1).

1646 Note:

1647 ¹ Average flow when discharging. Many of these discharges only occur intermittently and may be currently inactive.

1648 There are no large surface water withdrawals or water appropriation permits issued for the
 1649 Embarrass River in the NorthMet Project area. The headwaters of the Embarrass River
 1650 Watershed include a portion of the City of Babbitt, but are otherwise relatively undeveloped and
 1651 unaffected by any mining. The City of Babbitt WWTP has an annual average discharge of
 1652 approximately 0.33 cfs to the headwaters (PolyMet 2015j).

1653 **Embarrass River Water Quality**

1654 As indicated in Table 4.2.2-30, PolyMet collected water quality data from five locations that can
 1655 be used to establish baseline water quality along the Embarrass River. Samples from two primary
 1656 locations, PM-12 and PM-13, were subject to evaluation for all water quality parameters, while
 1657 samples from locations PM-12.2, PM-12.3, and PM-12.4 were analyzed for a more limited set of
 1658 parameters. The locations of the monitoring stations, all along the main branch of the Embarrass
 1659 River, are shown in Figure 4.2.2-17. Table 4.2.2-32 summarizes the water quality data for the
 1660 five Embarrass River sites sampled by PolyMet between 2004 and 2013. Average parameter
 1661 concentrations above evaluation criteria were observed for aluminum at PM-12.3 and PM-13, for
 1662 sulfate at PM-13 (where the 10 mg/L wild rice sulfate standard is applicable), and for mercury at
 1663 PM-12 and PM-13.

1667 Notes:
 1668 C-N Study – Regional Copper-Nickel Study (Siegel and Ericson 1980)

1669 ¹ Monitoring station formally designated as CN121.

1670 The Regional Copper-Nickel Study (Siegel and Ericson 1980) considered monitoring station
 1671 PM-12 (formally designated as CN121) as representative of “undisturbed” conditions. Under
 1672 current assumed conditions, this monitoring station receives stormwater runoff and WWTP
 1673 discharges (0.33 cfs of predominantly domestic wastewater) from the City of Babbitt, but is
 1674 otherwise unaffected by mining or other significant development (PolyMet 2015j). Table
 1675 4.2.2-31 compares 1976 data from the Regional Copper-Nickel Study with recent data from
 1676 PolyMet for monitoring station PM-12. These data show that mean water quality at this
 1677 monitoring station currently meets surface water quality standards for the parameters monitored.
 1678 Most of the measured parameters exhibit relatively little change over the 30-year period,
 1679 although concentrations of several constituents (notably iron, manganese, and zinc) have
 1680 increased, while concentrations of aluminum and cobalt appear to be decreasing slightly.

1681 **Table 4.2.2-31 Comparison of Historic and Recent Mean Water Quality Data for Selected**
 1682 **Parameters at PM-12 on the Embarrass River**

General Parameter	Units	Evaluation Criteria	1976	2004–2013⁽¹⁾

Sources: Siegel and Ericson 1980; Barr 2007i for 1976 data; Barr 2014d for 2004–2013 data.

Notes:

¹ Includes non-detects at half the detection limit.

² Sulfate standard of 10 mg/L applies to designated “waters supporting the production of wild rice.”

³ Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 50 mg/L.

⁴ Based on fewer than five samples.

1689 As indicated in Table 4.2.2-30, PolyMet collected water quality data from five locations that can
 1690 be used to establish baseline water quality along the Embarrass River. Samples from two primary
 1691 locations, PM-12 and PM-13, were subject to evaluation for all water quality parameters, while
 1692 samples from locations PM-12.2, PM-12.3, and PM-12.4 were analyzed for a more limited set of
 1693 parameters. The locations of the monitoring stations, all along the main branch of the Embarrass
 1694 River, are shown in Figure 4.2.2-17. Table 4.2.2-32 summarizes the water quality data for the
 1695 five Embarrass River sites sampled by PolyMet between 2004 and 2013. Average parameter
 1696 concentrations above evaluation criteria were observed for aluminum at PM-12.3 and PM-13, for
 1697 sulfate at PM-13 (where the 10 mg/L wild rice sulfate standard is applicable), and for mercury at
 1698 PM-12 and PM-13.

1699 Surface water monitoring station PM-12 does receive a small discharge from the City of Babbitt
 1700 WWTP, but is otherwise upstream of all NorthMet Project Proposed Action activities and
 1701 therefore serves as a control location.

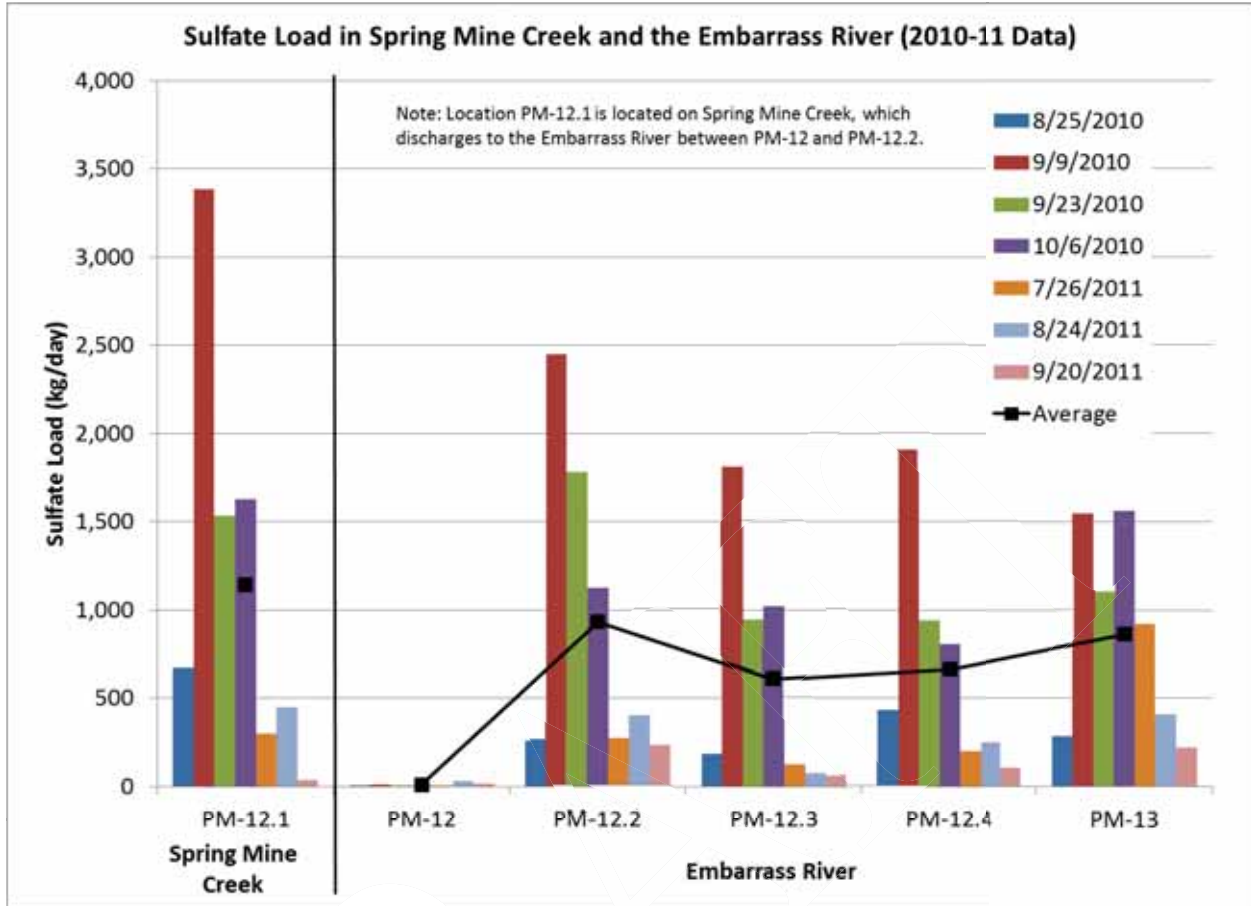

1702 Samples of limited water quality data collected at PM-12.2, PM-12.3, and PM-12.4 between
 1703 2010 and 2013 allow the identification of progressive trends for major anions and some metals
 1704 between PM-12 and PM-13 along the mainstem of the Embarrass River. Chloride appeared
 1705 relatively constant with location, varying from an average of 4.7 mg/L at PM-12 to 5.0 mg/L at
 1706 PM-12.4 and 5.8 mg/L at PM-13. pH also appeared relatively constant, from an average of 6.9 at
 1707 PM-12 to 7.3 at PM-12.4 and 7.4 at PM-13. Sulfate, however, varied substantially, increasing
 1708 from an average of 7.2 mg/L at PM-12 to 131 mg/L at PM-12.2, and then decreasing to an
 1709 average of 39.4 mg/L at PM-13, indicating either dilution or a process that sequesters sulfate in
 1710 the Embarrass River and the surrounding wetlands.

1711 The increase in sulfate concentrations between PM-12 and PM-12.2 can be attributed to sulfate
1712 loading from Spring Mine Creek, which flows into the Embarrass River immediately
1713 downstream from PM-12. Limited water quality data were collected at PM-12.1 on Spring Mine
1714 Creek, which receives drainage from former LTVSMC Pit 5NW (see Figure 4.2.2-1). These data
1715 are summarized in Table 4.2.2-32 alongside the Embarrass River mainstem sites. Pit 5NW is
1716 completely flooded and has been overflowing since before 2001, with an annual average flow of
1717 about 1.5 cfs to Spring Mine Creek, which discharges into the Embarrass River. This discharge
1718 has sulfate concentrations that average 1,060 mg/L (PolyMet 2015j), as measured at the Pit 5NW
1719 outflow. Sulfate concentrations at PM-12.1 averaged 388 mg/L and ranged as high as 944 mg/L,
1720 indicating that the Pit 5NW outflow via Spring Mine Creek provides a significant source of
1721 sulfate loading to Embarrass River, which accounts for the increase in sulfate concentrations
1722 between PM-12 and PM-12.2. As noted in Table 4.2.2-2, Spring Mine Creek from Ridge Creek
1723 to Embarrass River was listed by the MPCA as impaired for aquatic macroinvertebrates and fish
1724 while the Embarrass River Watershed from the headwaters to Embarrass Lake was listed as
1725 impaired for fish.

1726 Sulfate and chloride loading data were collected concurrently with water quality data in Spring
1727 Mine Creek and the Embarrass River in 2010 and 2011, and were consistent with the
1728 observations discussed above (see Figures 4.2.2-18 and 4.2.2-19). Sulfate loading increased from
1729 an average of 10.2 kg/day at PM-12 to an average of 932 kg/day at PM-12.2, due to sulfate
1730 loading contributed from Pit 5NW via Spring Mine Creek (average sulfate load of 1142 kg/day
1731 measured at PM-12.1). Between PM-12.2 and PM-13, the average sulfate load decreased by
1732 approximately 70 kg/day, even though there is approximately 3,120 kg/day currently leaving the
1733 Tailings Basin towards the Embarrass River (the sum of loads leaving the northern,
1734 northwestern, and western toes of the Tailings Basin; PolyMet 2015j). Meanwhile, the calculated
1735 load of chloride (Figure 4.2.2-19), a parameter which serves as a tracer for Tailings Basin
1736 seepage, increased in the downstream direction along the Embarrass River, indicating that the
1737 Tailings Basin seepage is reaching the Embarrass River. Consequently, the decrease in sulfate
1738 loading between PM-12.1 and PM-12.2, and between the Tailings Basin and the Embarrass
1739 River, is attributable to some natural process such as biological sulfate reduction that is
1740 sequestering sulfate in the wetlands and tributaries between the Tailings Basin and the Embarrass
1741 River.

1742 Flows from groundwater and surface seepage from the existing LTVSMC Tailings Basin reach
1743 the Embarrass River via several small tributaries including Mud Lake Creek and Trimble Creek,
1744 which enter upstream of station PM-12.3, and Unnamed Creek, which enters upstream of station
1745 PM-13 (see Figure 4.2.2-1). These tributaries are described in more detail below. There are also
1746 extensive wetlands on the northern, northwestern, and western sides of the LTVSMC Tailings
1747 Basin. While much of the wetlands water likely flows into the tributaries, other flows may
1748 directly reach the Embarrass River by means of the system of wetlands.

1749 The effects of Pit 5NW, the existing LTVSMC Tailings Basin, and groundwater seepage and
1750 surface runoff from elsewhere within the watershed are reflected in the water quality at station
1751 PM-13, which is located downstream of these and all NorthMet Project area sources of pollution
1752 within the Embarrass River Watershed (see Table 4.2.2-29). Since PM-13 is downstream of all
1753 Tailings Basin seepage, it was used to evaluate NorthMet Project Proposed Action effects on
1754 flow and water quality in the Embarrass River in Section 5.2.2.

 1770 ² Excludes 94.8 mg/L value from November 8, 2006.
 1771 ³ Excludes 688 mg/L value from November 8, 2006.
 1772 ⁴ The MPCA has listed the waters within and downstream from Embarrass Lake, the northernmost tip of Wynne Lake, and the segment of the Embarrass River from Sabin Lake to the Highway 135 bridge as waters used for the production of wild rice, so the 10 mg/L sulfate standard is only
 1773 applicable to that portion of the Embarrass River (PM-13).
 1774 ⁵ Water quality standard for this metal is hardness-dependent. Listed value assumes a concentration of 100 mg/L.

DRAFT

1776 **Embarrass River Tributary Streams**

1777 There are several tributaries to the Embarrass River that also serve as receiving waters for
1778 seepage from the existing LTVSMC Tailings Basin, including Mud Lake Creek, Trimble Creek,
1779 and Unnamed Creek. This Tailing Basin seepage occurs from both observable surface water
1780 seeps and diffuse surface water and groundwater seepage.

1781 The existing LTVSMC Tailings Basin, proposed for tailings deposition by PolyMet, was
1782 operated from 1953 until it was shut down in January 2001. The Tailings Basin is unlined and
1783 the perimeter embankments do not have a clay core or cutoff, which allows for both surface
1784 seepage through the embankment and groundwater seepage under the embankment.

1785 Most of the uncontrolled groundwater and surface water seepage from the existing LTVSMC
1786 Tailings Basin ultimately reaches the Embarrass River between monitoring stations PM-12 and
1787 PM-13. Table 4.2.2-33 identifies the observable Tailings Basin seeps and the flow range for the
1788 period from 2002 to 2006 for the 33 LTVSMC seeps shown in Figure 4.2.2-11 (Barr 2007f), but
1789 most of the existing Tailings Basin seepage is diffuse and not associated with these observed
1790 seeps.

1791 As the flow monitoring shows, flow at most of these identified surface seeps has declined or
1792 stopped since tailings disposal was discontinued in 2001. Only Seep 30, which drains to wetlands
1793 north of the Tailings Basin in the Embarrass River Watershed, and Seeps 32/33, which drain to
1794 Second Creek in the Partridge River Watershed, still have flow greater than 10 gpm (Table
1795 4.2.2-33). A portion of seeps 32/33 (outfall SD026) and all seepage from the vicinity of outfalls
1796 SD006 and SD004 are presently being pumped back into the Tailings Basin under the Consent
1797 Decree agreement between the MPCA and Cliffs Erie. In addition to surface Seep 32/33, it is
1798 possible that a relatively small amount of seepage may bypass the collection system at outfall
1799 SD026 and discharge to Second Creek.

1800 PolyMet estimates that the current combined groundwater seepage from the Tailings Basin to
1801 the Embarrass River is 2,590 gpm (PolyMet 2015j). The MPCA will evaluate information
1802 relative to water quality standards during the NPDES/SDS permitting process as part of its
1803 analysis to determine which pollutants in the discharge have a reasonable potential to cause or
1804 contribute to violation of a water quality standard.

1805 PolyMet has collected water quality data at four locations along the toe of the tailings
1806 embankment (PM-8, PM-9, PM-10, and UC-1) and along the three receiving streams, including
1807 three locations along Trimble Creek (PM-19, TC-1, and TC-1A), one location along Unnamed
1808 Creek (PM-11), and three locations along Mud Lake Creek (MLC-1, MLC-2, and MLC-3A).
1809 Table 4.2.2-34 lists the sampling periods for each location and Figure 4.2.2-17 shows the
1810 monitoring locations. Tables 4.2.2-35 through 4.2.2-38 contain summaries of the data from these
1811 locations.

1812 **Table 4.2.2-33 Summary of Existing LTVSMC Tailings Basin Surface Seeps**
 1813 **(see Figure 4.2.2-11)**

Seep ID	Average Seepage Flow (gpm) 2005-2014	Notes

TC-1A	PolyMet	2012–2013

1817 Sources: Barr 2007h; Barr 2014d.

1818 Note:

1819 ¹ The sample location was originally identified as MLC-3, but was inaccessible. The actual sample location, which was
 1820 approximately 50 yards from the intended sample location, was identified as MLC-3A at the time. However, because of the
 1821 close proximity of the intended and actual sample locations, and the fact that samples have only been taken at one location at
 1822 the headwaters of Mud Lake Creek, these samples have been re-labelled as MLC-3.

1825 Sources: Barr 2007b, Barr 2006f, Barr 2014d.

1826 Notes:
1827 Values in bold indicates an exceedance of surface water quality standards.
1828 ¹ Some detection limits exceed evaluation criteria; Barr 2006f. Data reported as less than such a detection limit is not included in the number of exceedances.

1829 ² Sulfate standard of 10 mg/L applies to designated "waters supporting the production of wild rice."
1830 ³ Water Quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L.
1831 ⁴ Predicted values represent total aluminum concentrations, while the water quality standard is for dissolved aluminum. Since aluminum has a very low solubility in water under relatively neutral pH conditions, it is expected that the predicted aluminum concentration would meet the surface water standard (see discussion in Section 4.1.2.2).
1832 ⁵ Includes non-detects at half the detection limit.
1833 ⁶ Seepage at PM-8 is presently being pumped back into the Tailings Basin in accordance with the Consent Decree between the MPCA and Cliffs Erie. Seepage at PM-9 and PM-10 are discharging to tributaries of the Embarras River.

1854 Source: Barr 2014d.

- 1855 Notes:
 1856 Values in bold indicates an exceedance of surface water quality standards.
 1857 ¹ Sulfate standard of 10 mg/L applies to designated "waters supporting the production of wild rice."
 1858 ² Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L.
 1859 ³ Mean includes non-detects at half the detection limit.
 1860 ⁴ The sample location was originally identified as MLC-3, but was inaccessible. The actual sample location, which was approximately 50 yards from the intended sample location, was identified as MLC-3A at the time. However, because of the close proximity of the intended and actual sample locations, and the fact samples have only been taken at one location at the headwaters of Mud Lake Creek, these samples have been re-labelled as MLC-3.

1863

1864 **Lower Embarrass River**

1865 Approximately 4 miles downstream from monitoring station PM-13, the Embarrass River flows
1866 through a chain of lakes: Sabin, Wynne, Embarrass, and Esquagama lakes. In addition to the
1867 previously discussed Embarrass River monitoring, PolyMet also conducted limited water quality
1868 monitoring for sulfate and chloride in Sabin Lake (PM-21 and PM-23), Wynne Lake (PM-22 and
1869 PM-24), and Embarrass Lake (EL-1 and EL-2) in 2010 and 2011 (see Figure 4.2.2-1). Water
1870 quality samples were also collected from the chain of lakes in 2009; however, those results are
1871 excluded from this discussion as they pre-date the Consent Decree and resulting remedial action,
1872 and are therefore not representative of current conditions in the lakes. Samples were taken at the
1873 inlet to each lake and near the center of each lake at multiple depths: surface, middle, and near-
1874 bottom. Additional monitoring was performed at PM-21 for total and dissolved aluminum
1875 (PolyMet 2015j).

1876 The average surface sulfate concentration in Sabin Lake was 11.7 mg/L (average surface
1877 concentration at PM-21 and PM-23 for 2010 to 2011) with concentrations increasing with depth.
1878 The northernmost tip of Wynne Lake is subject to the 10 mg/L sulfate standard for waters used
1879 for the production of wild rice. The monitoring shows that the lake exceeds this standard
1880 (average surface concentration 16.0 mg/L at PM-22 and PM-24) and that concentrations increase
1881 with depth. Embarrass Lake is also subject to the 10 mg/L sulfate standard for waters used for
1882 the production of wild rice. The monitoring shows that the lake exceeds this standard (average
1883 surface concentration 19.3 mg/L at EL-1 and EL-2). The data generally shows little fluctuation
1884 through the sampling period for all three lakes, although surface sulfate concentrations were
1885 typically higher in all three lakes in 2010 than in 2011. The increasing sulfate concentrations
1886 through the chain of lakes suggest that there is additional sulfate coming from other sources;
1887 however, monitoring did not identify specific sources (PolyMet 2015j). Section 4.2.2.1.3
1888 discusses additional sulfate monitoring conducted as part of wild rice and water quality
1889 monitoring surveys.

1890 Several lakes downstream of the NorthMet Project area within the chain of lakes are on the
1891 303(d) list for “mercury in fish tissue” impairment, including Sabin, Wynne, Embarrass, and
1892 Esquagama lakes (see Figure 4.2.2-1). Further downstream, most of the St. Louis River is also
1893 listed for “mercury in fish tissue” impairment. These lakes and the St. Louis River are not
1894 covered by the Statewide Mercury TMDL, but are impaired waters that are still in need of a
1895 TMDL pollution reduction study. These waters are not included in Minnesota’s regional mercury
1896 TMDL because the mercury concentrations in the fish are considered too high to be returned to
1897 Minnesota’s mercury water quality standard using solely the state-wide TMDL approach. Similar
1898 to other lakes in Minnesota, the main source of the mercury is atmospheric mercury deposition.

DRAFT

1 **4.2.3 Wetlands**

2 Wetlands in Minnesota are protected under federal and state laws, including Section 404 of the
3 federal Clean Water Act (CWA), the State of Minnesota’s Wetland Conservation Act (WCA),
4 the MDNR’s Public Waters Work Permit Program, and the MPCA’s Wetland Standards and
5 Mitigation Rules (*Minnesota Rules*, part 7050.0186). In addition, a DA permit pursuant to
6 Section 404 of the CWA is not valid until the state has either certified under Section 401 of the
7 CWA that the discharges comply with state water quality standards or waived the 401
8 certification requirements. For metallic mineral mining, WCA requirements are addressed under
9 the MDNR Permit to Mine. WCA rules (including those parts applicable to mining projects
10 under *Minnesota Rules* 8420.0930) include a special consideration for wetlands that are rare
11 natural communities (*Minnesota Rules* 8420.0515, subp. 3). See FEIS Section 4.2.4.2.1 for
12 additional information about these communities. The Permit to Mine would address special
13 consideration of wetlands that include rare natural communities. Additional information on rare
14 natural communities would be included in the wetland permit application as part of the Permit to
15 Mine process for further refinement of site-specific conditions.

16 The state and federal programs that regulate effects on wetlands differ with respect to the types
17 of resources over which each agency will assert jurisdiction. For example, under the state WCA,
18 “incidental” wetlands are not jurisdictional, but those wetlands may be subject to the permitting
19 requirements of Section 404 of the CWA at the federal level. Under the federal CWA, wetlands
20 that do not have a continuous surface connection or a significant nexus to a traditionally
21 navigable water are not regulated under the CWA but those wetlands may be regulated under the
22 WCA. Although there are wetlands within the NorthMet Project area that may be regulated
23 exclusively under state law, or conversely, exclusively under federal law, all of the wetlands in
24 the NorthMet Project area would be regulated under either the CWA or the WCA, with the
25 exception of two wetland areas that would not be regulated by either program as a result of being
26 located within an actively permitted waste storage facility. These two wetland areas are
27 discussed under Section 4.2.3.2 below.

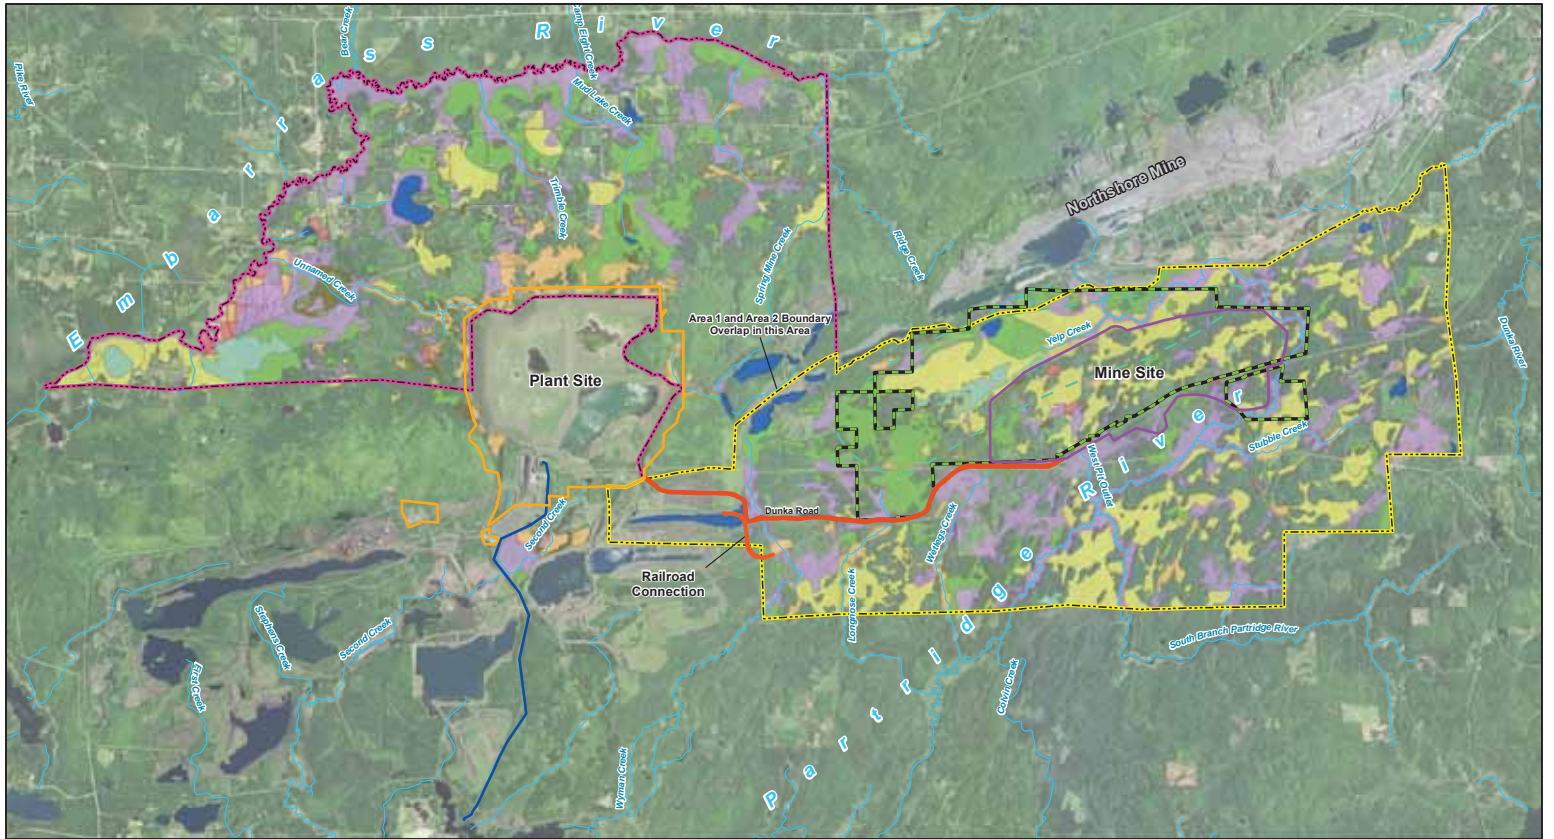

28 The required public notice to fulfill requirements for Section 404 permitting and Section 401
29 certification was originally issued by the USACE in May of 2005. The MPCA did not exercise
30 its right to review the NorthMet Project Proposed Action under Section 401 of the CWA at that
31 time; therefore, certification of the original NorthMet Project Proposed Action was waived by
32 default. However, due to the revised NorthMet Project Proposed Action, PolyMet submitted a
33 revised permit application in August 2013, and the public notice for the Section 404 application
34 was reissued on December 13, 2013. The MPCA will need to re-issue the Section 401 public
35 notice for the NorthMet Project Proposed Action. Under the provisions of the CWA, the MPCA
36 has one year from the public notice (December 3, 2014) to act upon an application for Section
37 401 Certification. However, the MEPA (*Minnesota Statutes* 116.04, subd. 2b) and rules
38 regarding environmental review (*Minnesota Rules* 4410.3100) prohibit final agency decisions,
39 such as the Section 401 Certification, until all environmental review steps are complete. The
40 environmental review process being undertaken by the Co-lead Agencies would not be
41 completed within the 1-year timeframe for issuance of the Section 401 Certification. Therefore,
42 PolyMet has made a procedural decision to withdraw the Section 401 application before the
43 MPCA and resubmit it in the near future to allow for processing of the application.

44 The wetland section for the NorthMet Project Proposed Action includes a discussion of the Mine
45 Site and Plant Site, as well as Area 1 and Area 2. Area 1 and Area 2 represent the wetland
46 boundaries that were developed and evaluated in 2010 and 2011 for the indirect effects on
47 wetlands and are exclusive to this environmental resource section. The USACE determined that
48 there was a need to evaluate and classify wetland types in the areas surrounding the Mine Site
49 (Area 1) and the Plant Site (Area 2) with the potential for indirect hydrologic wetland effects
50 (Barr 2011d). The Area 1 boundary extends beyond the Mine Site boundary and includes
51 23,927.4 acres. Area 1 encompasses the Mine Site, the federal lands, and the majority of the
52 Transportation and Utility Corridor, as well as adjacent lands. Area 2 encompasses 19,396.7-acre
53 area just north and northwest of the Plant Site.

54 Detailed wetland field delineation/mapping was performed in 2004, and supplemented in 2005,
55 2006, 2007, 2008, and 2010 (Barr 2006d; Barr 2007b; Barr 2008k; Barr 2011d; PolyMet 2015b).
56 These investigations delineated and mapped the portion of each wetland located within the Mine
57 Site, Area 1, Area 2, Plant Site, and the adjoining federal lands (see Section 4.3.3.1.1 for the
58 federal lands discussion).

59 The NorthMet Project area includes 166 wetlands covering 1,579.6 acres (see Figure 4.2.3-1).
60 The percentage of wetland types identified in the NorthMet Project area include: coniferous bog
61 (55 percent); shrub swamp (12 percent), which includes alder thicket and shrub-carr; shallow
62 marsh (11 percent); coniferous swamp (9 percent); deep marsh (7 percent); sedge/wet meadow
63 (3 percent); open bog (1 percent); hardwood swamp (1 percent); and open water (less than
64 1 percent) (PolyMet 2015b). Within the NorthMet Project area, 105 of the 166 wetlands
65 (63 percent) are rated as high-quality, 11 wetlands (7 percent) are rated as moderate-quality, and
66 50 wetlands (30 percent) are rated as low-quality. The low-quality wetlands are located at the
67 Hydrometallurgical Residue Facility and the existing LTVSMC Tailings Basin. The moderate-
68 quality wetlands are located at the Mine Site and the existing LTVSMC Tailings Basin.
69 Wetlands at the Mine Site and Transportation and Utility Corridor are ranked as high-quality.

70 In addition to the NorthMet Project area, the Colby Lake Water Pipeline Corridor and Second
71 Creek areas were evaluated. The area of analysis for Second Creek includes the origin of the
72 creek at the south end of Tailings Basin and ends at the east edge of the Colby Lake Water
73 Pipeline Corridor (see Figure 4.2.3-1). These two areas include 44 wetlands covering 305.9 acres
74 (see Figure 4.2.3-1). The percentage of wetland types identified in the two areas include: shrub
75 swamp (44 percent), which includes alder thicket and shrub-carr; shallow marsh (36 percent);
76 deep marsh (7 percent); hardwood swamp (7 percent); coniferous swamp (5 percent); and
77 sedge/wet meadow (1 percent) (PolyMet 2015b). The majority of the wetlands within the Colby
78 Lake Water Pipeline Corridor have been rated low quality (93 percent), with the remaining
79 wetlands related as moderate quality (7 percent).

82 **4.2.3.1 Mine Site and Transportation and Utility Corridor**

83 The Mine Site is 3,014.5 acres (see Figures 4.2.3-1, 4.2.3-2, and 4.2.3-3) and is located in the
84 Partridge River Watershed, about 3 miles south of the Laurentian Divide. The Partridge River is
85 located in the East St. Louis River Watershed, which discharges into Lake Superior. The
86 Transportation and Utility Corridor (120.1 acres), which includes the Railroad Connection
87 Corridor, is discussed below (see Figures 4.2.3-1 and 4.2.3-4). The following sections provide
88 baseline information on the Mine Site, Transportation and Utility Corridor, and Area 1.

89 **4.2.3.1.1 Wetland Delineation and Classification**

90 Wetland characterization, mapping, and surveys for the Mine Site, Transportation and Utility
91 Corridor, and Area 1 were conducted between 2004 and 2010 (Barr 2006d; Barr 2007b; Barr
92 2008k; Barr 2011d; PolyMet 2015b). Wetland acreages were determined using USGS
93 topographic and USFWS National Wetlands Inventory (NWI) maps, aerial photographs, soil
94 survey data, and field investigations.

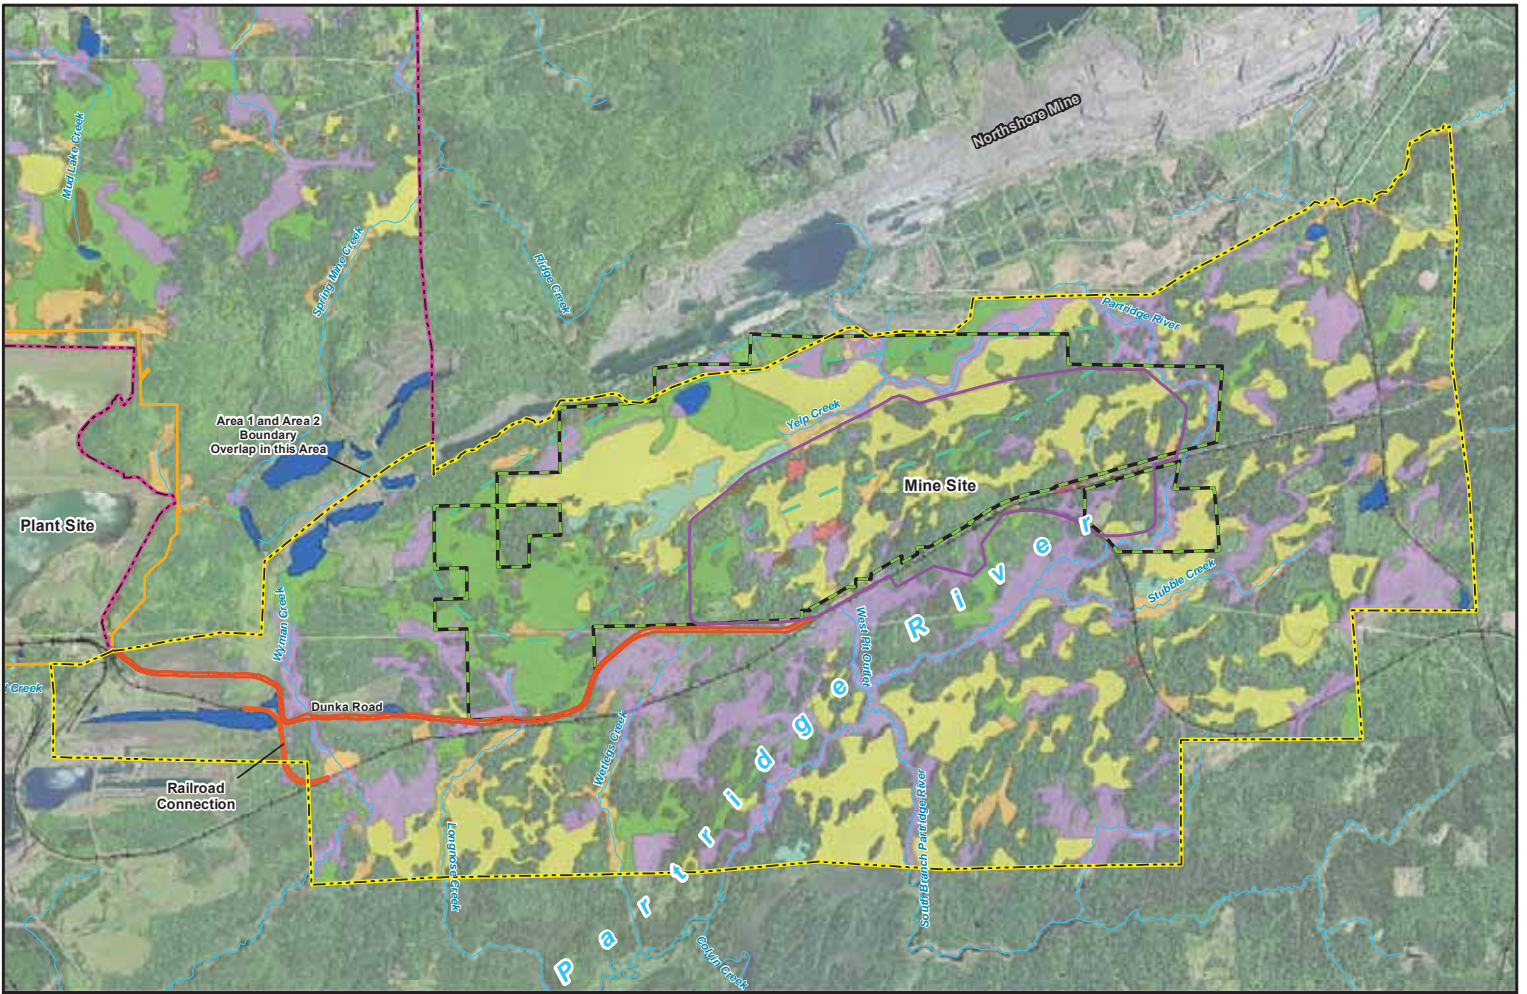

95 Wetlands on the Mine Site were initially mapped in June 2004 based on a general survey of the
96 area for wetland and upland habitats potentially used by various species of fish and wildlife.
97 Wetland and upland plant communities were mapped on 1997 infrared aerial photographs of the
98 site. A wetland delineation of the Mine Site and lands surrounding the Mine Site was
99 subsequently conducted in August 2004, June 2005, and July 2006. This wetland delineation
100 consisted of applying a combination of on-site and off-site procedures in accordance with the
101 1987 USACE Wetland Delineation Manual (Manual; USACE 1987). Wetland boundaries were
102 field-mapped using Global Positioning System (GPS), aerial photographic interpretation,
103 topography, and soils information.

104 Along Dunka Road and other possible transportation routes, field studies were conducted to
105 determine wetland boundaries, vegetation cover types, and plant species composition of
106 identified wetlands. For areas outside of Dunka Road and possible transportation routes,
107 wetlands were mapped primarily based on the presence of photographic signatures with limited
108 field-truthing and GPS locating.

109 Subsequent to publication of the DEIS, baseline wetland types were re-evaluated. Additional
110 field visits were conducted from April to October 2010, in addition to further mapping efforts. A
111 Wetland Impact Assessment Planning (IAP) Workgroup was formed and facilitated the
112 refinement of the wetland resource mapping efforts. In addition to the ground surveys, wetlands
113 were evaluated during a helicopter reconnaissance in October 2010. Photographs were taken
114 during the aerial reconnaissance using a GPS-equipped digital camera from a distance of 20 to
115 100 ft above the ground.

116 In 2010 and 2011, a baseline wetland evaluation was conducted using information from studies
117 and surveys undertaken between 2004 and 2010. Wetlands were evaluated and classified in the
118 areas around the Mine Site and the existing LTVSMC Tailings Basin to determine the potential
119 for indirect hydrologic wetland effects using the Eggers and Reed (1997) community
120 classification system, as determined by the Wetlands IAP Workgroup. This system classifies the
121 wetlands into 15 unique plant communities (see Table 4.2.3-1).

129 **Table 4.2.3-1 Wetland Classification System Descriptors**

Wetland Plant Community Types¹	Water Depth	Soils	Common Vegetation
Shallow, open water	6.6' deep; permanently inundated	Lacustrine deposits and sediments	Pondweed, duckweed, coontail, water milfoil, water lily
Deep marsh	6" to > 3' deep; permanently to semi-permanently inundated	Lacustrine deposits	Cattail, reed, bulrush, pickerelweed, giant bur-reed, Phragmites, spikerush, wild rice, pondweed, naiad, coontail, water milfoil, waterweed, duckweed, water lily, spatterdock
Shallow marsh	Saturated soils to < 6" deep	Organic or mineral	Manna grass, spikerush, cattail, arrowhead, lake sedge, pickerelweed, smartweed
Sedge meadow	Saturated soils	Organic	Sedges-dominant; spike rush, bulrush, nut grass, Canada blue-joint grass, true rush, forbs
Fresh (wet) meadow	Saturated soils	Mineral or organic	Grass and forbs-dominant; redtop, reed canary grass, manna grass, prairie cordgrass, mint
Wet to wet-mesic prairie	High groundwater table < 12" during portion of growing season	Mineral	Native grasses and forbs-dominant; prairie cordgrass, big bluestem, aster, culver's root, sunflower
Calcareous fen	Upwelling, calcareous, groundwater discharge	Organic alkaline	Calciphiles-dominant; shrubby cinquefoil, sterile sedge, wild timothy, beaked spike rush, Riddell's goldenrod, common valerian, lesser fringed gentian
Open bog	Saturated	Organic acid	Continuous sphagnum moss mat present; scattered immature (dbh < 6 in) black spruce or tamarack, ericaceous shrubs, sedges and forbs, such as pitcher plants
Coniferous bog	Saturated	Organic acid	Continuous sphagnum moss mat present; mature (dbh > 6 in) black spruce or tamarack, ericaceous shrubs, sedges and forbs such as pitcher plants
Shrub-carr	Saturated to seasonally flooded	Organic or mineral	Woody vegetation < 20 ft high and dbh < 6 in dominated by willows and/or dogwoods with various sedges, grasses and forbs
Alder thicket	Saturated to seasonally flooded	Organic or alluvial	Woody vegetation < 20 ft high and dbh < 6 in dominated by speckled alder with various sedges, grasses and forbs
Hardwood swamp	Saturated to < 12" deep during most of growing season	Organic alkaline	Continuous sphagnum moss mat absent; black ash, red maple, yellow birch, silver maple, aspen, American elm, dogwood, alder and various sedges, grasses and forbs
Coniferous swamp	Saturated to < 12" deep during most of growing season	Organic ranging from acid to alkaline	Continuous sphagnum moss mat absent; northern white cedar, tamarack, balsam fir, birch, black ash, alder and various sedges, grasses and forbs

Wetland Plant Community Types¹	Water Depth	Soils	Common Vegetation
Floodplain forest	Inundated during flood events; somewhat well-drained during growing season	Alluvial	Silver maple, green ash, river birch, plains cottonwood, American elm, black willow, jewelweed, nettle
Seasonally flooded basin	Poorly drained; inundated for a few weeks during the growing season	Mineral	Smartweed, beggartick, nut-grass, wild millet and other annual species

131 dbh = Diameter at breast height

132 ¹ All wetland classification systems have some limitations; however, wetlands identified as open bogs or coniferous bogs under
 133 the Eggers and Reed (1997, 2014) classification system were further subcategorized as either ombrotrophic (hydrology and
 134 mineral inputs entirely from direct precipitation) or somewhat minerotrophic (some degree of mineral inputs from groundwater
 135 and/or surface water runoff) (Eggers 2011a, 2015; PolyMet 2015b). See Section 4.2.3.1.2 and Section 5.2.3 for more
 136 information.

137 Wetlands were evaluated within Area 1 and Area 2 (see Figures 4.2.3-1). The boundaries for
 138 each evaluation area generally follow the St. Louis County section lines and large streams,
 139 including portions of the Partridge and Embarrass rivers. The baseline wetland type evaluation
 140 was deemed final by the USACE at the wetland workgroup meeting on March 30, 2011 (Barr
 141 2011d). Updates to previous wetland delineations were made between April 2011 and the fall of
 142 2012 as a result of additional site visits and aerial photograph review. Wetland boundaries and
 143 types were further refined (PolyMet 2015b).

144 Prior to conducting the various field delineations, numerous sources of existing information were
 145 gathered and reviewed to assist in developing a strategy for evaluating wetlands within the
 146 NorthMet Project area. Wetlands within Area 1 and Area 2 that were not delineated between
 147 2004 and 2010 were also identified and classified using the following sources:

- 148 • Farm Service Administration true color aerial photographs between 2003 and 2010;
- 149 • Farm Service Administration color infrared aerial photographs (2003 and 2008);
- 150 • USFWS NWI maps;
- 151 • Superior National Forest USFS stand data GIS shapefile (Area 1 only);
- 152 • USFS Ecological Land Type (ELT) soils data (where available);
- 153 • Natural Resources Conservation Service (NRCS) soils data for St. Louis County (where
 154 available);
- 155 • USGS topographic maps and digital elevation models; and
- 156 • MDNR 2005 color infrared photography stereo pairs with 60 percent overlap (Barr 2011d).

157 During the field surveys, data were collected for the functions and values of the wetlands within
 158 the Mine Site. Wetland functions and values were rated using the guidelines in the Minnesota
 159 Routine Assessment Method (MnRAM) for Evaluating Wetland Functions, Versions 3.0 to 3.2.
 160 Final wetland locations and wetland functional assessment areas are shown on Figure 4.2.3-2.

161 **4.2.3.1.2 Hydrology, Wetland Vegetation, and Community Types**

162 The NorthMet Project area is located near the headwaters of the Partridge River and Embarrass
163 River watersheds. The Partridge River is a tributary to the St. Louis River, which is located
164 within the Lake Superior Basin. The Mine Site and Transportation and Utility Corridor are
165 located within the Upper Partridge River Watershed. See Section 4.2.2 for more information on
166 water resources.

167 Currently, runoff from the northernmost area of the Mine Site generally drains north into the One
168 Hundred Mile Swamp and associated wetlands along the Partridge River. These wetlands form
169 the headwaters of the Partridge River, which meanders around the east end of the Mine Site
170 before turning southwest. Runoff from the majority of the Mine Site naturally drains to the south
171 through culverts under Dunka Road and the adjacent rail line, into the Partridge River
172 downstream of the Dunka Road crossing. The Partridge River hydrology is affected by the
173 periodic and variable dewatering of the Northshore Mine pits near the headwaters of the
174 Partridge River, upstream of the proposed Mine Site.

175 The hydrology of the wetlands at the Mine Site has been stable over time (Barr 2008h). Factors
176 contributing to this stability include: 1) the general lack of continuity between the bedrock and
177 surficial aquifers within the perched wetlands, 2) slow water movement through heterogeneous
178 soils, 3) a slow lateral groundwater flow component that helps sustain downgradient wetlands
179 with a continual supply of groundwater over time, 4) recharge from surrounding uplands slowly
180 providing local groundwater discharge to wetlands over time, 5) relatively flat topography across
181 most of the site, and 6) the high water-holding capacity of the soils (Barr 2008h). However,
182 monitoring would detect connectivity trends and reveal potential drawdown issues, which would
183 then be mitigated as direct effects.

184 The hydrogeologic setting of the Partridge River watershed consists of a thin veneer of
185 heterogeneous unconsolidated deposits (glacial till) underlain by fractured bedrock (Duluth
186 Complex in most of the Mine Site and Virginia Formation in the northern portion of the Mine
187 Site). In the Mine Site, saturated conditions exist within the unconsolidated deposits and bedrock
188 and the depth to groundwater is typically less than 10 ft. The water table is generally a subdued
189 replica of the land surface, with groundwater divides in the Mine Site expected to roughly
190 coincide with surface water divides. Wetlands cover approximately 43 percent of the Mine Site.

191 Because of the general lack of interaction between the surficial and bedrock aquifers, the
192 hydrology of many wetlands at the Mine Site is primarily supported by direct precipitation with
193 some variable surficial groundwater components from the uplands. Organic and mineral soils at
194 the Mine Site are typically perched over the dense till or a local sandy textured surficial aquifer,
195 resulting in perched wetlands. The primary method for water to move across the landscape
196 towards the Partridge River is either by lateral flow that is either on the surface or within the
197 subsurface soil. Surface flow laterally across the wetland complexes is negligible because of the
198 flat slopes and surface roughness. The wetlands on the site receive minimal surficial runoff from
199 the upland areas because the soil texture allows rapid infiltration (Barr 2008h). The bedrock has
200 low primary permeability, so groundwater flow within the bedrock is through fractures or other
201 secondary porosity features. Because of the low permeability of the bedrock, the interaction
202 between the surficial deposits and the bedrock aquifers is assumed to be insignificant, according
203 to Siegel and Ericson (1980) (Barr 2010d).

204 Lateral flow within the soils is typically very slow. Fibric peat at the surface allows infiltration of
205 surficial water; however, the more highly decomposed sapric peat has greatly reduced lateral and
206 vertical hydraulic conductivity compared to the fibric peat. Therefore, water tends to stay
207 perched and stored within the large peat complexes, which typically exhibit only subtle
208 variations in the water tables over time. The silty sand or clay that typically underlies the organic
209 soil has low hydraulic conductivity and, therefore, is a contributing factor that helps maintain the
210 hydrology of the wetlands. The silty sands are sands mixed with clay and silt that are not
211 permeable enough to be used as drainage sands (Barr 2008h).

212 The soils and hydrology at the Mine Site support stable wetland systems comprised in large part
213 by open and coniferous bogs, as well as shrub carr/alder thickets dominated by alder and willow
214 species, and forested wetland communities comprised of hardwood swamps and coniferous
215 swamps. Most of the wetland vegetation present at the Mine Site (69 percent) is indicative of
216 acid peatland systems (i.e., open and coniferous bogs) that are dependent on precipitation rather
217 than groundwater for hydrologic inputs (i.e., ombrotrophic) and reflect a perched water table.
218 However, it should be noted that although the hydrology of ombrotrophic bogs is solely
219 precipitation-driven, these wetlands can have flowpath connections to groundwater (Eggers
220 2015). Potential effects are discussed in Section 5.2.3.

221 The soils at the Mine Site have been mapped by the USFS using the Superior National Forest
222 Ecological Classification System (ECS). This system utilizes ELTs. ELTs present at the Mine
223 Site include Lowland Loamy Moist (ELT 1), Lowland Loamy Wet (ELT 2), Lowland Organic
224 Acid to Neutral (ELT 6), and Upland Shallow Loamy Dry (ELT 16). With the exception of the
225 Wahlsten-Eaglenest-Rock outcrop complex (ELT 16), all the soils associated with these ELTs
226 are listed as hydric soils (USDA 2012). These ELTs have been cross-correlated by the University
227 of Minnesota with the NRCS classification as follows:

- 228 • ELT 1 – Babbitt-Bugcreek complex 0 to 2 percent slope;
- 229 • ELT 2 – Bugcreek stony loam;
- 230 • ELT 6 – Rifle-Greenwood; and
- 231 • ELT 16 – Wahlsten-Eaglesnest-Rock outcrop complex, 2 to 8 percent slopes and Eveleth-
232 Conic Rock complex.

233 Pre-NorthMet Project Proposed Action wetland hydrology monitoring reports, to meet reporting
234 requirements, have been compiled and document 5 years of pre-project planning and monitoring
235 at the Mine Site (2005 to 2009). PolyMet has continued to conduct wetland hydrology
236 monitoring at the Mine Site since 2009. Future wetland hydrology monitoring reports would be
237 submitted in accordance with any permit issued. The degree of hydraulic connection between the
238 wetland areas and adjacent unconsolidated deposits and bedrock at the Mine Site is expected to
239 be variable, depending on the characteristics of the wetlands and the localized hydraulic
240 conductivity and degree of bedrock fracturing. The hydraulic conductivity of the bedrock and
241 surficial deposits have been estimated at the Mine Site by a variety of methods, including
242 conducting aquifer tests and using grain-size distribution data from soil borings and ranges over
243 several orders of magnitude. Data collected during a 30-day pumping test at the Mine Site
244 showed a small amount of drawdown in the deep wetland piezometer nearest to the pumping
245 well, but there was no detectable drawdown at other water table or deep wetland piezometers,
246 indicating that the connection between the bedrock, unconsolidated deposits, and wetlands may

247 be relatively weak. Virtually all water movement in peat wetlands occurs horizontally in the
248 upper layers of peat. The deeper, more decomposed peat soils limit vertical seepage because of
249 the low hydraulic conductivities (approximately 0.0028 ft/day) and the wetland hydrology is
250 generally perched on the relatively impermeable peat layer; however, groundwater flowpaths
251 may still occur. Vertical seepage losses from wetlands without peat soils would only have the
252 potential to occur in isolated areas of contiguous, high hydraulic conductivity bedrock faults and
253 fracture zones located under isolated areas of high hydraulic conductivity glacial till and aligned
254 with wetlands containing high hydraulic conductivity soils (Barr 2010d; Barr 2011j). There is a
255 surface drainage divide oriented generally from southwest to northeast near the northern border
256 of the Mine Site. The majority of the Mine Site, approximately 80 percent, drains south to the
257 Partridge River through extensive wetland complexes. The remaining 20 percent of the Mine Site
258 drains north to the One Hundred Mile Swamp and the Partridge River or northeast to the
259 Partridge River. The 2005 to 2009 wetland hydrology monitoring has determined the following
260 (Barr 2010d):

- 261 • The four full years of monitoring wetland well data indicated that the large fluctuations in
262 water levels exhibited within the majority of the wetlands are indicative of wetlands
263 supported primarily by precipitation and local surface runoff. The hydrology of these
264 wetlands tends to fluctuate in a pattern that closely mirrors weather patterns. The shrub
265 swamp wetlands located near the downstream portion of the project generally show more
266 stable water levels due to larger watershed areas and some apparent groundwater inflow. The
267 groundwater flowpaths are generally short with recharge areas (uplands) located close to the
268 discharge areas (wetlands). Surface water runoff and local groundwater contributions from
269 uplands can cause increased mineral content within the water in adjacent wetlands. Wetlands
270 that are solely dependent on precipitation for their hydrology are classified as ombrotrophic.
271 Although the hydrology of ombrotrophic wetlands is solely driven by precipitation, they can
272 have flowpath connections with groundwater. As such, they may be susceptible to effects
273 from groundwater drawdown associated with mining operations; however, that susceptibility
274 is estimated to be low (Eggers 2011a, 2015). Potential effects are discussed in Section 5.2.3.
- 275 • There is a general lack of connectivity between the shallow water table in the wetlands and
276 the deeper bedrock aquifer. The depth of soil and till overlying the bedrock ranges up to 33
277 ft, with bedrock outcrops present that alter local groundwater flowpaths. A pumping and
278 isotope test conducted in 2006 indicated that the groundwater pumped during a 30-day pump
279 test was derived from aquifer recharge rather than surface water seepage from surface water
280 features such as the Northshore Mine Pit or wetlands. The variability of the bedrock and soil
281 surface, along with the location of the surface water divide, creates localized, short, surficial
282 groundwater flowpaths within the watersheds on the Mine Site.
- 283 • From 2005 to 2009, the maximum water level fluctuation was less than 12 inches in two
284 wetlands (58 and 114) and between 12 and 18 inches in all other wetlands. Wells located in
285 the southwest and south-central areas of the Mine Site show the greatest range of water table
286 fluctuations, while wells in the northwest area of the Mine Site show the least fluctuation.
287 The wetlands on the Mine Site exhibit stable year-to-year water levels and elevations. Water
288 levels in all wells fluctuated in direct response to precipitation events, with the exception of
289 one well in 2008 and 2009 and one well in 2009. These two wells showed stability indicative
290 of contributing discharge from the larger upstream watersheds.

291 • The hydrographs in the monitored black spruce and tamarack dominated wetlands
292 (i.e., coniferous bogs) exhibited a stable water table with some fluctuations indicative of
293 saturated, precipitation-driven hydrology (i.e., rapid response to precipitation with mid-
294 summer drawdown). However, Eggers (2015) noted that these coniferous bogs could have
295 flowpath connections to groundwater, albeit limited.

296 Wetlands were found to consist predominantly of coniferous bog, shrub swamp, and coniferous
297 swamp. Other wetlands include shallow marsh, sedge/wet meadow, open bog, and hardwood
298 swamps. The largest wetland complex near the Mine Site is the One Hundred Mile Swamp (see
299 Figure 4.2.3-2). The swamp is drained by Yelp Creek, which flows east into the Partridge River.
300 The Partridge River flows to the north of the Mine Site and then through the eastern and
301 southeastern portions of the adjoining federal lands. In addition, several impounded wetlands
302 associated with past mine workings and detention ponds were found during the field work along
303 the northern boundary of the adjoining federal lands. These wetlands are best classified as
304 precipitation-driven wetlands on low-permeability soils. Several wetlands have been enlarged
305 due to damming of streams by beaver dams, and other obstructions along the Partridge River
306 have helped to raise water levels that resulted in stands of dead and dying spruce along portions
307 of the river (AECOM 2011a).

308 The coniferous bog communities have a tree canopy of black spruce and tamarack with
309 occasional balsam fir, while stunted forms of these species may exist in open bog communities.
310 White cedar and deciduous swamp birch are also occasionally found in this community. Shrubs
311 are usually ericaceous (belonging to the heath family) species such as leatherleaf, bog-Labrador
312 tea, and cranberry. Sphagnum moss comprises an almost continuous mat with interspersed, non-
313 dominant forbs such as bunchberry and blue bead lily along with sedges and grasses.
314 Hydrologically, this complex is characterized by a relatively stable year-to-year water table (Barr
315 2006e; Barr 2010d). All but one of the coniferous bogs identified at the Mine Site are rated as
316 high-quality in accordance with the MnRAM for Evaluating Wetland Functions. This wetland
317 has some fill and therefore was rated as moderate quality.

318 Wetlands hydrology can be driven by precipitation, or by groundwater, or a combination or both.
319 Wetlands identified as open bogs or coniferous bogs under the Eggers and Reed (1997, 2014)
320 classification system can be further subcategorized as either ombrotrophic (i.e., hydrology and
321 mineral inputs entirely from direct precipitation) or somewhat minerotrophic (i.e., some degree
322 of mineral inputs from groundwater and/or surface water runoff). This is important because
323 ombrotrophic bogs would likely not be affected by groundwater drawdowns associated with
324 proposed mining operations, whereas more minerotrophic bogs would have a higher likelihood
325 of being affected (Eggers 2011a). Eggers (2015) noted that although the hydrology of
326 ombrotrophic bogs is solely precipitation-driven, they can have flowpath connections to
327 groundwater. As such, these wetlands types could be affected by groundwater drawdowns,
328 although the degree of that effect is estimated to be low (Eggers 2015). Please refer to Section
329 5.2.3 for detailed discussion on effects to these wetland types from drawdown.

330 An assessment of wetland types within the NorthMet Project area was conducted to distinguish
331 between open and coniferous bogs that are principally precipitation driven (i.e., ombrotrophic
332 peatlands) versus those with some degree of mineral inputs from groundwater and/or surface
333 water runoff (i.e., minerotrophic peatlands). In order to help differentiate ombrotrophic bog
334 communities from bog communities that are somewhat minerotrophic, the *Field Guide to the*
335 *Native Plant Communities of Minnesota – The Laurentian Mixed Forest Province*

336 (MDNR 2003b) was used, which characterizes plant communities to a finer level of detail than
337 Eggers and Reed (1997, 2014). Ombrotrophic peatlands develop from minerotrophic peatlands
338 when conditions allow *Sphagnum* peat to accumulate to levels above the groundwater table.
339 Once the peat is above the water table, surface water flows away from or around the elevated
340 peat surface, which reduces inputs of minerals and nutrients (Eggers 2011a; MDNR 2003b). Of
341 the 149 coniferous and open bogs within the Mine Site/Area 1 boundaries, 144 are ombrotrophic
342 and five are minerotrophic (PolyMet 2015b).

343 The shrub communities generally have a sparse tree canopy and are mostly alder thickets, with
344 some willow and raspberry. Occasionally, balsam fir and paper birch were observed along the
345 perimeter of the wetlands. Grasses, sedges, rushes, and some ferns comprise most of the herb
346 stratum with some areas of sphagnum moss. Hydrologically, this community can be
347 characterized by prolonged periods of shallow inundation with the water table dropping 6 to 12
348 inches below the ground surface during dry periods (Barr 2006e). Soils are typically fibric
349 (i.e., the least decomposed of the peats and containing un-decomposed fibers) and hemic peat
350 (i.e., peat that is somewhat decomposed) at the surface underlain by bedrock or mineral soils. All
351 of these wetlands are rated as high-quality.

352 The forested swamp communities (coniferous swamps and hardwood swamps) are dominated by
353 a mix of coniferous (conifers) and deciduous (hardwood) forest complexes. Common trees
354 include black spruce, tamarack, and balsam fir, with some white cedar, black ash, paper birch,
355 and aspen present. The shrub canopy is comprised of speckled alder, willows, and raspberry.
356 Grasses and sedges comprise a majority of the ground story stratum with occasional sphagnum
357 moss. Soils include organic and mineral soils. Some hydrologic observations indicate a greater
358 level of hydrologic fluctuation in the forested swamp community than in the larger bog wetlands,
359 with saturation near the surface early in the growing season and a lower water table in late
360 summer (Barr 2006e). All of these wetlands are rated as high-quality.

361 Sedges, grasses, and bulrushes dominate wet meadow and sedge meadow communities. Soils are
362 organic at the surface and underlain with mineral soils. These plant communities typically have
363 saturated or inundated water levels for prolonged periods during the growing season (Barr
364 2006e). Two of these communities, situated between Dunka Road and the railroad, are rated
365 moderate-quality, while the others are rated as high-quality.

366 Approximately one-half of the shallow marsh communities at the Mine Site have resulted from
367 artificial impoundments by roads, railroads, and beavers. These wetlands are dominated by
368 cattails, bulrushes, sedges, and grasses. Soils are usually organic at the surface underlain by
369 mineral soils. Inundation with 1 to 4 inches of water is common throughout most of the growing
370 season except during dry periods. Eight of these shallow marshes are rated as high-quality and
371 four as moderate-quality. Hydrologic disturbance in these four wetlands is primarily responsible
372 for the moderate-quality rating.

373 The wetland delineation identified 87 wetlands covering 1,297.8 acres (43 percent) within the
374 3,014.5-acre Mine Site (see Figure 4.2.3-3) (PolyMet 2015b). Table 4.2.3-2, below, summarizes
375 the wetland areas within the Mine Site represented by each Eggers and Reed (1997, 2014)
376 wetland community type. A large portion of the wetlands to the west of the Mine Site on the
377 federal lands is located in the floodplains of Yelp Creek and the Partridge River or one of their
378 associated tributaries. The most common wetland types within the Mine Site are coniferous bogs
379 (approximately 67 percent); shrub swamps (approximately 14 percent), which includes alder

380 thicket and shrub-carr; and coniferous swamps (10 percent). A total of seven wetlands, each over
381 50 acres in size within the Mine Site, comprise 773.7 acres of wetlands within the Mine Site.
382 There are an additional five wetlands, each over 20 acres in size within the Mine Site that
383 comprise 164.5 acres of wetlands. Together, these 12 wetlands make up 72 percent of the
384 wetland areas within the Mine Site (PolyMet 2015b). A total of 79 percent of the wetlands in the
385 Mine Site are coniferous swamp, coniferous bog, and open bog communities.

386 Other wetland community types present at the Mine Site include shallow marshes, sedge/wet
387 meadows, open bogs, hardwood swamps, and deep marshes. The sedge/wet meadows may
388 receive some portion of their hydrology from groundwater while the shallow marsh community
389 generally results from artificial impoundment by beaver dams, roads, and railroads and is
390 primarily dependent on surface waters for hydrology.

391 **Table 4.2.3-2 Wetland Acreage by Wetland Community Type for Mine Site, Transportation**
392 **and Utility Corridor, and Area 1**

Eggers and Reed Class ¹	Mine Site						Transportation and Utility Corridor		Area 1 ²

394 ¹ Eggers and Reed 1997, 2014.

395 ² Area 1 acreage is inclusive of the other project area components (e.g., Mine Site, federal lands).

396 A total of 25 wetlands, encompassing 7.2 acres, have been identified within the Transportation
397 and Utility Corridor (see Figure 4.2.3-4 and Table 4.2.3-2). The wetlands in the corridor include
398 shrub swamps (57 percent), coniferous swamps (22 percent), coniferous bogs (12 percent), and
399 shallow marshes (8 percent). Some of the wetlands adjacent to Dunka Road have been
400 previously logged. Wetlands in the western half of the Dunka Road and Transportation and
401 Utility Corridor are located within areas previously disturbed by mining activities of the former
402 LTVSMC operations (PolyMet 2015b).

403 Overall, Area 1 encompasses 465 wetlands covering 11,201.2 acres (see Figure 4.2.3-2), and
404 these 465 wetlands represent approximately 47 percent of the overall area. The total number of
405 wetlands and the amount of wetlands within Area 1 is inclusive of the other project area
406 components (e.g., Mine Site, federal lands wetlands). Table 4.2.3-2, above, summarizes the
407 wetland areas represented by each Eggers and Reed (1997, 2014) wetland community type for
408 Area 1 (PolyMet 2015b).

409 Coniferous bogs are the dominant wetland type present within Area 1, comprising approximately
410 41 percent of the overall wetland area, while open bogs represent only a small component
411 (approximately 3 percent). Coniferous bogs generally have a tree cover greater than 50 percent,
412 which is typically made up of black spruce and/or tamarack. Forested wetlands that are acid
413 peatlands dominated by dense cover of black spruce and/or tamarack with a more or less
414 continuous carpet of Sphagnum mosses have been classified as coniferous bogs in the Eggers
415 and Reed (1997, 2014) classification system. Occasionally, there are areas with balsam fir, jack
416 pine, and northern white cedar present within the large coniferous bog complexes. The open bogs
417 do not support a dense tree cover and it was observed that typically only a scattering of immature
418 black spruce and/or tamarack are present (Barr 2011d). Additionally, Eggers (2015) and MDNR
419 (2003b) state that ombrotrophic bogs exhibit four specific characteristics: 1) the landform type is
420 a raised bog that is always higher than the peatland margin; 2) there is an absence of
421 minerotrophic (i.e., fen) indicator species; 3) the surface water chemistry has a pH of less than
422 4.2 and calcium concentrations of less than 2 mg/L; and 4) the hydrology and source of minerals
423 is entirely sourced from precipitation.

424 The shrub layer and ground layer of coniferous bogs and open bogs have similar composition.
425 The shrub layer is typically dominated by ericaceous shrubs such as leatherleaf, bog-Labrador
426 tea, and cranberry. The ground layer herb stratum commonly includes a continuous sphagnum
427 moss mat with various sedges and other herbaceous vegetation also observed. Northern pitcher
428 plants are abundant in the large bog areas that surrounded Mud Lake. Soils in the coniferous
429 bogs and open bogs generally consist of fibric peat that is usually saturated to the surface
430 throughout much of the growing season (Barr 2011d).

431 Shrub swamps, which include both alder thicket and shrub-carr community types, represent the
432 second most dominant wetland type within Area 1, comprising approximately 30 percent of the
433 overall wetland area. These shrub swamps are dominated by either alder or willow species, with
434 some dogwoods also present. The ground layer was made up of Canada bluejoint grass and
435 various sedge species, with woolgrass, rushes, and ferns also present. Sphagnum mosses may be
436 present but do not typically form a continuous mat within these shrub swamps. Soils in the shrub
437 swamps are usually fibric and hemic peat at the surface underlain by bedrock or mineral soil
438 (Barr 2011d).

439 Coniferous swamps represent the third-most dominant wetland type within Area 1, comprising
440 approximately 18 percent of the overall wetland area. These swamps are dominated by black
441 spruce and/or tamarack, with balsam fir and northern white cedar. Deciduous tree species, such
442 as aspen, birch and, on a few occasions, black ash, are also observed in some areas. The shrub
443 layer is observed to be typically dominated by alder and willows. The ground layer commonly
444 includes Canada bluejoint grass, sedges, bunchberry, wild sarsaparilla, and starflower.
445 Sphagnum mosses are also present in the ground layer; however, a continuous sphagnum mat is
446 usually absent. Soils in the coniferous swamps are generally organic and are usually saturated to
447 the surface throughout much of the growing season (Barr 2011d).

448 Although shallow and deep marshes are present within Area 1, they represent a relatively small
449 percentage of the overall wetland area. These wetlands are dominated by cattails, with sedges
450 and Canada bluejoint grass also present. Soils in the shallow and deep marshes are typically
451 organic at the surface and underlain by mineral soils. The shallow marshes are typically
452 inundated with up to 6 inches of water throughout the entire growing season, while the deep
453 marshes are inundated with over 6 inches of water throughout the entire growing season. These
454 wetlands are often associated with disturbances, such as beaver activity (Barr 2011d).

455 Hardwood swamps are present but not abundant in Area 1. The hardwood swamps that are
456 present are dominated by black ash, aspen, and birch. Coniferous trees, such as balsam fir, black
457 spruce, and northern white cedar are occasionally present in these hardwood swamps. The shrub
458 layer is generally dominated by alder and young trees while the ground layer species present
459 includes Canada bluejoint grass, sedges, and ferns. Sphagnum mosses were also observed;
460 however, they typically did not form a continuous mat. Soils in the hardwood swamps vary
461 between organic or mineral and are usually saturated throughout much of the growing season
462 (Barr 2011d).

463 Sedge meadow and wet meadow communities are present within Area 1 but represent a very
464 small portion of the total wetland area. These wetlands are dominated by sedges, Canada
465 bluejoint grass, woolgrass, manna grass, and bulrushes. Soils in the sedge meadow and wet
466 meadow communities are typically organic at the surface underlain by mineral soils. These
467 wetlands are generally saturated close to the ground surface or have shallow inundation for
468 prolonged periods during the growing season (Barr 2011d).

469 **4.2.3.1.3 Wetlands Functional Assessment**

470 Wetlands can serve many functions, including groundwater recharge/discharge, flood storage
471 and alteration/attenuation, nutrient and sediment removal/transformation, toxicant retention, fish
472 and wildlife habitat, wildlife diversity/abundance for breeding migration and wintering, shoreline
473 stabilization, production export, aquatic diversity/abundance, vegetative diversity/integrity, and
474 support of recreational activities. Both the USACE and MDNR use MnRAM for rating wetland
475 functions in Minnesota.

476 MnRAM is an assessment tool designed to assess functions and values of Minnesota wetlands.
477 MnRAM versions 3.0, 3.1, and 3.2 were used to assess wetland functions and values on the Mine
478 Site (Barr 2006d) and the federal lands (AECOM 2011d; AECOM 2011a). Information on the
479 overall functions and values of the wetland and vegetative quality of each wetland community at
480 the Mine Site was obtained during wetland surveys in 2005 and 2006 and included: 1) plant
481 cover and types, 2) plant community diversity and interspersion, 3) outlet characteristics,
482 4) watershed and adjacent upland land uses and condition, 5) soil condition, 6) erosion and
483 sedimentation, and 7) past and present human disturbance (Barr 2006d).

484 Landscape characteristics are also important for evaluating wetland functions within the
485 NorthMet Project area. Key landscape wetland characteristics considered in rating functional
486 quality in the MnRAM assessment are provided in Table 4.2.3-3.

487

488 **Table 4.2.3-3 Key Landscape Factors Influencing Wetland Functional Scores in**
 489 **MnRAM 3.0**

MnRAM 3.0 Factor	Role in Wetland Function and Quality
Wetland or Lake Outlet Characteristics	Outlets influence flood attenuation, downstream water quality, and other hydrologic processes
Watershed and Adjacent Land Uses and Condition	Adjacent land uses influence wetland hydrology, sediment and nutrient loading to wetlands, connectivity for wildlife habitat, and other factors
Soil Condition	Soil condition influences plant community type, vegetative diversity, overall wetland quality and productivity (trophic state)
Erosion and Sedimentation	Influences downstream water quality, trophic state of wetlands, vegetative diversity, and overall wetland quality
Wetland Vegetative Cover and Vegetation Types	Influences vegetative diversity and wildlife habitat as well as hydrologic characteristics (e.g., evapotranspiration or resistance to flow in floodplain wetlands)
Wetland Community Diversity and Interspersion	Influences the vegetative diversity and overall wetland quality as well as value for wildlife habitat
Human Disturbance (both past and present)	Mining, logging, road-building, stream channelization, and other alterations to the landscape

490 Source: MnRAM 3.0.

491 These broader landscape factors were applied and evaluated on a larger scale than a single
 492 wetland because there are soil and vegetation similarities within the sub-watersheds that are
 493 characteristic of large groups of similar wetland types. Human disturbance factors were also
 494 similar across broad areas, notably that the majority of the Mine Site is relatively undisturbed by
 495 humans and the limited disturbance that does exist is due to logging. Other local factors were
 496 considered for each wetland or small groups of wetlands.

497 Approximately 92 percent of the wetlands in the Mine Site are of high overall wetland quality,
 498 and 8 percent of wetlands are of moderate overall wetland quality. High-quality wetlands have
 499 low disturbance levels and high vegetative diversity and integrity. Moderate-quality wetlands
 500 have impounded open water because of beaver dams and downstream culverts under Dunka
 501 Road or the railroad, are adjacent to USFS roads, the Dunka Road corridor, or the railroad
 502 corridor (PolyMet 2015b). Summaries of the 87 wetlands evaluated for vegetative
 503 diversity/integrity and overall functional quality rating (low, moderate, or high) for wetlands at
 504 the Mine Site are presented in Table 4.2.3-4. The overall wetland quality rating was based on
 505 professional judgment and considered several wetland functions and the overall degree of human
 506 disturbance (Barr 2006d). The plant community diversity/integrity ratings incorporate two
 507 principal components, integrity and diversity (MnRAM). Diversity refers to species richness
 508 (i.e., number of plant species). The more floristically diverse a community is, the higher the
 509 rating. Integrity refers to the condition of the plant community in comparison to the reference
 510 standard for that community. The degree and type of disturbance typically play an important role
 511 in the diversity/integrity rating.

512

513 **Table 4.2.3-4 Wetland Functions and Value Assessment for the Mine Site from 2004 and**
 514 **2006**

Wetland Functions and Values Rating	Vegetative Diversity/Integrity (%)	Overall Wetland Quality (%)	Existing Disturbance Level (%)
High	75	92	8
Moderate	8	8	5
Low	0	0	70
Not Available	17	0	17
Total	100	100	100

515 Source: Barr 2006d.

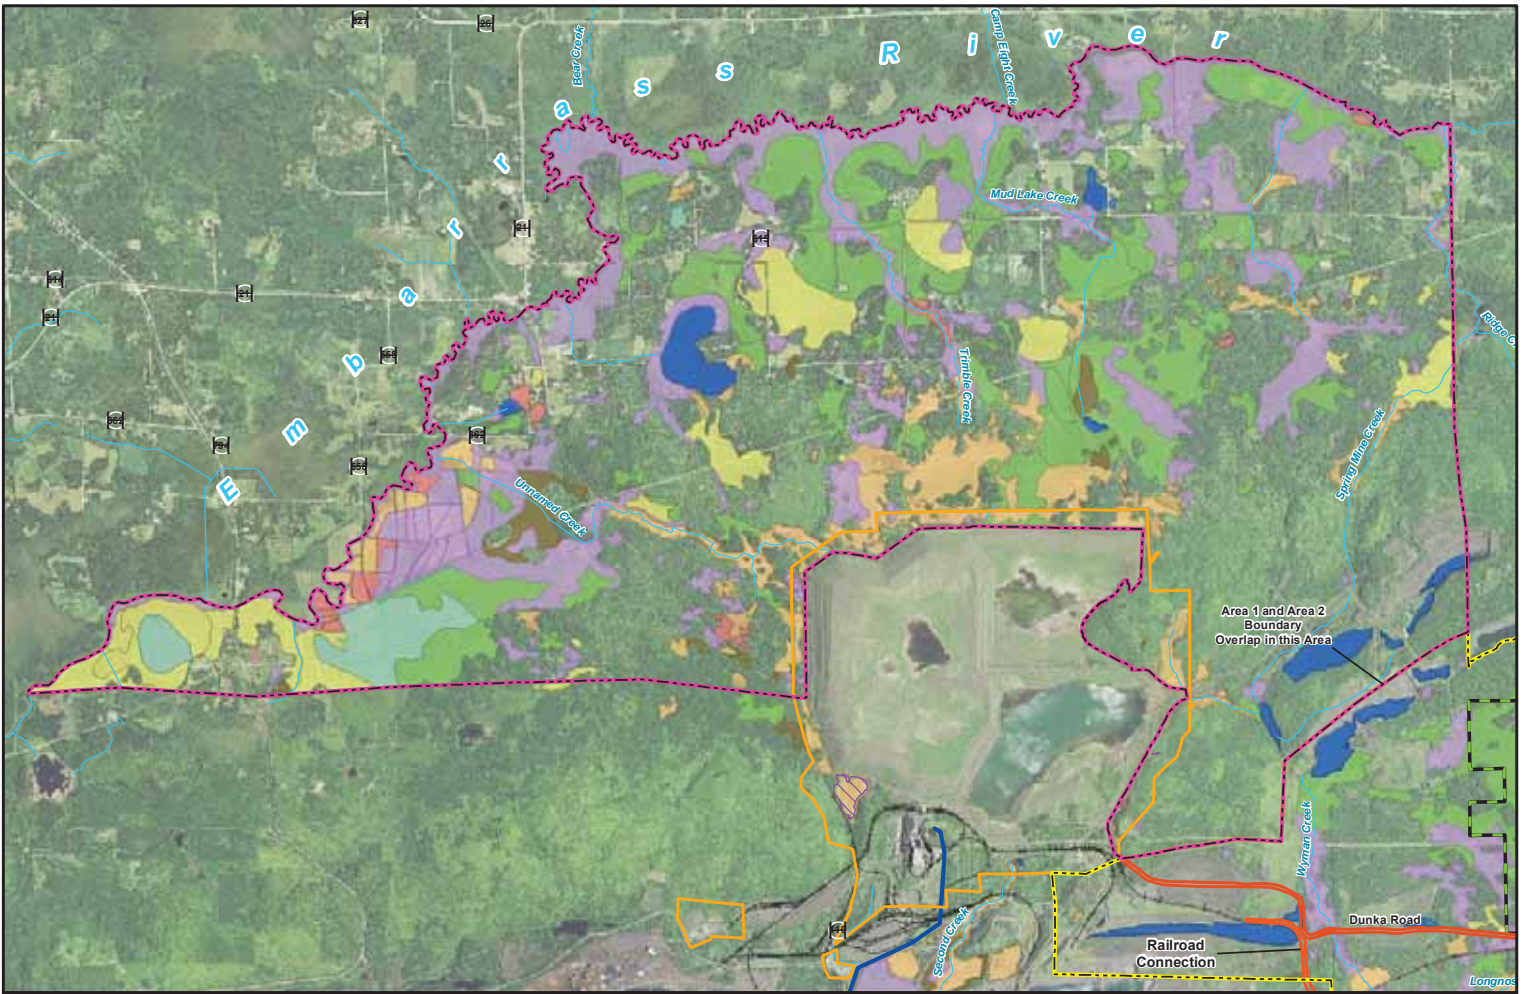

516 The wetlands along the Transportation and Utility Corridor have all been rated as high-quality.
 517 While the wetlands along the Railroad Connection Corridor are moderately affected by either a
 518 haul road or an existing railroad, they have a high vegetative diversity/integrity (PolyMet
 519 2015b).

520 **4.2.3.2 Plant Site**

521 **4.2.3.2.1 Wetland Delineation and Classification**

522 The Plant Site and Area 2 were delineated and classified using the same methodology as
 523 discussed in Section 4.2.3.1.1 above. The Plant Site encompasses 4,515.4 acres, which includes
 524 the former LTVSMC processing plant, the existing LTVSMC Tailings Basin, Area 1 Shops, the
 525 Hydrometallurgical Residue Facility, and the administration buildings. Area 2 encompasses
 526 about a 19,396.7-acre area just north and northwest of the existing LTVSMC Tailings Basin
 527 (see Figures 4.2.3-1, 4.2.3-5, and 4.2.3-6).

528 In addition to the NorthMet Project area, two non-project areas (i.e., the Colby Lake Water
 529 Pipeline Corridor (50.6 acres) and Second Creek) are included within this discussion (see Figures
 530 4.2.3-6 and 4.2.3-7).

537 **4.2.3.2.2 Hydrology, Wetland Vegetation, and Community Types**

538 The NorthMet Project area is located near the headwaters of the Partridge River and Embarrass
539 River watersheds. The Partridge River and the Embarrass Rivers are both tributary to the St.
540 Louis River, which is located within the Lake Superior Basin. A portion of the Plant Site and the
541 Colby Lake Water Pipeline Corridor are located within the Upper Partridge River Watershed,
542 while the majority of the Plant Site and the remaining portion of the Colby Lake Water Pipeline
543 Corridor are located in the Embarrass River watershed. See Section 4.2.2 for more information
544 on water resources.

545 Currently, groundwater and surface water seepage from the Tailings Basin drain towards Mud
546 Lake Creek to the north, Trimble Creek to the northwest, and Unnamed Creek to the west.
547 Runoff from the outer slopes of the Tailings Basin is tributary to the surrounding creeks and
548 precipitation falling within the Tailings Basin is contained in the basin.

549 The hydrogeologic setting of the Embarrass River watershed is generally similar to the Partridge
550 River watershed, although the unconsolidated deposits are generally thicker and more continuous
551 north of the Plant Site area along the Embarrass River valley. The Plant Site is located south of
552 the Laurentian Divide and the area is underlain by granitic rocks of the Giants Range batholith.
553 Although these rocks may be fractured to some extent, they are expected to have significantly
554 lower hydraulic conductivity than the bedrock units at the Mine Site. There are some wetlands
555 located within the Plant Site and saturated conditions generally exist less than 10 ft below the
556 ground surface, like the Mine Site. Similar to the Mine Site, the degree of hydraulic connection
557 between the wetland areas and adjacent unconsolidated deposits and bedrock at the Plant Site is
558 expected to be variable, depending on the characteristics of the wetlands and the localized
559 hydraulic conductivity and degree of bedrock fracturing. Given the very low hydraulic
560 conductivity of the underlying bedrock, there is minimal potential for hydraulic connection
561 between bedrock and wetlands.

562 The southwest corner of the Plant Site, the former LTVSMC processing plant, has almost
563 entirely been disturbed by past mining activities. Although there is a plant reservoir located east
564 of the concentrator, the plant reservoir is not regulated as a wetland and is exempt (see Figure
565 4.2.3-6) (PolyMet 2015b). Wetland hydrology at the Plant Site has been affected by the
566 operation of the existing LTVSMC Tailings Basin. Evidence suggests that hydrologic changes
567 from seepage originating from the Tailings Basin, along with beaver dams, have resulted in
568 inundation of wetland areas immediately north of the Tailings Basin (Barr 2008b). Wetlands
569 within the Plant Site are presented in Table 4.2.3-5 and Figure 4.2.3-6.

570 The existing wetlands differ from the wetlands that occupied the area prior to the construction of
571 the existing LTVSMC Tailings Basin. Historical aerial photographs (1940 and 1948) indicate the
572 presence of large wetland complexes that were a mixture of forested and shrub swamp wetlands,
573 which were primarily saturated to the surface with relatively few open water areas. Past
574 disturbances that have affected the hydrology and vegetative characteristics of the wetlands in
575 the vicinity of the existing LTVSMC Tailings Basin include seepage from the basin along with
576 beaver dams, culverts, road construction, parking areas, railroad embankments, and diversion of
577 flowages (Barr 2008k).

578 The Plant Site, the Colby Lake Water Pipeline Corridor, and the Second Creek area contain
579 wetland resources (see Table 4.2.3-5). Portions of the existing LTVSMC Tailings Basin and the

580 Hydrometallurgical Residue Facility are located within the LTVSMC Permit to Mine Ultimate
581 Tailings Basin Limit Boundary. When LTVSMC ceased production in January 2001, the mining-
582 related assets were transferred to Cleveland Cliffs, Inc., which formed Cliffs Erie LLC. Wetlands
583 (28.6 acres) located within the Cliffs Erie (formerly LTVSMC) Permit to Mine Ultimate Tailings
584 Basin Limit Boundary are not regulated by state and federal wetland regulations, as it is an
585 actively permitted waste storage facility (see Figure 4.2.3-6) (PolyMet 2015b).

586 The regulated wetlands within the Plant Site include a total of 52 wetlands covering 246.1 acres.
587 Wetlands located within the Plant Site are presented in Table 4.2.3-5 and Figure 4.2.3-6.
588 A 0.03-acre area of sedge/wet meadow within the Tailings Basin and a 28.6 acre area of shallow
589 marsh within the Hydrometallurgical Residue Facility are exempt from state and federal wetland
590 regulations as they are both located within the Cliffs Erie Permit to Mine Ultimate Tailings Basin
591 Limit Boundary. Existing wetland resources within the Plant Site consist largely of deep marshes
592 and shallow marshes with dead black spruce trees scattered throughout (Barr 2008I; PolyMet
593 2015b). Other smaller wetland areas are coniferous swamps, hardwood swamps, sedge/wet
594 meadows, and shrub swamps.

595 There would be no construction within the Colby Lake Water Pipeline Corridor as the existing
596 pipeline would be used to provide water for the NorthMet Project Proposed Action. A total of 14
597 wetlands covering 7.0 acres were identified within the Colby Lake Water Pipeline Corridor
598 (see Figure 4.2.3-7 and Table 4.2.3-5). The wetlands in the corridor include shallow marshes
599 (37 percent), shrub swamps (29 percent), sedge/wet meadows (19 percent), and deep marshes
600 (14 percent). The wetlands are adjacent to an unpaved, gravel road and within a previously
601 disturbed corridor (PolyMet 2015b).

602 There would be no construction within the Second Creek area, which is located south of the
603 Plant Site. A total of 30 wetlands covering 298.9 acres were identified within the Second Creek
604 area of analysis (see Figure 4.2.3-6 and Table 4.2.3-5). The wetlands in the Second Creek area of
605 analysis included shrub swamps (44 percent), shallow marshes (35 percent), deep marshes
606 (7 percent), hardwood swamps (7 percent), coniferous swamp (6 percent), sedge/wet meadows
607 (less than 1 percent), and open water (less than 1 percent) (PolyMet 2015b).

608 Overall, Area 2 contains 373 wetlands covering 8,621.9 acres of the 19,396.7-acre area, or
609 approximately 44 percent of Area 2. The wetlands are shown on Figure 4.2.3-5. Table 4.2.3-5,
610 below, summarizes the wetland areas represented by each Eggers and Reed (1997, 2014) wetland
611 community type classification system (Barr 2011d; PolyMet 2015b).

612 Shrub swamps, which include both alder thicket and shrub-carr wetland types, represent the most
613 abundant wetland type within Area 2 comprising approximately 34 percent of the overall
614 wetland area. These shrub swamps are dominated by either alder or willow species, with some
615 dogwoods also present. The ground layer is dominated by Canada bluejoint grass and sedges,
616 woolgrass, rushes, and ferns are also present. Sphagnum mosses may also be present but do not
617 typically form a continuous mat within these shrub swamps. Soils in shrub swamps are usually
618 fibric and hemic peat at the surface underlain by bedrock or mineral soil (Barr 2011d; PolyMet
619 2015b).

620 Coniferous swamps within Area 2 are the second most abundant wetland type, comprising
621 approximately 29 percent of the overall wetland area. These swamps are made up of black spruce
622 and/or tamarack, with balsam fir and northern white cedar present in some areas. Deciduous tree
623 species, such as aspen, birch and, to a minor extent, black ash, are also present in some locations.

624 The shrub layer is observed to be typically dominated by alder and willow species. The ground
625 layer commonly includes Canada bluejoint grass, sedges, bunchberry, wild sarsaparilla, and
626 starflower. Sphagnum mosses are also present in the ground layer; however, a continuous
627 sphagnum mat is usually absent. Soils in the coniferous swamps are generally organic and are
628 usually saturated to the surface throughout much of the growing season (Barr 2011d; PolyMet
629 2015b).

630 Coniferous bogs are the third-most abundant wetland type within Area 2, representing
631 approximately 12 percent of the overall wetland area, while open bogs represent only a small
632 component of wetlands in Area 2 (approximately 4 percent). Coniferous bogs generally have a
633 tree cover greater than 50 percent, which is typically dominated by black spruce and/or tamarack.
634 Forested wetlands that are acid peatlands dominated by dense cover of black spruce and/or
635 tamarack with a more or less continuous carpet of Sphagnum mosses have been classified as
636 coniferous bogs in the Eggers and Reed (1997, 2014) classification system. Occasionally, there
637 are areas with balsam fir, jack pine, and northern white cedar present within the large coniferous
638 bog wetland complexes. The open bogs do not support a dense tree cover and it was observed
639 that typically only a scattering of immature black spruce and/or tamarack are present (Barr
640 2011d; PolyMet 2015b).

641 The shrub layer and ground layer of coniferous bogs and open bogs have similar composition.
642 The shrub layer is typically dominated by ericaceous shrubs such as leatherleaf, bog Labrador-
643 tea, and cranberry. The ground layer commonly includes a continuous sphagnum moss mat with
644 various sedges and herbaceous vegetation also observed. Northern pitcher plants are abundant in
645 the large bog areas that surround Mud Lake. Soils in the coniferous bogs and open bogs
646 generally consist of fibric peat that is usually saturated to the surface throughout much of the
647 growing season (Barr 2011d; PolyMet 2015b).

648 Shallow and deep marshes are present within Area 2, and together represent about 14 percent of
649 the wetland area. These wetlands are dominated by cattails, with sedges and Canada bluejoint
650 grass also present. Soils in the shallow and deep marshes are typically organic at the surface and
651 underlain by mineral soils. The shallow marshes present are typically inundated with up to
652 6 inches of water throughout the entire growing season, while the deep marshes are inundated
653 with over 6 inches of water throughout the entire growing season. These wetlands are often
654 associated with disturbances, such as beaver activity (Barr 2011d; PolyMet 2015b).

655 Hardwood swamps are present but not abundant in Area 2. The hardwood swamps that are
656 present are dominated by black ash, aspen, and birch. Coniferous trees, such as balsam fir, black
657 spruce, and northern white cedar are occasionally present in these hardwood swamps. The shrub
658 layer is generally dominated by alder and young saplings while the ground layer species present
659 include Canada bluejoint grass, sedges, and ferns. Sphagnum mosses are also observed; however,
660 they do not typically form a continuous mat. Soils in the hardwood swamps are either organic or
661 mineral and are usually saturated throughout much of the growing season (Barr 2011d; PolyMet
662 2015b).

663 Sedge meadow and wet meadow communities are present within Area 2 but represent only a
664 small proportion of the total wetland area. These wetlands are populated by sedges, Canada
665 bluejoint grass, woolgrass, manna grass, and bulrushes. Soils in the sedge meadows and wet
666 meadow communities are typically organic at the surface and underlain by mineral soils. These

667 wetlands are generally saturated close to the ground surface or have shallow inundation for
668 prolonged periods during the growing season (Barr 2011d; PolyMet 2015b).

669 **Table 4.2.3-5 Total Wetland Acreage by Wetland Type for Plant Site, Colby Lake Water**
670 **Pipeline Corridor, Second Creek Area, and Area 2**

Eggers and Reed Class ¹	Plant Site ²		Colby Lake Water Pipeline Corridor		Second Creek Area ⁵		Area 2

Total ⁶	274.7	100	7.0	99	298.9	100	8,621.9	100

671 Source: PolyMet 2015b.

672 ¹ Eggers and Reed 1997, 2014.

673 ² There are 52 unique wetland areas at the Plant Site, which includes the Tailings Basin and Hydrometallurgical Residue Facility
674 footprint. Two wetlands (ID 1155 and 1159) have been split between the Tailings Basin and Hydrometallurgical Residue
675 Facility footprint in the Wetland Data Package for a total of 54 wetlands resource areas in Wetland Data Package report.

676 ³ A 0.03-acre area of this wetland type is classified as exempt from state and federal wetlands regulations.

677 ⁴ A 28.56-acre area of this wetland type is classified as exempt from state and federal wetlands regulations.

678 ⁵ A total of 30 wetlands are associated with the Second Creek area of analysis; however, only 22 are unique to the Second Creek
679 area of analysis as one wetland is associated with the Plant Site and 7 wetlands are located within the Colby Lake Water
680 Pipeline Corridor. To avoid double counting during the analysis of impacts, these 8 wetlands (6.2 acres) would be excluded
681 from the Second Creek area of analysis.

682 ⁶ Percent totals are greater than 100 percent due to rounding.

683 4.2.3.2.3 Wetlands Functional Assessment

684 Wetlands within the Tailings Basin have been previously affected by the LTVSMC tailings
685 deposition, roads, and impoundment. The majority (92 percent) of the wetlands within this area
686 are currently rated as low-quality with low vegetative diversity/integrity. Eight percent of the
687 wetlands within the Tailings Basin are rated as moderate quality. The wetlands within the
688 Hydrometallurgical Residue Facility are located on the south side of an unpaved, gravel road
689 with small buildings and associated facilities used in the former LTVSMC operations. These
690 wetlands are currently rated as low-quality (PolyMet 2015b).

691 The majority of wetlands within the Colby Lake Water Pipeline Corridor, which are located
692 adjacent to an unpaved, gravel road and within a previously disturbed corridor, are rated as low-
693 quality (93 percent), with the remaining wetlands rated as moderate-quality (7 percent) (PolyMet
694 2015b).

1 **4.2.4 Vegetation**

2 This section describes the existing cover type categories, plant communities, and individual plant
3 species in the NorthMet Project area. Cover type categories and plant communities are defined
4 for each parcel, and their geographic locations are presented on the corresponding figures.
5 Minnesota Biological Survey (MBS) Sites of Biodiversity Significance, Scientific and Natural
6 Areas (SNAs), and culturally important plant species are also discussed for each parcel. Species
7 are grouped into two partially overlapping categories: state-listed Endangered, Threatened, or
8 Special Concern (ETSC) species; and the USFS's Regional Foresters Sensitive Species (RFSS).
9 There are no federally listed plant species within the NorthMet Project area.

10 Additional information beyond what the MDNR Natural Heritage Information System (NHIS)
11 contained, such as species conservation ranking, distribution, and habitat, were obtained from
12 NatureServe, an online public database that utilizes sources such as scientific literature, web
13 sites, expert knowledge, and information from local data centers. The Bell Museum of Natural
14 History, which maintains an herbarium vascular plant collection database, was also consulted.

15 Several vegetation surveys have been conducted on the federal lands (including part of the Mine
16 Site) and the non-federal lands. These studies gathered information on dominant plant species
17 within various habitats, as well as the presence or absence of ETSC species.

18 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
19 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
20 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
21 associated with the updated list. A Biological Evaluation (BE) has been prepared that contains
22 further information about RFSS. The BE is included in Appendix D and is posted on the USFS
23 website (<http://www.fs.usda.gov/goto/superior/northmet>).

24 **4.2.4.1 Regional Setting**

25 The Mine Site, Transportation and Utility Corridor, and Plant Site are located in the MDNR-
26 designated Nashwauk Uplands and Laurentian Uplands subsections of the Northern Superior
27 Uplands section of the Laurentian Mixed Forest Province ecoregion, corresponding roughly to
28 the Arrowhead region of northeastern Minnesota (MDNR 2006a; MDNR 2011e). Most of the
29 vegetative cover types in these subsections grow in acidic to neutral glacial materials over
30 Precambrian bedrock (MDNR 2011f; MDNR 2011i). Soils vary from medium to coarse texture,
31 and they support forest communities of aspen-birch, jack pine (*Pinus banksiana*), balsam fir
32 (*Abies balsamea*), white spruce (*Picea glauca*), red pine (*Pinus resinosa*), and white pine (*Pinus*
33 *strobus*) on the uplands and conifer bogs and swamps on the lowlands.

34 **4.2.4.2 Mine Site**

35 The Mine Site includes a single contiguous 3,014.5-acre tract of land. It is located on both
36 private lands (295.2 acres) and federal lands (2,719.3 acres) within the Superior National Forest.

37 **4.2.4.2.1 Cover Types**

38 Cover types are of several classifications, including MDNR Gap Analysis Program (GAP) land
39 cover types, specific plant communities identified through surveys, MBS Sites of Biodiversity
40 Significance, native plant communities, and SNAs.

41 **Habitat Types**

42 The MDNR uses a hierarchical land classification system called the GAP land cover system,
 43 which organizes vegetation communities into 1-acre blocks. The primary GAP land cover types
 44 at the Mine Site are upland conifer forest (40 percent) and lowland conifer forest (26 percent), in
 45 addition to upland deciduous forest (see Table 4.2.4-1 and Figure 4.2.4-1). Some of the least
 46 represented cover types on the Mine Site include cropland/grassland or upland conifer-deciduous
 47 mixed forest types. The MDNR GAP land cover types below do not fully represent the extent of
 48 mixed forest types, since the cover type level below is fairly specific. As detailed below in ENSR
 49 (2005) surveys, there is much more mixed forest types than indicated.

50 **Table 4.2.4-1 NorthMet Mine Site Cover Types**

Cover Types	Total Acres	Percent of Area
Upland coniferous forest ¹	1,195.5	40
Lowland coniferous forest ²	781.2	26
Upland deciduous forest ³	648.0	21
Shrubland	241.7	8
Disturbed	128.0	4
Aquatic environments	12.7	<1
Cropland/Grassland	4.9	<1
Upland conifer-deciduous mixed forest ⁴	2.4	<1
Lowland deciduous forest ⁵	0.1	<1
Total	3,014.5	100

51 Source: MDNR 2006b.

52 Notes:

53 ¹ Includes pine and spruce/fir forest cover types.

54 ² Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

55 ³ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

56 ⁴ Includes all mixed coniferous-deciduous forest cover types.

57 ⁵ Includes black ash forest cover types.

58 **Plant Community Surveys**

59 The primary cover types at the Mine Site are mixed pine-hardwood forests on the uplands and
 60 black spruce (*Picea mariana*) swamp/bog in the wetlands (ENSR 2005). USFS stand data and
 61 field verification indicate that northern white cedar also occurs at the Mine Site in lowland
 62 conifer forests (Barr 2011d). The remaining forest on the Mine Site is made up of aspen
 63 (*Populus* spp.), aspen-birch, jack pine, and mixed hardwood swamp. The relatively small amount
 64 of grass/brushland habitat that is present is land recovering from past logging through natural
 65 succession. There are also small areas of open water and disturbed ground that were previously
 66 cleared for logging roads and log landings. Of the wetlands that are located on the Mine Site, the
 67 majority (92 percent) is rated as having a high overall wetland quality and 8 percent are of
 68 moderate overall wetland quality. Vegetation diversity and integrity are rated moderate to high
 69 for all wetlands because recent human contact and alteration are minimal and the wetlands have
 70 a relatively constant supply of water. Section 4.2.3 provides a more detailed discussion on
 71 wetlands.

- 72 Many of the upland forest areas on the Mine Site have been harvested in the last 20 to 60 years.
73 The oldest forest at the Mine Site includes approximately 297 acres of 40- to 80-year-old trees
74 within the mixed pine-hardwood forest in the southwest portion of the Mine Site (ENSR 2005).

79 **Minnesota Biological Survey**

80 The MDNR operates the MBS program, which includes spatial information from survey reports
81 on native plant communities and rare species. Sites of Biodiversity Significance are designated
82 and ranked by the MDNR based on the environmental conditions present, including native plant
83 communities, rare species, and unique habitat. The MBS utilizes a four-tiered ranking system:
84 Outstanding, High, Moderate, and Below (from highest to lowest). Sites of High Biodiversity
85 Significance contain very good-quality occurrences of the rarest species, high-quality examples
86 of rare native plant communities, and/or important functional landscapes (MDNR 2008a). The
87 entire 3,014.5-acre Mine Site has been characterized by the MBS as various Sites of High
88 Biodiversity Significance due to the presence of the One Hundred Mile Swamp site, which
89 covers 15 percent of the Mine Site, and the Upper Partridge River site, which is 85 percent of the
90 Mine Site (see Figure 4.2.4-2) (MDNR 2008a).

91 Native plant communities are also ranked by the MDNR by their quality and abundance in a
92 given area. “Imperiled” or “vulnerable” designations indicate that the communities have high
93 ecological value, are rare in a given area, and/or could face danger of extirpation. Those with
94 “apparently secure” designations are uncommon in a given area, but are not rare. Those with
95 “widespread and secure” designations are fairly common and in no immediate risk of extirpation.
96 Native plant communities are identified by their name and a unique code assigned to them by the
97 MDNR (e.g., FDn32c). Two native plant communities, black spruce-jack pine woodlands
98 (FDn32c; 34 percent of Mine Site) and rich black spruce swamp (FPn62a; 7 percent of Mine
99 Site), have been characterized by the MBS as “imperiled/vulnerable” and “vulnerable,”
100 respectively (MDNR 2008b). Poor tamarack-black spruce swamps (APn81b) and black spruce
101 bogs (APn80a1) are ranked as “apparently secure” based on abundance, distribution, trends, and
102 threats (MDNR 2008b). Aspen-birch forests: balsam fir subtype (FDn43b1), alder (*Alnus* spp.)
103 swamps (FPn73a), poor black spruce swamps (APn81a), and low shrub poor fens (APn91a) are
104 all considered “widespread and secure.”

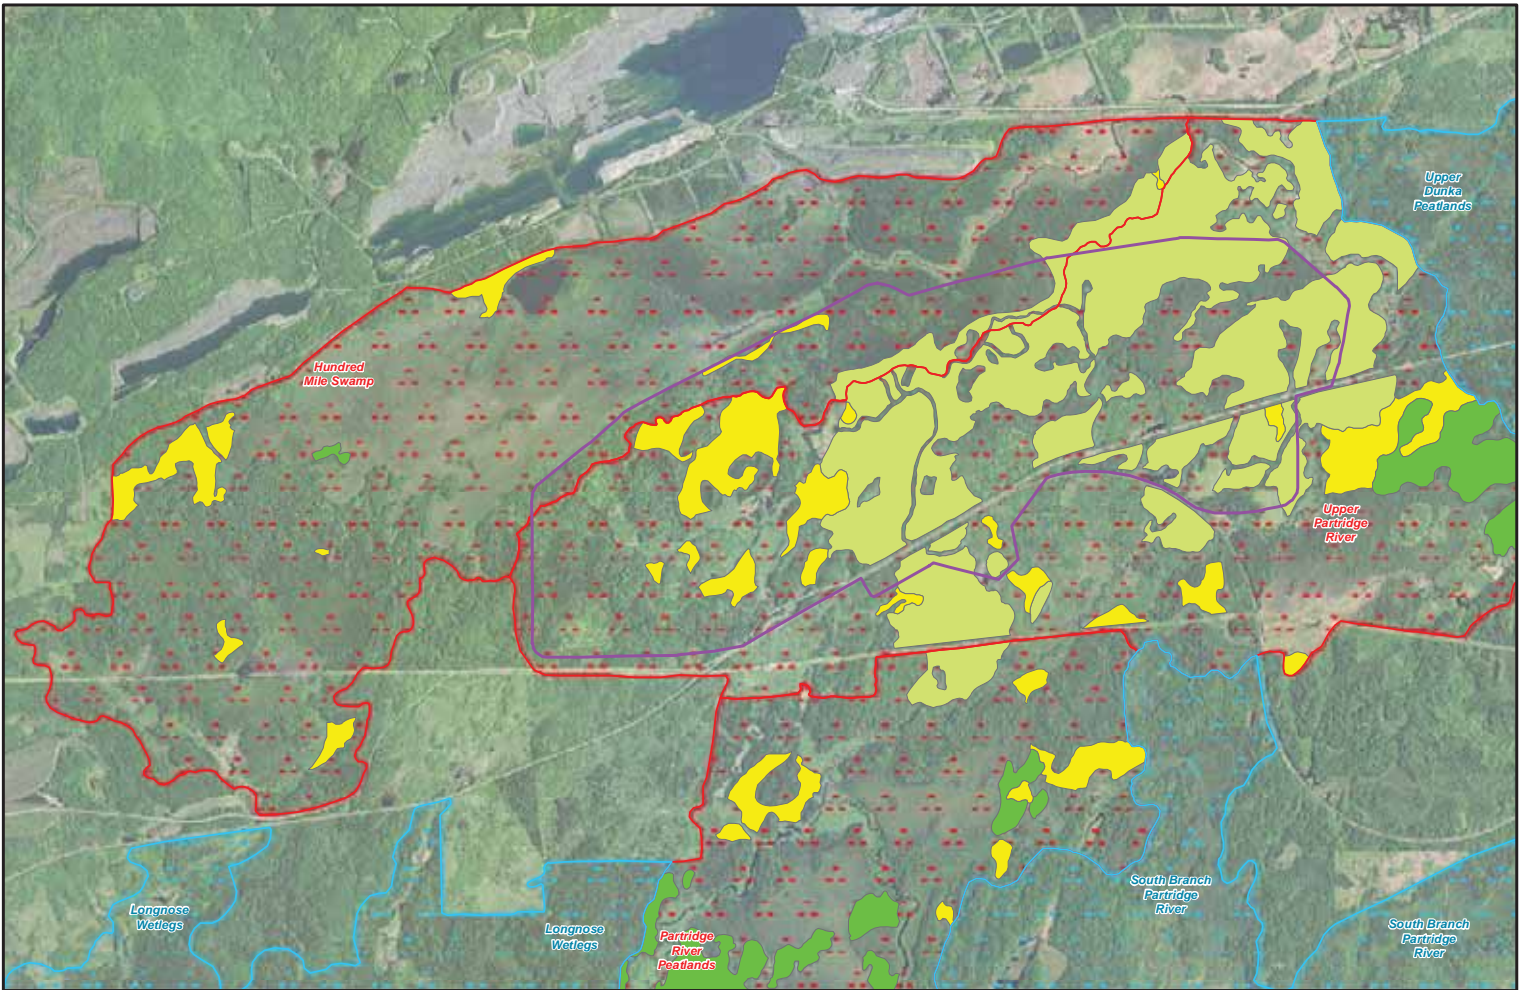

105 **Scientific and Natural Areas**

106 The MDNR SNA program designates and preserves areas that have outstanding rare resources or
107 features. There are no lands designated or nominated for designation as SNAs on the Mine Site
108 (MDNR 2006c; Wilson, MDNR, Pers. Comm., February 14, 2012).

109 **Culturally Important Plants**

110 Wild rice is an important plant species to the Bands, as well as an important wildlife food source.
111 The MPCA staff have recommended three segments within the Partridge River watershed as
112 waters used for the production of wild rice; the closest segment is about 2 miles from the Mine
113 Site and includes the lower portion of the Upper Partridge River just upstream of the railroad
114 bridge near Allen Junction to where it enters Colby Lake (see Figure 5.2.2-1) (MPCA 2012b).
115 There were no observations of wild rice in Colby Lake itself or the tributary stream Wyman
116 Creek (Barr 2011a; Barr 2012a; MPCA 2012b). The MPCA’s draft staff recommendation
117 identifies the portion of the Partridge River from Colby Lake to its confluence with the St. Louis
118 River as a water source used for production of wild rice. Small populations of wild rice have
119 been observed in Second Creek from First Creek to its confluence with the Partridge River (Barr
120 2011a). Natural resources culturally important to the Bands are discussed in Section 4.2.9.3.3.

DRAFT

Mine Site	Native Plant Community (S-Rank)
MBS Site of Biodiversity Significance - High	S2 - imperiled
MBS Site of Biodiversity Significance - Moderate	S2-S3 - imperiled/vulnerable
	S3 - vulnerable

124 **National Hierarchical Framework of Ecological Units**

125 The National Hierarchical Framework of Ecological Units (NHFEU) is a land classification
126 system that uses a nested hierarchy of eight levels of ecological units (Cleland et al. 1997). Units
127 are differentiated using a combination of physical and biological factors, such as geology,
128 topography, soils, and vegetation. The Landscape scale contains the Land Type Association
129 (LTA) level, which is defined using several factors, including bedrock types, lake and stream
130 distributions, wetland patterns, and pre-European settlement vegetation (MDNR 2011g). The
131 Land Unit scale contains the ELT level, which is a subtype of the LTA level. The MDNR and
132 USFS also have an ECS that identifies and classifies lands in a similar fashion according to
133 provinces, sections, subsections, and LTAs (MDNR 2011g).

134 The portion of the One Hundred Mile Swamp that is on the federal lands, including part of the
135 Mine Site, has been identified as a Site of High Biodiversity Significance and was aerially
136 surveyed by Chel Anderson in 1997. The One Hundred Mile Swamp comprises approximately
137 3,028 acres located within LTA 8A – Big Rice Outwash (MDNR 1997), which has since been
138 reclassified as LTA 212Le11 – Big Lake-Bird Lake End Moraines. Two other sites besides the
139 One Hundred Mile Swamp site were surveyed on the ground and by air in LTA 212Le11. These
140 sites provide a good representation of most of the LTA’s biological and physical attributes at the
141 ELT level, as mentioned above. The One Hundred Mile Swamp and the two other sites surveyed
142 provide a complete representation of the prominent ELTs present within LTA 212Le11.

143 **4.2.4.2.2 Invasive Non-native Plants**

144 Invasive non-native plants are a concern because they can quickly form self-sustaining
145 monocultures that out-compete native plants or reduce the quality of wildlife habitat, particularly
146 in disturbed areas. “Non-native” species are those that have been introduced, or moved, by
147 human activities to a location where they do not naturally occur (MDNR 2011b). “Invasive”
148 species are non-native species that cause ecological or economic problems (e.g., out-competing
149 indigenous species or altering the existing ecological community through rapid development of
150 monocultures). In general, few invasive non-native plants have been observed on the federal
151 lands because wetland disturbance has been minimal, upland disturbance has been restricted to
152 timber harvests, and human access has been limited, thereby reducing the spread of these plants
153 (AECOM 2011a; ENSR 2005). No known occurrences of invasive species on the federal lands
154 are listed in the Superior National Forest invasive plant geodatabase, but no inventories have
155 been performed in the NorthMet Project area (USFS 2010a). The majority of representative
156 wetland locations surveyed on the federal lands yielded 100 percent native plants with no
157 occurrences of non-native species at those sites according to MnRAM 3.2 worksheets (AECOM
158 2011d). Field surveys indicate that disturbed upland areas on the federal lands contain
159 occurrences of yellow sweetclover and bladder campion, both of which are invasive non-native
160 species. Yellow sweetclover invades grasslands and early successional habitats by overtopping
161 and shading out native species (MDNR 2011b). Bladder campion is a prolific seed-producer and
162 can spread vegetatively, as well.

163 A vegetation survey of mines on the Mesabi Iron Range (Apfelbaum et al. 1995) identified a
164 large number of invasive non-native plant species that could invade the Mine Site, and some
165 species are estimated to be currently present on the Mine Site (see Table 4.2.4-2). Some of these
166 species are grasses and legumes that were planted on mines and other sites to reduce erosion and

167 to fix nitrogen into the soil as part of a reclamation effort (e.g., redtop, smooth brome, birdsfoot
 168 trefoil, yellow sweetclover, white sweetclover, alfalfa, timothy, Kentucky bluegrass, Canada
 169 bluegrass, and white clover). In addition, a road weed survey by the Superior National Forest
 170 (USFS 2011k) documented several invasive species (species tracked by the USFS and Minnesota
 171 Class 2 invasive species) within 3 miles of the Mine Site, primarily along roadways (see Table
 172 4.2.4-3). Species with a high percentage of occurrences in the surveys (e.g., common tansy) are
 173 more likely to occur on the Mine Site.

174 **Table 4.2.4-2 Invasive Non-native Plant Species Found on Mine Sites in the Mesabi Iron**
 175 **Range**

Scientific Name	Common Name	Percent Occurrence ¹	Wetland/ Upland	Estimated Abundance at NorthMet Mine Site
<i>Bromus inermis</i>	Smooth brome	60	U	Uncommon
<i>Tanacetum vulgare</i>	Common tansy	60	U	Uncommon
<i>Taraxacum officinale</i>	Dandelion	60	U	Common
<i>Cirsium arvense</i>	Canada thistle	40	U	Uncommon
<i>Phleum pratense</i>	Timothy	40	U	Common
<i>Poa pratensis</i>	Kentucky bluegrass	40	U	Common
<i>Leucanthemum vulgare</i>	Oxeye daisy	30	U	Common
<i>Lotus corniculatus</i>	Birdsfoot trefoil	30	U	Common
<i>Hieracium pratense</i>	Yellow hawkweed	20	U	Uncommon
<i>Lychnis alba</i>	Bladder campion	20	U	Uncommon
<i>Melilotus officinalis</i>	Yellow sweetclover	20	U	Uncommon
<i>Agrostis alba</i>	Redtop	10	W/U	Uncommon
<i>Cirsium vulgare</i>	Bull thistle	10	U	Uncommon
<i>Hieracium aurantiacum</i>	Devil's hawkweed	10	U	Common
<i>Medicago lupulina</i>	Black medic	10	U	Common
<i>Trifolium repens</i>	White clover	10	U	Common

176 Source: Apfelbaum et al. 1995.

177 Note:

178 ¹ Percent occurrence is the percentage of mine areas in the Mesabi Iron Range with reported observations based on 3-minute
 179 surveys at 10 mine areas. Three-minute surveys report the most abundant plant species observed during a 3-minute time period
 180 and provide a rough estimate of species abundance.

181 **Table 4.2.4-3 Invasive Non-native Plant Species Found Within 3 Miles of the Mine Site and**
 182 **Plant Site by the USFS Road Weed Survey**

Scientific Name	Common Name	Percent Occurrence Near Plant and Mine Sites ¹	Wetland/Upland
<i>Tanacetum vulgare</i> ³	Common tansy	35	U
<i>Hypericum perforatum</i> ²	St. John's wort	29	U
<i>Cirsium arvense</i> ³	Canada thistle	24	U
<i>Cirsium vulgare</i>	Bull thistle	6	U
<i>Centaurea stoebe (C. maculosa)</i> ³	Spotted knapweed	5	U

183 Source: USFS 2011k.

184 Notes:

185 ¹ Percent occurrence is the observed number of populations of the species divided by the 96 total plant populations identified
 186 within 3 miles of the Mine and Plant Sites.

187 ² Tracked by USFS.

188 ³ Minnesota Class 2 - Controlled noxious weed as identified by the 2012 Minnesota Noxious Weed Law.

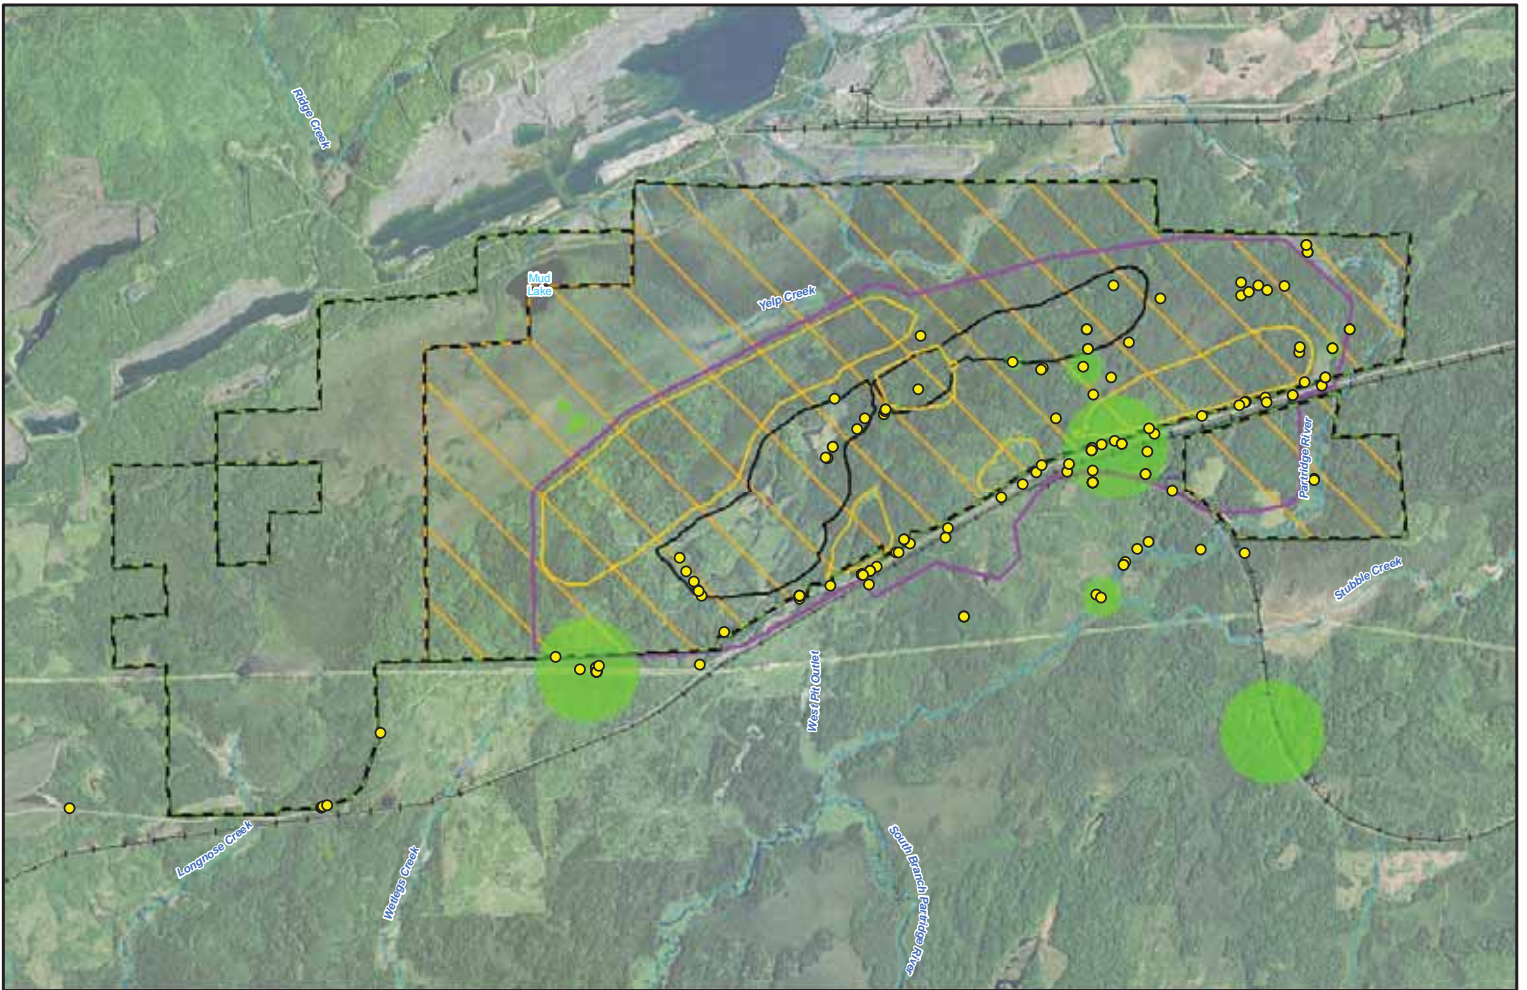

189 **4.2.4.2.3 Threatened and Endangered Plant Species**

190 **Endangered, Threatened, and Special Concern Plant Species**

191 No federally listed threatened and endangered plant species are known to occur on the federal
 192 lands, including the Mine Site. However, ten state-listed ETSC plant species are known to occur
 193 in the vicinity of the Mine Site. Based on a review of the MDNR NHIS and field investigations
 194 (AECOM 2009b; Barr 2007i; Johnson-Groh 2004; Pomroy and Barnes 2004; Walton 2004), one
 195 state endangered species, and nine state species of special concern have been identified on the
 196 Mine Site (see Table 4.2.4-4 and Figure 4.2.4-3). No other state-listed species are known to
 197 occur and no appropriate habitat for other species occurs on the Mine Site. Minnesota's
 198 endangered species law (*Minnesota Statute*, § 84.0895) and associated rules (*Minnesota Rules*,
 199 part 6212.1800 to 6212.2300 and 6212.6134) impose a variety of restrictions, permits, and
 200 exemptions pertaining to ETSC species. Rulemaking was conducted with the intent to update the
 201 list of ETSC species (*Minnesota Rules*, parts 6134.0100 to 6134.0400), with new listings
 202 becoming effective on August 19, 2013 (MDNR 2013h). This FEIS considers any new listings,
 203 or changes in the previous listings, associated with the updated list.

204 Population numbers correspond to the MDNR Element Occurrence within the NHIS database
 205 (Joyal, MDNR, Pers. Comm., February 13, 2012). According to the 2011 MDNR NHIS training
 206 notes, Element Occurrences may have multiple observations in a given area, but are considered
 207 one population if they are "within close enough proximity to one another to allow for gene flow
 208 and there are no known barriers to movement." These clusters of observations are described here
 209 as colonies for given populations. An individual is defined as a single plant of a species.
 210 A colony is a group of individual plants of one species in a distinct geographic location.
 211 A population is a group of individuals or colonies of one species that may be separated
 212 geographically, but are close enough to interbreed and persist over time.

Scientific Name	Common Name	State Status ¹	No. of Populations ²	No. of Individuals ^{2,3}	Habitat and Location
<i>Botrychium campestre</i>	Prairie moonwort	SC	1	Unknown	Dry soils along the Dunka Road.
<i>Botrychium pallidum</i>	Pale moonwort ⁴	SC	1	21	Full to shady exposure, edge of alder thicket, along Dunka Road.
<i>Botrychium rugulosum (ternatum)</i>	Ternate or St. Lawrence grapefern ⁴	SC	1	4	Early successional habitats, fields, open woods, forests, and along Dunka Road.
<i>Botrychium simplex</i>	Least grapefern ⁴	SC	3	~1,580	Full to shady exposure, edge of alder thicket, forest roads, along Dunka Road.
<i>Caltha natans</i>	Floating marsh marigold ⁴	E	1	56	Shallow water in ditches and streams, alder swamps, shallow marshes, beaver ponds, and Partridge River mudflat.
<i>Eleocharis nitida</i>	Neat spikerush ⁴	SC	1	~1,562 ft ²	Full exposure, moist ditches along Dunka Road, wet area between railroad grades, and railroad ditch.
<i>Juncus stygius</i> var. <i>americanus</i>	Bog rush ⁴	SC	1	Unknown	Open-patterned peatlands, rich and poor fens, northern spruce bog within the One Hundred Mile swamp.
<i>Platanthera clavellata</i>	Club-spur orchid	SC	1	Unknown	Black spruce and/or tamarack swamps, northern spruce bog within the One Hundred Mile swamp.
<i>Ranunculus lapponicus</i>	Lapland buttercup	SC	1	~919 ft ²	On and adjacent to Sphagnum hummocks in black spruce stands, up to 60 percent shaded with alder also dominant.
<i>Torreyochloa pallida</i>	Torrey's manna-grass	SC	1	~25 ft ²	In muddy soil along shore and in water within shallow channels, beaver ponds, shallow marshes, along Partridge River.

218 Sources: AECOM 2009b; Barr 2007i; Johnson-Groh 2004; MDNR 2005; MDNR 2011L; MDNR 2014d; Pomroy and Barnes
219 2004; Walton 2004.

220 Notes:

221 ¹ E = Endangered, T = Threatened, SC = Species of Special Concern.

222 ² Note that the number of populations may differ from those given in the NHIS data because of populations found during other
223 surveys.

224 ³ Where the number of individuals could not be determined without damaging the population, patch size (square feet) was used
225 as a representative abundance measure.

226 ⁴ These species are also RFSS as tracked by the USFS.

227 ⁵ Data included here were provided by the Division of Ecological Resources, MDNR, and were current as of August 5, 2014.
228 These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be
229 construed to mean that no significant features are present.

230 **Species Life Histories**

231 The following summary provides descriptions of the life histories, statewide distributions, and
232 sensitivity to disturbance for each of the 10 ETSC species found on the Mine Site.

233 Prairie moonwort (*Botrychium campestre*) is listed as a species of special concern in Minnesota;
234 it is not listed as an RFSS in the Superior National Forest. It occurs primarily in prairies, dunes,
235 grassy railroad sidings, and fields over limestone bedrock. *B. campestre* is a perennial fern that
236 emerges in early spring and matures in late spring to early summer (eFlora 2011). This species is
237 among the smallest moonworts and is difficult to observe when occurring among prairie
238 vegetation; therefore, it is likely more widespread and abundant within its range than is typically
239 apparent. It is now known to occur in several counties throughout Minnesota and even across the
240 continent (MDNR 2011L). *B. campestre* is less frequently associated with disturbance than many
241 moonwort species. On the Mesabi Iron Range of Minnesota, however, *B. campestre* has been
242 found growing abundantly on sparsely vegetated mineral soil developed from sediments of iron
243 mine tailings ponds.

244 Pale moonwort (*Botrychium pallidum*) is listed as a species of special concern in Minnesota and
245 as an RFSS in the Superior National Forest. *B. pallidum* was only first identified in Minnesota in
246 1992 and new populations are documented each year in a variety of habitats across northern
247 Minnesota (MDNR 2011L). It occurs in open early successional habitats, log landings, roadsides,
248 sandy gravel pits, and mine tailings within the Mesabi Iron Range of northeastern Minnesota.
249 This diminutive perennial fern emerges in the late spring, produces spores, and matures within 3
250 to 4 weeks. Like many of the moonworts, *B. pallidum* may be sensitive to changes in soil
251 mycorrhizae, herbivory from introduced earthworms, vegetative cover (i.e., increased vegetative
252 competition and shading), soil moisture, or other environmental factors affecting suitable
253 microhabitats. Disturbances such as vegetation clearing, mining, soil scarification, reduction of
254 vegetative competition, decreased canopy cover, or fire likely play an important role in the
255 preservation and proliferation of this species.

256 St. Lawrence grapefern (*Botrychium rugulosum*) (Synonym: *B. ternatum*, ternate grapefern) is
257 listed as a species of special concern in Minnesota and as an RFSS in the Superior National
258 Forest. The name “rugulosum” refers to the tendency of the segments to become wrinkled and
259 convex. Relatively little is known about the overall distribution, genetics, and life history
260 requirements of *B. rugulosum*, and some taxonomists question whether *B. rugulosum* is a distinct
261 species. It is a perennial semi-evergreen fern that occurs in the northern and south-central
262 portions of Minnesota (MDNR 2011L). In northern Minnesota, *B. rugulosum* prefers partially
263 shaded mine tailings, sandy conifer forests and plantations, and shaded vernal pool margins in
264 rich deciduous hardwood forests. It also occurs in wetland areas within habitats subject to past
265 clearing or cultivation (NatureServe 2014b). *B. rugulosum* is similar morphologically and in its
266 life history requirements to *B. multifidum* (leathery grapefern), and these two species are often
267 confused in the field. *B. rugulosum* is most easily distinguished from similar species in the late
268 summer and early autumn when the trophophore (i.e., photosynthetic branch) has matured. Like
269 *B. pallidum*, *B. rugulosum* may be associated with soil mycorrhizae and may be sensitive to
270 increased competition, earthworms, changes in soil moisture, and other environmental factors
271 affecting microhabitats. *B. rugulosum* is often found in small stands of 5 to 10 individuals,
272 though larger populations can also occur (eFlora 2011). Disturbance also likely plays an
273 important long-term role in the proliferation of this species.

274 Least grapefern (*Botrychium simplex*) is listed as a species of special concern in Minnesota and
275 as an RFSS in the Superior National Forest. Least grapefern occurs throughout northern and
276 central Minnesota, with no occurrences documented in southern Minnesota (Bell Museum of
277 Natural History 2011). Least grapefern was first described as a species in 1823 (eFlora 2011) and

278 has been extensively surveyed and studied for over a century. *B. simplex* is a perennial fern that
279 produces a single leaf each year and occurs in a variety of natural and disturbed habitats,
280 including brushy fields (often with other species of *Botrychium*), moist or dry woods, edges of
281 forested vernal pools and swamps, mine tailings, and edges of sand/gravel/exposed forest roads.
282 The morphology of the species is quite variable, and the many environmental forms and juvenile
283 stages of *B. simplex* have resulted in the naming of numerous intraspecific taxa (eFlora 2011).
284 Like the other *Botrychium* species, disturbance likely plays an important role in the proliferation
285 of this species.

286 Floating marsh marigold (*Caltha natans*) is listed as an endangered species in Minnesota and as
287 an RFSS in the Superior National Forest. *C. natans* was first collected in Minnesota in 1889 from
288 Vermilion Lake in St. Louis County (Coffin and Pfannmuller 1988). All subsequent collections
289 have been from St. Louis County (Bell Museum of Natural History 2011) and all known
290 occurrences in the NHIS database occur in St. Louis County. Very few populations are known in
291 Minnesota. Habitat loss is largely the reason behind recent local extirpations of this species in
292 Minnesota (MDNR 2011L). Floating marsh marigold is a perennial aquatic forb and occurs
293 within shallow open water or on moist mud within northern ponds, lakes, slow-moving rivers,
294 streams, ditches, and wet meadows. The species flowers in late spring-summer (i.e., June to
295 August). *C. natans* is found in relatively stable aquatic systems and may be sensitive to
296 disturbances, including alteration of hydrology or hydro-period, water quality, water chemistry,
297 and non-native species invasion, although a few populations are found in disturbed habitats.

298 Neat spike-rush (*Eleocharis nitida*) is listed as a species of special concern in Minnesota and as
299 an RFSS in the Superior National Forest. Neat spike-rush's distribution in Minnesota is limited
300 to the northeastern counties of the Arrowhead region and west to Itasca County. *E. nitida* was
301 first collected in Minnesota in 1946 from various wetland habitats in Cook and St. Louis
302 counties. Despite the long collection record for this species in Minnesota, relatively few
303 populations have been documented and little is known about the overall distribution of the
304 species throughout the state. *E. nitida* occurs within various wetland habitats of northern
305 Minnesota, including acid bog pools, small streams, areas of seasonal water drawdown
306 (mucky/peaty flats), disturbed wetland edges, and along roads and trails (MDNR 2011L).
307 *E. nitida* is a perennial plant that flowers in late spring and develops fruit in early to mid-
308 summer. Mature achenes (i.e., seed-containing fruit) are often necessary to positively identify *E.*
309 *nitida* species (both in the field and herbarium). This rooted perennial species may be
310 intolerant of hydrologic fluctuations and alterations to water quality and chemistry associated
311 with landscape and wetland alteration and development. However, roadside distributions suggest
312 the species may be semi-tolerant to disturbance and at least mild alterations in water quality in
313 the short term.

314 Bog rush (*Juncus stygius* var. *americanus*) is listed as a species of special concern in Minnesota
315 and as an RFSS in the Superior National Forest. Within Minnesota, bog rush is distributed across
316 the northern and northeastern Arrowhead counties in large patterned peatlands and calcareous
317 fens. It was first documented in St. Louis County in 1886 (Bell Museum of Natural History
318 2011). It is generally not a dominant species; even in ideal, large-patterned peatland settings, it
319 occurs in isolated colonies with scattered individuals (MDNR 2011L). Bog rush is a perennial
320 graminoid species that occurs in full sun, and, generally, it is restricted to narrow wet zones of
321 bogs and fens where it can exploit small gaps in surrounding vegetation. Since it often grows in
322 calcareous fens, it is influenced in some way by mineralized groundwater. It flowers and bears

323 fruit in mid to late summer (eFlora 2011). Threats to *J. stygius* var. *americanus* include climate
324 warming, water diversion (since it cannot compete well without vegetation gaps caused by
325 inundation), and invasion of non-native species.

326 Club-spur orchid (*Platanthera clavellata*) (synonyms: *Habenaria clavellata*, *Gymnadeniopsis*
327 *clavellata*) is listed as a species of special concern in Minnesota; it is not listed as an RFSS in the
328 Superior National Forest. Club-spur orchid was first recorded in Ramsey County in 1886 and has
329 since been documented in several counties across the northeast Arrowhead region and south to
330 Ramsey and Hennepin counties (Bell Museum of Natural History 2011). It generally occurs in
331 swamp forests with a canopy of black spruce and tamarack, and in non-forested fens with
332 hummocks of *Sphagnum* moss species (MDNR 2011L). *P. clavellata* is a perennial orchid with a
333 root/tuber system that is usually confined to growing within the living moss layer rather than the
334 peat below it. The species flowers in mid-summer (from early to late July), and is insect-
335 pollinated. Germination of the wind-borne seeds requires the presence of certain habitat-specific
336 mycorrhizal fungi. Club-spur orchid may be sensitive to habitat alterations and changes in
337 hydrology. It is suggested that activities several miles from a site could disrupt the hydrological
338 processes (through groundwater and surface water) that are needed to sustain habitat for
339 *P. clavellata* (MDNR 2011L).

340 Lapland buttercup (*Ranunculus lapponicus*) is listed as a species of special concern in
341 Minnesota; it is not listed as an RFSS in the Superior National Forest. Lapland buttercup occurs
342 throughout much of northern Minnesota, with the exception of extreme northwestern Minnesota.
343 This species was first documented in 1928 in Minnesota from a *Sphagnum* bog in Aitkin County
344 (Bell Museum of Natural History 2011). *R. lapponicus* is a perennial forb species that occurs
345 amongst *Sphagnum* moss hummocks and pools in rich forested swamps in Minnesota, usually
346 under a canopy of northern white cedar (MDNR 2011L). No populations have been found on
347 disturbed sites. Lapland buttercup is sensitive to changes in conifer forest canopy, wetland
348 hydrology/hydro-period, water chemistry, and other environmental factors affecting optimal
349 conifer forest pools and hummock micro-sites.

350 Torrey's manna grass (*Torreyochloa pallida*) (synonym: *Puccinellia pallida*) is listed as a
351 species of special concern in Minnesota; it is not listed as an RFSS in the Superior National
352 Forest. Torrey's manna grass was first collected in 1886 from Vermilion Lake in St. Louis
353 County (Bell Museum of Natural History 2011). Within Minnesota, *T. pallida* occurs throughout
354 the Arrowhead Region south to Chisago County (along the St. Croix River drainage). Torrey's
355 manna grass is a perennial graminoid species that occurs in various wetland habitats in northern
356 Minnesota. Habitats include shallow muck-bottomed pond and stream shores, bogs, and beaver
357 meadows. Some populations occur within roadside ditches, suggesting the species may be
358 somewhat tolerant of disturbance; however, this rooted perennial wetland species is sensitive to
359 alterations in wetland hydro-period, water level fluctuations, sedimentation, changes in water
360 chemistry associated with landscape alteration, and development and competition from
361 introduced invasive wetland species (e.g., *Typha angustifolia*, *Typha x glauca*, *Lythrum*
362 *salicaria*, *Phragmites australis*, *Phalaris arundinacea*).

363 **Regional Foresters Sensitive Species**

364 The Mine Site is located within the current boundaries of the Superior National Forest; however,
365 following the Land Exchange Proposed Action, the federal lands including a portion of the Mine
366 Site would no longer be National Forest System land. The USFS currently manages 58 vascular

367 and non-vascular plant species that are listed as RFSS in the Superior National Forest (see Table
 368 4.2.4-5). The list of these species was updated in early 2012 (USFS 2012f). The assessment of
 369 effects to RFSS would be detailed in the Biological Evaluation; this section provides a summary
 370 based on RFSS plants that could exist on the NorthMet Project area lands. The Biological
 371 Evaluation is an assessment of the likely effects on species with viability concerns and their
 372 suitable habitat as a result of the NorthMet Project Proposed Action.

373 Eight of the RFSS are state-listed ETSC species relevant to the NorthMet Project Proposed
 374 Action (*Botrychium pallidum*, *Botrychium rugulosum*, *Botrychium simplex*, *Caltha natans*,
 375 *Eleocharis nitida*, *Juncus stygius*, *Pyrola minor*, and *Saxifraga paniculata*) and are discussed
 376 above or in Section 4.3.4. All of these species, except *Pyrola minor* and *Saxifraga paniculata*,
 377 occur at the Mine Site. The RFSS plant species in Table 4.2.4-5 are grouped according to
 378 predominant habitat types/natural communities in which they occur, specifically Management
 379 Indicator Habitat (MIH) types if available. Additionally, more specific suitable habitat
 380 descriptions within each MIH type are provided for each species, and whether that habitat is
 381 potentially present on or near the federal lands, including portions of the Mine Site.

382 **Table 4.2.4-5 USFS RFSS Plant Species within Superior National Forest**

Species Name	Common Name	Habitat Description	Potential Habitat on/near Federal Lands
Upland Forest - MIH 1			
<i>Adoxa moschatellina</i>	Muskroot	Shaded damp cliffs and slopes in upland mature northern hardwood forest on North Shore	No
<i>Botrychium lanceolatum</i>	Triangle grapefern	Mature northern hardwood forests	Yes
<i>Botrychium lanceolatum</i> var. <i>angustisegmentum</i>	Lanceleaf grapefern	Northern hardwood forest, old fields, old logging roads, trails	Yes
<i>Botrychium lunaria</i>	Common moonwort	Open habitats such as old log landings, sawmill sites, old building sites	Yes
<i>Botrychium michiganense</i> (<i>hesperium</i>) ³	Michigan moonwort	Open habitats such as old log landings, old dirt roads, gravel pits, power line corridors, borrow pits, old fields, trails, and dredge spoil dumps	Yes
<i>Botrychium mormo</i>	Little goblin moonwort	Mesic northern hardwood forest with thick leaf litter layer	No
<i>Botrychium pallidum</i> ^{1,2}	Pale moonwort	Open disturbed habitats, log landings, roadsides, dunes, sandy gravel pits	Yes
<i>Botrychium rugulosum</i> ^{1,2}	Ternate or St. Lawrence grapefern	Generally open habitats, such as old log landings and edges of trails	Yes
<i>Botrychium simplex</i> ^{1,2}	Least grapefern	Generally open habitats, such as old log landings, roadside ditch, trails, open fields, base of cliff, railroad rights-of-way	Yes

Species Name	Common Name	Habitat Description	Potential Habitat on/near Federal Lands
<i>Carex novae-angliae</i>	New England sedge	Moist woods with sugar maple, also with birch, aspen, tall shrubs; yellow birch and white spruce-dominated forest	Yes
<i>Crataegus douglasii</i>	Douglas' hawthorn	North Shore rocky, gravelly streambeds/ banks and open areas, rocky borders of woods	No
<i>Osmorhiza berteroi</i>	Chilean sweet-cicely	Northern hardwood forest dominated by sugar maple on North Shore	No
<i>Piptatherum (=Oryzopsis) canadense</i>	Canada mountain ricegrass	Sandy/gravelly soil, red pine/jack pine plantations, borders/edges, trail sides, openings	Yes
<i>Polystichum braunii</i>	Braun's holly fern	Cool, shady cliffs and slopes in northern hardwoods in North Shore Highlands subsection	No
<i>Prosartes trachycarpa</i> (syn= <i>Disporum trachycarpum</i>)	Roughfruit fairybells	Semi-open jack pine forest with aspen, birch, shallow rocky soils, in east Border Lakes subsection	No
<i>Taxus canadensis</i>	Canada yew	Wide variety of uplands and lowlands, including cedar/ash swamps, talus and cliffs, northern hardwoods, aspen/birch forest	Yes
<i>Waldsteinia fragarioides</i>	Barren strawberry	Upland coniferous and deciduous forests, in recently harvested areas, established plantations	Yes
Lowland Black Spruce-tamarack Forest - MIH 9			
<i>Caloplaca parvula</i>	Lichen spp.	Smooth bark of young black ash in moist, humid old-growth black ash stand	No
<i>Calypso bulbosa</i>	Fairy slipper	Hummocks in northern white cedar swamps, moist to wet lowland conifer swamps, and to lesser extent in upland coniferous forests	Yes
<i>Cetraria (=Ahtiana) aurescens</i>	Lichen spp.	Conifer bark in lowland conifer swamps (old cedar/black spruce)	Yes
<i>Cypripedium arietinum</i>	Ram's-head lady's-slipper	White cedar swamps, forests dominated by jack pine, red pine, or white pine	Yes
<i>Drosera linearis</i>	Slenderleaf sundew	Minerotrophic water tracks in patterned peatlands	Yes
<i>Frullania selwyniana</i>	Selwyn's scalewort	Lowland cedar swamps on bark of white cedar	Yes
<i>Menegazzia terebrata</i>	Honey-combed lichen	Cedar swamps, especially old growth, base of cedar trees	Yes
<i>Polemonium occidentale</i> ssp. <i>lacustre</i>	Western Jacob's-ladder	White cedar swamps, also mixed conifer swamps, thrives in openings	Yes

Species Name	Common Name	Habitat Description	Potential Habitat on/near Federal Lands
<i>Pyrola minor</i> ²	Snowline wintergreen/small shinleaf	Black spruce swamps, and ecotone between uplands and lowland alder/conifer swamp, prefers closed canopy	Yes
<i>Ramalina thrausta</i>	Cartilage lichen	Cedar swamps, especially old growth	Yes
<i>Rubus chamaemorus</i>	Cloudberry	Black spruce/sphagnum forest, acidic; Superior National Forest at southern edge of species range	Yes
<i>Sticta fuliginosa</i>	Spotted felt lichen	On hardwood trees in humid, old growth cedar or ash bogs	Yes
<i>Usnea longissima</i>	Beard lichen	On old conifer trees in moist situations, often in or near a conifer or hardwood swamp	Yes
Aquatic Habitats – MIH 14			
<i>Astragalus alpinus</i>	Alpine milkvetch	Sandy, gravelly fluctuating shorelines with sparse vegetation	No
<i>Caltha natans</i> ^{1,2}	Floating marsh marigold	Shallow water of pools, ditches, sheltered lake margins, slow-moving creeks, sloughs/oxbows, pools in shrub swamps	Yes
<i>Juncus subtilis</i>	Creeping rush	Sandy lakeshore – only known occurrence in BWCAW	No
<i>Listera auriculata</i>	Auricled twayblade	On alluvial- or lake-deposited sands or gravels, with occasional seasonal flooding, associated with riparian alder or spruce/fir forest	Yes
<i>Littorella uniflora</i> (=L. americana)	American shoregrass	Shallow margins of nutrient-poor lakes, seepage lakes, sandy substrate, may have fine gravel/organic soil	Yes
<i>Nymphaea leibergii</i>	Dwarf water-lily	Slow-moving streams, rivers, beaver impoundments 1 to 2 meters deep	Yes
<i>Potamogeton oakesianus</i>	Oakes' pondweed	Quiet, acidic waters of bogs, ponds, and lakes	No
<i>Subularia aquatica</i>	Awlwort	Beach zone of sandy nutrient-poor lakes, shallow lake margins, 15- to 45-centimeter-deep water	Yes
Other - Emergent wetland habitats			
<i>Bidens discoidea</i>	Swamp beggarticks	Silty shores, hummocks in floating mats and swamps, partly submerged logs	Yes
<i>Eleocharis nitida</i> ^{1,2}	Neat spikerush	Mineral soil of wetlands, often with open canopy and disturbance, such as logging roads/ditches through wetlands	Yes
<i>Juncus stygius</i> ^{1,2}	Moor rush/bog rush	Shallow pools in non-forested peatlands, often in a sedge-dominated community	Yes

Species Name	Common Name	Habitat Description	Potential Habitat on/near Federal Lands
<i>Muhlenbergia uniflora</i>	Bog muhly	Wet sandy beaches, floating peat mats	Yes
<i>Viola lanceolata</i>	Bog white violet	Sandy to peaty lakeshores, borders of marshes and bogs, damp sand ditches	Yes
Other - Cliff, Talus Slopes, and Exposed Rock Habitat			
<i>Arctoparmelia centrifuga</i>	<i>Arctoparmelia</i> lichen	Sunny rocks and open talus slopes	No
<i>Arctoparmelia subcentrifuga</i>	<i>Arctoparmelia</i> lichen	Sunny rocks and open talus slopes	No
<i>Arnica lonchophylla</i>	Northern arnica	Cool and moist cliffs and ledges on North Shore	No
<i>Asplenium trichomanes</i>	Maidenhair spleenwort	In crevices of moist, mostly east-facing cliffs, ledges, and talus, Rove formation	No
<i>Carex rossii</i>	Short sedge	Rocky summits, dry exposed cliff faces, rocky slopes, in east Border Lakes subsection	No
<i>Cladonia wainioi</i>	Wain's cup lichen	On rock outcrops and thin soil, exposed sites with lots of light	No
<i>Huperzia appalachiana</i>	Appalachian clubmoss	Shelves and crevices on cliff/talus/rock outcrops, and shrub dominated talus piles	No
<i>Moehringia macrophylla</i>	Largeleaf sandwort	Cliffs/rock outcrops, talus, conifer sites on shallow soils, pine plantation with rocky outcrops, usually semi-open shrub or tree canopy	No
<i>Oxytropis borealis</i> var. <i>viscida</i>	Viscid locoweed	Slate cliffs and talus slopes in east Border Lakes subsection	No
<i>Saxifraga cernua</i>	Nodding saxifrage	Cliffs, ledges, diabase cliff (calcium-based feldspars)	No
<i>Saxifraga paniculata</i> ²	White mountain saxifrage/encrusted saxifrage	Cliffs, sheltered crevices, and ledges of north-facing cliffs	No
<i>Tofieldia pusilla</i>	Scotch false asphodel	Sedge mats at edges of shoreline rock pools along Lake Superior	No
<i>Woodsia glabella</i>	Smooth woodsia	Moist, north-facing cliffs along Lake Superior	No
None Specified			
<i>Pseudocyphellaria crocata</i>	<i>Pseudocyphellaria</i> moss	Mossy rocks, trees in partially shaded, moist, frequently foggy habitats	Yes
<i>Peltigera venosa</i>	Felt lichen	Soil and moist cliffs, exposed root wads	Yes

383 Sources: NatureServe 2011; NatureServe 2014b; USFS 2004a; USFS 2010d; USFS 2012f.

384 Notes:

385 ¹ Listed as a state ETSC species and located at the Mine Site.

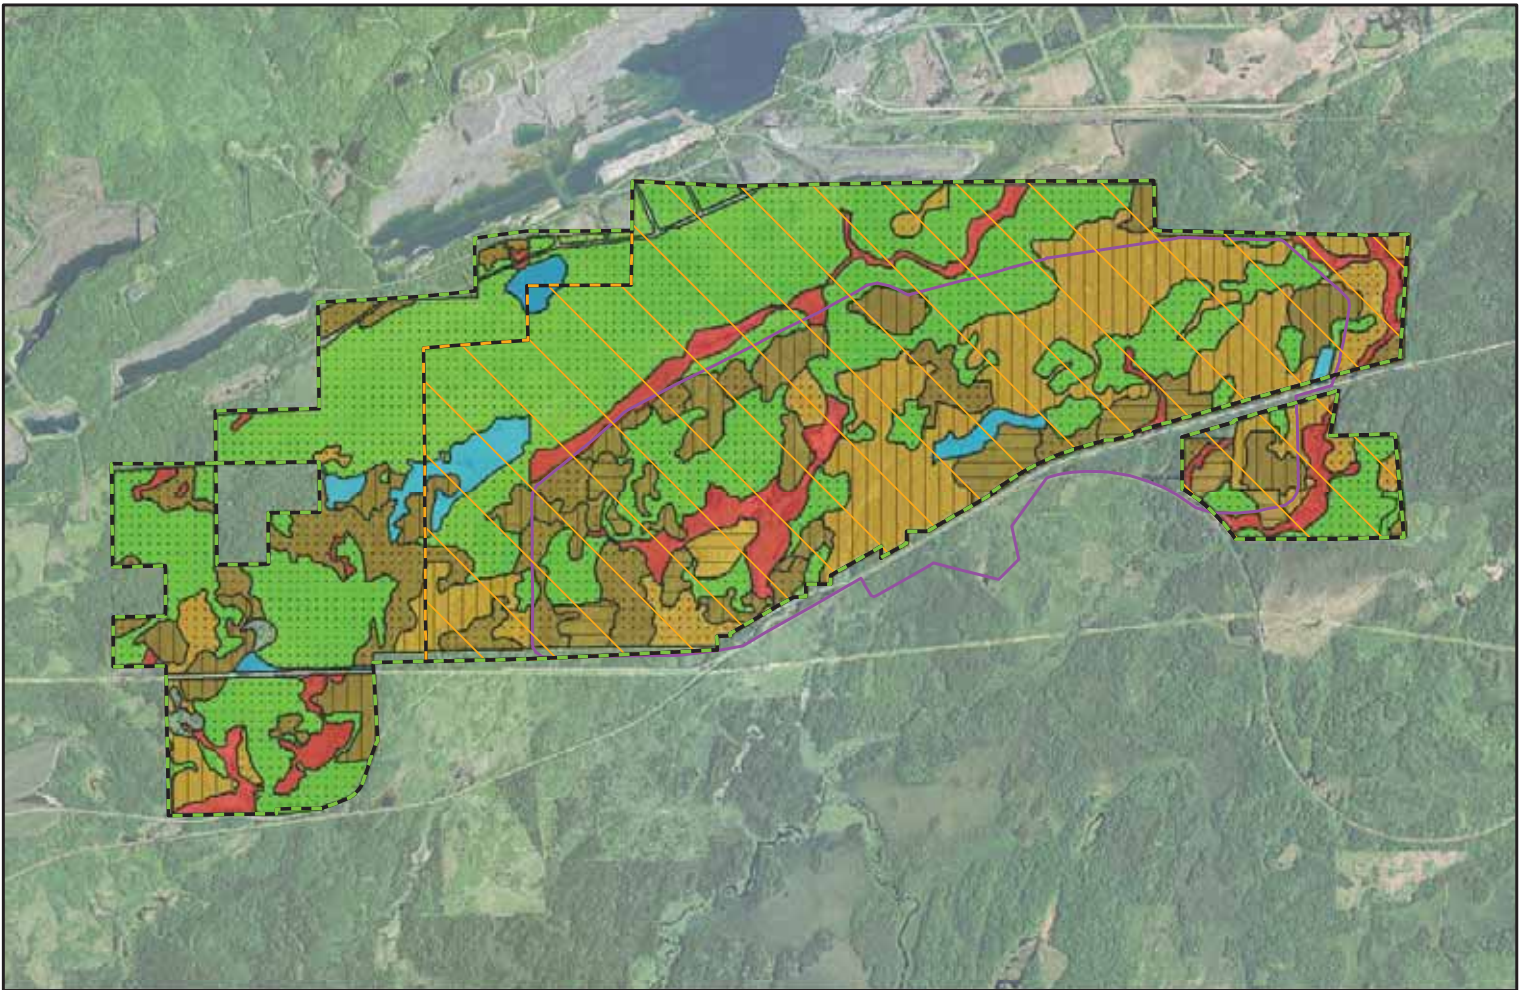

386 ² Listed as a state ETSC species and located on the federal or non-federal lands.

387 ³ Known to occur on the federal lands.

388 Six state-listed ETSC plant species (*Botrychium pallidum*, *Botrychium rugulosum*, *Botrychium*
389 *simplex*, *Caltha natans*, *Eleocharis nitida*, and *Juncus stygius*) are also RFSS plants and are
390 located on the Mine Site, as discussed in Section 4.2.4.2.3. *Botrychium michiganense* is also
391 located on the Mine Site, according to MDNR NHIS data, and is an RFSS plant (see Table
392 4.2.4-5). The USFS designates and maintains data about MIH types on federal lands; MIH types
393 are categories of forest types, including dominant species, stand age class, and stand condition. A
394 smaller subset of all MIH types was used for this RFSS discussion, including upland forest (MIH
395 1), upland conifer forest (MIH 5), lowland black spruce-tamarack forest (MIH 9), and aquatic
396 habitats (MIH 14). Upland forest (MIH 1) and lowland black spruce-tamarack forest (MIH 9) are
397 almost most prevalent in the federal lands portion of the Mine Site (see Table 4.3.4-3 and Figure
398 4.2.4-4), indicating that the 17 RFSS associated with MIH 1 and the 13 RFSS associated with
399 MIH 9 have the highest probability of occurring on the federal lands, including the Mine Site.
400 Upland conifer forest (MIH 5) occurs in smaller acreage; however, there are no RFSS associated
401 with MIH 5. Since this category overlaps MIH 1, the 17 RFSS associated with MIH 1 may also
402 occur within this category. The lowland emergent habitat type occurs on the federal lands portion
403 of the Mine Site, as well, and the five associated RFSS may be present.

DRAFT

407 **4.2.4.3 Transportation and Utility Corridor**

408 The Transportation and Utility Corridor includes the existing private Dunka Road, an existing
 409 private PolyMet railroad grade, a Minnesota Power Company 138-kV electric transmission line,
 410 a proposed Treated Water Pipeline, a proposed 13.8-kV electric distribution line, and a proposed
 411 railroad connection between the Cliffs Erie railroad track and existing PolyMet track.

412 **4.2.4.3.1 Cover Types**

413 ***Habitat Types***

414 Because of prior use during the former LTVSMC taconite mining operation, the Transportation
 415 and Utility Corridor is now defined as having a “disturbed” cover type (see Table 4.2.4-6). The
 416 remaining MDNR GAP land cover types that are not disturbed include cropland/grassland
 417 (8 percent of the Corridor), shrubland (6 percent of the Corridor), and smaller acreages of the
 418 remaining types. The MDNR GAP land cover types below may not fully represent the extent of
 419 mixed forest types, since the cover type level below is fairly specific, so there may be more
 420 mixed forest types than indicated.

421 **Table 4.2.4-6 NorthMet Transportation and Utility Corridor Cover Types**

Cover Types	Total Acres	Percent of Area
Disturbed	94.4	79
Cropland/Grassland	9.8	8
Shrubland	7.7	6
Aquatic environments	2.7	2
Upland deciduous forest ⁴	2.7	2
Upland coniferous forest ³	2.6	2
Lowland coniferous forest ¹	0.2	<1
Lowland deciduous forest ²	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	120.2⁽⁶⁾	100

422 Source: MDNR 2006b.

423 Notes:

424 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

425 ² Includes black ash forest cover types.

426 ³ Includes pine and spruce/fir forest cover types.

427 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

428 ⁵ Includes all mixed coniferous-deciduous forest cover types.

429 ⁶ Total acres may be more or less than presented due to rounding.

430 ***Minnesota Biological Survey***

431 There are two MBS Sites of High Biodiversity Significance (18.8 acres) located within the
 432 Transportation and Utility Corridor, including the One Hundred Mile Swamp (2 percent of the
 433 Corridor) and the Upper Partridge River (13 percent of the Corridor) (MDNR 2008a).

434 There are several native plant communities occupying the Transportation and Utility Corridor,
 435 most of which have no assigned conservation status rank. The aspen-birch forest: balsam fir
 436 subtype (FDn43b1) native plant community (1 percent of the Corridor) is ranked as “widespread
 437 and secure” (MDNR 2008b).

438 **Scientific and Natural Areas**

439 There are no SNAs located within the Transportation and Utility Corridor.

440 **Culturally Important Plants**

441 As with the Mine Site discussion, Section 4.2.9.3.3 provides a discussion of natural resources
 442 culturally important to the Bands.

443 **4.2.4.3.2 Invasive Non-native Plants**

444 According to the Superior National Forest invasive plant geodatabase, there are no known
 445 occurrences of invasive species within the Transportation and Utility Corridor, but no invasive
 446 species inventories have been performed in the NorthMet Project area (USFS 2010a). USFS
 447 roadside surveys indicate that several invasive non-native species (e.g., common tansy, spotted
 448 knapweed, etc.) could be located within the Corridor (see Table 4.2.4-3). A qualitative vegetation
 449 field survey conducted by Barr (2012n) indicated that hawkweeds, red and white clover, oxeye
 450 daisy, smooth brome, bluegrass, and timothy were observed along the Transportation and Utility
 451 Corridor.

452 **4.2.4.3.3 Threatened and Endangered Plant Species**

453 **Endangered, Threatened, and Special Concern Plant Species**

454 Based on a review of the MDNR NHIS and field investigations, no federally listed plant species
 455 occur on the Transportation and Utility Corridor. However, two state-listed ETSC plant species
 456 (*Botrychium pallidum*, *B. simplex*) have been identified within the Transportation and Utility
 457 Corridor area (see Figure 4.2.4-3). These two species' populations that occur along Dunka Road
 458 immediately adjacent to or overlapping the Mine Site were discussed previously in the review of
 459 the Mine Site to avoid repetition. The species (*B. pallidum*) populations that occur along Dunka
 460 Road, farther away from and not overlapping the Mine Site are discussed separately below (see
 461 Table 4.2.4-7).

462 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
 463 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
 464 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
 465 associated with the updated list.

466 **Table 4.2.4-7 Endangered, Threatened, and Special Concern Plant Species Identified**
 467 ***within the Transportation and Utility Corridor***

Scientific Name	Common Name	State Status ¹	No. of Populations	No. of Individuals	Habitat and Location
<i>Botrychium pallidum</i>	Pale moonwort ²	SC	3	16	Full to shady exposure, edge of forests along Dunka Road

468 Source: Barr 2012n.

469 Notes:

470 ¹ SC = Species of Special Concern

471 ² These species are also RFSS as tracked by the USFS.

472 **Species Life History**

473 Section 4.2.4.2.3 discusses the life history of *Botrychium pallidum*.

474 **4.2.4.4 Plant Site**

475 The Plant Site includes the Beneficiation Plant, Area 1 Shops, Area 2 Shops, Hydrometallurgical
476 Residue Facility and Plant, and the Tailings Basin (PolyMet 2015a). The Plant Site itself
477 comprises 4,515.4 acres, but including the surrounding buffer lands that PolyMet owns or has
478 leased surface rights to, the Plant Site consists of approximately 15,000 acres, one-third of which
479 is estimated to have been disturbed by previous LTVSMC operations. The Colby Lake Water
480 Pipeline Corridor is also included in this section. The pipeline connects the Plant Site to Colby
481 Lake, which is south of the Plant Site.

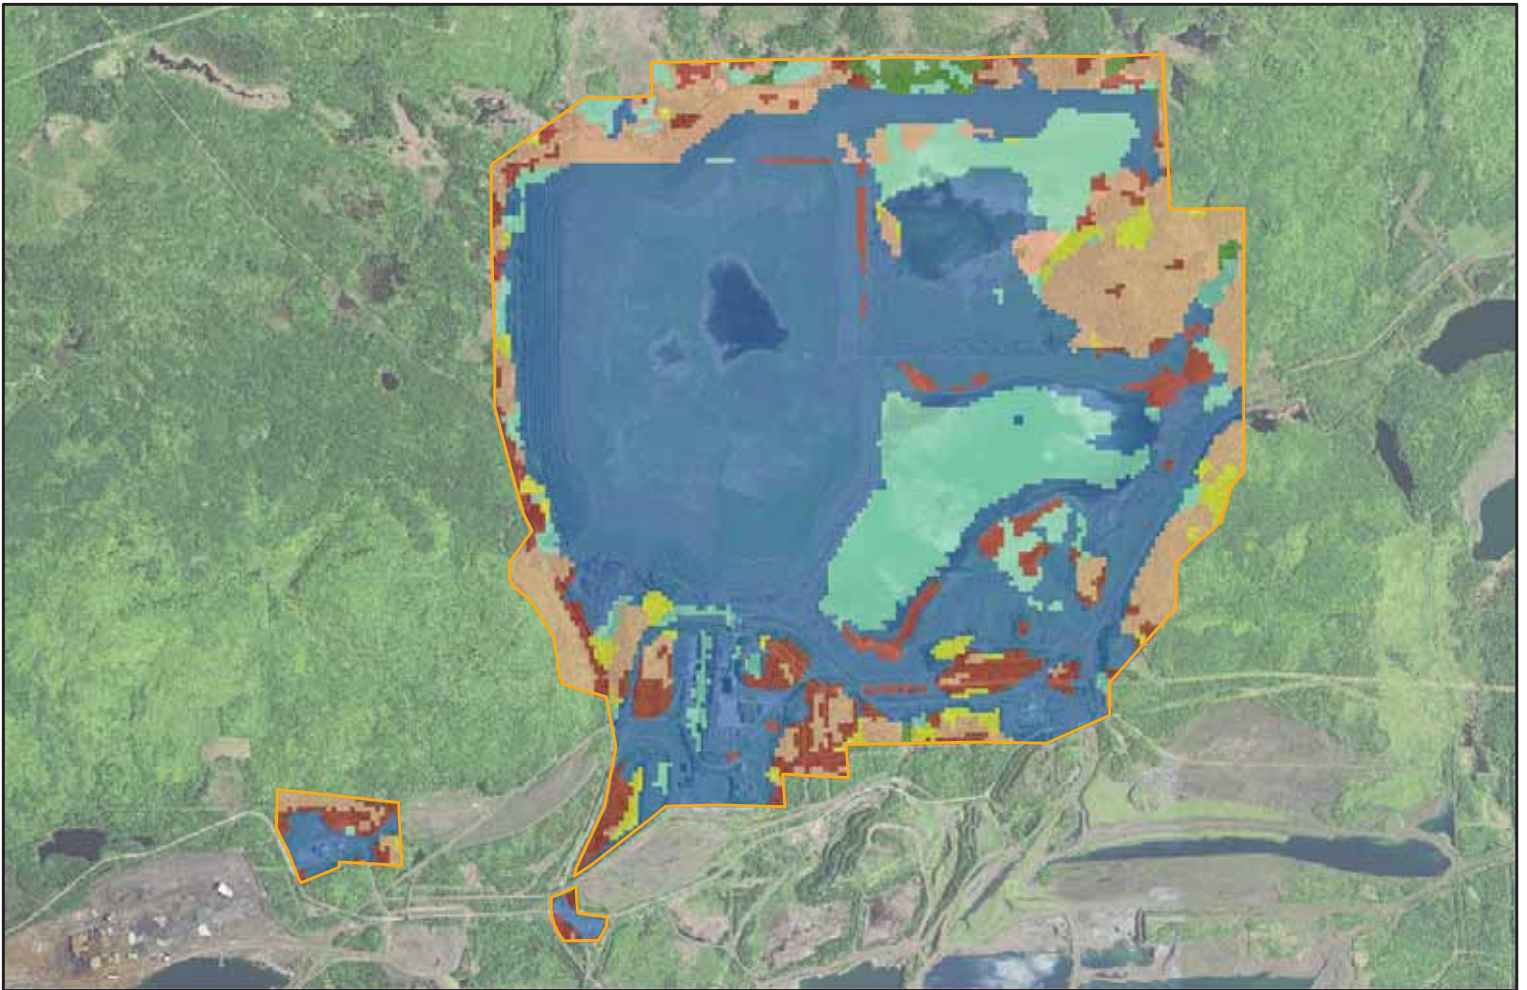

482 **4.2.4.4.1 Cover Types**

483 **Plant Site**

484 **Habitat Types**

485 Because of use during the former LTVSMC taconite mining operation, the majority of the Plant
486 Site is now defined as having a “disturbed” cover type (see Table 4.2.4-8 and Figure 4.2.4-5).
487 The remaining MDNR GAP land cover types include approximately equal areas of aquatic
488 environments (14 percent of the Plant Site) and upland deciduous forests (14 percent of the Plant
489 Site), and smaller areas of shrubland, upland conifer forest, and lowland conifer forest. The
490 MDNR GAP land cover types below may not fully represent the extent of mixed forest types,
491 since the cover type level below is fairly specific, so there may be more mixed forest types than
492 indicated.

DRAFT

496 **Table 4.2.4-8 NorthMet Plant Site Cover Types**

Cover Types	Total Acres	Percent of Area
Disturbed	2,755.5	61
Upland deciduous forest ⁴	647.6	14
Aquatic environments	636.8	14
Shrubland	333.8	7
Upland coniferous forest ³	99.8	2
Lowland coniferous forest ¹	41.9	1
Cropland/Grassland	0.0	0
Lowland deciduous forest ²	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	4,515.4	99⁽⁶⁾

497 Source: MDNR 2006b.

498 Notes:

499 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

500 ² Includes black ash forest cover types.

501 ³ Includes pine and spruce/fir forest cover types.

502 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

503 ⁵ Includes all mixed coniferous-deciduous forest cover types.

504 ⁶ Percent totals are less than 100 percent due to rounding.

505 **Minnesota Biological Survey**

506 There are no MBS Sites of Biodiversity Significance located on the Plant Site (see Figure
 507 4.2.4-4) (MDNR 2008a). Native plant community rankings are not available for the Plant Site.

508 **Scientific and Natural Areas**

509 There are no SNAs located on or near the Plant Site.

510 **Culturally Important Plants**

511 The most upstream portion of the Embarrass River Watershed, recommended as a water source
 512 used for production of wild rice, is from the MN-135 highway bridge to the inlet of Sabin Lake
 513 (MPCA 2012b). The former Wild Rice Valley Farms is located adjacent to the Embarrass River,
 514 but no wild rice was observed within this area or the adjacent portion of the Embarrass River
 515 during field surveys, and it is not recommended as a water source used for production of wild
 516 rice (MPCA 2012b). Hay Lake, located along the upper stretch of the Embarrass River, is
 517 recommended as a water source used for production of wild rice, but Sabin and Wynne lakes are
 518 not recommended as waters used for production of wild rice except for the northern-most tip of
 519 Wynne Lake (MPCA 2012b). Embarrass Lake is recommended as a water used for production of
 520 wild rice (MPCA 2012b). Though low-density beds of wild rice were observed on Embarrass
 521 Lake in 2009 and 2010, no rice was observed in 2011 (Barr 2012a). No wild rice was observed in
 522 Spring Mine Creek, Trimble Creek, or Unnamed Creek near the Plant Site and they are not
 523 recommended as waters used for production of wild rice (Barr 2011a; Barr 2012a; MPCA
 524 2012b). Section 4.2.2 provides a discussion on wild rice survey results and water quality
 525 standards (see Figure 4.2.2-3).

526 A discussion of natural resources culturally important to the Bands is presented in Section
 527 4.2.9.3.3.

528 ***Colby Lake Water Pipeline Corridor***

529 ***Habitat Types***

530 Extending south from the Plant Site is the Colby Lake Water Pipeline Corridor. There would be
 531 no construction within this pipeline corridor, as an existing pipeline would be used for the
 532 NorthMet Project Proposed Action. The corridor consists of 50.6 acres (see Table 4.2.4-9), and
 533 the MDNR GAP land cover types are dominated by disturbed areas (42 percent) and
 534 cropland/grassland (23 percent).

535 **Table 4.2.4-9 NorthMet Colby Lake Water Pipeline Corridor Cover Types**

Cover Types	Total Acres	Percent of Area
Disturbed	21.4	42
Cropland/Grassland	11.5	23
Shrubland	8.4	17
Upland deciduous forest ⁴	6.5	13
Aquatic environments	1.4	3
Lowland deciduous forest ²	0.6	1
Upland coniferous forest ³	0.5	1
Lowland coniferous forest ¹	0.2	<1
Upland conifer-deciduous mixed forest ⁵	0	0
Total	50.5⁽⁶⁾	100

536 Source: MDNR 2006b.

537 Notes:

538 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

539 ² Includes black ash forest cover types.

540 ³ Includes pine and spruce/fir forest cover types.

541 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

542 ⁵ Includes all mixed coniferous-deciduous forest cover types.

543 ⁶ Total acres may be more or less than presented due to rounding.

544 **4.2.4.4.2 Invasive Non-native Plants**

545 The Tailings Basin at the Plant Site is severely disturbed and already contains invasive non-
 546 native plants such as smooth brome grass, reed canary-grass, and yellow sweet clover. These
 547 species are tolerant of a wide variety of conditions, and can spread vegetatively or reproductively
 548 (MDNR 2011b). They often grow on disturbed lands, roadsides, and ditches. According to the
 549 Superior National Forest invasive plant geodatabase, there are no known occurrences of invasive
 550 species on the Plant Site, but no inventories have been performed in the NorthMet Project area
 551 (USFS 2010a). Similar to the Mine Site, the Plant Site could also have the species listed in Table
 552 4.2.4-3, including common tansy, spotted knapweed, or thistle species.

553 **4.2.4.4.3 Threatened and Endangered Plant Species**

554 ***Endangered, Threatened, and Special Concern Plant Species***

555 Based on a review of the MDNR NHIS, no federally listed or state-listed ETSC plant species are
556 known to occur on the Plant Site or within Colby Lake Water Pipeline Corridor. A detailed
557 ETSC plant species survey was not conducted at the Plant Site because suitable habitat for these
558 species is not present at this predominantly disturbed and developed site. ETSC species that are
559 disturbance-adapted may exist along the rail line or roads. Consequently, the federal lands
560 (including the Mine Site), Transportation and Utility Corridor, and non-federal lands are the
561 focus of this FEIS vegetation analysis.

DRAFT

DRAFT

1 **4.2.5 Wildlife**

2 This section describes the existing wildlife species and habitat which are or may be present in the
3 NorthMet Project area. These species or their sign, such as tracks or droppings, have been
4 observed during surveys, were identified as historically present, and/or typically use habitat
5 present in the NorthMet Project area. Species are grouped in four partially overlapping
6 categories: federally and state-listed ETSC (16 species); SGCN (95 species); the USFS's RFSS
7 (18 species, excluding aquatic species); and other wildlife species, including wildlife species
8 important to the Bands.

9 Several federally and state-listed ETSC wildlife species that were identified in scoping as
10 potentially present in the NorthMet Project area are described in Section 4.2.5.1.1. Others were
11 added to this section upon updating of the NHIS records and new state ETSC list. Federally
12 listed species records are maintained by the USFWS and the state-listed species records are
13 maintained in the Minnesota NHIS. The NHIS is the most complete source of data on
14 Minnesota's rare or otherwise significant wildlife species, but it is not a comprehensive statewide
15 inventory. It is based on historical museum records, published information, and field work, and is
16 continually updated as new information becomes available. Therefore, the lack of a species
17 occurrence in the NHIS database does not necessarily confirm the absence of a particular species
18 in that area (MDNR 2014d). A county-by-county survey of rare natural features is being
19 conducted by the MDNR as part of the Minnesota Biological Survey.

20 Additional information—such as species conservation ranking, distribution, and habitat—was
21 obtained from NatureServe, an online public database that utilizes sources such as scientific
22 literature, web sites, experts, and information from local data centers.

23 Several wildlife surveys have been conducted on the federal lands (including the Mine Site),
24 Plant Site, Transportation and Utility Corridor, and non-federal lands. These studies gathered
25 information on general wildlife utilization of the area, presence or absence of species of concern,
26 and identification of habitat used by wildlife.

27 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
28 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
29 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
30 associated with the updated list. A Biological Assessment (BA) that provides further information
31 on federally listed species, and a BE that contains further information about RFSS have been
32 prepared. The BA and BE are included in Appendix D and are posted on the USFS website
33 (www.fs.usda.gov/goto/superior/northmet). The Co-lead Agencies met with the USFWS several
34 times during informal consultation. The USACE, USFS, and USFWS initiated informal
35 consultation on February 26, 2010, when the agencies met to discuss the NorthMet Project. The
36 USACE subsequently met with the USFWS on May 3, 2011, September 1, 2011, and February
37 28, 2013 to discuss it further. The USACE, USFS, and USFWS met on July 9, 2014 to identify
38 tasks to be accomplished in the development of the BA. Specifically, the northern long-eared bat
39 and habitat were discussed, which led to further USFS bat survey work being proposed. The
40 USACE, USFS, and USFWS met on October 29, 2014 to discuss comments received on the draft
41 BA and potential mitigation measures.

42

43 **4.2.5.1 Mine Site**

44 **4.2.5.1.1 Federally and State-listed Species and Species of Special Concern**

45 **Canada Lynx**

46 Canada lynx (*Lynx canadensis*) populations in the continental United States are protected under
47 the ESA as a federally listed threatened species. The species is also listed as a species of special
48 concern in Minnesota, but is considered globally secure by NatureServe (NatureServe 2014a).
49 Lynx population cycles are related to snowshoe hare populations, and therefore, lynx are
50 predominantly found in boreal forests, specifically spruce and fir. This habitat type corresponds
51 to USFS MIH types 5, 6, and/or 9. Lynx mortality due to starvation and declining reproduction
52 rates have been documented during periods of hare scarcity (Poole 1994; Slough and Mowat
53 1996). Hunger-related stress, which induces dispersal, may increase exposure of lynx to other
54 forms of mortality such as trapping and vehicle collisions (Brand and Keith 1979; Ward and
55 Krebs 1985; Bailey et al. 1986). Between 2001 and 2013, the USFWS has documented two lynx
56 killed by trains and seven lynx killed by road traffic in Minnesota (USFWS 2013). Lynx may
57 also be subject to competition and predation from species such as bobcat and cougar (Buskirk et
58 al. 2000).

59 Lynx have been described as generally tolerant of humans (Sunde et al. 1998). Reports suggest
60 that lynx are not displaced by human activity, including moderate levels of snowmobile traffic
61 (Mowat et al. 2000) and ski resort activities (ENSR 2006). In an area with sparse roads in north-
62 central Washington State, logging roads did not appear to affect habitat use by lynx (McKelvey
63 et al. 2000). By contrast, lynx in the southern Canadian Rocky Mountains, where road density is
64 higher, crossed highways within their home ranges less than would be expected (Apps 2000).

65 Over three-quarters of lynx records in Minnesota are from the northeastern portion of the state
66 (McKelvey et al. 2000). Research in Minnesota confirmed a resident breeding population of
67 lynx. Of the 426 sightings reported to the MDNR Division of Ecological Resources between
68 2000 and 2006, 76 percent were in St. Louis, Lake, and Cook counties. Approximately 113 lynx
69 were sighted in St. Louis County between 2000 and 2006 and 8 percent of these lynx showed
70 evidence of reproductive activity (MDNR 2012d).

71 Current conditions for this species in the NorthMet Project area were determined through review
72 of existing data sources, including various lynx sighting databases (Moen et al. 2006; MDNR
73 2012d; USFS 2013), project-specific studies during the summer season (ENSR 2005), and a
74 winter tracking survey (ENSR 2006). The winter tracking survey also included interviews with
75 experts, private conservation groups, and the public, who are familiar with lynx use of the survey
76 area.

77 On February 25, 2009, the USFWS published the *Final Rule for Revised Designation of Critical*
78 *Habitat for the Contiguous United States Distinct Population Segment of the Canada Lynx*
79 (50 CFR 17). Portions of the Mine Site lie within the revised boundaries of federally designated
80 lynx critical habitat, which includes most of northeastern Minnesota. A recovery plan has not yet
81 been issued for the Canada lynx.

82 The USFS designates Lynx Analysis Units (LAUs) within the Superior National Forest that
83 include landscape-scale analysis areas for lynx management. These LAUs were developed in
84 consultation with the USFWS. The federal lands, including the Mine Site, are located within

85 LAU 12, a 70,980-acre area in the southwest portion of the Superior National Forest. According
86 to the USFS (USFS 2013), approximately 69,131 acres, or 96 percent, of LAU 12 currently
87 provide suitable lynx habitat.

88 Lynx sign has been observed at the Mine Site. Moen et al. (2006) found that at least 20 different
89 individual lynx sightings have occurred within 18 miles of the NorthMet Project area, including
90 several radio-collared and reproductive individuals. During this study, the nearest reported
91 sighting was approximately 6 miles from the Mine Site (Moen et al. 2006). The majority of
92 sightings are clustered along roads and other places frequented by people.

93 An ENSR 2006 lynx winter tracking survey covered a 250-square-mile area centered on the
94 NorthMet Project area. The survey did not find any sign of lynx within the Mine Site or federal
95 land boundaries, but tracks and DNA analysis of scat indicated four unrelated female lynx had
96 been present at some time within the 250-square-mile survey area approximately five miles south
97 and east of the Mine Site (ENSR 2006). Track surveys suggest that two individuals made most of
98 the trails found. Although preferred cover types for the snowshoe hare exist on the Mine Site
99 (i.e., jack pine, fir-aspen-birch, aspen-birch), the forest may be too old for there to be appreciable
100 hare densities, as snowshoe hare generally favor sapling or young pole stands (ENSR 2006). The
101 USFS observed lynx tracks at the Mine Site in 2010, and multiple observations of lynx sign
102 within 5 miles of the federal lands are noted in the USFS lynx tracking database (USFS 2013).
103 Lynx density may increase as the snowshoe hare population cycles from a low point. Areas of
104 blow down or logging slash where there is both vertical and horizontal cover may be used by
105 lynx for denning sites (Moen 2009). Some logging slash is located on the west end of the Mine
106 Site.

107 **Northern Long-Eared Bat**

108 The northern long-eared bat (*Myotis septentrionalis*), also known as the northern myotis, is
109 proposed to be federally listed as threatened, is currently state-listed as a species of special
110 concern in Minnesota, and is also a Superior National Forest RFSS. It is considered imperiled
111 globally or vulnerable in Minnesota by NatureServe (NatureServe 2014a). Several bat species
112 were added to the Minnesota ETSC list due to the emergence of white-nose syndrome, a fungal
113 disease that could threaten Minnesota bat populations as it has in eastern bat populations. On
114 October 2, 2013, the USFWS published a proposal to federally list the northern long-eared bat
115 throughout its range. There was a 6-month extension and re-opening of the public comment
116 period on the proposed rule listing on June 30, 2014. The final listing and interim 4(d) rule were
117 published on April 2, 2015, and go into effect on May 4, 2015 (50 CFR Part 17, April 2, 2015).

118 The northern long-eared bat occurs throughout Canada and in much of the eastern United States,
119 west to North and South Dakota. Its preferred summer habitat includes upland forests and
120 riparian areas where they forage for insects in forest clearings, under tree canopies, and over
121 water (MDNR 2014b; NatureServe 2014a). Generally, summer day roost sites include those
122 under loose tree bark or within buildings, while night roosts include areas in caves, mines, and
123 tunnels. It seems to be opportunistic in the selection of roost sites (USFWS 2013b). The northern
124 long-eared bat enters its winter hibernacula (which may include caves, mines, overhangs,
125 crevices, drill holes, and similar sites) in late August to September. Typically, winter hibernacula
126 require constant temperatures, high humidity, and no air currents (USFWS 2013b). It generally
127 hibernates in small colonies (fewer than 100 individuals) (MDNR 2014b; NatureServe 2014a),
128 but the Soudan Underground Mine in northern Minnesota has supported a winter hibernating

129 colony of up to 2,000 individuals. However, there is uncertainty in the high end of this estimate,
130 as much of the mine may not be available for surveys (MDNR 2006e). Both summer and winter
131 habitat types may be found on or near the Mine Site.

132 Baseline acoustic surveys for bats, which include the northern long-eared bat, the eastern
133 pipistrelle, and the little brown bat, have been completed in the Superior National Forest east of
134 the NorthMet Project area (Abel 2011). Bats were observed at the Mine Site and surrounding
135 federal lands during echolocation surveys, but they were not identified to species (AECOM
136 2011a). The USFS conducted various bat surveys at the NorthMet Project area during summer of
137 2014 (USFS 2014b). Passive bat detectors were deployed on exploration trails within the Mine
138 Site to detect bat calls. The northern long-eared bat was responsible for 13.6 percent of all calls
139 detected at the Mine Site during this survey. The USFS also conducted additional bat surveys at
140 sites in Lake and St. Louis counties in spring 2014 (USFS 2014c). Of the 130 bats captured
141 during mist-netting surveys, 28 were northern long-eared bats. A USFS survey in the Kawishiwi
142 District in the summer of 2013 found that of 34 bats captured by mist-netting efforts, 13 were
143 northern long-eared bat (Grandmaison et al. 2013).

144 **Gray Wolf**

145 On July 1, 2009, the U.S. District Court issued a settlement agreement to remand an April 2009
146 USFWS decision to delist the western Great Lakes population of gray wolves. As a result, the
147 gray wolf (*Canis lupus*) was again a federally listed threatened species. On May 4, 2011, the
148 USFWS once again proposed to reinstate the 2009 decision to delist the gray wolf population in
149 the western Great Lakes. This decision was finalized on December 26, 2011 and was made
150 effective on January 27, 2012. Effective on December 19, 2014, however, the U.S. District Court
151 again reinstated federal protection of the gray wolf, classifying it as a threatened species. The
152 gray wolf was removed from the Minnesota ETSC species list in 2013, but it is still listed as a
153 Superior National Forest RFSS. With the 2014 federal re-listing of the wolf, Minnesota is again
154 divided into the five federal wolf management zones and critical habitat has been reinstated.
155 According to NatureServe, it is globally ranked as apparently secure, but vulnerable in
156 Minnesota (NatureServe 2014a).

157 Populations of gray wolves have been re-established in several western states from their low
158 point in the mid-1970s when only northeast Minnesota, among the lower 48 states, had a
159 reproducing population. Gray wolf populations in the western Great Lakes Region
160 (i.e., Minnesota, Wisconsin, and Michigan) are expanding and have exceeded recovery goals for
161 several years (Erb and Benson 2004). A 2007 to 2008 winter survey by the MDNR (Erb 2008)
162 estimated that 2,921 gray wolves lived in Minnesota, which is second only to Alaska in wolf
163 populations across the United States. The MDNR considers the gray wolf population fully
164 recovered, as it has surpassed the federal delisting goal of 1,251 to 1,400 wolves (MDNR
165 2012e). Surveys conducted in the winter of 2013 to 2014 estimate the Minnesota wolf population
166 to be approximately 2,423 animals, 212 more than estimated in 2013 (Erb et al. 2014). In the fall
167 of 2013, the MDNR established a designated wolf hunt with an overall quota of 220 wolves. A
168 total of 238 wolves were harvested during the hunt. The MDNR set a 2014 statewide target
169 harvest of 250 wolves.

170 In northern Minnesota, the principal prey of the gray wolf includes white-tailed deer, moose,
171 beaver, snowshoe hare, and muskrat, with occasional other small mammals, birds, and large
172 invertebrates. Most wolves live in 2- to 11-member family packs and defend territories of 8 to

173 184 square miles. In Minnesota, the average pack size during winter 2013-2014 was estimated to
174 be 4.4 individuals (Erb et al. 2014). The forest and brush habitats at the federal lands and Mine
175 Site are typical wolf habitat (MIHs 1 to 14).

176 Radio-collared wolves have been observed in the vicinity of the federal lands and the Mine Site.
177 Additionally, tracks and scat have been observed along Dunka Road and the roads within the
178 Mine Site. The surrounding area is likely to support a pack of at least three individuals (ENSR
179 2005).

180 **Moose**

181 The moose (*Alces americanus*) is not federally listed, but was added to the Minnesota ETSC
182 species list as a species of special concern in 2013. It is considered globally secure by
183 NatureServe (NatureServe 2014a). Moose, which have been observed in the NorthMet Project
184 area (ENSR 2005), are a species of importance to the Bands. Moose typically utilize a mosaic of
185 habitat types, including early successional (young) forests, mixed conifer-hardwood forests,
186 wetlands, and lakes (NatureServe 2014a). Waterbodies are often used in summer for foraging
187 aquatic plants, cooling down, or escaping insects, while early successional forests (created by
188 logging, forest fires, or windstorms) are browsed year-round. Dense conifer stands are used for
189 thermal cover in the heat of summer, or used in winter to avoid deep snow. Moose are adapted
190 very well for cold conditions, but are fairly intolerant of heat, making thermal cover or access to
191 water important to reduce heat stress. However, Lenarz et al. (2011) suggest that moose in
192 northeastern Minnesota may display higher preferences for early successional habitat in summer
193 and winter than either aquatic environments or conifer forests. Some research suggests that
194 climate change and warming temperatures may be related to mortality along the southern edge of
195 the moose range (Lenarz et al. 2011). Higher mortality rates could be due to several causes,
196 including heat stress or increased parasites. Several parasites and diseases can negatively affect
197 moose mortality rates; these include winter ticks, brainworm, and liver flukes, among several
198 others (NRRI 2014).

199 The overall moose population in Minnesota declined approximately 35 percent from 2012 to
200 2013 (MDNR 2013d). The 2014 winter aerial moose survey estimated the population at 4,350
201 animals, up from the 2013 estimate of 2,760 (DelGiudice 2014). However, this is likely due to
202 variability in the survey conditions from year to year and uncertainty inherent in the survey itself.
203 The MDNR is currently partnering with several other agencies to conduct multiple research
204 projects to identify the causes of the increase in moose mortalities.

205 Due to decreased population levels in the state of Minnesota and its new state listing as a species
206 of special concern, there was not a 2013 or 2014 moose hunting season. In previous years, when
207 moose hunting was open, the NorthMet Project area would have been outside of the hunting
208 zone, though moose zone 30 has been located to the south of the Transportation and Utility
209 Corridor in previous hunting seasons. In 2012, two bull moose were harvested in zone 30
210 (DelGiudice 2012).

211 **Little Brown Bat**

212 The little brown bat (*Myotis lucifugus*), also known as the little brown myotis, is not federally
213 listed, but is state-listed as a species of special concern in Minnesota. It is listed as a Superior
214 National Forest RFSS. It is considered globally vulnerable by NatureServe, but ranges across
215 North America (NatureServe 2014a). Several bat species were added to the Minnesota ETSC list

216 due to the emergence of white-nose syndrome, a fungal disease that could threaten Minnesota
217 populations as it has in eastern populations. A habitat generalist, its preferred habitat includes
218 boreal forests, bogs and fens, open fields, shrublands, and urban areas. It forages primarily in
219 woodlands near water sources. The little brown bat generally enters its hibernacula in September
220 to October, and utilizes caves, tunnels, and abandoned mines with a relatively stable temperature
221 (NatureServe 2014a). The Soudan Underground Mine in northern Minnesota has served as a
222 hibernaculum for an estimated 10,000 bats, the majority of which are little brown bat (MDNR
223 2006e). Its summer day roost and maternity sites include hollow trees, caves, and human-made
224 structures. This tree roost habitat may potentially be found at the Mine Site. Bats were observed
225 at the Mine Site and surrounding federal lands during echolocation surveys, but they were not
226 identified to species (AECOM 2011a).

227 The USFS conducted various bat surveys at the NorthMet Project area during the summer of
228 2014 (USFS 2014b). Passive bat detectors were deployed on exploration trails within the Mine
229 Site to detect bat calls. The little brown bat was responsible for 77.8 percent of all calls detected
230 at the Mine Site during this survey. The USFS also conducted additional bat surveys at sites in
231 Lake and St. Louis counties in spring 2014 (USFS 2014c). Of the 130 bats captured during mist-
232 netting surveys, 59 were little brown bats. A USFS survey in the Kawishiwi District in the
233 summer of 2013 found that of 34 bats captured by mist-netting efforts, 21 were little brown bat
234 (Grandmaison et al. 2013).

235 **Eastern Pipistrelle**

236 The eastern pipistrelle (*Perimyotis subflavus*), also known as the tri-colored bat, is not federally
237 listed, but is state-listed as a species of special concern in Minnesota. It is also listed as a
238 Superior National Forest RFSS. It is considered vulnerable globally and in Minnesota by
239 NatureServe (NatureServe 2014a). Several bat species were added to the Minnesota ETSC list
240 due to the emergence of white-nose syndrome, a fungal disease that could threaten Minnesota
241 populations as it has in eastern populations. Minnesota is located at the western edge of the
242 species' range. Its preferred habitat includes partially open areas with large trees and woodland
243 edges, but it avoids open fields and deep woods (MDNR 2014b; NatureServe 2014a). It
244 primarily forages over open water areas. It generally enters its hibernacula beginning in October,
245 and occupies the deeper portions of caves and mines where temperatures and humidity levels are
246 higher. Typically, they are semi-solitary hibernators, hanging singly and separated from other
247 bats (Nordquist and Birney 1985). The eastern pipistrelle has occasionally been observed
248 hibernating in the Soudan Underground Mine in northern Minnesota (MDNR 2006e). During
249 summer, its day roost sites include trees and human-made structures, while night roosts may
250 include caves. Tree roost habitat can potentially be found at the Mine Site, though the species is
251 more common in the southern half of Minnesota. Bats were observed at the Mine Site and
252 surrounding federal lands during echolocation surveys, but they were not identified to species
253 (AECOM 2011a). The USFS conducted various bat surveys at the NorthMet Project area during
254 summer of 2014 (USFS 2014b). The USFS also conducted additional bat surveys at sites in Lake
255 and St. Louis counties in spring 2014 (USFS 2014c) and on the Kawishiwi District in summer
256 2013 (Grandmaison et al. 2013). The eastern pipistrelle was not detected during any of the USFS
257 surveys.
258

259 **Northern Goshawk**

260 The northern goshawk (*Accipiter gentilis*) is not federally listed and is considered globally secure
261 by NatureServe (NatureServe 2014a). It is state-listed as a species of special concern in the state
262 of Minnesota, and the Minnesota NHIS records indicate it does occur on the Mine Site. Its
263 preferred habitat includes older forests, particularly aspen. This habitat is found in the NorthMet
264 Project area. Calling surveys did not identify northern goshawk at the Mine Site (ENSR 2005;
265 AECOM 2009a); however, a northern goshawk nest was identified at the Mine Site. Two
266 northern goshawk territories have been identified at or near the Mine Site, as northern goshawk
267 have nested on the Mine Site and adjacent federal lands in 2000, 2009, 2011, and 2013
268 (USFS 2013). The One Hundred Mile Swamp northern goshawk territory, which is within the
269 Mine Site, is no longer considered active. The Wetlegs Creek northern goshawk territory, located
270 on the federal lands adjacent to the Mine Site, is still considered active and is currently being
271 monitored.

272 **Boreal Owl**

273 The boreal owl (*Aegolius funereus*) is not federally listed and is considered globally secure by
274 NatureServe (NatureServe 2014a). It is state-listed in Minnesota as a species of special concern.
275 Its preferred habitat includes dense coniferous and mixed forests containing spruce, pine, aspen,
276 and alder trees. This habitat is found on and near the NorthMet Project area. A boreal owl was
277 heard on Dunka Road during surveys in 1988 to 1989 near the Mine Site and federal lands
278 (ENSR 2005); however, Minnesota is at the southern edge of its range in North America. The
279 Minnesota NHIS does not contain any boreal owl records within 10 miles of the NorthMet
280 Project area, and it was not observed during subsequent surveys (ENSR 2000; ENSR 2005;
281 AECOM 2009; AECOM 2011a). The boreal owl nests in tree holes and natural cavities in far
282 northeastern Minnesota, but is rarely seen due to its nocturnal hunting habit (MDNR 2014e).

283 **Wood Turtle**

284 The wood turtle (*Glyptemys insculpta*) is listed as a threatened animal species by the state of
285 Minnesota and as an RFSS by the USFS. The wood turtle is not federally listed, but is considered
286 globally vulnerable (imperiled in Minnesota) by NatureServe (NatureServe 2014a). The species'
287 range extends from Virginia to Nova Scotia and westward to Minnesota and northeast Iowa. The
288 NorthMet Project area is located at the western edge of its range in Minnesota. Significant wood
289 turtle populations, however, are unlikely to be found at the Mine Site because it prefers a habitat
290 of sandy-gravelly streams and bars, used for hibernating, mating, and nesting (Compton et al.
291 2002), which are not present at the Mine Site.

292 The Minnesota NHIS records indicate the northernmost population in the state was observed
293 immediately south of the Mine Site. Given this proximity, it is possible that wood turtles may
294 potentially occur along the southern fringes of the Mine Site.

295 **Eastern Heather Vole**

296 The eastern heather vole (*Phenacomys ungava*) is listed as a species of special concern by the
297 state of Minnesota and as an RFSS by the USFS. It is not federally listed, and is globally secure
298 but vulnerable in Minnesota according to NatureServe (NatureServe 2014a). The eastern heather
299 vole is a habitat generalist, but typically inhabits the coniferous zones in upland forests and

300 brushlands and meadows with low shrub species, usually near water. Habitats of this type may
301 occur on the federal lands or at the Mine Site; however, the Minnesota NHIS does not contain
302 any eastern heather vole records within 10 miles of the NorthMet Project area. It was also not
303 found in nearby surveys of small mammals on the Chippewa National Forest (Christian 1993)
304 and in Cook County (Jannett 1998). The NorthMet Project area is at the southern edge of the
305 eastern heather vole's home range in far northern Minnesota and only a few collections of the
306 species occur within Minnesota. The USFS MIH 8, which is primarily jack pine forest, is
307 considered indicative of eastern heather vole habitat. No significant stands of MIH 8 were
308 observed on the federal lands or the proposed Mine Site.

309 **Yellow Rail**

310 The yellow rail (*Coturnicops noveboracensis*) is a state-listed species of special concern. It is not
311 federally listed, and its global rank is considered apparently secure, although vulnerable in
312 Minnesota (NatureServe 2014a). Habitat for yellow rail includes lowland sedge meadows.
313 Several small patches (totaling 39.5 acres) of wet meadow/sedge meadow occur at the Mine Site.
314 The Minnesota NHIS has no records of the yellow rail occurring within 10 miles of the
315 NorthMet Project area and field surveys did not identify any yellow rail (ENSR 2005).

316 **Laurentian Tiger Beetle**

317 The Laurentian tiger beetle (*Cicindela denikei*) is listed as a species of special concern by the
318 state of Minnesota. It is not federally listed, and its global rank is considered vulnerable
319 (imperiled in Minnesota) (NatureServe 2014a). Although it was not searched for during field
320 surveys, the NHIS has no records of Laurentian tiger beetle occurring within 10 miles of the
321 NorthMet Project area. This species inhabits openings in northern coniferous forests, specifically
322 abandoned gravel and sand pits, undisturbed corners of active gravel and sand pits, sand and
323 gravel roads, and sparsely vegetated rock outcrops (MDNR 2012g). Conifer forests occur on the
324 Mine Site, but field surveys did not detect sandy or rocky openings in the forest (ENSR 2005).
325 Rock exposures are evident in areas disturbed by past mining, but conifer forests do not surround
326 these areas.

327 **Taiga Alpine**

328 The taiga alpine (*Erebia mancinus*) butterfly is listed as a species of special concern by the State
329 of Minnesota. It is not federally listed, and it is considered globally secure by NatureServe
330 (NatureServe 2014a). Minnesota is at the southern limit of the species' range. Although it was
331 not searched for during field surveys, the NHIS has no records of taiga alpine occurring within
332 10 miles of the NorthMet Project area. This species inhabits black spruce bogs and swamps that
333 include Labrador tea shrub layers, and sphagnum moss carpets (MDNR 2014b). These habitat
334 types occur on the Mine Site and federal lands.

335 **Freija's Grizzled Skipper**

336 The Freija's grizzled skipper (*Pyrgus centaureae freija*) butterfly is listed as a species of special
337 concern by the State of Minnesota. It is not federally listed, and it is considered globally
338 apparently secure by NatureServe (NatureServe 2014a). Minnesota is at the southern limit of the
339 species' range, and it is known to occur in Minnesota from only a single locality in Lake County
340 (MDNR 2014b). Although it was not searched for during field surveys, the NHIS has no records

341 of Freija's grizzled skipper occurring within 10 miles of the NorthMet Project area. This species
342 inhabits primarily forest edges and openings; the Lake County location included grassy and
343 sandy openings with willow, alder, and blueberries, bordered by black spruce and tamarack
344 swamps (MDNR 2014b). These habitat types occur on the Mine Site and federal lands.

345 **Nabokov's Blue**

346 The Nabokov's blue (*Lycaeides idas nabokovi*) butterfly is listed as a species of special concern
347 by the State of Minnesota. It is not federally listed, and it is globally unrankable by NatureServe
348 (NatureServe 2014a). This subspecies ranges from the Great Lakes states up into Ontario and
349 southeastern Manitoba (MDNR 2014b). Although it was not searched for during field surveys,
350 the NHIS has no records of Nabokov's blue occurring within 10 miles of the NorthMet Project
351 area. This species' preferred habitat includes open woodlands and upland openings where the
352 larval host plant, dwarf bilberry (*Vaccinium cespitosum*), is abundant (MDNR 2014b). In
353 Minnesota, all known colonies of this butterfly subspecies occur at sandy sites. These habitat
354 types may occur on the Mine Site and federal lands, but the larval host plant was not observed.

355 **Quebec Emerald**

356 The Quebec emerald dragonfly (*Somatochlora brevicincta*) is listed as a species of special
357 concern in the state of Minnesota. It is not federally listed, and is considered globally apparently
358 secure by NatureServe (NatureServe 2015). Field surveys for this species were not completed,
359 but the NHIS has no records of Nabokov's blue occurring within 10 miles of the NorthMet
360 Project area. The Minnesota Odonata Survey Project, however, found an individual in northern
361 Lake County approximately 30 miles north of the NorthMet Project area in 2006. This species'
362 habitat requirements are not well-understood in Minnesota. Reports suggest that it inhabits poor
363 fens found in the NorthMet Project area and wet meadow/sedge meadow habitat such as at the
364 Mine Site. The likelihood of observing Quebec emerald individuals or populations in the vicinity
365 of the federal lands and Mine Site is low.

366 **4.2.5.1.2 Species of Greatest Conservation Need**

367 The Minnesota Comprehensive Wildlife Conservation Strategy (MCWCS), an ecoregion-based
368 wildlife management strategy (MDNR 2006d) identifies SGCN by ecoregion subsections based
369 on a statewide approach. The MCWCS was created with input from multiple stakeholders and
370 expert panels to cover issues of regional, as well as statewide, concern. The Mine Site and Plant
371 Site are located within the Nashwauk and Laurentian Uplands subsections and include five key
372 habitat types. The SGCN species associated with these habitat types at the Mine Site are
373 identified below in Table 4.2.5-1.

374 Mature upland and lowland forest is the most common habitat type at the NorthMet Project area
375 (primarily at the Mine Site). Section 4.2.4 provides a more detailed discussion of vegetation
376 cover and habitat types (see Figure 4.2.4-1). Northern goshawk, spruce grouse, black-backed
377 woodpecker, and boreal owl were observed in these forests (ENSR 2005). These species
378 represent a group that generally requires large forested blocks and/or minimal human intrusion.

379 Brush/grassland and very early successional forest are uncommon at the Mine Site (ENSR 2005)
380 and, where present, are typically small patches resulting from recent logging. The USFS has
381 indicated that American woodcock has been observed at the Mine Site and the least weasel may

382 occur as well. Most of the other SGCN species in Table 4.2.5-1 are generally associated with
 383 large patches of grassland and savanna habitats that are not present at the Mine Site.

384 **Table 4.2.5-1 Key Habitat, Cover Types, and Associated Species in the Nashwauk and**
 385 **Laurentian Uplands Subsections at the NorthMet Project Area**

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species ¹	Mine Site (Acres)	Transportation and Utility Corridor (Acres)	Plant Site (Acres)
1. Mature Upland Forest, Continuous Upland/Lowland Forest: aspen forest/aspen-birch forest, jack pine forest, mixed pine-hardwood forest (MIH 1-13)	Veery, whip-poor-will, eastern wood-pewee, yellow-bellied sapsucker, ovenbird, Canada warbler, Cape May warbler, spruce grouse , winter wren, boreal chickadee, wood thrush, black-backed woodpecker , <i>bald eagle</i> ² , boreal owl (MIH 4, 5, and 9) , <i>bay-breasted warbler</i> , <i>black-throated blue warbler</i>	2,627.2	5.5	789.3
2. Open Ground, Bare Soils: disturbed/ developed (no MIH)	None	128.0	94.4	2,755.5
3. Grassland and Brushland, Early Successional Forest (no MIH)	Eastern meadowlark, Franklin's ground squirrel, brown thrasher, white-throated sparrow, sharp-tailed grouse, golden-winged warbler, <i>American woodcock</i> , northern harrier, sedge wren, common nighthawk, black-billed cuckoo, red-headed woodpecker, tawny crescent, <i>least weasel</i>	246.6	17.5	333.8
4. Aquatic Environments: Tailings Basin, Partridge River, Embarrass River, former LTVSMC mine pits, wetlands (MIH 14)	Common loon, red-necked grebe, common snapping turtle, northern rough-winged swallow, American white pelican, common tern, Wilson's phalarope, black tern, trumpeter swan, black duck, American bittern, swamp sparrow, eastern red-backed salamander, bog copper, taiga alpine, <i>marbled godwit</i>	12.7	2.7	636.8
5. Multiple Habitats (MIH 1-14)	Gray wolf ² (1-4 ⁽³⁾), <i>Canada lynx</i> ² (1-4), rose-breasted grosbeak (1, 3), Macoun's arctic (1, 3), least flycatcher (1, 3), <i>Connecticut warbler</i> (1, 3), <i>olive-sided flycatcher</i> (1, 4), grizzled skipper (2, 3), Nabokov's blue (2, 4), wood turtle ² (1, 3, 4)			
Total		3,014.5	120.1	4,515.4

386 Source: MDNR 2006d.

387 Notes:

388 ¹ Bold text indicates SGCN species observed at Mine Site and/or Plant Site (ENSR 2005); italicized text indicates SGCN species
 389 targeted by ENSR (2005) that were not found; plain text indicates SGCN species identified as likely to be present at the Mine
 390 Site or Plant Site but not targeted in surveys.

391 ² Canada lynx, gray wolf, bald eagle, and wood turtle are or have recently been listed as ETSC species, as discussed in detail in
 392 the ETSC species section.

393 ³ Numbers refer to the Key Habitat Types (1-5) where those species may occur or are known to occur.

395 The Mine Site and adjacent federal lands contain a large expanse of wetland habitat consisting
396 primarily of coniferous bogs and coniferous swamps. No wetland SGCN species have been
397 observed in this area. Marbled godwit was not found likely because its preferred habitat of
398 graminoid wetlands and shallow marshes near extensive upland grassland are not present at the
399 Mine Site. Currently, there are no bodies of open water at the Mine Site.

400 Multiple habitats are not mapped as such, but are made up of combinations of other key habitat
401 types. This category is used for SGCN species that are known to use multiple habitats during a
402 season. The gray wolf, Canada lynx, least flycatcher, and wood turtle were observed in the
403 general vicinity of the Mine Site and are known to utilize multiple key habitat types, including
404 mature and early-successional upland forest and wetlands. The Connecticut warbler, which also
405 uses mature and early-successional upland forest and wetlands, was searched for, but not found.
406 Similarly, the olive-sided flycatcher was surveyed for in both lowland forest and wetlands, but
407 was not found, most likely because it prefers more open and mature conifer and mixed conifer-
408 deciduous stands. The butterfly species grizzled skipper and Nabokov's blue are not found
409 within 12 miles of the Mine Site or Plant Site.

410 **4.2.5.1.3 Regional Forester Sensitive Species**

411 RFSS are not protected but their needs are taken into consideration by the USFS when planning
412 natural resource management on USFS lands. The majority of the Mine Site (and adjacent
413 federal lands) is located in the Superior National Forest. Currently, 18 terrestrial wildlife RFSS
414 are included on the Superior National Forest RFSS list, which was updated on February 20, 2012
415 (USFS 2012f).

416 Twelve of the RFSS are federally or state-listed ETSC species (i.e., gray wolf, northern long-
417 eared bat, little brown bat, eastern pipistrelle, eastern heather vole, northern goshawk, boreal
418 owl, wood turtle, taiga alpine, Freija's grizzled skipper, Nabokov's blue, and Quebec emerald)
419 and are discussed above in Section 4.2.5.1.1. Three other RFSS (the olive-sided flycatcher, bay-
420 breasted warbler, Connecticut warbler) are on the SGCN list and are discussed by habitat type in
421 Table 4.2.5-1 above. Three other RFSS species are discussed briefly below.

422 **Bald Eagle**

423 The bald eagle (*Haliaeetus leucocephalus*) was removed from the federal threatened species list
424 on June 28, 2007. After a period of decline due to hunting and widespread use of
425 dichlorodiphenyltrichloroethane (DDT), bald eagle populations in the lower 48 states rose
426 dramatically beginning in 1972. The bald eagle was removed from the Minnesota ETSC species
427 list in 2013, but continues to be listed as an RFSS by the USFS. According to NatureServe, it is
428 globally secure, but vulnerable in Minnesota (NatureServe 2014a). In addition, the bald eagle is
429 federally protected by the Bald and Golden Eagle Protection Act and the Migratory Bird Treaty
430 Act.

431 The Minnesota NHIS (MDNR 2014d) contains records of 18 nesting areas, some with multiple
432 nests, within 12 miles of the federal lands and Plant Site. Some of these areas contained nests in
433 close proximity to each other and were assumed to be used by a single pair of bald eagles
434 (Guinn 2004). No nests were recorded at the Mine Site and field surveys found no evidence of
435 any nests (ENSR 2005). The five closest bald eagle nesting territories were 2.4 to 7.3 miles from
436 the Mine Site or Plant Site (averaging 5.7 miles apart). Bald eagles are typically associated with
437 large lakes surrounded by mature forest where large trees provide suitable nest sites and a perch

438 while searching for fish and other prey. No large lakes are located at the Mine Site and it is
439 unlikely that bald eagles would heavily use these areas.

440 The NorthMet Project area was also reviewed to evaluate whether it may provide wintering
441 habitat for bald eagles. Eagles generally winter where there is available food at or near open
442 water, and where carrion is available. Animal-vehicle collisions on Dunka Road and/or natural
443 deer mortality are not likely to produce sufficient carrion to sustain bald eagles at the Mine Site
444 (ENSR 2005). While bald eagles have been observed utilizing dead trees on other tailings basins
445 in the Mesabi Iron Range for nesting and perching, no nests have been observed in the NorthMet
446 Project area. Bald eagles may use standing dead trees near the existing LTVSMC Tailings Basin
447 for perching.

448 MIH 7, which is primarily red and white pine forest, is considered indicative of bald eagle
449 habitat by the USFS. No stands of MIH 7 were specifically observed on the federal lands or
450 proposed Mine Site; however, MIH 7 is a subset of the broader MIH 5, which was observed at
451 the Mine Site (see Figure 4.2.4-3).

452 **Great Gray Owl**

453 The great gray owl (*Strix nebulosa*) is not listed federally or in Minnesota, nor is it tracked in the
454 Minnesota NHIS. It is considered globally secure by NatureServe (NatureServe 2014). Its
455 preferred habitat includes coniferous and mixed forests and boreal bogs, which include MIHs 4,
456 5, and 9. These habitats are found in the NorthMet Project area. Calling surveys did not identify
457 great gray owls at the Mine Site (ENSR 2000 and 2005); however, 2009 surveys identified a
458 great gray owl hunting along Dunka Road south of the Mine Site, and the USFS has records of a
459 great gray owl nesting in the NorthMet Project area in 2006 (AECOM 2009a), 2010, and 2011
460 (USFS 2013).

461 **Three-Toed Woodpecker**

462 The three-toed woodpecker (*Picoides tridactylus*) is not listed federally or in Minnesota and is
463 globally secure according to NatureServe (NatureServe 2014a). It is not tracked in the Minnesota
464 NHIS. This species was identified during winter field surveys (ENSR 2000); however, it was not
465 identified during summer field surveys (ENSR 2005). A limiting factor for this species is
466 foraging habitat where sufficient insects can be found to feed its young during the breeding
467 season. Three-toed woodpeckers prefer and are most abundant in large tracts of old growth
468 coniferous forest near recent burns where they forage on dead and dying trees for bark beetles
469 (Burdett and Niemi 2002). MIH 9 and MIH 12 are considered habitat for the three-toed
470 woodpecker. No old growth coniferous habitat or recent burns are present at the Mine Site or
471 adjacent federal lands. A three-toed woodpecker was observed at the Mine Site by USFS
472 personnel in 2007; however, the birds are unlikely to be common due to a lack of suitable
473 habitat.

474 **Bat Species**

475 The northern long-eared bat, eastern pipistrelle, and little brown bat species were added to the
476 2011 RFSS list due to the spread of white-nose syndrome, which is a fungal disease impacting
477 bats. The disease carries a high mortality rate for all bat species; the Superior National Forest is
478 closely watching the RFSS bat species to identify signs of white-nose syndrome, as discussed
479 above in Section 4.2.5.1.1.

480 **4.2.5.1.4 Other Wildlife Species**

481 Other wildlife species common to the area may be present at the Mine Site and surrounding
482 NorthMet Project area. Species of interest include the monarch butterfly, northern leopard frog,
483 common loon, hooded merganser, osprey, red-tailed hawk, ruffed grouse, spruce grouse,
484 American woodcock, killdeer, common tern, belted kingfisher, pileated woodpecker, black-
485 backed woodpecker, brown creeper, golden-crowned kinglet, Swainson's thrush, magnolia
486 warbler, pine warbler, savannah sparrow, beaver, porcupine, black bear, and white-tailed deer.

487 Species observed, or their sign, on the Mine Site and surrounding federal lands include black
488 bear, white-tailed deer, coyote, red fox, beaver, marten, snowshoe hare, red squirrel, ruffed
489 grouse, spruce grouse, American woodcock, common snipe, mallard, lesser scaup, hooded
490 merganser, red-tailed hawk, broad-winged hawk, barred owl, saw-whet owl, great-horned owl,
491 great blue heron, pileated woodpecker, and several passerine bird species (ENSR 2005; AECOM
492 2009a; AECOM 2009b).

493 Game species such as white-tailed deer and black bear are found in and near the NorthMet
494 Project area, and are of importance to the Bands. The NorthMet Project area is located within
495 bear management unit 31. The 6-year harvest average is 319 animals within unit 31 (MDNR
496 2013b; MDNR 2014c). Similarly, the NorthMet Project area is within the hunting zone for deer
497 area 176. The 5-year average is 2.3 deer harvested per square mile in this deer area (MDNR
498 2013c). Sections 4.2.9 and 5.2.9 discuss species of importance to the Bands.

499 **4.2.5.2 Plant Site and Transportation and Utility Corridor**

500 **4.2.5.2.1 Federally and State-listed Species and Species of Special Concern**

501 **Canada Lynx**

502 The Plant Site is not on USFS land, and therefore is not located within an LAU. The western
503 edge of the Plant Site borders a critical lynx habitat zone but not an LAU. The lynx winter
504 tracking survey (ENSR 2006) did not identify any sign of lynx at the Plant Site.

505 The eastern portion of the Transportation and Utility Corridor, located directly south of the
506 federal lands, is included in LAU 12 and in a lynx critical habitat zone. The western portion of
507 the Transportation and Utility Corridor is not located in an LAU or critical habitat zone. The
508 Transportation and Utility Corridor is located along areas of potential for moderate and high
509 quality wildlife travel corridors, including surveyed wildlife corridors (Emmons and Olivier
510 2006; Barr 2009a). Section 6.2.5.4.2 includes further discussion of wildlife travel corridors.

511 **Northern Long-Eared Bat**

512 The USFS conducted various bat surveys at the NorthMet Project area during summer of 2014
513 (USFS 2014b). Driving surveys were conducted along Dunka Road, the Tailings Basin, and the
514 Plant Site, and the northern long-eared bat was responsible for 4.6 percent of all calls detected.
515 Emergence surveys were also conducted around Plant Site buildings to identify potential roost
516 sites. The largest number of emerging bats was observed at the coarse crusher building. Of the
517 bats observed within and emerging from the buildings, the northern long-eared bat comprised 6.9
518 percent at the coarse crusher building, and 27.8 percent at the concentrator building.

519 **Gray Wolf**

520 As previously mentioned, collared gray wolves and gray wolf signs have been observed in the
521 vicinity of the NorthMet Project area, including the Plant Site. Gray wolf tracks and scat have
522 been observed along Dunka Road, and radio-collared individuals and call survey responses
523 indicate that gray wolves may be present along the Transportation and Utility Corridor. As noted
524 previously, the area near the federal lands and Mine Site, including the eastern end of the
525 Transportation and Utility Corridor, may support a pack of three or more individual gray wolves.

526 **Moose**

527 The Minnesota NHIS does not contain any records of moose occurring within the Transportation
528 and Utility Corridor or Plant Site, and no wildlife surveys specifically for moose were conducted
529 in these areas. Moose have been observed at the Mine Site and federal lands (ENSR 2005;
530 AECOM 2011a), which are both located in close proximity to the Transportation and Utility
531 Corridor and Plant Site. Due to the areas' primarily disturbed nature, it is possible that moose
532 occur in these areas, but it is unlikely that they utilize them often.

533 **Little Brown Bat**

534 The USFS conducted various bat surveys at the NorthMet Project area during summer of 2014
535 (USFS 2014b). Driving surveys were conducted along Dunka Road, the Tailings Basin, and the
536 Plant Site, and the little brown bat was responsible for 31.3 percent of all calls detected.
537 Emergence surveys were also conducted around Plant Site buildings to identify potential roost
538 sites. The largest number of emerging bats was observed at the coarse crusher building. Of the
539 bats observed within and emerging from the buildings, the little brown bat comprised 93.1
540 percent at the coarse crusher building, 72.2 percent at the concentrator building, and 100 percent
541 (8 to 10 bats) at the drive house.

542 **Eastern Pipistrelle**

543 The USFS conducted various bat surveys at the NorthMet Project area during summer of 2014
544 (USFS 2014b). The eastern pipistrelle was not detected during any of the USFS surveys along
545 Dunka Road, the Tailings Basin, or the Plant Site buildings.

546 **Northern Goshawk**

547 The northern goshawk's preferred habitat includes older forests, particularly aspen. This habitat
548 is found on and near the Plant Site and Transportation and Utility Corridor. The Minnesota NHIS
549 does not contain any northern goshawk records within the Transportation and Utility Corridor or
550 Plant Site. However, since a northern goshawk nest was identified at the Mine Site, and two
551 northern goshawk territories have been identified at or near the Mine Site, it is possible that
552 northern goshawks utilize the Plant Site and Transportation and Utility Corridor.

553 **Boreal Owl**

554 Given the lack of dense coniferous and mixed forests, which is the boreal owl's preferred habitat,
555 it is unlikely that it would occur at the Plant Site. However, this habitat is found in proximity to
556 the Plant Site and Transportation and Utility Corridor. A boreal owl was heard along Dunka
557 Road during surveys in 1988 to 1989 near the Mine Site and federal lands (ENSR 2005);
558 however, the Minnesota NHIS does not contain any boreal owl records within 10 miles of the

559 NorthMet Project area, and it was not observed during subsequent surveys (ENSR 2000; ENSR
560 2005; AECOM 2009; AECOM 2011a).

561 **Wood Turtle**

562 No wood turtles were observed during wildlife surveys of the NorthMet Project area. Given the
563 lack of sandy-gravelly streams and bars, which is the preferred habitat for the wood turtle, it is
564 unlikely that the wood turtle would be found at the Plant Site. There are no NHIS records of
565 wood turtles at the Plant Site (MDNR 2014d). The NHIS records indicate that the northernmost
566 population of wood turtle in the state was observed immediately south of the Mine Site. Given
567 the proximity of the Transportation and Utility Corridor, it is possible that wood turtles could be
568 present along the eastern portion of the corridor and southern fringes of the Mine Site.

569 **Eastern Heather Vole**

570 The eastern heather vole is a habitat generalist, but typically inhabits the coniferous zones in
571 upland forests and brushlands and meadows with low shrub species, usually near water. Habitats
572 of this type occur at the Plant Site or along the Transportation and Utility Corridor; however, the
573 Minnesota NHIS does not contain any eastern heather vole records within 10 miles of the
574 NorthMet Project area. The NorthMet Project area is at the southern edge of the eastern heather
575 vole's home range in far northern Minnesota and only a few collections of the species occur
576 within Minnesota.

577 **Yellow Rail**

578 Yellow rail prefer sedge meadow, which is present in a very small amount (1.5 acres) at the Plant
579 Site and in small patches adjacent to the Transportation and Utility Corridor. The Minnesota
580 NHIS has no records of the yellow rail occurring within 10 miles of the NorthMet Project area
581 and field surveys did not identify any yellow rail (ENSR 2005).

582 **Laurentian Tiger Beetle**

583 The Laurentian tiger beetle prefers rocky or sandy areas adjacent to conifer forests. This habitat
584 is found at the Plant Site and along the Transportation and Utility Corridor, though there were no
585 Minnesota NHIS records of occurrences of the species near the Plant Site or Transportation and
586 Utility Corridor.

587 **Taiga Alpine**

588 The taiga alpine butterfly prefers black spruce bogs and swamps. This habitat is found at the
589 Plant Site and along the Transportation and Utility Corridor in limited areas, though there are no
590 Minnesota NHIS records of occurrences of the species near the Plant Site or Transportation and
591 Utility Corridor.

592 **Freija's Grizzled Skipper**

593 The grizzled skipper butterfly prefers forest edges and openings. This habitat is found at the
594 Plant Site and along the Transportation and Utility Corridor, though there are no Minnesota
595 NHIS records of occurrences of the species near the Plant Site or Transportation and Utility
596 Corridor.

597 **Nabokov's Blue**

598 The Nabokov's blue butterfly prefers open woodlands and upland openings where the larval host
599 plant, dwarf bilberry, is abundant. This habitat is found at the Plant Site and along the
600 Transportation and Utility Corridor in limited areas, though there are no Minnesota NHIS
601 records of occurrences of the species near the Plant Site or Transportation and Utility Corridor.

602 **Quebec Emerald**

603 The Quebec emerald dragonfly prefers poor fens and wet meadow/sedge meadow habitat. This
604 habitat is found at and near the Plant Site and along the Transportation and Utility Corridor in
605 limited areas, though there are no Minnesota NHIS records of occurrences of the species near the
606 Plant Site or Transportation and Utility Corridor.

607 **4.2.5.2.2 Species of Greatest Conservation Need**

608 As with the federal lands and Mine Site, the Plant Site is located along the border of the
609 Nashwauk Uplands and Laurentian Uplands subsections. The habitat types and associated
610 species are summarized in Table 4.2.5-1.

611 Areas of open ground and bare soils are rare at the Mine Site but are abundant at the Plant Site
612 due to LTVSMC operations or deposition in the existing Tailings Basin. Both open ground and
613 bare soils are considered non-natural habitats. No SGCN are associated with this habitat type.

614 Natural brush/grassland and very early successional forest are uncommon at the Plant Site
615 (ENSR 2005). The existing Tailings Basin re-vegetation is counted as grassland, though it is
616 disturbed habitat and is unlikely to be heavily used by wildlife species. Most of the SGCN
617 species in Table 4.2.5-1 are generally associated with large patches of grassland and savanna
618 habitats that are not present at the Plant Site.

619 Open water and aquatic communities are confined to the existing LTVSMC Tailings Basin at the
620 Plant Site. The Tailings Basin attracts Canada geese, ducks, common loons, and other waterfowl,
621 though the NorthMet Project area does not otherwise appear to provide good habitat for
622 waterfowl or waterbirds. American white pelican, common tern, Wilson's phalarope, black tern,
623 and trumpeter swan were surveyed for, but not found (ENSR 2000 and 2005).

624 As previously discussed, multiple habitats are made up of combinations of other key habitat
625 types. Section 4.2.5.1 and Table 4.2.5-1 provide more discussion on species commonly found in
626 multiple habitat types.

627 As with the federal lands (including the Mine Site) and the Plant Site, the Transportation and
628 Utility Corridor is in the Laurentian Uplands and Nashwauk Uplands subsections. Section
629 4.2.5.1.2 and Table 4.2.5-1 provide more discussion of the habitat and species which may be
630 present.

631 **4.2.5.2.3 Regional Forester Sensitive Species**

632 Section 4.2.5.1.3 provides additional discussion of the RFSS associated with the NorthMet
633 Project area.

634

635 **Bald Eagle**

636 Typical bald eagle habitat is not present at the Plant Site, as there are no large nesting trees or
637 waterbodies that are open year-round near the NorthMet Project area. Similarly, there is no bald
638 eagle habitat located along the Transportation and Utility Corridor. As previously mentioned,
639 animal-vehicle collisions on Dunka Road and/ or natural deer mortality are not likely to produce
640 sufficient carrion to sustain bald eagles (ENSR 2005).

641 **Great Gray Owl**

642 The great gray owl preferred habitat includes coniferous and mixed forests and boreal bogs.
643 These habitats are found in proximity to the Plant Site and Transportation and Utility Corridor.
644 Calling surveys did not identify great gray owls at the Plant Site (ENSR 2000 and 2005);
645 however, 2009 surveys identified a great gray owl hunting along Dunka Road south of the Mine
646 Site, and the USFS has records of a great gray owl nesting in the NorthMet Project area in 2006
647 (AECOM 2009a), 2010, and 2011 (USFS 2013).

648 **Three-Toed Woodpecker**

649 The three-toed woodpecker prefers large tracts of old growth coniferous forest near recent burns
650 where they forage on dead and dying trees for bark beetles (Burdett and Niemi 2002). No old
651 growth coniferous habitat or recent burns are present at the Plant Site or Transportation and
652 Utility Corridor. Though a three-toed woodpecker was observed at the Mine Site by USFS
653 personnel in 2007, the birds are unlikely to be common at the Plant Site or Transportation and
654 Utility Corridor due to a lack of suitable habitat.

655 **4.2.5.2.4 Other Wildlife Species**

656 Other wildlife species common to the region may be present on and around the Plant Site.
657 Section 4.2.5.1.4 provides more discussion on these species.

DRAFT

1 **4.2.6 Aquatic Species**

2 The NorthMet Project area encompasses several waterbodies that provide a variety of habitats
3 for fish and aquatic macroinvertebrates. This section describes the known existing conditions of
4 the fish and aquatic macroinvertebrate communities associated with waterbodies found in the
5 Partridge River and Embarrass River watersheds and potentially affected by the NorthMet
6 Project Proposed Action. For purposes of this FEIS, the Strahler Order (USEPA 2011a) is used
7 to describe the hierarchical ordering of streams, where a first-order stream describes a headwater
8 type stream with no branching. Where two first-order streams meet, they become larger, second-
9 order streams, and where two second-order streams meet, they become third-order streams, etc.

10 The majority of the streams are low velocity; exhibit glide pool characteristics; meander through
11 emergent, scrub-shrub, and forested wetlands; and have silty to boulder substrates.

12 The riparian edge along these streams is predominantly vegetated, which supports quality habitat
13 for aquatic biota with little evidence of human disturbance. Baseline surveys are indicative of
14 habitat supporting fish communities that are comparable to communities in similar waterbodies
15 in the region. Macroinvertebrate habitat degradation from biological stressors is minimal and fair
16 macroinvertebrate habitat exists. Habitat for several freshwater mussel species likely exists in the
17 vicinity of the NorthMet Project area; however, only two species of mussels were observed in
18 two years of baseline freshwater mussel surveys.

19 No federally or state-listed threatened or endangered, SGCN, or RFSS aquatic special status
20 species or invasive species were found in the NorthMet Project area during surveys. According
21 to available data, however, there are nine RFSS species, three SGCN species, and three state-
22 listed special concern species known to occur in the general vicinity of the NorthMet Project site.
23 Of these, suitable habitat likely exists for five special status species: headwaters chilostigman
24 caddisfly, Quebec emerald, ebony boghaunter, creek heelsplitter, and northern brook lamprey.
25 However, no occurrences of these species have been documented in baseline surveys in the
26 NorthMet Project area.

27 Based on Minnesota's fish tissue mercury standard, the MDH has issued fish consumption
28 advisories for the state. Waterbodies within the vicinity of the NorthMet Project area with fish
29 consumption advisories include Colby Lake, Whitewater Reservoir, and the St. Louis River. No
30 advisories have been issued for stream features within the NorthMet Project area. Fish sampling
31 results from the Partridge River in 2014 indicated some species within the watershed exhibited
32 elevated baseline levels of mercury found in the fish tissue. The streams located within the
33 Partridge River Watershed are also tributaries of the St. Louis River, which does have fish
34 consumption advisories.

35 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
36 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
37 (MDNR 2013h). The FEIS considers any new listings, or changes in the previous listings,
38 associated with the updated list. The FEIS also considers any federal listing changes. A
39 Biological Evaluation has been prepared that contains further information about RFSS species.
40 The BE is included in Appendix D and is posted on the USFS website
41 (www.fs.usda.gov/goto/superior/northmet).

42 **4.2.6.1 Upper Partridge River Watershed**

43 This section describes the aquatic resources found primarily within the Upper Partridge River
44 Watershed portion of the NorthMet Project area generally described as the Partridge River
45 headwaters, downstream to Colby Lake, as well as Second Creek, a tributary of the Lower
46 Partridge River downstream of Colby Lake.

47 **4.2.6.1.1 Surface Water Features and Habitat**

48 The surface water features within the Upper Partridge River include Mud Lake, Partridge River,
49 and several tributaries of the Partridge River (e.g., Yelp Creek, Longnose Creek, Wetlegs Creek,
50 Wyman Creek). The limnological features include a range of aquatic biota habitats consisting of
51 an undeveloped freshwater lake to a river system with several headwater tributaries each
52 combining to form a fourth-order river.

53 The 30.5-acre Mud Lake is located in the One Hundred Mile Swamp northwest of the Mine Site
54 but within the federal parcel (see Figure 4.2.6-1). It has a shoreline of 4,550.0 ft and a lake
55 frontage index of 0.7 ft per acre (see Table 4.2.6-1). Review of aerial photography indicates the
56 lake is entirely surrounded by a vegetated wetland riparian area with no apparent development,
57 which should provide adequate undeveloped shoreline for quality fish and macroinvertebrate
58 habitat. The lake also has extensive shallow, emergent vegetated areas throughout, which would
59 also provide quality habitat. Mud Lake may be susceptible to winterkill, which would minimize
60 fish habitat.

61 Yelp Creek is a first order, headwater stream that flows through the One Hundred Mile Swamp
62 where it connects with the Partridge River, forming a second-order stream at the confluence of
63 Yelp Creek and Partridge River (see Figure 4.2.6-1). Both streams combine to encompass
64 5.3 miles of river through the federal parcel with a frontage index of 8.6 ft per acre. No apparent
65 development and a wide vegetated wetland riparian buffer are exhibited from aerial photograph
66 review, which indicates that quality fish and macroinvertebrate habitat is likely present
67 throughout the entire Yelp Creek and Partridge River wetted water course.

68 Wetlegs, Longnose, and Wyman creeks are each first-order, headwater streams that flow north to
69 south with origins between the federal parcel and Plant Site and each form confluences with the
70 Partridge River (see Figure 4.2.6-1). These streams exhibit approximately 13.8 miles of river,
71 collectively, prior to their confluence with the fourth-order segments of the Partridge River.

72 Second Creek is a headwater stream located south of the Plant Site and is joined by several
73 unnamed tributaries as it flows southwest, forming a second-order tributary prior to connecting
74 with the Partridge River (see Figure 4.2.6-1). The riparian zone of Second Creek is characterized
75 by reed canarygrass, grasses, willows and alder shrubs, birch, and other larger trees. Second
76 Creek, upstream of CR 666, is characterized by open-water wetland and numerous beaver ponds,
77 while the lower portion is characterized by riparian woods. Portions of Second Creek are
78 channelized or otherwise altered due to mining activity, particularly between CR 666 and CR
79 110.

80 A total of seven habitat assessment surveys were conducted at six locations within the Partridge
81 River Watershed in the vicinity of the NorthMet Project area that describe in-stream channel
82 characteristics and habitat within select study reaches (see Figure 4.2.6-1; Table 4.2.6-2). Five
83 locations (four sites on the Upper Partridge River and one site on Second Creek) were in the

84 direct vicinity of the NorthMet Project area. The site located on the South Branch of the
 85 Partridge River is considered a reference site. These survey sites were established as baseline
 86 sampling sites for the DEIS in order to analyze habitat and aquatic biota within select study
 87 reaches. Data from these and other sampling sites from various MPCA programs are summarized
 88 below. Sites PR-B1 and PR-B2 scored near the upper range of the Qualitative Habitat Evaluation
 89 Index (QHEI) (Rankin 1989) scale, which indicates good fish habitat was present. The scores for
 90 PR-B3, PR-west, and PR-east sites scored lower in the QHEI range, which is likely a function of
 91 the dominant silt substrate found at these sites.

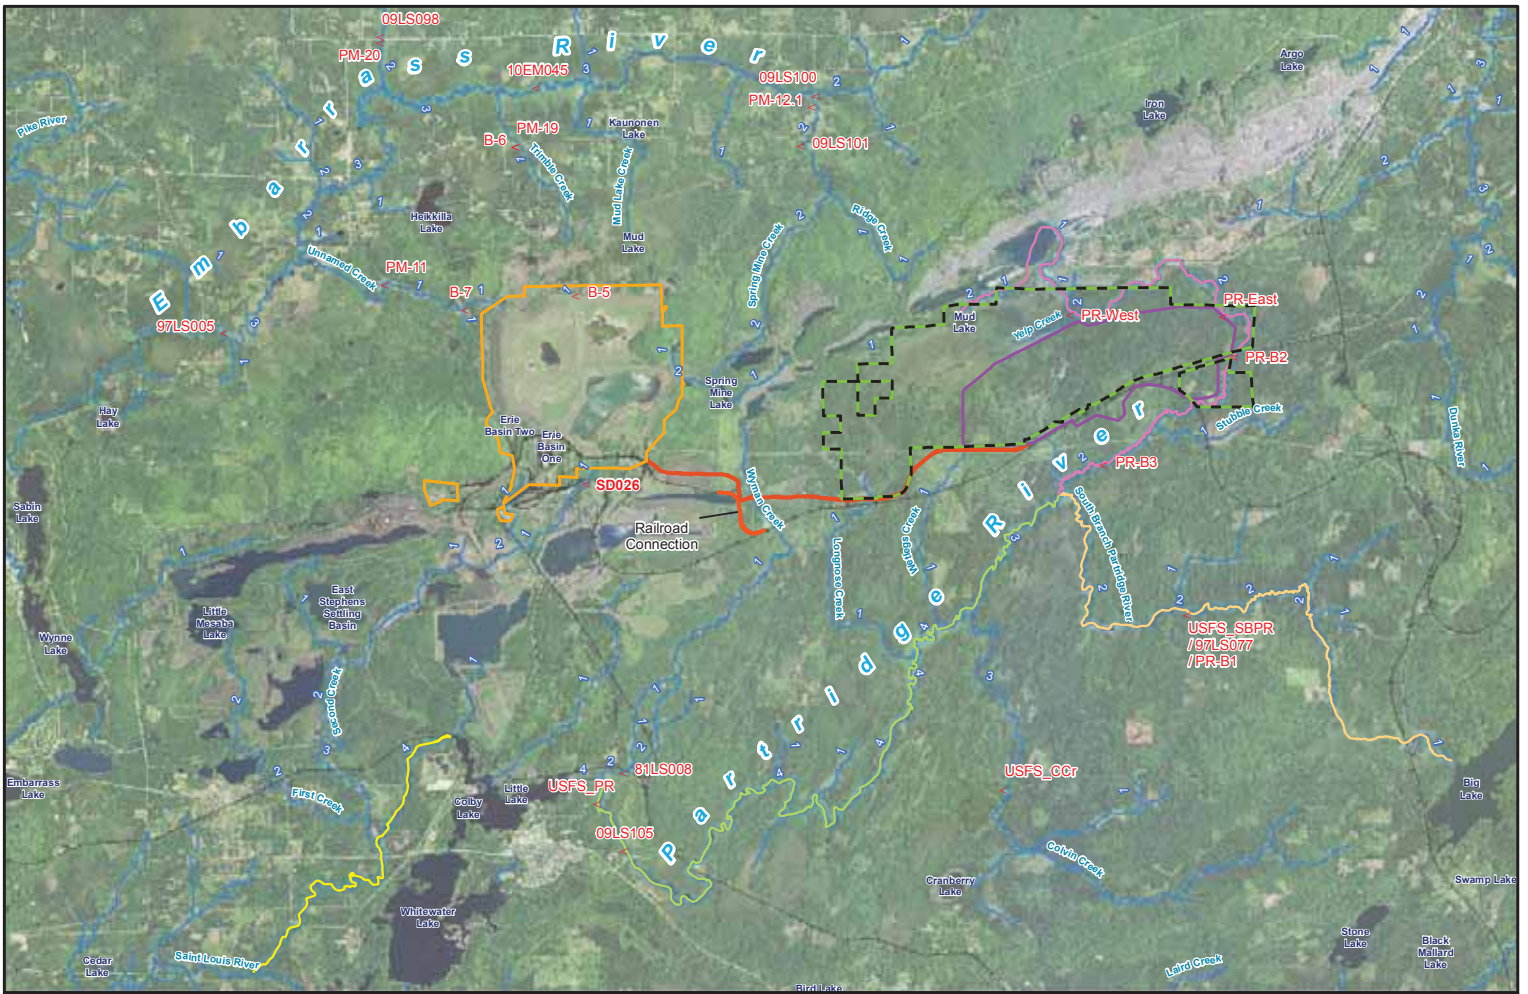

92 Tables 4.2.6-1 and 4.2.6-2 provide information regarding those waterbodies located within the
 93 federal parcel and those within the larger Partridge River Watershed, respectively. The USFS
 94 tracks MIHs, which are categories of habitat types. One of the MIH categories used by USFS
 95 includes MIH 14, which is defined as the wide variety of lakes, rivers, streams, ponds, marshes,
 96 or pools (permanent, intermittent, or seasonal) that provide habitat to wildlife (USFS 2004b).
 97 The MIH represented within the boundaries of the federal parcel includes 30.5 acres for Mud
 98 Lake and 55,968.0 linear ft for Partridge River and Yelp Creek (see Table 4.2.6-1). Based on the
 99 in-stream channel characteristics and habitat, these streams and headwater tributaries should
 100 support warmwater game fish species such as northern pike, yellow perch, and bass, as they
 101 function as important spawning and rearing areas. Maintaining the seasonal variation in
 102 hydrological regime is important, especially during the spring when high flows cue spawning
 103 activity and provide access to traditional fish spawning and rearing habitat. The wetlands
 104 adjacent to all surface water features on the federal lands were not scored for fish habitat during
 105 the wetland functions and values assessment, since water levels were inadequate for most of the
 106 year to support fish habitat (AECOM 2011d).

107 **Table 4.2.6-1 Federal Land Parcel Surface Water Characteristics**

Surface Water	Size on Parcel	Approximate Shoreline Frontage (ft)	MIH Size	Frontage Index (ft/acre)
Mud Lake	30.5 acres	4,555.0	30.5 acres	0.7
Partridge River and Yelp Creek	5.3 miles	55,968.0	55,968.0 linear ft	8.6

115 Notes:

116 na = Not available

117 ¹ Referenced from Figure 4.2.6-1.

118 ² QHEI is designed to provide an integrated evaluation of physical habitat characteristics important to fish communities and
 119 ranges from 0 (low) to 100 (high).

120 ³ South Branch Partridge River reference sites PR-B1 and 7LS077 are the same location.

121 **Watershed Level Riparian Connectivity**

122 Intact riparian areas are an important factor contributing to diverse and productive aquatic
 123 ecosystems. The streams present in any watershed are each part of an intricate web of perennial,
 124 defined as waterbodies with water present year-round, and non-perennial streams, lakes, and
 125 rivers. They are part of a larger watershed where the connections between these surface water
 126 features are affected by the vegetated, undisturbed riparian edges bordering these waterbodies. A
 127 Riparian Connectivity Index (RCI), developed by the MDNR, measures the percentage of
 128 undeveloped, vegetated land within the riparian zone and is typically derived using a GIS
 129 analysis of vegetative cover along riparian areas and takes into consideration agriculture and land
 130 development affected natural riparian vegetative cover (MDNR 2015a). The Partridge River is a
 131 tributary to the larger St. Louis Watershed where the score for the St. Louis Watershed was rated
 132 at 0 percent agriculture in the riparian zone, 5 percent development in the riparian zone, and a
 133 total RCI of 95. Localized GIS analysis of the Partridge River within the boundary of the federal
 134 lands indicates the score is also representative of this area.

135 **Aquatic Connectivity**

136 Dams, bridges, and culverts in streams, creeks, and rivers may reduce the hydrologic
 137 connectivity of watersheds if they become fish barriers and may affect the habitat available for

138 aquatic organisms by influencing stream velocities, sediment deposition, substrate composition,
139 erosion potential, and water quality.

140 The MDNR has developed an Aquatic Connectivity Index (ACI), which reflects the extent of
141 dams, bridges, and culverts along stream segments. The number of structures that modify aquatic
142 connectivity in Minnesota streams is very high. The vast majority of watersheds score 20 or
143 below on a scale of 0 to 100, where 100 represented the fewest amount of structures per river
144 mile, indicating a high density of bridges, culverts, and dams (MDNR 2015b).

145 The index exhibited for the St. Louis River Watershed indicated a score of 15 for bridges and
146 culverts and 6 for dams. The overall ACI score for the St. Louis Watershed was 11, which
147 indicates that dams, bridges, and culverts impair the aquatic connectivity of the watershed and
148 limit the available physical habitat for aquatic organisms.

149 Localized analysis of dams, bridges, and culverts along the Partridge River are limited to one
150 Dunka Road crossing within the vicinity of the Mine Site.

151 4.2.6.1.2 Existing Water Quality within the Vicinity of the Mine Site

152 Water quality can have significant effects on aquatic species. The existing water quality data
153 collected within the Partridge River sampling locations provided the basis for the NorthMet
154 Project Proposed Action and Continuation of Existing Conditions (CEC) Scenario models
155 (Section 5.2.2.2.3). Existing condition mercury values were consistently in exceedance of Class
156 2B water quality standards while aluminum and thallium values were in exceedance of water
157 quality standards at one or more sampling locations (see Figure 4.2.6-2; Table 4.2.6-3). No data
158 were available to evaluate the Mud Lake and Yelp Creek water quality. Wyman Creek is
159 included on the 2012 TMDL list for aquatic life based on Fishes Bioassessment. Additional
160 existing water quality information is contained in Section 4.2.2.

Notes:

Bold font indicates exceedance of the Class 2B water quality standards evaluation criteria.

¹ Section 5.2.2 includes a detailed discussion of evaluation criteria.

² Water quality standard for this metal is hardness-dependent. Listed value assumes a hardness concentration of 100 mg/L.

³ Excludes single outlier value of 1,550 µg/L from values included in Barr 2014d.

⁴ Excludes single outlier value of 12.3 µg/L from values included in Barr 2014d.

4.2.6.1.3 Aquatic Biota Studies

Several aquatic biota surveys are summarized below as referenced from Breneman (2005), Barr (2011b), MPCA (2011c), and USFS (2014). Breneman conducted biological surveys at two sites in the Upper Partridge River near the Mine Site (PR-B2 and PR-B3) and at a third site on the South Branch Partridge River (PR-B1) during August and September 2004, while Barr conducted surveys at two other sites in the upper Partridge River near the Mine Site (PR-east and PR-west) during September 2009 (see Figure 4.2.6-1). Two additional July 2009 surveys were reported by the MPCA (MPCA 2011c and MPCA 2013c) and were located at the South Branch Partridge River (same site as PR-B1) and at a site upstream of the Wyman Creek and Partridge River confluence (MPCA_09LS105). The main stem Partridge River sites have been previously affected by discharges from the Northshore Mine (Breneman 2005). The site on the South Branch Partridge River (PR-B1/MPCAB_97LS077), identified by Breneman (2005) to be a suitable reference site for the Partridge River, is approximately 4.3 river miles upstream of the South Branch Partridge River confluence with the Partridge River and is unaffected by any mining discharge (Breneman 2005).

The results of the fish and macroinvertebrate surveys are summarized in Table 4.2.6-4 and 4.2.6-5. The assemblages observed in the survey are typical of those sampled elsewhere in the northeast region of Minnesota (Barr 2011b). No listed SGCN, RFSS, state, federal, or invasive species were observed during these surveys.

Fish Communities

Abundance and diversity of taxa among the Upper Partridge River sampling sites were indicative of a warmwater stream populated by typical warmwater species, including gamefish such as northern pike, bluegill, northern rock bass, and yellow perch (see Table 4.2.6-4). The IBI, which is a commonly used metric for assessing stream health related to human disturbance, was not available for many of the Partridge River sites closest to the NorthMet Project area. The presence of one or more intolerant or intermediate species in each of these monitoring locations is, however, one indication that quality habitat is present at these sites and chemical and physical stream deterioration is likely negligible. IBI scores were derived from the two MPCA fish surveys conducted at sites 97LS077 and 09LS105. The scores of 61 and 87, respectively, represent average to good habitat quality. A review of aerial photography reveals similar riparian vegetation cover for all Upper Partridge River sites.

200 Results of recent fish studies conducted in 2014 by the USFS (see Table 4.2.6-5) indicated
201 similar results to the other studies within the Partridge River Watershed and warmwater fish
202 species were common. Species diversity was variable and each sampling reach exhibited at least
203 one pollution intolerant species.

204 The MPCA collected fish community data during a 2009 sampling event for Wyman Creek, a
205 State of Minnesota-listed trout stream (see Figure 4.2.6-1). MDNR surveys were conducted on
206 Wyman Creek in 1968, 1981, and 2003 (MDNR 1981; MDNR 2003). Based on the latest 2009
207 survey, a variety of taxa were collected; however, no trout species were collected, which likely
208 contributed to an IBI score of only 33, four points below the minimum threshold for this stream
209 classification (see Table 4.2.6-4). MDNR survey results reference elevated stream temperatures
210 due to warmwater surface runoff from Mine Pit lakes to the east and west of the headwaters,
211 extensive logging in the watershed, and beaver dam and impoundments occurring along the
212 entire length of Wyman Creek. It should be noted that Wyman Creek is not a comparable stream
213 to others in the Upper Partridge River watershed for several reasons. Most notable, Wyman
214 Creek is a designated coldwater trout stream, it is affected by mining activity, and would not be
215 in the direct drainage of the NorthMet Project Proposed Action. It is included in this FEIS
216 because it contributes to watershed water quality.

217 No aquatic biota studies have been conducted in Longnose Creek, Wetlegs Creek, or Second
218 Creek, and no fish or macroinvertebrate community or habitat characteristics could be
219 documented, although, like Yelp Creek, all are first-order streams within the vicinity of the
220 NorthMet Project area.

237 Source: Varian, MDNR, Pers. Comm., January 12, 2015.

238 Note:

239 ¹ Rapid Bioassessment Protocols for Use in Streams and Wadeable Rivers: Periphyton, Benthic Macroinvertebrates, and Fish -
 240 Second Edition EPA 841-B-99-002 (USEPA 2012b). Tolerance values indicate qualitative tolerances of physical and chemical
 241 disturbances.

242 **Macroinvertebrate Communities**

243 Aerial photography review and habitat descriptions found in the various studies indicate the
 244 reference site (PR-B1) and the USFS Colvin Creek and South Branch Partridge River sites
 245 should have no effects from previous mining and quality habitat should exist for
 246 macroinvertebrate assemblages. The results of the 2011 macroinvertebrate studies indicate
 247 habitats for macroinvertebrate assemblages are just as good or better at the PR-B2 and PR-B3
 248 Partridge River study sites as the percent Ephemeroptera (mayflies), Plecoptera (stoneflies), and
 249 Trichoptera (caddisflies) (%EPT) exhibited better results at the Partridge River sites and similar
 250 %Diptera results. The Hilsenhoff Biotic Index (HBI), which measures the pollution tolerance for
 251 various benthic macroinvertebrate families, exhibited a fair ranking for both sites, which
 252 indicates habitat degradations from biotic stressors are minimal and fair macroinvertebrate
 253 habitat exists. %EPT and %Diptera results are also similar to the 2004 results for sites PR-B2
 254 and B3.

255 The results of the USFS studies indicate variable %EPT and %Diptera between three study
 256 years, but, in general, the results indicate %EPT scores on the high end. This indicates quality
 257 macroinvertebrate habitat likely exists at these sites. Comparing the generally high %EPT and
 258 low %Diptera results at the USFS sites with the 2011 studies indicates better habitat may be
 259 present at the USFS sites; however, the results may be indicative of differing sampling protocols
 260 or that the variability in sampling was absent for the one year effort in the 2011 studies.

262 **Table 4.2.6-6 Composition of Macroinvertebrate Assemblages at Six Sites in the Federal Parcel**

263 Sources: Data and functional group assignments from Breneman 2005, Barr 2011b, Barr 2011i, and USFS 2014.

264 Notes:

265 ¹ %EPT indicates the percent of mayflies, stoneflies, and caddisflies within the macroinvertebrate sample. High EPT percentages of the population typically indicates degraded
266 habitat conditions are not present.

267 ² %Diptera indicates the percent of true flies and bloodworms present within the macroinvertebrate sample. High percentages of the population typically indicates low habitat
268 diversity and predominant silty habitats often present within slow-moving, headwater streams.

269 ³ HBI is the measure of macroinvertebrate assemblages tolerance toward organic (nutrient) enrichment. Not calculated in Breneman 2005.

270 na = Not available

271 **Freshwater Mussel Communities and Habitats at Survey Sites**

272 Unionid mussels (*Unionidae*) constitute one of the most imperiled major taxa in the United
273 States (Master et al. 2000), and the MCWCS identifies 26 unionid species within Minnesota as
274 species of special concern. Two of these species, creek heelsplitter (*Lasmigona compressa*) and
275 black sandshell (*Ligumia recta*), are known to exist in the St. Louis River Watershed (see Table
276 4.2.6-6), but were not identified in areas near the Mine Site. Heath (2011) sampled mussels at
277 M1 and M2 in 2004 and at PR-upstream and PR-downstream in 2009 (see Figure
278 4.2.6-3). Only one mussel species was collected in the Partridge River Watershed, the giant
279 floater (*Pyganodon grandis*) (see Table 4.2.6-7), which is a widely distributed feeding generalist,
280 tolerant of silt-dominated substrate, and often found in lakes, ponds, or slow-moving water pools
281 of small to medium-sized creeks and rivers (Cummins and Mayer 1992; Heath 2011).

282 Some of the unionid species known to exist in the St. Louis River Watershed were not collected
283 by Heath (2011), including the creeper (*Strophitus undulatus*), plain pocketbook (*Lampsilis*
284 *cardium*), white heelsplitter (*Lasmigona complanata*), and the black sandshell (see Table
285 4.2.6-7). The creeper, plain pocketbook, and white heelsplitter are typically found in larger
286 streams (Cummins and Mayer 1992) and may only exist farther downstream in the drainage
287 system. It is unlikely that the SGCN-designated black sandshell occurs in the NorthMet Project
288 area given its absence from the sample sites. Habitat for this species (riffles or raceways in
289 gravel or firm sand; Cummins and Mayer 1992) likely only exists in small reaches within the
290 NorthMet Project area.

291 Other species known to exist in the St. Louis River Watershed, but also not collected by Heath
292 (2011) at all stations included cylindrical papershell (*Anodontoidea ferussacianus*) and creek
293 heelsplitter. The SGCN-designated creek heelsplitter is found in sand and fine gravel substrates
294 (Cummins and Mayer 1992). Sand and gravel were minor substrate type at the sites sampled and
295 is therefore unlikely to exist in the Partridge River Watershed (see Table 4.2.6-8).

296 **Table 4.2.6-7 Mussel Species Identified in the Lake Superior Basin, St. Louis River**

DRAFT

312 **4.2.6.1.4 Special Status Fish and Macroinvertebrates**

313 There are no federally listed or state-listed threatened or endangered fish or macroinvertebrate
 314 species known to occur in the Partridge River (USFWS 2011).

315 As with wildlife resources, assessment of fish and macroinvertebrates included consideration of
 316 the MCWCS (MDNR 2006d) and RFSS species. The MCWCS identifies SGCN by ecoregion
 317 subsections based on a statewide approach, and the RFSS species are identified for the potential
 318 to be found within the Superior National Forest. SGCN species identified in the Laurentian
 319 Uplands and Nashwauk Uplands, include two unionid mussel species (i.e., creek heelsplitter and
 320 black sandshell) and one species of fish (northern brook lamprey, *Ichthyomyzon fossor*), but
 321 these species were not found in the NorthMet Project area, though there is potential habitat for
 322 these species. These species also are listed by the state as species of special concern and the
 323 USFS as RFSS. In addition to the creek heelsplitter and the black sandshell, USFS also lists
 324 seven other species as RFSS for Superior National Forest, including three insects and four fish
 325 (see Table 4.2.6-9). Each of these RFSS species are briefly described below. No invasive fish or
 326 macroinvertebrate species are known to exist within the federal parcel.

329 Sources: MDNR 2006d and USFS 2012f.

330 **Headwaters Chilostigman Caddisfly**

331 This species of caddisfly has only been discovered in two locations within Minnesota where it is
 332 also listed as a state endangered species. In 1994, it was documented in a slow-moving, silt-
 333 dominated headwater stream in Itasca State Park and in 2005 in rich swamp to poor fen habitats
 334 within a large, acid to minerotrophic peatland complex in Finland State Forest (MDNR 2011n).
 335 Little is known about the headwaters chilostigman caddisfly. Headwater habitats are present at
 336 the Mine Site; however, since the distribution of this caddisfly appears to be very limited, it is
 337 unlikely to occur in the NorthMet Project area.

338 **Quebec Emerald**

339 The Quebec emerald dragon fly occurs in lentic habitats typically associated with bogs, fens, and
340 heaths near water-saturated or water-suspended sphagnum (USFS 2007a). This species has been
341 found within the Superior National Forest. Little distribution information is known regarding this
342 species due to lack of completed surveys. The known required habitat is likely present within the
343 federal parcel near the bogs associated with the headwater stream, Yelp Creek; however, this
344 species was not found in the benthic macroinvertebrate surveys. The likelihood of observing
345 Quebec emerald individuals or populations in the vicinity of the federal parcel and Mine Site is
346 low.

347 **Ebony Boghaunter**

348 The ebony boghaunter shares a similar habitat description with the headwaters chilostigman
349 caddisfly described above; however, the distribution is likely more widespread than the caddisfly
350 (MDNR 2011n). Habitat likely exists for this species in the NorthMet Project area in sphagnum
351 dominated bogs; however, this species has not been identified in the benthic macroinvertebrate
352 surveys conducted to date.

353 **Lake Sturgeon**

354 The lake sturgeon is a large fish that is broadly distributed throughout the Mississippi River,
355 Great Lakes, and Hudson Bay drainages (Scott and Crossman 1973a; Wilson and McKinley
356 2005). Lake sturgeon typically inhabit large lakes and rivers and are usually found in waters that
357 are 15 to 30 ft deep (Wilson and McKinley 2005). Spawning takes place in swift-flowing water 2
358 to 15 ft in depth, often at the base of a low waterfall that blocks further migration upstream
359 (Scott and Crossman 1973a). The species has been classified as threatened in both Canada and
360 the United States by a special committee of the American Fisheries Society (Williams et al.
361 1989) and is a species of special concern in Minnesota.

362 Historically, lake sturgeon migrated approximately 14 miles upriver from Lake Superior in the
363 St. Louis River (Auer 1996). Spawning occurred between the falls near Fond du Lac, which
364 formed a natural barrier to upstream migration, and Bear Island located a few miles downstream
365 (Goodyear et al. 1982; Kaups 1984; Schram et al. 1999). The lake sturgeon was extirpated from
366 the St. Louis River during the early 1900s (Schram et al. 1999).

367 The St. Louis River currently is one of 17 tributaries to Lake Superior identified by the Great
368 Lakes Fishery Commission as a priority stream where lake sturgeon rehabilitation should be
369 focused, and the St. Louis is one of only six rivers identified by the Great Lakes Fisheries
370 Commission as a priority for lake sturgeon stocking (Auer 2003). A stocking program was
371 initiated in 1983 to reintroduce lake sturgeon to the St. Louis River; however, stocking was
372 reduced in 1995 and discontinued in 2000 (MDNR 1995). The stocking has resulted in an
373 increase in lake sturgeon abundance in the St. Louis River estuary near Duluth (Schram et al.
374 1999). Two separate observations of juvenile lake sturgeon were observed by Fond du Lac and
375 MDNR biologists near the Fond du Lac dam in 2011 and 2014, respectively, which indicates
376 recruitment from naturally reproducing adult lake sturgeon, since no stocking has occurred
377 below the dam since 2000 (Varian, MDNR, Pers. Comm., November 7, 2014). Fond du Lac has
378 stocked lake sturgeon into the St. Louis River above the Fond du Lac dam near the confluence
379 with the Cloquet River and within the Cloquet River near Independence, Minnesota. Fond du
380 Lac has 2012 through 2014 lake sturgeon telemetry data, which indicates juvenile and adult

381 sturgeon have been located near Floodwood, Minnesota, downstream from the confluence of the
382 Whiteface River and St. Louis River (Varian, MDNR, Pers. Comm., January 12, 2015). No fish
383 have been observed upstream of this location and migration of lake sturgeon from this location
384 would be blocked by the dam at Forbes, Minnesota, approximately 14 miles downstream of the
385 Embarrass River confluence with the St. Louis River.

386 There are no known occurrences of lake sturgeon and no likely habitat for lake sturgeon within
387 the NorthMet Project area (USFS 2015a).

388 **Nipigon Cisco**

389 The nipigon cisco is found in waters of Lake Nipigon, Black Sturgeon Lake, Saganaga Lake, and
390 other lakes of northwest Ontario and Quebec (Hubbs and Lagler 2007). Saganaga Lake is the
391 only lake in this list shared with Minnesota and Ontario and is a deep, oligotrophic lake covering
392 approximately 13,800 acres (MDNR 2011d). There are no known occurrences or likely habitat
393 for nipigon cisco within the NorthMet Project area.

394 **Shortjaw Cisco**

395 Formerly found in deep waters of several of the Great Lakes (Scott and Crossman 1973c), the
396 shortjaw cisco has been eliminated from Lakes Erie, Huron, and Michigan and is in decline in
397 Lake Superior (COSEWIC 2003). The species is also found in Gunflint and Saganaga lakes
398 (MDNR 2006d), which are two of the deepest natural lakes in Minnesota. Invasive species,
399 habitat degradation, and competition or predation may be factors that are limiting recovery (Pratt
400 and Mandrak 2007). There are no known occurrences or likely habitat for shortjaw cisco within
401 the NorthMet Project area.

402 **Northern Brook Lamprey**

403 The northern brook lamprey is a small, nonparasitic, jawless fish. This species' typical habitat is
404 creeks and small rivers, apparently avoiding small brooks and large rivers (Scott and Crossman
405 1973b). There are no known occurrences of this species in or near the NorthMet Project area.
406 Cochran and Pettinelli (1987) identified northern brook lamprey at a site south of Cloquet,
407 Minnesota, approximately 75 miles south of the NorthMet Project area. Since 1986, it has been
408 collected from six other sites in the Lake Superior drainage (Hatch et al. 2003). Suitable habitat
409 for northern brook lamprey is likely to exist in the NorthMet Project area; however, the nearest
410 known occurrence of this species is far removed from the NorthMet Project area.

411 **Freshwater Mussels**

412 No special freshwater mussel species were observed during the mussel surveys described in
413 Heath (2011). As discussed above, it is unlikely the habitats required for the black sandshell exist
414 in the vicinity of the NorthMet Project area. The habitat for the creek heelsplitter likely exists in
415 portions of the NorthMet Project area, but no creek heelsplitter mussels have been identified in 2
416 years of baseline survey efforts.

417 **4.2.6.2 Whitewater Reservoir and Colby Lake**

418 This section describes the aquatic resources found in Colby Lake and Whitewater Reservoir.
419 Colby Lake and Whitewater Reservoir are the two lentic (standing) waterbodies potentially

420 affected by water discharges and withdrawals associated with the NorthMet Project Proposed
421 Action. The Partridge River flows through Colby Lake. Whitewater Reservoir is hydraulically
422 connected to Colby Lake by a diversion works, and water moves between the two waterbodies
423 either by controlled gravity-fed flow or by pumps, depending on the relative water levels in the
424 two lakes (see Section 4.2.2 for more details).

425 Colby Lake is a Class 11 lake with a surface area of 539 acres and a littoral (water depth up to
426 15 ft) area of 377 acres. Maximum depth is 30 ft. In the most recent habitat characterization, the
427 dominant littoral substrates were boulders (diameter greater than 10 inches), rubble (diameter 3
428 to 10 inches), and gravel (size unspecified) (MDNR 2010c). Aquatic plants were moderately
429 abundant, dominated by water lilies (*Nymphaeadeae*), pondweed (*Potamogeton* sp.), and water
430 shield (*Brasenia schreberi*). Average Secchi depth was 2 ft, and submersed plants grew to a
431 maximum depth of 6 ft. The non-native curly-leaf pondweed (*Potamogeton crispus*) was found
432 in the west end of the lake. During the most recent fisheries survey conducted in July 2010
433 (MDNR 2010c), surface water temperature was 76°F, and the bottom temperature was 53°F.
434 Oxic water (dissolved oxygen concentration greater than 2 parts per million [ppm]) supporting
435 fish extended to a depth of 15 ft where the temperature was 62°F. A heated water plume (greater
436 than or equal to 100°F at the surface) extended from the Laskin Energy Center power plant
437 discharge.

438 Fish species collected in Colby Lake through the latest July 2010 survey are listed in Table
439 4.2.6-10. The latest survey found species typically found in a lake Class 11 fish community
440 assemblage, with one exception. Channel catfish were abundant in Colby Lake, which is unique
441 for Class 11 lakes. Channel catfish, by weight, were the most abundant fish sampled in 2010.
442 There was a low-density, quality-sized population of northern pike and a representative array of
443 panfish species including bluegill, black crappie, and yellow perch. Historically, the walleye
444 population has been highly variable. The 2010 catch was the lowest on record and below the 25th
445 percentile value for lake Class 11. There is an MDH consumption advisory for fish in Colby
446 Lake due to high levels of mercury.

447 Whitewater Reservoir is a Class 7 lake that encompasses a total surface area of 1,210 acres and a
448 littoral area of 564 acres with a maximum depth of 73 ft. The dominant littoral substrate was
449 gravel, rubble, and sand during the most recent habitat characterization (MDNR 2007c). Aquatic
450 plants were moderately abundant along the shore and in shallow bays. The dominate taxa were
451 cattails (*Typha* sp.), sedges (*Cyperaceae*), northern milfoil (*Myriophyllum sibiricum*), and
452 pondweed. Average Secchi depth was 12 ft, and submersed plants grow to a maximum water
453 depth of 8 ft. During the more recent MDNR fisheries survey in mid-August 2012, the surface
454 water temperature was 73°F, and the bottom water temperature was 47°F. Oxic water extended to
455 a depth of 23 ft where the water temperature was 69°F.

456 Walleye were introduced to the reservoir following impoundment in 1955, and stocking
457 continued through 1984. Fish species collected in the Whitewater Reservoir by the MDNR
458 surveys are listed in Table 4.2.6-10. The fish population in 2012 was dominated by walleye,
459 northern pike, and bluegill and the total gillnet catch for each was above average among similar
460 lake classes in northeast Minnesota that share similar ecological characteristics (MDNR 2012m).
461 As is the case for Colby Lake, Whitewater Reservoir contains a similar MDH consumption
462 advisory for fish due to high levels of mercury. Colby Lake water quality is summarized in
463 Section 4.2.2, which identifies water quality exceedances for aluminum, iron, and manganese,

464 which is believed to be naturally occurring. Both Colby Lake and Whitewater Reservoir are
465 listed on the Minnesota 303(d) TMDL list because of high mercury concentrations in fish tissue.

466 **Table 4.2.6-10 Fish Species Collected in Colby Lake and Whitewater Reservoir by MDNR**
467 **Fisheries Surveys¹**

Scientific Name	Common Name	Colby Lake ²	Whitewater Reservoir ³

468 Notes:
469 ¹ Collection methods included gillnets, trapnets, and shoreline seining.
470 ² Surveys conducted in 1968, 1985, 2005, 2010, and 2012.
471 ³ Ten surveys conducted post-impoundment, 1967-2002.

472 Little information exists on the macroinvertebrate assemblages of Colby Lake and Whitewater
473 Reservoir. Sampling conducted in many lakes in the region (including Colby and Whitewater) as
474 part of the MEQB Regional Copper-Nickel Study (MEQB 1979) found that nearly all of the taxa
475 collected in the littoral zone of lakes were also collected in the streams of the region. The littoral
476 zone of the lakes had a more diverse macroinvertebrate fauna than did the profundal (deep water)
477 zone. Gastropods (snails) were collected from the littoral zone of Colby Lake and pelecypods
478 (clams) were collected from the profundal zone (Johnson and Lieberman 1981). The most
479 frequently collected and most abundant taxa collected from the profundal zone of Colby Lake
480 were the phantom midge (*Chaoborus* sp.), a mayfly species (*Hexagenia limbata*), and two midge
481 taxa (*Procladius* sp. and *Chironomus* sp.), similar to other lakes of the region and are
482 characteristic of good water quality (Johnson and Lieberman 1981).

483 4.2.6.3 Embarrass River Watershed

484 This section describes the aquatic resources found within the Embarrass River Watershed portion
485 of the NorthMet Project area.

486 4.2.6.3.1 Surface Water Features

487 Surface water features within the Embarrass River Watershed and within the NorthMet Project
488 area include the Embarrass River and several of its tributaries draining the existing LTVSMC

489 Tailings Basin including the first-order streams Mud Lake Creek, Trimble Creek, and Unnamed
 490 Creek. Mud Lake Creek and Trimble Creek originate from the wetlands and bogs to the north
 491 and northwest of the existing LTVSMC Tailings Basin, respectively. Unnamed Creek originates
 492 from the northwest corner of the existing LTVSMC Tailings Basin.

493 Aerial photograph review of these streams indicates a mix of disturbed and vegetated riparian
 494 buffers with human impact effects on the landscape and stream courses apparent. Major channel
 495 habitat and substrate characteristics for these streams are summarized in Table 4.2.6–11. Study
 496 locations are included in Figure 4.2.6-1.

497 **Table 4.2.6-11 Major Channel Characteristics at a Biological and Habitat Survey Stations**
 498 **for Streams within the Vicinity of the Plant Site**

Water Body/ Reference	Location	Channel Characteristics						QHEI ¹
	Site	Stream Order	Catchment (mi ²)	Dominant Substrate	Width (cm)	Depth (cm)	Velocity (m ³ /s)	
Trimble Creek (Breneman 2005)	B6 ²	1	7.4	Sand and Silt	190	58.70	0.10	65
Trimble Creek (Barr 2011b)	PM-19 ²	1	--	Sand and Silt	250 ⁽³⁾	53.3 ⁽³⁾	0.09	46
Unnamed Creek (Barr 2011b)	PM-11	1	--	Muck and detritus	183	58	0.08	59
Spring Mine Creek	PM-12.1	1	--	Sand and detritus	213 ⁽³⁾	29 ⁽³⁾	0.01 ⁽³⁾	--

499 Sources: Adapted from Breneman 2005, Barr 2011b, Barr 2011i, Barr 2011m. Referenced from Figure 4.2.6-1.

500 Notes:

501 ¹ QHEI (Rankin 1989) is designed to provide an integrated evaluation of physical habitat characteristics important to fish
 502 communities and ranges from 0 (low) to 100 (high).

503 ² Sample sites B-6 and PM-19 are the same sampling location; however, data was collected in separate years during different
 504 studies.

505 ³ Averaged between two study dates (September 2010 and June 2011).

506 4.2.6.3.2 Existing Water Quality

507 Water quality sampling has occurred at PM-12 (upstream of all mining influences); PM-12.1 (on
 508 Spring Mine Creek); PM-12.2, PM-12.3, and PM-12.4 (between PM-12 and PM-13), and PM-13
 509 (downstream of all NorthMet Project Proposed Action influences), as well as three tributary
 510 streams that drain the existing LTVSMC Tailings Basin (Mud Lake Creek, Trimble Creek, and
 511 Unnamed Creek) (see Figure 4.2.6-2 and Section 4.2.2.3.2 for additional sample information).
 512 Water quality evaluation criteria exceedances were found for aluminum and mercury at most
 513 locations, and elevated concentrations for sulfate, especially at Spring Mine Creek. The
 514 Embarrass River, from its headwaters to Embarrass Lake, and Spring Mine Creek, from Ridge
 515 Creek to the Embarrass River, are both included on the 2012 TMDL list for aquatic life based on
 516 Fishes Bioassessment and, in the case of Spring Mine Creek, also aquatic macroinvertebrate
 517 bioassessment. Section 4.2.2 describes the water quality of the Embarrass River in more detail.

518 **Table 4.2.6-12 Average Existing Water Quality Concentrations in the Embarrass River**

Parameter	Units	Evaluation Criteria ¹	PM-12	PM-12.1	PM 12.2	PM-12.3	PM-12.4	PM-13

519 Source: Barr 2014d.

520 Notes:

521 Bold font indicates exceedance of the Class 2B water quality standards evaluation criteria.

522 2010 data not collected for all parameters. Includes non-detects at half the detection limit.

523 ¹ Section 5.2.2 includes a detailed discussion of evaluation criteria.

524 ² Water quality standard for this metal is hardness-dependent. Listed value assumes a concentration of 100 mg/L.

525 ³ Excludes single outlier value of 94.8 mg/L from November 8, 2006.

526 ⁴ MPCA has listed the waters within and downstream from Embarrass Lake, the northernmost tip of Wynne Lake, and the segment of the Embarrass River from Sabin Lake to the Highway 135 bridge as waters used for the production of wild rice, so

527 the 10 mg/L sulfate standard is only applicable to that portion of the Embarrass River (PM-13).

528 ⁵ Excludes 688 mg/L value from November 8, 2006.

530 4.2.6.3.3 Aquatic Biota Studies

531 Breneman (2005) collected fish and macroinvertebrate community information at three sites in
532 the Embarrass River Watershed. Fish and macroinvertebrate data were also collected by Barr at
533 Spring Mine Creek, Trimble Creek, and Unnamed Creek. The results of these sampling events
534 are summarized in Tables 4.2.6-13 and 4.2.6-14.

535 Fish Communities

536 Sampling location PM-20 (Bear Creek) was used for a reference or control study site to compare
537 results for aquatic biota sampling locations PM-12.1 (Spring Mine Creek), PM-19 (Trimble
538 Creek), and PM-11 (Unnamed Creek). As part of an additional study, aquatic biota data was
539 collected from two additional sites on Unnamed Creek (B-5 and B-7) and a resampling of the
540 Trimble Creek site (B-6). The MPCA also conducted aquatic biota studies for five locations, one
541 of which was also conducted on Bear Creek near PM-20. A limited number of pollution-

542 intolerant fish were identified among the various sample locations, including the Bear Creek
543 control site. One pollution-intolerant species was found at Spring Mine Creek and one was
544 identified at an Embarrass River sampling location. IBI scores ranged from moderate to poor for
545 the various sampling locations, indicating impairment for aquatic life within these study reaches.
546 Aerial photograph review of the B-5, B-6, and B-7 sampling sites exhibits a mix of disturbed and
547 vegetated riparian buffers with human impact effects in the wetland landscape and stream
548 courses, which likely limits the quality and diversity of the fish habitat present at these locations.
549 Muck and silt were listed as dominant substrates within most of sample locations, which is
550 consistent with headwater stream characteristics in the region. Sampling location PM-12.1 was
551 located within a second-order section of Spring Mine Creek where sand and detritus were the
552 dominant substrate.

 557 ² Sample sites PM-19 and B-6 are the same sampling location; however, data was collected in separate years during different studies.
 558 ³ Number in parentheses represents MPCA classification (MPCA 2011c).
 559 ⁴ IBI is the sum of study specific metrics where 0 represents the worst fish assemblage conditions and 100 represents the best fish assemblage conditions (USEPA 2011b).

DRAFT

561 **Macroinvertebrate Communities**

562 The assemblages observed in the survey are typical of those sampled elsewhere in the northeast
563 region of Minnesota (Breneman 2005). Total taxa, abundance, %EPT, and %Diptera totals are
564 quite variable among the sites. Most sampling locations exhibited significant percentages of
565 stonefly, mayfly, and caddisfly populations, which, unlike the fish community data, indicate
566 desirable, non-degraded stream characteristics are likely present. Study sites PM-12.1 and PM-19
567 exhibited 44 and 41 percent EPT, respectively, which indicated some riffle/run habitat was likely
568 present, although this was not reflected from the substrate data provided in Table 4.2.6-13 or at
569 least was not a dominant habitat within the study stretch. The HBI scores exhibited variable
570 results, indicating fair to good macroinvertebrate habitat was present within these study stretches.
571 The exception to these results was the impairment for invertebrate life in Spring Mine Creek,
572 which resulted in the MPCA listing of “Impaired” in 2012.

DRAFT

573 **Table 4.2.6-14 Composition of Macroinvertebrate Assemblages for Sites in the Embarrass River Watershed**

Name	Year	Site	Total Taxa	Abundance	%EPT ¹	%Diptera ²	HBI ³	IBI ⁴

Bear Creek	2009	09LS098	25	--	--	21	4.3	67
Bear Creek	2010	PM-20	32	2,787	24	30	6.4	--

574 Sources: Data and functional group assignments from Breneman 2005, Barr 2011b, Barr 2011i, Barr 2011m, Barr 2011n, and MPCA 2011c.

575 Notes:

576 ¹ %EPT indicates the percent of mayflies, stoneflies, and caddisflies within the macroinvertebrate sample. High EPT percentages of the population typically indicates degraded habitat conditions are not present.

577 ² %Diptera indicates the percent of true flies and bloodworms present within the macroinvertebrate sample. High percentages of the population typically indicates low habitat diversity and predominant silty habitats often present within slow-moving, headwater streams.

578 ³ HBI is the measure of macroinvertebrate assemblages tolerance toward organic (nutrient) enrichment. Decreasing values indicate improving biotic condition. Higher values indicate fewer biological stressors (scale of 100).

579 ⁴ IBI derived by the MPCA (MPCA 2011c).

580 ⁵ Sample sites B-6 and PM-19 are the same sampling location; however, data was collected in separate years during different studies.

584 **4.2.6.3.4 Special Status Fish and Macroinvertebrates**

585 No special status fish or macroinvertebrates are known to occur within the Embarrass River
 586 Watershed, although the same potential SGCN, federal, and RFSS special status species
 587 described for the Partridge River Watershed would also apply to these areas. Suitable habitat is
 588 likely present for the same species discussed in Section 4.2.6.1.4.

589 No invasive fish or macroinvertebrate species are known to occur within the Embarrass River or
 590 its tributaries near the Plant Site.

591 **4.2.6.4 Mercury Concentrations in Fish**

592 As discussed in Section 4.2.2, Section 303(d) of the CWA requires states to publish a list of
 593 waters that are not meeting one or more water quality standards. The Partridge River is not listed
 594 as an impaired water body for mercury on the 303(d) list; however, fish tissue mercury
 595 concentrations in the Partridge River were indicative of an impaired waterbody (See Table
 596 4.2.6-15). It should be noted that these data only represent one sampling event and may not be
 597 representative of the overall fish tissue mercury concentrations within the Partridge River
 598 Watershed.

599 Most of the St. Louis River is listed for “mercury in fish tissue” impairment. Similarly, the
 600 Embarrass River is not on the 303(d) list for mercury; however, several lakes downstream of the
 601 NorthMet Project area (within the Chain of Lakes), through which the Embarrass River flows,
 602 are listed for “mercury in fish tissue” impairment. It should be noted that portions of the
 603 Embarrass River, from the headwaters to Embarrass Lake, are listed on the 303(d) list as
 604 impaired for “Fishes Bioassessment,” a category not related to mercury. Fish consumption
 605 advisories have been issued for “mercury in fish tissue” impaired waters by the MDH to provide
 606 site-specific consumption guidance on the quantity and frequency of fish species consumed. For
 607 waters not listed on the 303(d) list for “mercury in fish tissue,” statewide consumption advisories
 608 still apply because these waters have not been tested and it is assumed that fish within these
 609 waters could potentially contain mercury in sufficient quantities to warrant a consumption
 610 advisory. Table 4.2.2-2 provides a summary of impaired waters within the Embarrass River and
 611 Partridge River watersheds.

612 **Table 4.2.6-15 Mercury Concentrations in Fish Species Collected During 2014 MDNR**
 613 **Partridge River Fish Surveys**

Sample Size	Scientific Name	Common Name	Mercury (ppm)
6	<i>Perca flavescens</i>	Yellow Perch	0.25⁽¹⁾
4	<i>Catostomus commersonii</i>	White Sucker	0.16
6	<i>Sander vitreus</i>	Walleye	0.63⁽¹⁾
8	<i>Esox lucius</i>	Northern Pike	0.62⁽¹⁾

614 Source: Varian, MDNR, Pers. Comm., January 12, 2015.

615 Note:

616 Bold values indicate mercury concentrations in fish that are indicative of impaired waters (MPCA 2014).

617 ¹ Mercury concentrations above 0.2 ppm indicate an impaired water (MPCA 2014).

DRAFT

1 **4.2.7 Air Quality**

2 The NorthMet Project Proposed Action is subject to various federal and State of Minnesota air
3 quality regulations. These regulations are designed to protect the general climate and air quality
4 within the affected region of the NorthMet Project area. The USEPA has promulgated National
5 Ambient Air Quality Standards (NAAQS) for seven common pollutants found in the ambient air,
6 known as “criteria” pollutants. These standards are designed to ensure human and environmental
7 health criteria are met for the ambient air quality. Minnesota has also promulgated Minnesota
8 Ambient Air Quality Standards (MAAQS) to further protect human health. Minnesota has been
9 granted air permitting authority by the USEPA, so the NorthMet Project Proposed Action would
10 be issued a single permit by the MPCA.

11 The affected region can vary depending upon the specific regulations and the federal and state
12 jurisdictions. For the purpose of this section, the extent of the affected region would be bounded
13 by the Federal Land Managers’ (FLMs’) request to assess effects for all USEPA-defined Class I
14 areas within a 300-kilometer (km) radius of the NorthMet Project area. The remainder of this
15 section summarizes the regional climate, local meteorology, and the existing ambient air quality
16 for the affected region.

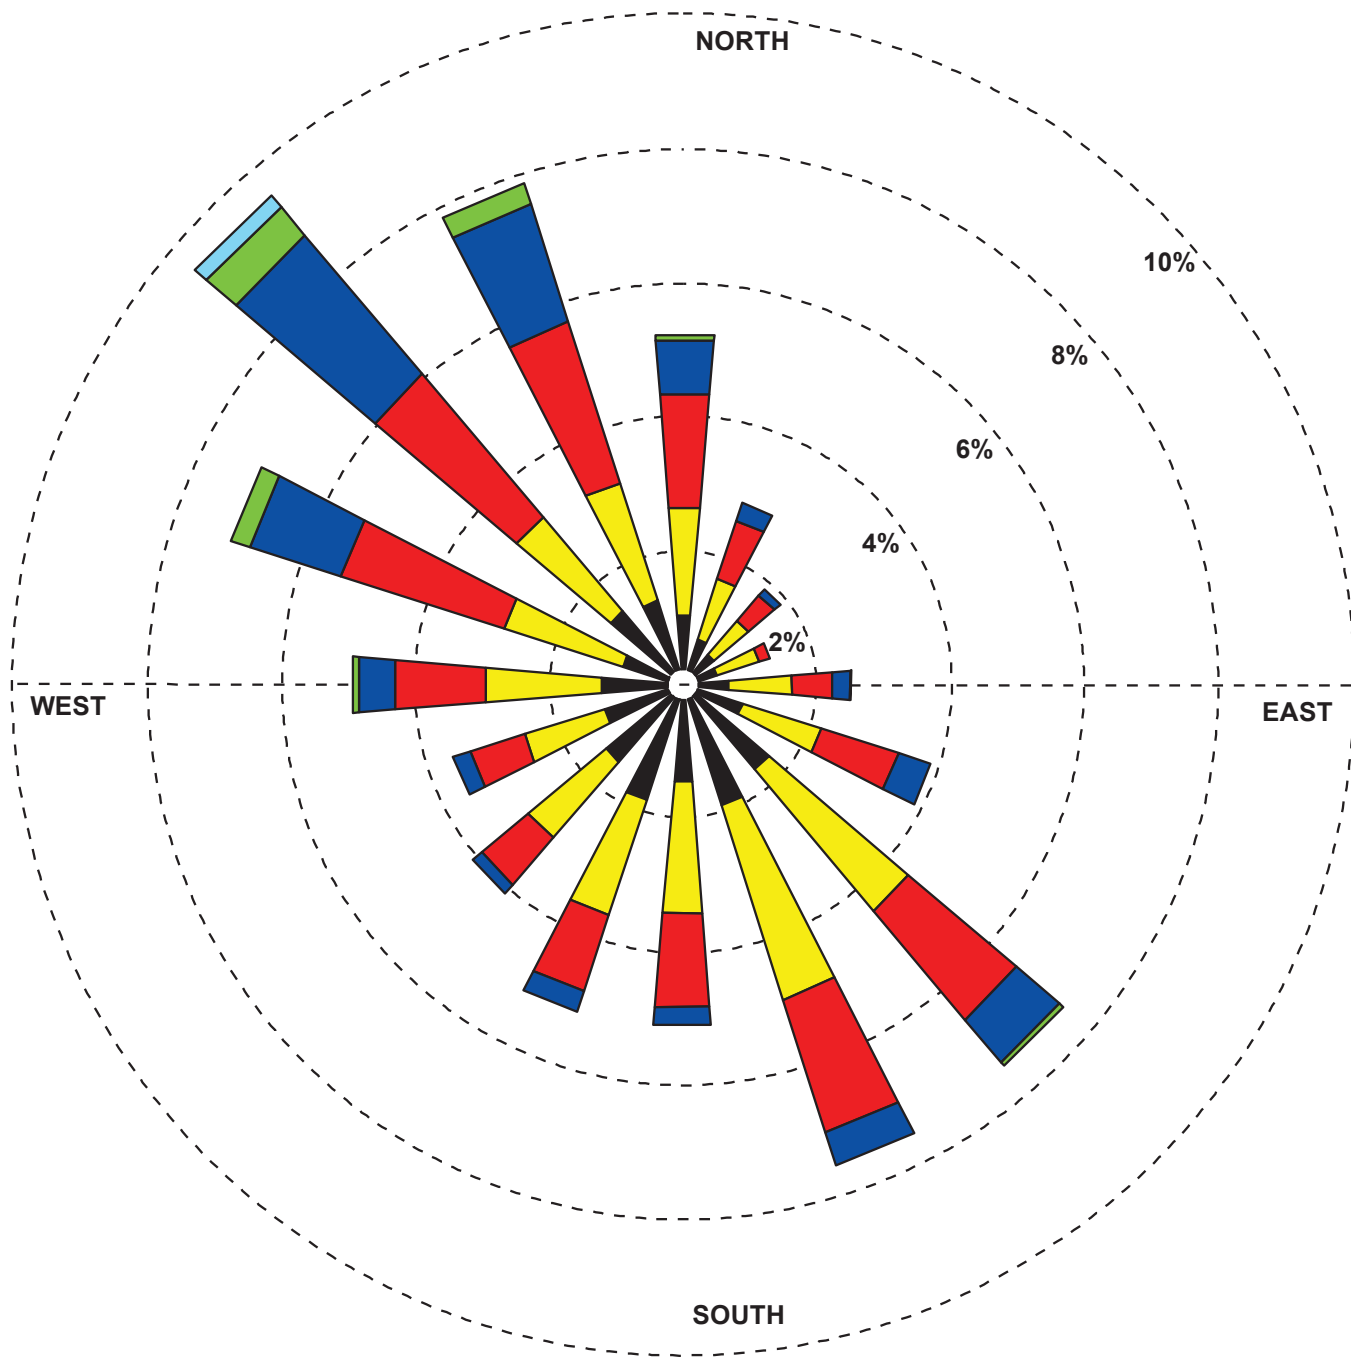

17 **4.2.7.1 Regional Climate and Meteorology**

18 The climate for the NorthMet Project area and Minnesota, in general, is defined as continental.
19 The region is subject to continental polar air masses throughout most of the year and, during the
20 cold season, is subject to more frequent Arctic air masses. During the summer months, the
21 southern portion of the state gives way to warm air entering northward from the Gulf of Mexico.
22 As Pacific Ocean air masses move across the western United States, relatively mild and dry
23 weather can be observed throughout the year, depending upon the strength of the air mass.

24 Based upon surface data taken at the Hibbing Monitoring Station (see Figure 4.2.7-1),
25 predominant winds are from the north-northwest through west-northwest, occurring
26 approximately 25 percent of the time. Winds from the south-southeast through southeast show a
27 secondary predominance, occurring approximately 15 percent of the time. Average monthly
28 temperatures range from 4°F in the coldest month (January in northwest Minnesota) to 85°F in
29 the hottest month (July in southwest Minnesota). Mean annual temperatures range from 36°F in
30 the extreme north to 49°F in the southeast along the Mississippi River. Extreme temperatures
31 throughout the state can vary from 114°F in the summer to -60°F in the winter (NCDC 2010).
32 During the three coldest months (December through February), maximum daily temperatures are
33 below 32°F for 24 days per month. Temperatures in the summer months rarely reach maximum
34 temperatures above 90°F (only 5 to 6 days per year).

35 Approximately two-thirds of the precipitation occurs between May and September, with annual
36 precipitation ranging from 35 inches in the southeast and gradually decreasing to 19 inches in the
37 extreme northwest. Northeastern Minnesota generally receives approximately 70 inches of snow
38 per year, decreasing to 40 inches per year near the south and eastern border states. Snow cover
39 occurs in Minnesota an average of 110 days per year with 1 inch or more on the ground,
40 although there is a marked difference between the northern (where the NorthMet Project area is
41 located) and southern portions of the state, ranging from 140 days per year to 85 days per year of
42 snow cover, respectively.

4.2.7.2 Local and Regional Air Quality

The MPCA monitors air quality at a number of stations throughout the state. The data collected helps the state determine major sources of air pollution as well as assess compliance with NAAQS and MAAQS. Per requirements of the federal CAA, monitoring is done for the criteria pollutants. The MPCA also monitors for a range of chemicals, referred to as air toxics, which, like the criteria pollutants, potentially affect human health.

As of 2012, air quality was monitored at 52 locations throughout Minnesota. Not all locations monitor all pollutants; rather, the selection of monitoring locations and parameters reflects consideration of a number of factors including population, pollutants of concern in the area, and wind direction. Table 4.2.7-1 provides the monitored background concentrations for the period 2008 to 2010 at monitoring stations within or close to the 300-km area of the NorthMet Project Proposed Action. Both the Duluth and Virginia locations are considered urban; the Cloquet site is rural, while the Voyageurs site is within Voyageurs National Park. The Virginia monitoring location has been in operation since 1968. In addition to demonstrating compliance with NAAQS and MAAQS, the monitoring site was also established to characterize metals concentrations and identify emissions sources from mining activities. The Cloquet site is three miles west of the city near several large forest products industries. Land use near the Voyageurs site is managed for recreation, timber, and wilderness. Pulp and paper mills in International Falls and Fort Frances, Ontario are approximately 95 miles northwest of the NorthMet Project area.

As seen from the table, all reported air quality data meet the NAAQS and the MAAQS, indicating that existing ambient air quality concentrations are below levels that are known to cause health-based impacts for these pollutants. These levels demonstrate that the general air quality area is considered in attainment under federal regulations.

Table 4.2.7-1 Monitored Background Concentrations (2008–2010)

Pollutant	Averaging Period	Monitored Background Concentration	Standard Value	Standard Type	Monitoring Station
Carbon Monoxide	8-Hour	1.9 ppm	9 ppm	Primary	Duluth – Torrey Building

71 Notes:

72 ¹ Minnesota State Ambient Air Quality Standard only.

73 ² Data available for only year 2010.

74 ³ The USEPA revoked the annual PM₁₀ standard (effective December 17, 2006). However, it is still reflected in the State of
 75 Minnesota's regulations.

76 ⁴ Secondary standard for Air Quality Control Regions 128, 131, and 133.

77 ⁵ For Air Quality Control Regions 127, 129, 130, and 132.

78 ⁶ Updated to the December 2012 standard.

79 µg/m³ = Micrograms per cubic meter

1 **4.2.8 Noise and Vibration**

2 This section addresses baseline noise and vibration conditions at the Mine Site and Plant Site,
3 including a brief introduction to noise concepts and terms.

4 Noise is generally defined as unwanted sound. Sound travels in a mechanical wave motion and
5 produces a sound pressure level. This sound pressure level, also referred to as loudness or
6 intensity, is measured in decibels (dB). The dB scale is logarithmic such that each 10 dB increase
7 represents a tenfold increase in noise intensity. For example, if sound energy is doubled, there is
8 a 3 dB increase in noise because the two sound levels are added logarithmically, not linearly or
9 arithmetically (e.g., 70 dB plus 70 dB equals 73 dB, not 140 dB). Sound measurement is further
10 refined by using an A-weighted scale that emphasizes the range between 1,000 and 8,000 cycles
11 per second, which is the range of sound frequencies most audible to the human ear. Unless
12 otherwise noted, all dB measurements presented in this FEIS are A-weighted (dBA) on a
13 logarithmic scale. This measurement is an expression of the relative loudness of sounds in air as
14 perceived by the human ear. In the A-weighted scale, the dB values of sounds at low frequencies
15 are reduced compared with unweighted dB, in which no correction is made for audio frequency.
16 This correction is made because the human ear is less sensitive at low audio frequencies,
17 especially below 1,000 hertz (Hz), than at high audio frequencies. A sound increase of 3 dBA is
18 barely perceptible to the human ear, while a 5 dBA increase is clearly noticeable and a 10 dBA
19 increase is heard as twice as loud (MPCA 2008a; Bies and Hansen 2009; IDOT 2011). Noise
20 emissions diminish or attenuate with distance from the source depending on the nature of the
21 source. When distance from a point source, such as a building, is doubled, the sound level
22 decreases by 6 dB. However, when distance from a line source, such as a busy roadway, is
23 doubled, the sound level decreases by 3 dB (MPCA 2008a).

24 The dB levels of common noise sources are shown in Table 4.2.8-1.

25 **Table 4.2.8-1 Decibel Levels of Common Noise Sources**

Common Noise Source	dB Levels
Jet Engine (at 25 meters)	140
Jet Aircraft (at 100 meters)	130
Rock Concert	120
Pneumatic Chipper	110
Jackhammer (at 1 meter)	100
Chainsaw, Lawn Mower (at 1 meter)	90
Heavy Truck Traffic	80
Business Office, Vacuum Cleaner	70
Conversational Speech, typical TV Volume	60
Library	50
Bedroom	40
Secluded Woods	30
Whisper	20

26 Source: MPCA 2008a.

27 A comparison of typical outdoor noise levels by land use category for daytime and nighttime is
 28 shown in Table 4.2.8-2.

29 **Table 4.2.8-2 Typical Outdoor Sound Levels by Land Use Category**

Land Use Category	L _{dn} (dBA)	L _d (dBA)	L _n (dBA)
Rural and sparsely populated areas	35 - 50	35 - 50	25 - 40
Quiet suburban (630 people/mi ² , remote from large cities and from industrial activity and trucking)	50	50	40
Normal suburban community (2,000 people/mi ² not located near industrial activity)	55	55	45
Urban residential community (6,300 people/mi ² not immediately adjacent to heavily traveled roads and industrial areas)	60	59	52
Noisy urban residential community (near relatively busy road or industry or 20,000 people/mi ²)	65	62	58
Very noisy urban residential community (63,000 people/mi ²)	70	67	63

30 Source: USEPA 1974.

31 Notes:

32 L_{dn}, or day-night sound level, is the average equivalent A-weighted sound level during a 24-hour time period with a 10-dB
 33 weighting applied to equivalent sound level during the nighttime hours of 10 p.m. to 7 a.m.

34 L_d, or daytime L_{eq}, is the average equivalent sound level for daytime (7 a.m. to 10 p.m.).

35 L_n, or nighttime L_{eq}, is the average equivalent sound level for nighttime (10 p.m. to 7 a.m.).

36 L_d and L_n values were determined from the L_{dn} values using methods described in the 1974 USEPA document referenced above
 37 (based on data from 63 sets of background measurements conducted at various land-use areas across the United States).

38 Vibration is defined as regularly repeated movement of a physical object about a fixed point.
 39 Blasting is an activity associated with mining that could result in vibration. There are two types
 40 of vibration associated with mine blasting: ground vibration and air vibration or airblast
 41 overpressure. The magnitude of ground vibration is expressed in terms of peak particle velocity
 42 (PPV) and is measured in inches per second (in/s) or millimeters per second (mm/s). Airblast
 43 overpressure is measured in linear-weighted decibels (dBL).

44 4.2.8.1 Types of Noise

45 Noise may be classified as steady, non-steady, impulsive, or low-frequency depending on the
 46 temporal variations in sound pressure level. The various types of noise are described below.

- 47 • **Steady noise** is a noise with negligibly small fluctuations of sound pressure level within the
 48 period of observation. Steady noise with audible discrete tones is called discrete frequency
 49 noise or tonal noise. **Tonal noise** is characterized by one or two single frequencies and is
 50 much more annoying than broadband noise, which is characterized by energy at many
 51 different frequencies and of the same sound pressure level as the tonal noise. Tonal noise is
 52 caused by rotating parts of machines such as fans, internal combustion engines, transformers,
 53 and pumps. **Broadband noise** is steady noise without discrete frequency tones. Sounds are of
 54 longer duration and vary little over time (e.g., large gas turbines and road traffic).
- 55 • **Non-steady noise** is a noise that occurs when its sound pressure levels shift significantly
 56 during the period of observation. This type of noise can be divided into **fluctuating noise**
 57 (i.e., noise for which the level changes continuously and to a great extent during the period of
 58 observation such as surface grinding, welding, and component assembly) and **intermittent**

59 **noise** (i.e., noise that returns to the ambient or background level several times during the
60 period of observation such as air compressors and automatic machinery during a work cycle).

- 61 • **Impulsive noise** consists of one or more bursts of sound energy, each of a duration less than
62 approximately 1 second (i.e., sounds of short duration with high peak pressures). This type of
63 noise can be divided into **highly impulsive sounds** (i.e., sound from one of the following
64 enumerated categories of sound sources: small-arms gunfire, metal hammering, wood
65 hammering, drop hammering, pile driving, drop forging, pneumatic hammering, pavement
66 breaking, metal impacts during rail-yard shunting operation, and riveting); **high-energy**
67 **impulsive sound** (i.e., sound from one of the following enumerated categories of sound
68 sources: quarry and mining explosions, sonic booms, demolition and industrial processes that
69 use high explosives, military ordinance, explosive ignition of rockets and missiles, explosive
70 industrial circuit breakers, and any other explosive source where the equivalent mass of
71 dynamite exceeds 25 grams); and **regular impulsive sound** (i.e., impulsive sound that is not
72 highly impulsive sound or high-energy impulsive sound) (ANSI 2005).
- 73 • **Low-frequency noise** or sounds with strong low-frequency content produce greater
74 annoyance than is predicted from A-weighted sound levels. Generally, annoyance is minimal
75 when octave-band sound pressure levels are less than 65 dB at 16, 31.5, and 63 Hz midband
76 frequencies. Annoyance to sounds with strong low-frequency content is virtually only an
77 indoor problem (ANSI 2005).

78 **4.2.8.2 Regional Setting**

79 Noise exposure goals for various types of land use reflect the varying noise sensitivities
80 associated with each of these uses. Residences, hospitals, and guest lodging are most sensitive to
81 noise intrusion and therefore have more stringent noise exposure targets than industrial or
82 commercial uses that are not subject to effects such as sleep disturbance. The land use in the
83 Superior National Forest is mostly for forest. The region surrounding the Mine Site has
84 traditionally supported various mining activities, as well as logging, on federal, state, county, and
85 private forest lands. Noise sources associated with logging activities include skidders, feller
86 bunchers, and log loaders. Noise sources associated with mining activities include drills,
87 explosives, dump trucks, excavators, crushers, and power generators. Considering the attenuation
88 effect of the surrounding forest and the fact that most of the mining and logging activities
89 typically occur several thousand ft away from each other, the noise levels are localized (rather
90 than regional) and diminish very quickly with distance due to geometric divergence or spreading
91 losses. In addition to the spreading losses, dense vegetation (foliage) in the Superior National
92 Forest also helps to attenuate noise from the mining and logging activities.

93 **4.2.8.3 Mine Site**

94 The Mine Site is situated mostly on federal land in the Superior National Forest, except for the
95 privately owned land bordering Dunka Road to the south of the Mine Site. As indicated above,
96 the region surrounding the Mine Site has traditionally supported various mining activities, as
97 well as logging, on federal, state, county, and private forest lands. The Northshore Mine and
98 Mesabi Nugget Phase I Plant are located approximately 2 miles north and 8 miles west of the
99 Mine Site, respectively. Dunka Road, which provides access to the Mine Site, is an existing
100 private road located south of the Mine Site, with no public access and little usage. The existing
101 LTVSMC railroad grade is also located south of the Mine Site.

102 Review of the most up-to-date aerial maps indicates that there are no noise-sensitive areas or
103 receptors (e.g., residences, campgrounds, schools, churches, or wilderness areas) within the Mine
104 Site and surrounding federal lands. However, there are a few receptors outside the Mine Site.
105 The closest noise-sensitive receptor to the Mine Site is the City of Babbitt, located approximately
106 6 miles to the north. Survey data identified a Boy Scout camp located 5 miles from the Mine
107 Site, but the clerk's office of the City of Hoyt Lakes indicated that the only Boy Scout camp near
108 the Mine Site is located on Colby Lake, approximately 10 miles southwest of the Mine Site.
109 Other noise-sensitive receptors in the general area of the Mine Site include: Skibo (a small
110 residential area), approximately 8 miles to the south; the City of Hoyt Lakes, approximately
111 9 miles to the southwest; and the City of Aurora, approximately 13 miles to the south. The
112 BWCAW is part of the national wilderness preservation system where sensitivity to human-
113 caused sound and noise effects are important considerations. It is approximately 20 miles (in a
114 northeasterly direction) from the Mine Site to the closest portion of the BWCAW. The cities of
115 Ely and Tower are also located close to the BWCAW and are approximately 21 miles north-
116 northeast and 19 miles northwest of the Mine Site, respectively. The Bois Forte Reservation is
117 located near Tower. In addition to the receptors identified above, other receptors such as
118 recreational sites (family campgrounds, campsites, boating, fishing, swimming, and family
119 picnic areas), wildlife corridors, trails, and MPCA staff-recommended wild rice waters/beds
120 (used by tribal members for harvesting) are also within the Mine Site vicinity. The closest
121 recreational site is a family picnic area located approximately 9 miles south of the Mine Site
122 (near Skibo). The closest wildlife corridor and trail (Stony Spur Snowmobile Trail) are located
123 approximately 1 mile northwest and 6 miles northeast of the Mine Site, respectively. The closest
124 MPCA staff-recommended wild rice waters/beds are located approximately 5.5 miles north (Mud
125 Lake) and 7 miles northeast (Birch Lake) of the Mine Site. Figure 4.2.8-1 shows the locations of
126 the closest receptors to the Mine Site. Though not depicted on Figure 4.2.8-1 due to sensitivity
127 regarding cultural resources and locations, the federal Co-lead Agencies have identified a few
128 archaeological sites in consultation with the SHPO and the Bands. Although barely discernible in
129 some cases, a few well-defined trail segments of the BBLV Trail and two other unnamed trail
130 segments (BBLV Trail Segment #1) represent the trail corridors that cross the Mine Site and
131 Plant Site, as well as the NorthMet Project area (see Section 4.2.9, Cultural Resources).

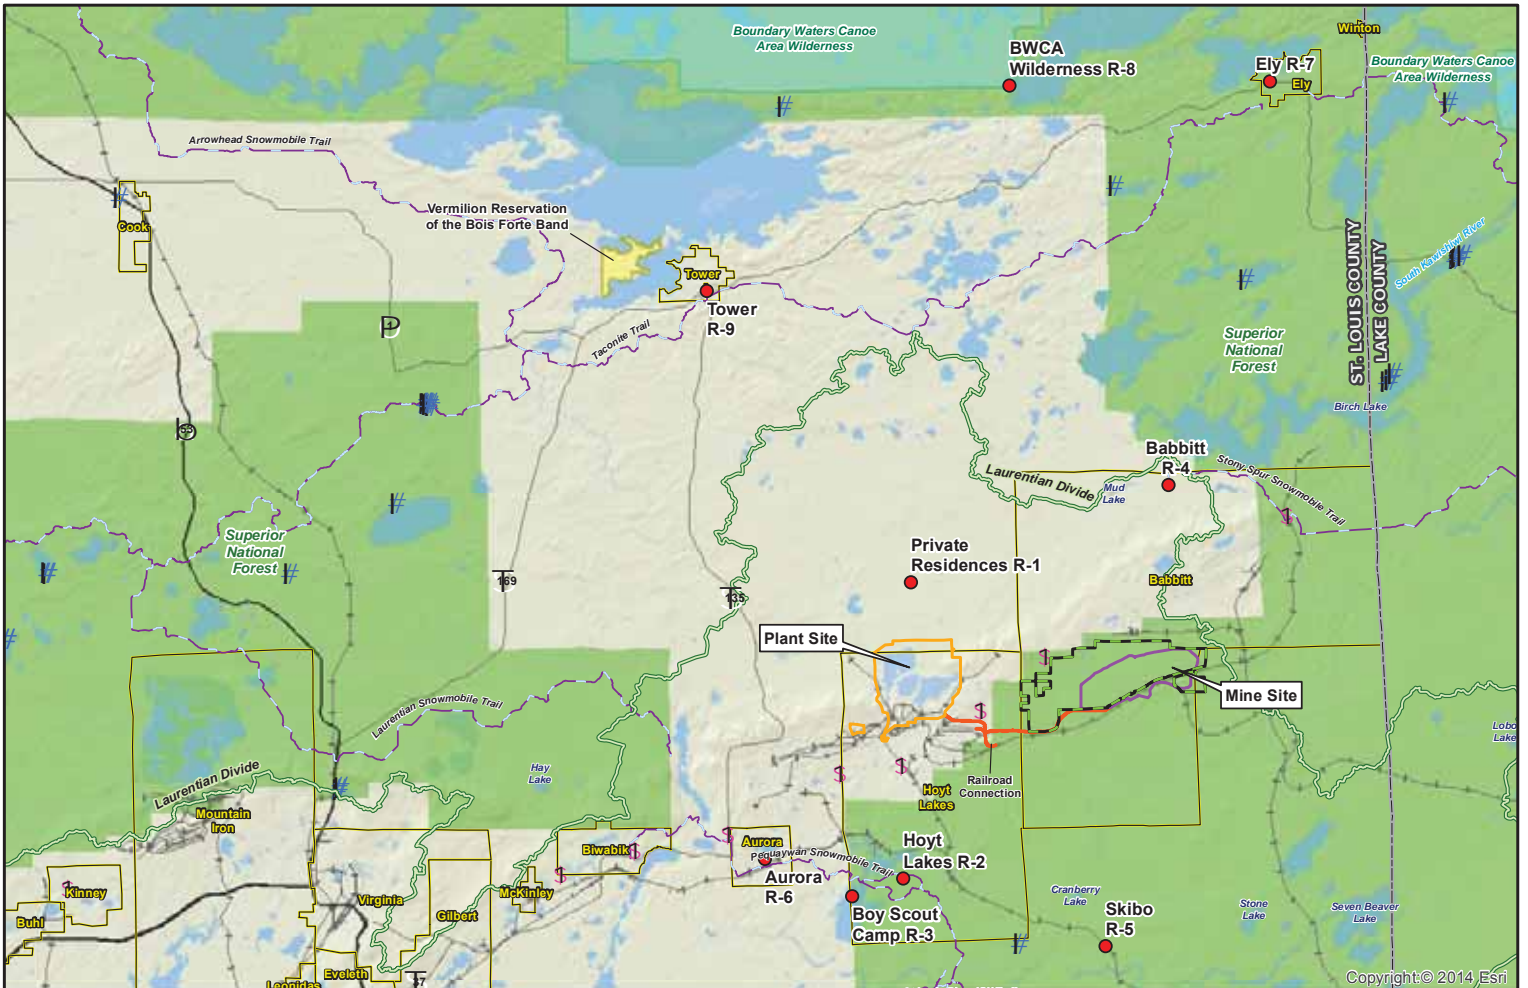

132 Since the Mine Site is located in a rural and sparsely populated environment, the existing
133 ambient steady L_{eq} for all nearby sensitive receptors (except the BWCAW), are expected to
134 range from 35 to 50 dBA or approximately 45 dBA (daytime) and 25 to 40 dBA or
135 approximately 35 dBA (nighttime) (see Tables 4.2.8-2 and 4.2.8-3). The ambient L_{eq} assumed
136 for receptors outside the Mine Site area account for existing noise from the Northshore Mine
137 located approximately 2 miles north of the Mine Site. Since the BWCAW is located in a natural
138 environment that is generally quieter than areas outside the wilderness, the existing ambient L_{eq}
139 at the BWCAW area is expected to be lower than the levels for other receptors surrounding the
140 Mine Site area. In February 2011, the USFS Superior National Forest unit conducted an ambient
141 sound level survey at Little Gabbro Lake in the western part of the BWCAW (ambient data
142 provided by USFS staff via email in June 2013). In March 2011, the Superior National Forest
143 unit also conducted an ambient sound level survey at Royal Lake in the eastern part of the
144 BWCAW (USFS 2012e). The ambient data at both sites are comparable, but the data at Royal
145 Lake is slightly lower. For the purpose of the NorthMet Project Proposed Action, the Royal Lake
146 ambient data has been used to provide a conservative natural ambient level at BWCAW (see
147 Table 4.2.8-3). In addition to the fact that the Royal Lake ambient data are more conservative

148 (i.e., lower than Gabbro Lake data), the USFS staff indicated that the measured ambient data at
149 Gabbro Lake has not been reviewed by the National Park Service, but the measured data at
150 Royal Lake has been reviewed and used by the National Park Service soundscape program for
151 some recent work they did to model noise effects on the BWCAW.

152 Minnesota's noise standards are based on statistical calculations that quantify noise levels
153 according to duration over a 1-hour monitoring period. The L_{10} is the noise level that is exceeded
154 for 10 percent, or 6 minutes, of the hour, and the L_{50} is the noise level exceeded for 50 percent,
155 or 30 minutes, of the hour. There is not a limit on maximum noise (MPCA 2008a). For the
156 purposes of this assessment, the estimated baseline L_{eq} levels for the nearest receptors (except for
157 the BWCAW, where measured percentile data were available) were converted to other noise
158 percentile metrics, such as L_{50} and L_{10} using a USEPA calculation methodology (USEPA 1974).
159 The calculation was based on an assumed standard deviation of 3 dB for the sound level
160 statistical distribution. A summary of the estimated existing daytime and nighttime ambient
161 levels (i.e., L_{eq} , L_{50} , and L_{10}) expected at receptors closest to the NorthMet Project area is
162 presented in Table 4.2.8-3. As indicated above, natural ambient levels for the BWCAW were
163 based on measured L_{50} and L_{10} data taken from Royal Lake in the eastern part of the BWCAW
164 (USFS 2012e).

DRAFT

168 **Table 4.2.8-3 Summary of Estimated Existing Ambient Noise Levels at the Closest**
 169 **Receptors to the NorthMet Project Area, including the BWCAW**

Ambient Noise Levels	Daytime (dBA)	Nighttime (dBA)
All Receptors except the BWCAW ¹ :		
L _{eq}	45.0	35.0
L ₅₀	44.0	34.0
L ₁₀	48.8	37.8
BWCAW ² :		
L _{eq}	34.0	34.0
L ₅₀	23.4	23.4
L ₁₀	33.2	33.2

170 Notes:
 171 ¹ Source: USEPA 1974.
 172 ² Source: USFS 2012e.

173 Currently, no ground- or air-vibrating sources or activities (e.g., mine blasting, piling, etc.) occur
 174 at the Mine Site. The closest vibration-generating activity is blasting at the Northshore Mine.
 175 Like noise emissions, ground and air vibration effects diminish with distance from the source.
 176 Because of the distance from the operating mine, existing baseline levels of vibration at the Mine
 177 Site and nearby receptors are expected to be negligible.

178 **4.2.8.4 Plant Site**

179 The Plant Site is situated on private land located 8 miles west of the Mine Site. The closest
 180 noise-sensitive receptors to the Plant Site include a few private residences located approximately
 181 3.5 miles north; the City of Hoyt Lakes, located approximately 5 miles south; and the City of
 182 Aurora, located approximately 8 miles southwest. A Boy Scout camp, which is only used
 183 occasionally, is located approximately 10 miles south-southwest. In addition to the receptors
 184 identified above, other receptors such as recreational sites, wildlife corridors, trails,
 185 archaeological sites (used by tribal members for cultural and spiritual purposes), and sites used
 186 by tribal members for harvesting of wild rice are also within the Plant Site vicinity. The closest
 187 recreational site is a family picnic area located approximately 9 miles south of the Plant Site
 188 (near Skibo). The closest wildlife corridor and trail (Pequaywan Snowmobile Trail) are located
 189 approximately 2 miles south and 6 miles southeast of the Plant Site, respectively. The closest
 190 MPCA staff-recommended wild rice waters/beds are located approximately 6 miles west (Hay
 191 Lake) of the Plant Site. Figure 4.2.8-1 shows the locations of the closest receptors to the Plant
 192 Site. Though not depicted on Figure 4.2.8-1 due to sensitivity regarding cultural resources and
 193 locations, the federal Co-lead Agencies have identified a few archaeological sites in consultation
 194 with the SHPO and the Bands. These archaeological sites include the Spring Mine Lake
 195 Sugarbush (a natural maple-basswood stand of cultural significance, less than 1 mile east of the
 196 Plant Site) and the *Mesabe Widjiu* (a long, linear landform running the length of the Mesabi Iron
 197 Range, and intersecting portions of the Laurentian Divide and northeast of the Plant Site near the
 198 Tailings Basin), and possess important spiritual and cultural significance to the Ojibwe people.
 199 Although barely discernible in some cases, a few well-defined trail segments of the BBLV Trail
 200 and two other unnamed trail segments (BBLV Trail Segment #1) represent the trail corridors that
 201 cross the Mine Site and Plant Site, as well as the NorthMet Project area (See Section 4.2.9,
 202 Cultural Resources).

203 Like the Mine Site, the Plant Site is also located in a rural and sparsely populated environment;
204 therefore, the daytime and nighttime ambient levels (i.e., L_{eq} , L_{50} , and L_{10}) for all nearby
205 sensitive receptors, such as residential houses, are expected to be similar to the levels shown in
206 Table 4.2.8-3. The closest noise-generating sources are the coal and flux pulverizer, rotary hearth
207 furnace, and cooling towers at Mesabi Phase I Plant in Hoyt Lakes, which is approximately
208 1 mile west-southwest of the Plant Site. The baseline noise levels of the identified receptors near
209 the Plant Site (see Table 4.2.8-3) already capture or account for noise from the Mesabi Phase I
210 Plant.

211 Currently, no ground- or air-vibrating sources or activities (e.g., mine blasting or pile driving)
212 occur at the Plant Site. The closest vibration-generating sources are the coal and flux pulverizer
213 and rotary hearth furnace at the Mesabi Phase I Plant in Hoyt Lakes, which is approximately
214 1 mile west-southwest of the Plant Site. Since ground and air vibration effects diminish with
215 distance from the source, existing baseline levels of vibration at the Plant Site and the nearest
216 sensitive receptors are expected to be negligible.

DRAFT

1 **4.2.9 Cultural Resources**

2 **4.2.9.1 Introduction**

3 The MDNR, USACE, and USFS have prepared this joint state-federal FEIS for the proposed
4 NorthMet Project Proposed Action and Land Exchange Proposed Action. USEPA, the Fond du
5 Lac Band of Lake Superior Chippewa, the Bois Forte Band of Chippewa, and the Grand Portage
6 Band of Lake Superior Chippewa (herein referred to as the Bands) participated as cooperating
7 agencies based on regulatory authority and/or subject matter expertise. Cooperating agencies
8 have not participated in production or endorsement of any components of the EIS or the
9 NorthMet Project.

10 Although not required by NEPA and MEPA, the Co-lead Agencies committed to providing an
11 appendix in this FEIS that contains the Tribal Cooperating Agencies' comments and supporting
12 documentation representing Major Differences of Opinion (MDOs). See Appendix C for
13 comments and supporting documentation from the Bois Forte, Grand Portage, Fond du Lac,
14 GLIFWC, and the 1854 Treaty Authority. These take the form of eight position papers and a
15 Co-lead Agency Preliminary SDEIS comment disposition spreadsheet for the Tribal Cooperating
16 Agencies.

17 The Tribal Cooperating Agency submittals in Appendix C are provided verbatim and in identical
18 form as they were for the SDEIS. They were considered in the development of this FEIS. Refer
19 to Chapter 8 for more information.

20 **4.2.9.2 Cultural Resources**

21 “Cultural resources” is a very general term that includes a wide range of resources. There is no
22 legal or generally accepted definition of “cultural resources” within the federal government, but
23 it is commonly used in connection with the identification of historic properties in compliance
24 with Section 106 of the National Historic Preservation Act (NHPA). However, historic properties
25 are only a subset of cultural resources, and are but one aspect of the “human environment”
26 defined by the NEPA regulations.

27 Under NEPA, the human environment includes the natural and the physical (e.g., structures)
28 environment, and the relationships of people to that environment. A NEPA review must address
29 the cultural context in which the project effects would occur. Management policies, and guidance
30 within federal and state agencies, seek to identify and consider all types of cultural resources and
31 balance the need for development with the need to protect cultural resources.

32 The intent of this section is to describe the affected environment within this cultural context.
33 Cultural resources within this context include historic properties, which are considered under the
34 NHPA, and natural resources of cultural significance to the Bands. A discussion of treaty rights
35 under the 1854 Treaty is also provided as part of this cultural context to understand the
36 significance of the Ceded Territory to the Bands.

37 **4.2.9.2.1 National Historic Preservation Act Overview**

38 The NorthMet Project Proposed Action is considered an undertaking as defined in 36 CFR 800,
39 the regulation implementing Section 106 of the NHPA. A more narrow view of cultural
40 resources is necessary for these regulatory requirements. The intent of Section 106, as set forth in

41 the impending regulations, is for federal agencies to take into account the effects of a proposed
42 undertaking on historic properties and to consult with the Advisory Council on Historic
43 Preservation (ACHP), State Historic Preservation Offices (SHPOs), federally recognized tribes,
44 other federal agencies with concurrent undertakings in connection with the project, applicants for
45 federal assistance, local governments, and any other parties with a demonstrated interest in the
46 proposed undertaking and its potential effects on historic properties.

47 Section 106 establishes a process for identifying historic properties that may be affected by the
48 proposed undertaking; assessing the undertaking's effects on those resources; and engaging in
49 consultation that seeks ways to avoid, minimize, or mitigate adverse effects on properties that are
50 either listed on, or considered eligible for listing on, the National Register of Historic Places
51 (NRHP). The area in which effects on resources are evaluated is the Area of Potential Effect
52 (APE). The APE is defined as, "... the geographic area or areas within which an undertaking
53 may directly or indirectly cause alterations in the character or use of historic properties, if any
54 such properties exist. The area of potential effects is influenced by the scale and nature of the
55 undertaking and may be different for different kinds of effects caused by the undertaking"
56 (36 CFR § 800.16(d)).

57 A historic property is defined as any district, site, building, structure, or object that is either
58 listed, or eligible for listing, in the NRHP.

59 To be eligible for listing in the NRHP, a cultural resource must meet one of the four criteria for
60 eligibility. The criteria (36 CFR 60.4(a–d)) used to evaluate the significance of a cultural
61 resource are as follows:

- 62 a) It is associated with events that have made a significant contribution to the broad patterns of
63 history;
- 64 b) It is associated with the lives of past significant persons;
- 65 c) It embodies the distinctive characteristics of a type, period, or method of construction, or that
66 represent the work of a master, or that possess high artistic values, or that represent a
67 significant and distinguishable entity whose components may lack individual distinction; or
- 68 d) It has yielded or may be likely to yield, information important in history or prehistory.

69 Properties also need to exhibit integrity of location, materials, setting, design, association,
70 workmanship, and feeling and must be at least 50 years old. However, under Criteria
71 Consideration G, a property achieving significance within the past 50 years is eligible if it is of
72 exceptional importance.

73 Historic properties can include properties of traditional religious and cultural significance to
74 Indian tribes; these properties are commonly referred to as Traditional Cultural Properties
75 (TCPs). Because the cultural practices or beliefs that give a TCP its significance are typically
76 still observed in some form at the time the property is evaluated, it is sometimes perceived that
77 the intangible practices or beliefs themselves, not the tangible property, constitute the subject of
78 evaluation. There is naturally a dynamic relationship between tangible and intangible. The
79 beliefs or practices associated with a TCP are of central importance in defining its significance.
80 However, it should be clearly recognized at the outset that the NRHP does not include intangible
81 resources themselves. The entity evaluated must be a tangible property—i.e., a district, site,
82 building, structure, or object. A property must meet several preconditions in order to meet the
83 federal definition of TCP as articulated in National Register Bulletin 38. These conditions

84 include the ongoing use of a property in spiritual practice or other traditional activities. TCPs are
85 defined in National Register Bulletin 38 as a place “eligible for inclusion in the NRHP because
86 of its association with cultural practices or beliefs of a living community that (a) are rooted in
87 that community’s history, and (b) are important in maintaining the continuing cultural identity of
88 the community” (National Register Bulletin 38:1). It is difficult to identify properties of
89 traditional cultural significance, since they are often kept secret. It is through consultation with
90 Native American tribes themselves that historic properties of religious and cultural significance
91 can be properly identified and evaluated (ACHP 2008).

92 Local, state, tribal, and federal agencies shall be consulted as appropriate in findings and
93 determinations made during the Section 106 process, as specified in 36 CFR 800. This includes
94 any SHPO whose state would physically include any portion of the APE. The SHPO is appointed
95 by each state to protect the interests of its citizens with respect to issues of cultural heritage. In
96 addition to the SHPO, the lead federal agencies have an obligation, as appropriate, to work with
97 state and local governments, and private organizations, applicants, or individuals with a
98 demonstrated interest from initiation to completion of the review under Section 106 of the
99 NHPA.

100 Once the lead federal agencies have identified the appropriate SHPO, 36 CFR 800.3(f)(2)
101 requires the federal agencies to identify Native American tribes that may attach religious and
102 cultural significance to historic properties within the APE and invite them to be consulting
103 parties.

104 If a historic property were affected, the federal Co-lead Agencies would follow the provisions of
105 36 CFR 800.5 to determine whether the effect were adverse. If an effect were adverse, the
106 USACE and the USFS would consult with the parties identified above to resolve the adverse
107 effect either through avoidance of the effect or mitigation of the effect pursuant to 36 CFR 800.6.
108 Prior to the federal agencies taking an action, whether it is the issuance of a USACE CWA
109 permit or a USFS land exchange in connection with the NorthMet Project Proposed Action, the
110 federal agencies must comply with Section 106 of the NHPA. Such compliance can be achieved
111 by, among other things, avoiding an adverse effect on historic properties or developing
112 appropriate mitigation measures and executing a Memorandum of Agreement (MOA) requiring
113 such mitigation.

114 **4.2.9.2.2 Identification of Consulting Parties**

115 The USACE invited 15 federally recognized tribes, as listed in the Native American Consultation
116 Database (maintained by the Department of the Interior, National Park Service) for St. Louis
117 County, Minnesota, and select state and federal agencies by letter to consult on the NorthMet
118 Project Proposed Action and notified the consulting parties that the USACE would be the lead
119 federal agency. Another letter from the USACE sent May 2006 invited Native American tribes
120 that had not responded to the initial invitations. Those federally recognized tribes that did not
121 respond to the first or second written invitations were contacted via phone.

122 As a result of this initial round of consultation, the Bois Forte Band of Chippewa Indians and
123 Fond du Lac Band of Lake Superior Chippewa had requested to be included as cooperating
124 agencies for the NorthMet Project Proposed Action under NEPA. Following this initial round of
125 consultation, the Grand Portage Band of Chippewa requested to be included as a cooperating
126 agency. The federal Co-lead Agencies continue consultation with the Bands, Minnesota SHPO,

127 and PolyMet as determinations are made concerning NRHP eligibility of identified cultural
128 resources, effects of the NorthMet Project Proposed Action on historic properties, and resolution
129 of any adverse effects, as required under 36 CFR 800. The federal Co-lead Agencies also
130 continue to consult on issues outside of the NHPA, including other issues pertinent to this FEIS.

131 **4.2.9.2.3 Methods for Identifying Historic Properties**

132 The NorthMet Project Proposed Action is considered an *undertaking* as defined in 36 CFR
133 800.16. The Co-lead Agencies must consider effects on historic properties before an undertaking
134 were to occur. The intent of Section 106 is for federal agencies to take into account the effects of
135 a proposed undertaking on any historic properties situated within the APE and to consult with the
136 ACHP, SHPOs, federally recognized Native American tribes and their Tribal Historic
137 Preservation Officers (THPOs), local governments, applicants, and any other interested parties
138 regarding the proposed undertaking and its potential effects on historic properties.

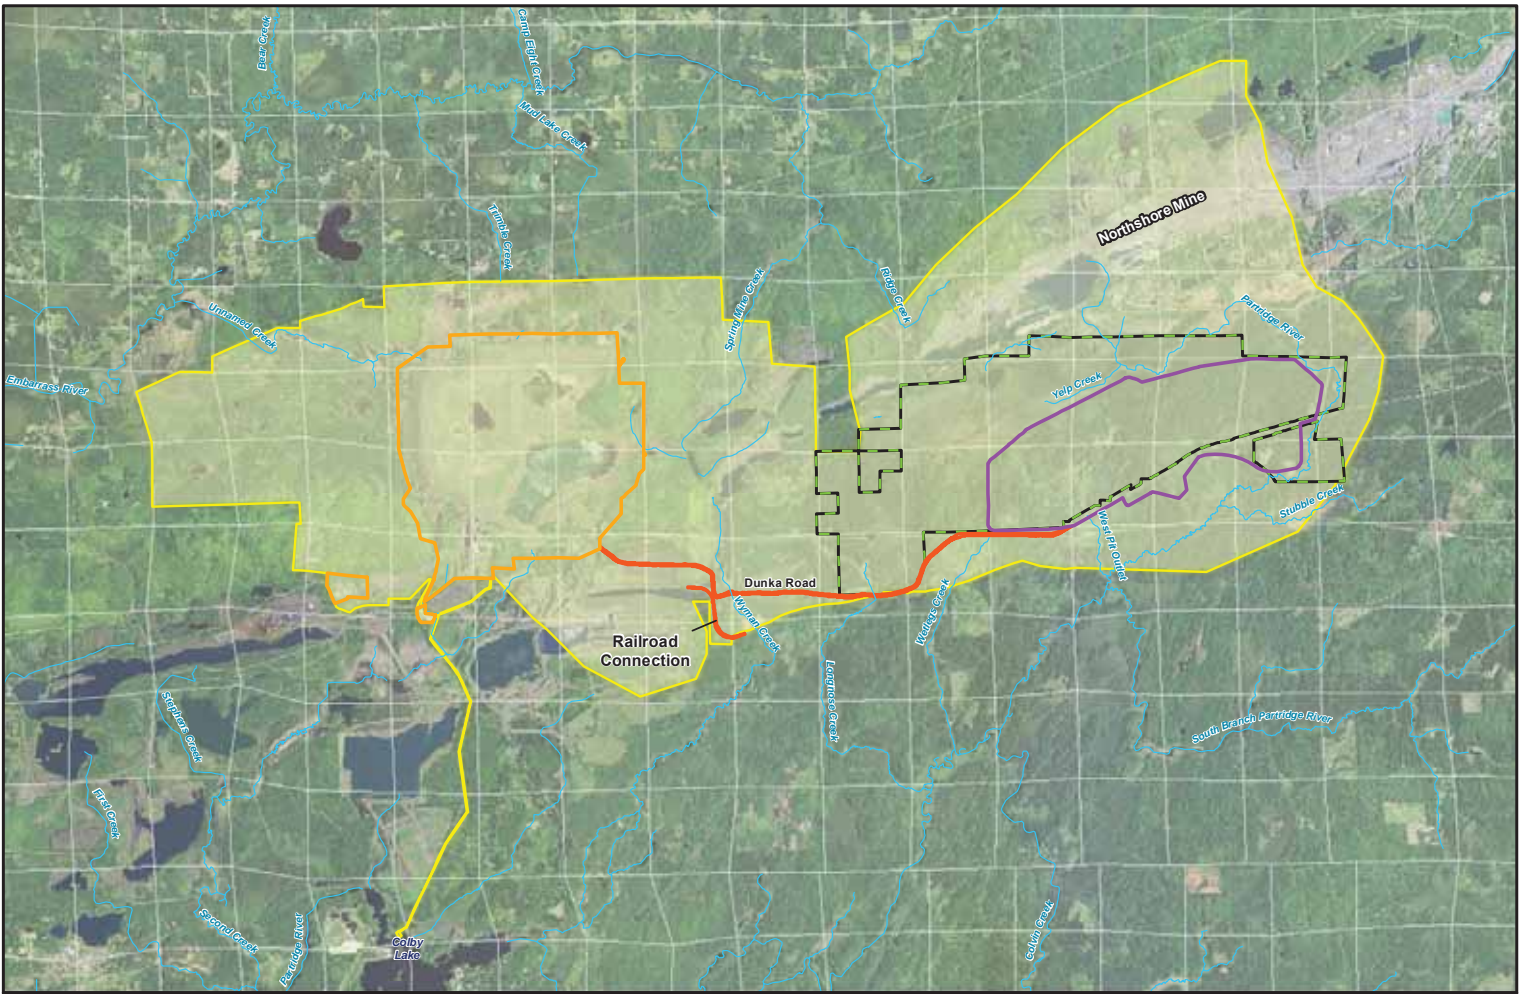

139 **Area of Potential Effect**

140 The APE is the area in which a federal agency has identified historic properties that may be
141 affected by the undertaking. For the purpose of any discussion pertaining to historic properties,
142 direct effects physically alter the historic property in some way and indirect effects are further
143 removed in time or space and diminish some aspect of the historic property, but do not
144 physically alter it. Direct effects on archaeological sites and historic structures would occur in a
145 fairly circumscribed area. Indirect effects could occur within a more geographically expansive
146 area that typically reflects potential effects resulting from visual, audible, or atmospheric
147 changes.

148 Typically, archaeological surveys are only done within the area where direct effects would occur.
149 However, for the NorthMet Project Proposed Action, the Co-lead Agencies conducted
150 archeological surveys in some areas within the APE where both direct and/or indirect effects
151 could occur.

152 The APE for the NorthMet Project Proposed Action was developed using the analysis discussed
153 below and in other resource-specific sections of this FEIS. The APE includes potential effects
154 areas for both direct and indirect effects (see Figure 4.2.9-1). The purpose of this summary is to
155 address the APE for the NorthMet Project Proposed Action and discuss the rationale behind the
156 areas that were included in the APE. As discussed in this section, cultural resources may include
157 components that are, in part or entirely, natural resources. Therefore, to address indirect visual,
158 audible, or atmospheric effects on all types of cultural resources, the APE includes aspects
159 related to aesthetics, water, air, and noise. The Co-lead Agencies' consultation concerning the
160 APE is ongoing with the SHPO, Bands, and PolyMet; the APE may be subject to change based
161 on new information vetted through and accepted by the Co-lead Agencies. For the purposes of
162 evaluating effects on cultural resources, the APE discussed in this FEIS is being used.

163 The DEIS was issued in October 2009. From 2007 to 2009, archaeological and architectural
164 surveys were conducted for the NorthMet Project Proposed Action, as discussed below. Those
165 surveys focused on the existing Plant Site area and the proposed Mine Site area (see Figure
166 4.2.9-2).

DRAFT

171 In early 2009, the consulting Bands proposed the 1854 Ceded Territory as a historic property.
172 Prior to that, the Bands reiterated their concerns about effects on water quality and quantity, for
173 both surface water and groundwater. At that point in the NorthMet Project Proposed Action
174 review, data were not available on which to reasonably extrapolate the APE. The result was an
175 APE that included a large area inclusive of portions of the Partridge River and Embarrass River
176 watersheds, extending down the St. Louis River to Lake Superior.

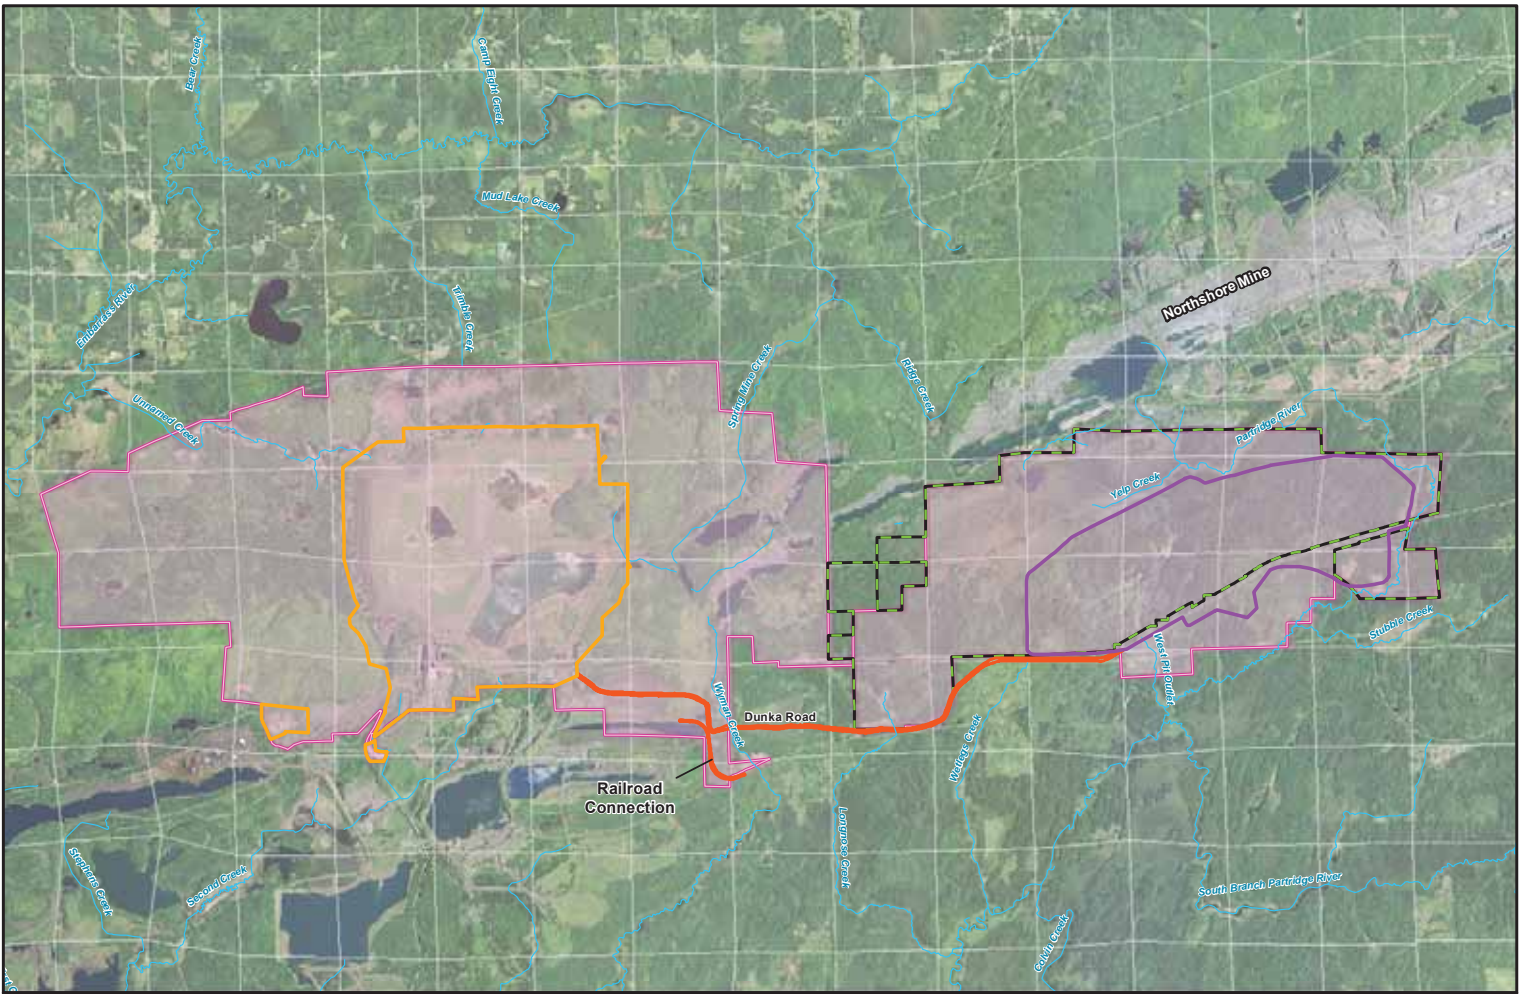

177 As consultation progressed with the Bands, it became apparent that further identification efforts
178 were warranted. Supplemental field investigations focused on the areas around the proposed
179 Plant Site and Mine Site. Since this initial effort, the Co-lead Agencies have received the results
180 of water quality and quantity modeling. The APE has been revised based on these results.

181 The NorthMet Project Proposed Action would meet ambient air quality standards at the property
182 boundary. Compliance with ambient air quality standards suggests that there would be no
183 significant effects on vegetation or soils. Therefore, it was suggested that the property boundaries
184 at both the Plant Site and the Mine Site be used to define the maximum extent of NorthMet
185 Project Proposed Action air impacts that would have the potential to affect historic properties
186 (see Section 5.2.7.2.3; Figure 4.2.9-3). In 2013, during analysis for the SDEIS, the Co-lead
187 Agencies refined the NorthMet Project Proposed Action APE to include this larger ambient air
188 boundary. Within the redefined APE, modeling shows where fugitive dust from the Plant Site,
189 Tailings Basin, and Mine Site stockpiles is predicted to settle. Areas of fugitive dust deposition
190 that extend beyond the APE would not exceed the ambient air quality standard (see Section
191 5.2.7.1.3). The intra-property APE for air is defined by these fugitive dust deposition areas (see
192 Figure 4.2.9-4). Therefore, in 2015, at the request of the consulting Bands and SHPO, the federal
193 Co-lead Agencies conducted additional Phase IA (historic aerial photography) desktop survey
194 for portions of the APE adjacent to the proposed Plant Site. This survey coverage focused on
195 areas outside of the previously disturbed mining district that are within the NorthMet Project
196 Proposed Action's ambient air boundary.

197 Water quality modeling (see Section 5.2.2) predicts that the NorthMet Project Proposed Action
198 would meet all Class 2B (aquatic life) water quality standards with the possible exception of
199 aluminum in Embarrass River tributaries draining the Tailings Basin. For aluminum, ambient
200 water quality, at times, already exceeds the Class 2B standard in both the Partridge River and
201 Embarrass River. In the Partridge River, the NorthMet Project Proposed Action would not
202 measurably increase aluminum concentrations relative to the Continuation of Existing
203 Conditions (CEC) Scenario results (Section 5.2.2.3.2). In the Embarrass River, the increase in
204 concentration relative to the CEC Scenario would not be the result of increased aluminum
205 loadings from the NorthMet Project Proposed Action, but rather the result of mass loading from
206 surface runoff and the loading from other minor sources (Section 5.2.2.3.3). Figure 4.2.9-5
207 shows surficial groundwater flowpaths with the potential to transport mine- and Tailings Basin-
208 affected groundwater from source areas to surface waters. Therefore, these distances around the
209 mine pit and Tailings Basin define the APE for potential changes to groundwater and surface
210 water quality (see Figure 4.2.9-5).

211 Changes to groundwater quantity due to groundwater drawdown resulting from mine pit
212 dewatering are not predicted to occur beyond 3,200 ft from the mine pit (see Section 5.2.2.3.2).
213 Therefore, this distance around the mine pit defines the APE for changes to groundwater quantity
214 (see Figure 4.2.9-6).

DRAFT

224 The APE for visual effects was based on a cultural resource-specific analysis completed for the
225 NorthMet Project Proposed Action by the federal Co-lead Agencies. At a distance of
226 approximately 12 miles on a prominent landform (Skibo Scenic Overlook), the NorthMet Project
227 Proposed Action stockpiles would be visible as a thin line on the horizon. The existing Plant Site
228 buildings are visible from the same location. However, proposed construction at the Plant Site
229 would not result in changes to the existing Plant Site profile visible in the distance. At
230 intermediate distances between Skibo and the Mine Site, the elevations are lower and the Mine
231 Site would not be visible. Therefore, the visual APE for the Mine Site is bounded by the crest of
232 the Laurentian Divide (*Mesabe Widjiu*) and an area about 1 mile from the Mine Site on the
233 eastern, western, and southern sides (see Section 5.2.11.2.2). The visual APE for the existing
234 LTVSMC Tailings Basin at the Plant Site is not considered to be expansive, because the
235 proposed Tailings Basin would be, for the most part, coincident with the existing basin and
236 would not extend to an elevation higher than the existing LTVSMC Tailings Basin (see Figure
237 4.2.9-7).

238 To determine the combined noise effect of the NorthMet Project Proposed Action, the total noise
239 generated from operations at both the Mine Site and Plant Site was added to the existing ambient
240 daytime and nighttime baseline levels. Noise effects from rail transport were also assessed, but
241 qualitatively. Blasting at the Mine Site would be a source of intermittent or non-continuous noise
242 and vibration. Blasting noise is not included in the noise level estimates shown in the noise
243 analysis because mine-blasting is typically an instantaneous event (not continuous or steady),
244 and would occur only during daytime periods.

245 Operations at the Mine Site and Plant Site would occur 24 hours per day. The analysis showed
246 total noise that would be experienced at any receptor location during the daytime (7 a.m. to
247 10 p.m.) and nighttime (10 p.m. to 7 a.m.) would be well below the Minnesota daytime and
248 nighttime noise standards. In all cases, the NorthMet Project Proposed Action, when mining,
249 hauling, and ore-crushing operations occur, would comply with the applicable Minnesota noise
250 standards.

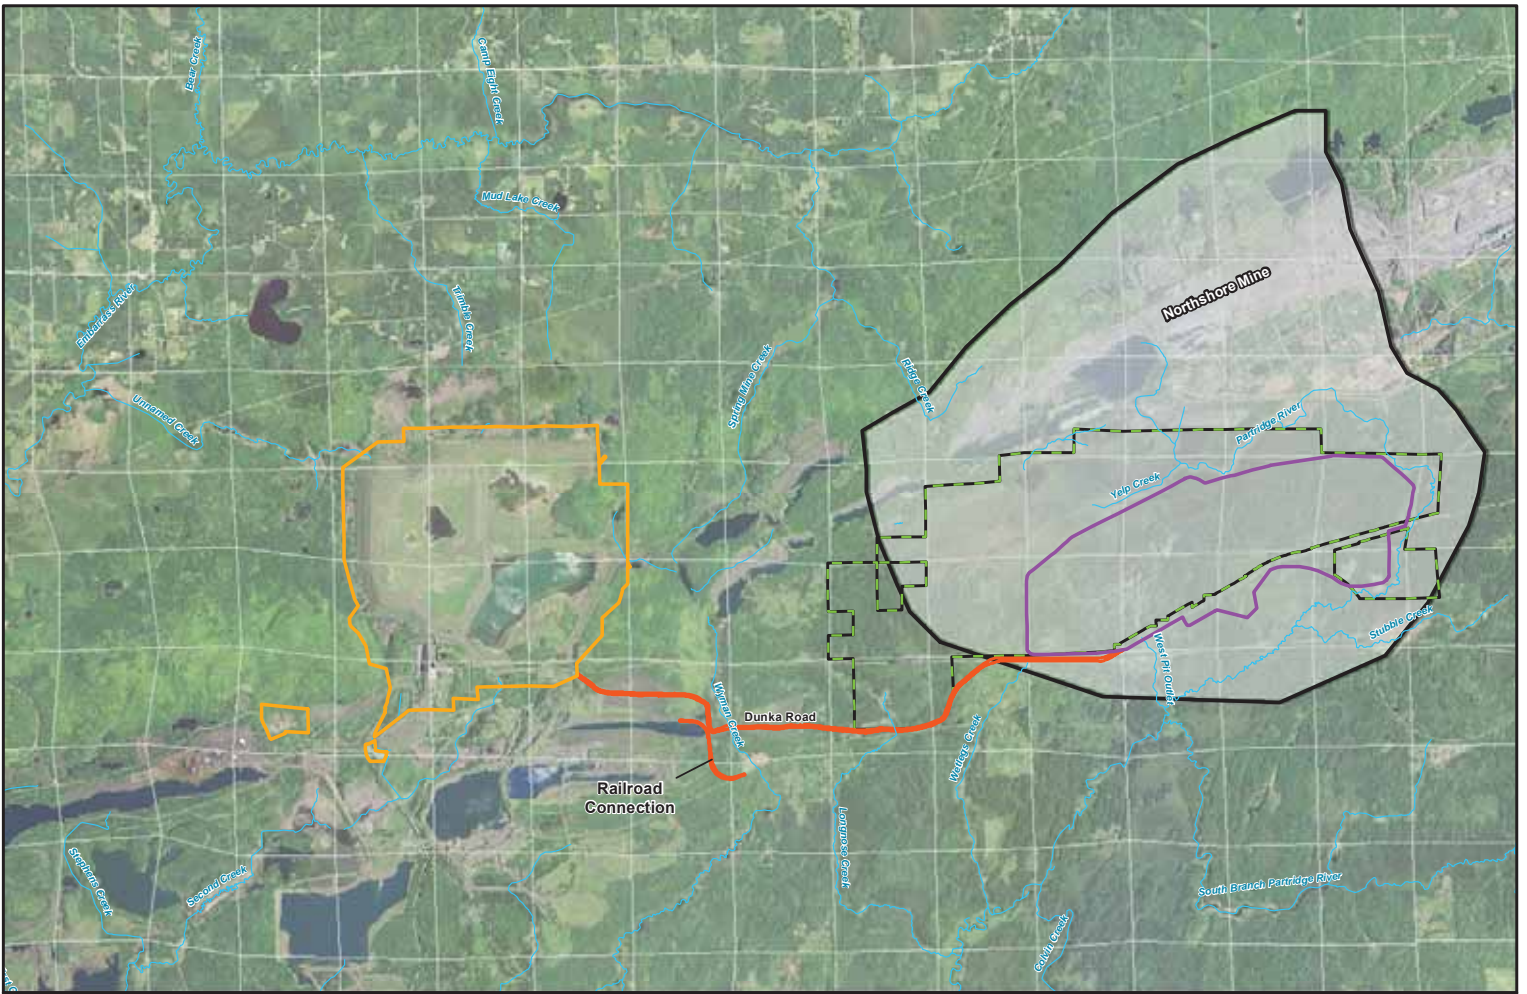

251 More specific information on noise-related effects is included in Section 5.2.8, for effects on
252 humans, and Section 5.2.5, for effects on wildlife.

253 Lastly, the Co-lead Agencies recognized that several refinements were needed in order to finalize
254 the APE. These refinements included the addition of the Dunka Road corridor, inclusion of
255 206.96 acres of federal parcels included in the Land Exchange Proposed Action that were
256 omitted from the APE in the SDEIS, and inclusion of the Colby Lake Pumphouse and pipeline
257 refurbishment.

258 **Identification of Historic Properties**

259 The SHPO maintains the official inventory of historic properties in Minnesota, as specified in the
260 NHPA and *Minnesota Statutes* 138.081. This inventory is physically housed in two separate sets
261 of files: the History/Architecture files contain records of buildings, structures, and landscapes,
262 and the Archaeological Site files contain records of archaeological sites. A review of SHPO and
263 USFS files and all previous cultural resources studies was conducted for the area covered by the
264 APEs.

268 ***Cultural Context***

269 This section provides a basis for understanding the identification and evaluation of historic
270 properties as it relates to existing conditions. An emphasis is also placed on understanding
271 Ojibwe history and traditions because of a greater emphasis on environmental effects and their
272 potential to affect resources of importance to the Bands. This section provides sufficient context
273 to understand the process of identification and evaluation of historic properties of religious and
274 cultural significance to the Bands.

275 ***Paleoindian (Circa 13,300 to 9,000 Before Present)***

276 The earliest evidence for human occupation in North America is referred to as the Paleoindian
277 Period. The beginning of this period largely coincides with the transition from the Pleistocene to
278 the Holocene about 11,700 years before present (BP), which marks the transition out of the last
279 glaciation. The Paleoindian Period spans from about 13,300 to 9,500 BP and is generally
280 associated with finely made fluted, lanceolate-shaped projectile points.

281 This was a period of rapid environmental change as the climate was warming. The ice probably
282 began to retreat about 17,000 BP and, by 9,000 BP, had largely retreated to the Hudson Bay
283 Lowland. Thinning of the ice allowed changes in atmospheric circulation patterns, further
284 affecting climate change (Teller 1987).

285 Proglacial lakes formed from the meltwater of the ice sheets as its flow was blocked by vast
286 amounts of glacially deposited sediment at the terminal positions of the ice. As the ice continued
287 its retreat, the outlets to the glacial lakes down-cut, lowering lake levels and developing well-
288 defined drainage ways, leading to rapid hydrologic change. Areas where stagnant blocks of ice
289 were buried in glacial sediment developed spruce forests on them and persisted for thousands of
290 years.

291 The people during this time lived in a subarctic environment that has no direct analogue in the
292 world today. The animals of this environment included mammoths, giant bison, and other now-
293 extinct species. In ice-free areas during this early period, there were variations of fluted,
294 lanceolate-shaped projectile points, as found on archaeological sites. The first published
295 discovery of these projectiles in association with mammoth and an extinct form of bison
296 occurred at archaeological sites in New Mexico.

297 These early people are thought of as highly mobile big-game hunters who traveled in small
298 bands. Tools were light, efficient, and remarkably similar across great distances (Mason 1981),
299 which suggests that there was a rapid spread of people across the continent at that time.

300 Radiocarbon dates on mammoth bone collagen and wood associated with stone tools place
301 people in the southeast Lake Michigan Basin by at least 12,500 BP. In Minnesota, the lack of
302 excavated or recorded early Paleoindian sites makes it difficult to identify site types or assess
303 their distribution across the landscape. The known sites appear to be oriented toward the current
304 waterbodies, but that may reflect survey coverage as opposed to actual site distribution. The
305 small number of sites suggests there was a small population in Minnesota or that a large number
306 of sites were destroyed or were deeply buried as the landscape evolved (Mather and Lindbeck
307 2011).

308 The late Paleoindian Period is better represented in Minnesota and adjacent parts of Canada.
309 Sites on paleo-shoreline features of proglacial lakes in the Great Lakes region are a well-

310 documented aspect of early settlement patterns such as at the Lakehead Complex sites at
311 Thunder Bay, Ontario dating to roughly 9,500 BP; sites on the Campbell beaches of Lake
312 Agassiz in the Quetico Provincial Park and Boundary Waters Canoe Area Wilderness (Julig et al.
313 1990); and on a beach ridge of Glacial Lake Aitkin in Aitkin County (Allan 1993). Julig suggests
314 that the beach ridges may have been used for travel routes around the large glacial lake basins
315 (Julig 1988; Julig et al. 1990).

316 The Reservoir Lakes northwest of Duluth are well-known for extensive surface collections that
317 include Late Paleoindian and Archaic Points (Harrison et al. 1995). Dates from the Bradbury
318 Brook site in Mille Lacs County place the site occupation at about 10,000 to 9,000 BP (Malik
319 and Bakken 1993).

320 The Bradbury Brook investigation and analysis of other late Paleoindian assemblages suggest a
321 preference for the use of Knife Lake Siltstone, which is a preference that may extend to much of
322 northeast Minnesota and is reflected in the collections from the Reservoir Lakes.

323 Archaic (Circa 9,000 to 2,500 Before Present)

324 By 9,000 BP, climatic conditions were probably similar to that of present day, as inferred from
325 the pollen record (Wright 1974). Around 9,400 BP, Lake Superior was dropping rapidly from its
326 Minong levels (Julig et al. 1990) and by 9,000 BP, Lake Agassiz was retreating northward.

327 At the beginning of this period, lakes covered substantially larger areas and open water would
328 have occupied areas of present day peatland (Hohman Caine and Goltz 1995). Water levels in the
329 larger pro-glacial lakes receded as streams developed and down cut their outlets. As post-glacial
330 warming continued, hydrology and vegetation changed. About 7,000 years ago, much of
331 Minnesota was dominated by prairie and lakes may have periodically dried up during summer
332 droughts (Wright 1974; Watts and Winter 1966; Webb et al. 1983). With changes to the
333 composition of plant communities and shifts in the ranges and varieties of animal species, human
334 adaptations to the environment changed, as well. Moose and caribou were probably replaced by
335 bison in many locations.

336 Less predictable resources during the mid-Holocene may have resulted in populations
337 concentrating in areas around the largest lakes and streams (Mason 1981) and a shift from a
338 foraging to a collector strategy, with greater use of local environments as task groups ranged
339 from camps located near predictable resources (Hohman Caine and Goltz 1995; Dobbs 1989).

340 The Itasca Bison Kill Site is an Early Archaic site located at the headwaters of the Mississippi
341 River. It is the only archaeological site in Minnesota where the remains of extinct bison (*Bison*
342 *occidentalis*) were found in association with cultural material. The bison were killed on the shore
343 of a now-extinct lake. Radiocarbon dates suggest the site dates to about 8,000 years ago. Pollen
344 and macrofossils preserved at the site indicate that the surrounding countryside was an open,
345 pine-dominated woodland giving way to expanding prairie (Shay 1971).

346 Early Archaic sites in the Canadian-Shield/boreal forest areas are somewhat rare when compared
347 to areas south of the Great Lakes (Mason 1981). The lack of Archaic sites was striking in the
348 results of an archaeological survey on Rainy Lake (Gibbon and Woolworth 1977). In general, the
349 Shield Archaic assemblages lack the complexity found in other regions. Assemblages do include
350 some woodworking tools such as trihedral adzes.

351 The Shield Archaic is a cultural tradition showing in place continuity over thousands of years
352 with late Paleoindian antecedents as opposed to an intrusion of new people. It appears to be a
353 gradual succession of individual small-scale adaptations to new conditions (Mason 1981; Dobbs
354 1989).

355 Population levels during the mid-Holocene may have been lower than those during the late
356 Paleoindian period, because the closed, coniferous forests would have been relatively resource
357 poor (Mason 1981). The lack of recorded sites may be the result of large portions of the
358 archaeological record for this period being submerged as lake levels rose to modern levels, being
359 deeply buried under alluvial sediment, or eroded as stream flows changed (Michlovic 1982;
360 Bettis and Thompson 1981; Overstreet and Kolb 2003).

361 Woodland Tradition (Circa 2,500 Before Present to European Contact)

362 This stage in prehistory is characterized by the initial appearance of earthen mounds and
363 ceramics, although it is not certain if mound-building and the adoption of ceramics are related
364 and occur at the same time. The most important cultural trends during this time are increasing
365 population growth, intensification of regional identity, increasingly efficient use of local raw
366 materials and food resources, and the intrusion of ideas and technologies. Dobbs (1989)
367 suggested that, in northern Minnesota, ceramic use seems like more of a “vener” that overlays a
368 basic Archaic hunting and gathering lifestyle.

369 Initial Woodland populations in northern Minnesota are represented by a net-impressed ceramic
370 type known as Brainerd Ware, which spans a period of from about 3,000 BP to 1,600 BP. The
371 distribution of Brainerd Ware is well-known in the Mississippi River headwaters, extending west
372 onto the plains. Brainerd Ware is also represented on some sites in St. Louis County (Hamilton
373 2009; Hohman Caine and Goltz 1995). Mather and Lindbeck (2011) suggest that this
374 development occurred roughly at the same time wild rice was migrating from the lakes of
375 southern and central Minnesota into the lakes of northern Minnesota. Residue from Brainerd
376 vessels has produced rice phytoliths and radiocarbon dates of 2,000 years ago (Justin and
377 Thompson 1995) and 2,700 BP to 2,800 years ago.

378 Many of the Brainerd sites are found on beach ridges associated with higher lake levels of this
379 period. The remains of elk, bison, deer, and possibly caribou from a site near Leech Lake suggest
380 the people who made Brainerd Ware were highly adapted to the prairie-forest ecotone (Hohman
381 Caine and Goltz 1995).

382 The first burial mounds in northern Minnesota are associated with the Laurel Culture (Arizigian
383 2008). While the cultural relationship between Brainerd and Laurel is poorly understood,
384 radiocarbon dates suggest that Brainerd precedes Laurel. Laurel dates range from 2,000 to 1,000
385 years ago. At the Big Rice site north of Virginia, Minnesota, wild rice grains were recovered
386 from three pit features containing only Laurel ceramics and produced radiocarbon dates of about
387 2,035 to 1,700 years ago (Valppu and Rapp 2000).

388 In stylistic terms, Laurel is comparable to other woodland manifestations to the south and east.
389 Laurel distribution is extremely broad, extending from west-central Quebec to east-central
390 Saskatchewan, including northern Minnesota, where it is common in the Superior National
391 Forest (Hamilton 2009). The best-known concentrations of Laurel occur in the Rainy River,
392 Rainy Lake, and Vermillion River drainages and the Mississippi headwaters (Arizigian 2008).

393 Extensive surveys in Voyageurs National Park and the Superior National Forest have identified
394 numerous Laurel sites, with 94 percent of those sites in the MDNR Laurentian Mixed Forest
395 province and concentrated in the Border Lakes subsection of the Northern Superior Uplands.
396 Most sites are in lacustrine settings (lakeshore, islands, and peninsulas), less than 20 percent are
397 in riverine settings, and only 3 percent are in uplands.

398 During the Terminal Woodland, there are increases in site size and density, suggesting a
399 population increase. The period begins in northern Minnesota, with the Blackduck-Kathio-Clam
400 River cultures comprising stylistically similar ceramics. Kathio ceramics are primarily from the
401 central lakes area of Minnesota, and Clam River ceramics are found mostly on tributaries to the
402 St. Croix River in western Wisconsin. Early Blackduck begins about 1,400 years ago in the
403 Mississippi headwaters and on the Rainy River, ending about 900 to 1,000 years ago.

404 The stratigraphic relationship of Blackduck ceramics to Laurel and the later Sandy Lake Ware is
405 fairly well-known. Laurel and Blackduck may have coexisted for several hundred years. There
406 have been no well-stratified sites excavated with components transitional between Laurel and
407 Blackduck (Shaaf and Johnson 1978) and it is unclear whether Blackduck represents in situ
408 evolution of Laurel (Thomas and Mather 1996) or the replacement of Laurel by a separate group
409 of people (Stoltman 1973).

410 The most recent pre-contact archaeological culture in northern and central Minnesota is the
411 Psinomani, dating from 900 to 360 years ago. It is associated with Sandy Lake and Ogechie
412 ceramics. Sandy Lake ceramics are similar to other woodland ceramic types throughout North
413 America, but Ogechie ceramics are most similar to Oneota ceramic types produced by the
414 agricultural communities to the south. These groups were north of areas where corn agriculture
415 was practiced successfully, particularly on major lakes and waterways of the Mississippi River
416 headwaters: the Rainy River – Rainy Lake, and Boundary Waters systems and eastward to Lake
417 Superior, with some sites in the prairie region to the west. The larger site size and greater
418 population density is often attributed to the use of wild rice, but evidence also suggests use of the
419 prairie forest ecotone and prairie, which includes seasonal bison hunts. The differences in the
420 archaeological assemblages in the prairie region versus the central lakes area may represent the
421 seasonal round, as opposed to different subsistence strategies.

422 Psinomani archaeological sites in the Mille Lacs area have been linked to the historic
423 Mdewakanton Dakota through early historic records and artifact assemblages that include French
424 trade goods.

425 In the Mille Lacs area, the end date for the Psinomani is based on the historic record for the
426 displacement of Dakota people by the Ojibwe in 1750 AD. In the Rainy River area at the Long
427 Sault Site, Sandy Lake pottery was found in association with historic trade goods, overlying a
428 Blackduck component that dated to 1750 AD. At the Creech site on Leech Lake, there were
429 levels with both Sandy Lake and Blackduck stratigraphically above levels containing only
430 Blackduck ceramics (Johnson 1991) and at Mitchell Dam, Sandy Lake was described as
431 associated with Blackduck (Cooper and Johnson 1964).

432 The practice of these Eastern Woodland lifeways was disrupted during the mid-17th century as
433 European explorers and trade goods began to enter the region.

434

435 Ojibwe Context

436 The Ojibwe people were living in the upper Great Lakes region when European explorers first
437 entered the area. Some archaeologists associate Blackduck ceramics with the Algonkian-
438 speaking groups, including the Cree and Ojibwe (Johnson 1969; Steinbring 1980), while others
439 have suggested association with Siouan-speaking Assiniboine. More recently, archaeologists
440 believe that the makers of Blackduck ceramics were most likely Algonkian speakers, but the
441 ethnic divisions of Cree and Ojibwe are historical constructions with little validity in prehistory
442 (Greenberg and Morrison 1982).

443 The ancestral Ojibwe were part of a large clan-based group of people that referred to themselves
444 as Anishinabe (original people). This Algonquian-speaking group was spread over a vast area of
445 the subarctic region of southern Canada and the northern United States, a territory much larger
446 than that of any other Native American tribe in North America (Tanner 1986).

447 Subsistence patterns depended, to some extent, on the location any one particular group
448 inhabited and varied greatly across the territory occupied. The groups were not connected by a
449 uniform subsistence base, but by a clan network. These clan groups were seasonally mobile,
450 autonomous groups for centuries prior to the arrival of Europeans in North America. The earliest
451 accounts talk of a number of distinct, but related groups, such as the Saulteur, the Outchibou, or
452 Marameg (Tanner 1994). These people became known as “Ojibway” after the publication in
453 1885 of William Warren’s *History of the Ojibway People* (Warren 1984).

454 Their story starts prior to arrival of Europeans in North American, when the Anishinabe were
455 living along the eastern seaboard. It was during that time, according to the Anishinabe sacred
456 migration story, that a man beheld a vision from the Creator that foretold of the destruction of the
457 Anishinabe and called on them to move west until they found the place “where food grows on
458 the water:”

459 While we were on the east coast, a man had a dream or a vision if you will. In this dream,
460 he was told a number of things. The first was, he was to leave the area and take as many
461 people as would go with him. The second was, if people did not leave many would
462 perish. The third was, to travel towards the west and to follow the great megis shell when
463 it rose out of the water, or sand, and to stop when it lowered back into the water, or sand,
464 or if something reminded them of a turtle. The fourth was that their journey would end
465 when they found the food that grows on water.

466 He left with many following him, and went down the St. Lawrence River and waterways
467 that led to the Great Lakes area. While in the central part of the Great Lakes area, two
468 peoples split off from us. They are the Potawatomi and the Ottawa, who went into
469 Canada, Michigan, and Wisconsin. The Anishinabe continued on to the edge of Lake
470 Superior. Once we came inland, we never saw the megis shell again. This journey took
471 over five hundred years and the prophecy that was told while we were on the east coast
472 was kept alive orally from generation to generation by traditional storytelling. On our
473 journey, we stopped seven times, sometimes for five days, sometimes for five years, it all
474 depended on the megis shell. (Berens and Raske, Pers. Comm., August 14, 2012)

475 Pressures from European trade and from their Iroquois neighbors are often cited as motivation
476 for this move (Risjord 2005). However, this explanation for westward migration is a Euro-

477 American perspective and contrary to oral history (Berens and Raske, Pers. Comm., August 14,
478 2012).

479 Anishinabe oral tradition relates a 500-year journey, beginning in about 900 AD on the east
480 coast. Near the end of this journey, the fifth of the seven stopping places was in the area that is
481 now the location of Sault Ste. Marie, Michigan, where a group stayed because of the rich
482 fisheries. From Sault Ste. Marie, the Ojibwe split into two groups. One traveled north around
483 Lake Superior and the other south around the lake. They met at Spirit Island in the St. Louis
484 River Estuary, the sixth stopping place, where they found wild rice.

485 From Spirit Island, some moved east along the southern shore of Lake Superior to find the
486 seventh stopping place, which was at Madeline Island—the last point on the migration.

487 Perhaps because the last part of the migration occurred during the time of European explorations,
488 early accounts of settlement locations and how they relate to the migration and first arrival in the
489 western Great Lakes are difficult to interpret. Oral tradition places the Ojibwe in the Lake
490 Superior region as early as 1400 AD (Benton-Banai 1988:102). Other sources place the Ojibwe
491 on the north shores of Lake Superior and the Upper Peninsula of Michigan by 1500 AD (Clifton
492 et al. 1986).

493 The first known encounter with Europeans was at Sault Ste. Marie in 1609, when Samuel
494 Champlain, founder of New France, established relations, intending to set up trading
495 partnerships. As the Ojibwe began to focus on trapping for furs to trade, the once-autonomous
496 bands reorganized into village-centered sociopolitical entities. This was an important
497 demographic consequence of French influence and endemic native wars. Villages were
498 established along the southern shore of Lake Superior in Keweenaw Bay, La Point, and Sault
499 Ste. Marie, and probably represented only a fraction of the population dispersed across the
500 Western Great Lakes and interior waters (Zedeño et al. 2001).

501 As the fur trade gained momentum in the east, increased conflict resulted as the beaver supply
502 was being exhausted. In the mid-1600s, the British-allied Iroquois pushed the Huron out of their
503 land and into the Tionontati, Erie, and Ottawa regions, which also affected the Ojibwe presence
504 at Sault Ste. Marie. Subsequently, throughout the early 1700s, many groups moved into areas
505 previously vacated because of the Iroquois threat. The Fox began an aggressive campaign against
506 the French in the Detroit area, who were thought to prevent the Fox from carrying on trade with
507 the Dakota. The Fox and the Dakota were allied in their interests in Plains resources. The Ojibwe
508 went to the aid of the French as a sign of their loyalty. The final battle between the Fox and the
509 Ojibwe was fought at St. Croix Falls in 1755. The Ojibwe conflict with the Fox had affected
510 Dakota-Ojibwe relations.

511 After the second Treaty of Paris in 1783 sealed the victory of the American Revolution, the new
512 Americans felt that the land ceded to them in the treaty included the land where the Ojibwe and
513 other Great Lakes tribes lived (Tanner 1986). Warfare between the Ojibwe and the Dakota made
514 merchants extremely cautious of moving to land west of Michigan (Hickerson 1970). In order to
515 end continuing land disputes between the Ojibwe and the Dakota, and secure a peaceful frontier
516 for settlers, the United States encouraged the signing of the 1825 Treaty. The treaty defined
517 boundaries of land owned by the Ojibwe (Kappler 1904).

518 As more settlers pushed into the Lake Superior region in search of timber and minerals, the
519 United States government bought land from the Ojibwe through cession treaties. The Treaty of

520 1836 ceded land in Michigan's Upper and Lower Peninsulas and parts of the Great Lakes, and
521 the Treaty of 1837 ceded land in north-central Wisconsin and east-central Minnesota. The Treaty
522 of 1842 ceded land in northern Michigan and Wisconsin and the western part of Lake Superior;
523 and the 1854 Treaty ceded land in northeastern Minnesota, and created reservations for many
524 Ojibwe bands. These treaties reserved the rights of the Ojibwe to hunt, fish, and gather on lands
525 they sold to the United States (Kappler 1904).

526 *History of the Iron Range*

527 Minnesota became the thirty-second state in 1858, which spurred an ever-increasing flow of
528 European-American settlement and the establishment of towns, cities, and enterprises other than
529 fur trade (Mason 1981). Wheat surpassed corn as the principal crop in 1860, with much of it
530 being exported out of state. White pine and red pine were sought after by loggers, and were
531 harvested in the Fort Snelling area as early as 1820. By 1870, there were 207 saw mills in
532 Minnesota. In 1877, a law allowing sale of timber off state lands further opened the state for
533 logging. The logging boom had tapered off by the early 1900s (Risjord 2005).

534 In 1865, the newly appointed Minnesota state geologist, Augustus Hanchett, with the help of his
535 assistant, Thomas Clark, issued a report generally describing copper ore deposits in the Lake
536 Superior area and iron ore deposits at Lake Vermilion (Hanchett and Clark 1865). The following
537 year, Henry H. Eames replaced Hanchett as state geologist and issued a report confirming the
538 presence of gold ore around Lake Vermilion, creating a short-lived Minnesota gold rush during
539 which other Minnesota ores were ignored (Lamppa 2004). Discovery of iron ore in the
540 Vermilion Range led the Pennsylvania industrialist Charlemagne Tower to buy large tracts of
541 land on the Vermilion Range. In 1882, Tower organized the Minnesota Iron Company and, by
542 1884, shipped the first ore from the Soudan Mine by rail on the company's Duluth and Iron
543 Range Railroad to Lake Superior (Risjord 2005).

544 The Merritt Brothers of Duluth laid groundwork for their Mountain Iron Mine through their
545 explorations during the 1890s (Minnesota Historical Society 2008). Up to that point, only the far-
546 eastern portion of the Mesabi Range had been mined for iron, and not on a large commercial
547 scale, with mostly hand tools being employed (Walker 1979; Atkins 2007). They opened their
548 second mine in 1891 near Biwabik. By 1892, they shipped their first carload of ore on their
549 Duluth, Missabe, and North Railroad to dock in Superior, Wisconsin (Minnesota Historical
550 Society 2008). A loan from John D. Rockefeller to the Merritts to expand the railroad ultimately
551 led to the transfer of all of their mining and rail properties to Rockefeller. Shortly thereafter, all
552 of the mining interests in Minnesota were owned by eastern interests, with J.P. Morgan
553 consolidating the Rockefeller and Carnegie holdings in 1901 under U.S. Steel (Risjord 2005).

554 By 1890, when the Mesabi Iron Range deposits were discovered, nearly 300 iron mining
555 companies had been incorporated in Minnesota. By 1900, the Mesabi Range was the most
556 extensive iron ore mining area in the world, supplying increasing demand by steel mills
557 throughout the Great Lakes states (Hall 1987). Early mining ventures in the Mesabi Iron Range
558 focused on hematite, a soft granular rock rich in iron that could be mined with steam shovels and
559 required limited processing. More than 95 percent of the iron deposits in the Mesabi Range
560 consist of taconite, a hard iron-bearing rock that must be pulverized and processed for mineral
561 extraction (Risjord 2005).

562 In the late 1920s, increased mechanization reduced the number of workers needed and increased
563 productivity. However, due to the Great Depression, iron ore production in the Iron Ranges
564 dropped dramatically by the early 1930s (Lamppa 2004). A cost-effective technology for
565 taconite processing was developed by the late 1930s. Taconite mining was made even more
566 economically feasible by two factors: 1) legislation passed in 1941, replacing property taxes
567 within the Iron Range with taxes on actual ore mined, and 2) increased demand due to World
568 War II. The Reserve Mining Company was formed in 1942 (Risjord 2005). In 1964, when
569 interest in taconite pellet use in steel manufacture prompted interest in increasing taconite pellet
570 production, an amendment was passed that guaranteed that the tax advantages of the 1941
571 taconite legislation would be maintained (Lamppa 2004).

572 In 1957, the Erie Mining Company opened its concentration plant at Hoyt Lakes. This plant was
573 Minnesota's second large-scale taconite plant, and it remained in operation through 2001, with a
574 change in ownership to LTVSMC in the 1980s, and then to Cleveland Cliffs in 2001 (Zellie
575 2007). While six new taconite plants were built on the Iron Range in the 1960s and '70s,
576 inexpensive imports changed the industry and decreased demand by two-thirds (Risjord 2005).

577 ***Cultural Resources Investigations***

578 Several cultural resources studies have been completed within or adjacent to the NorthMet
579 Project and Land Exchange areas (see Figure 4.2.9-8). This section presents previous
580 investigations that have been conducted prior to the development of the NorthMet Project
581 Proposed Action, as well as investigations conducted specifically for the NorthMet Project
582 Proposed Action.

583 ***Previous Investigations***

584 In 1985, the USFS conducted a Phase I cultural resources survey as part of the Yelp Lake Timber
585 Sale (USFS 1985). The survey consisted of a desktop review of historical aerial photographs and
586 pedestrian reconnaissance survey of manmade features such as clearings, roadways, and trails, as
587 well as landforms exhibiting the potential for containing archaeological sites. Overall, the area
588 was considered to have low potential for containing prehistoric and historic archaeological sites,
589 as well as architectural structures. During the Phase I cultural resources survey, one historic
590 period resource (SHPO ID 09-09-01-115) was identified. The resource was only described as
591 being related to the historical railroad and logging context and does not fall within the current
592 NorthMet Project or Land Exchange areas.

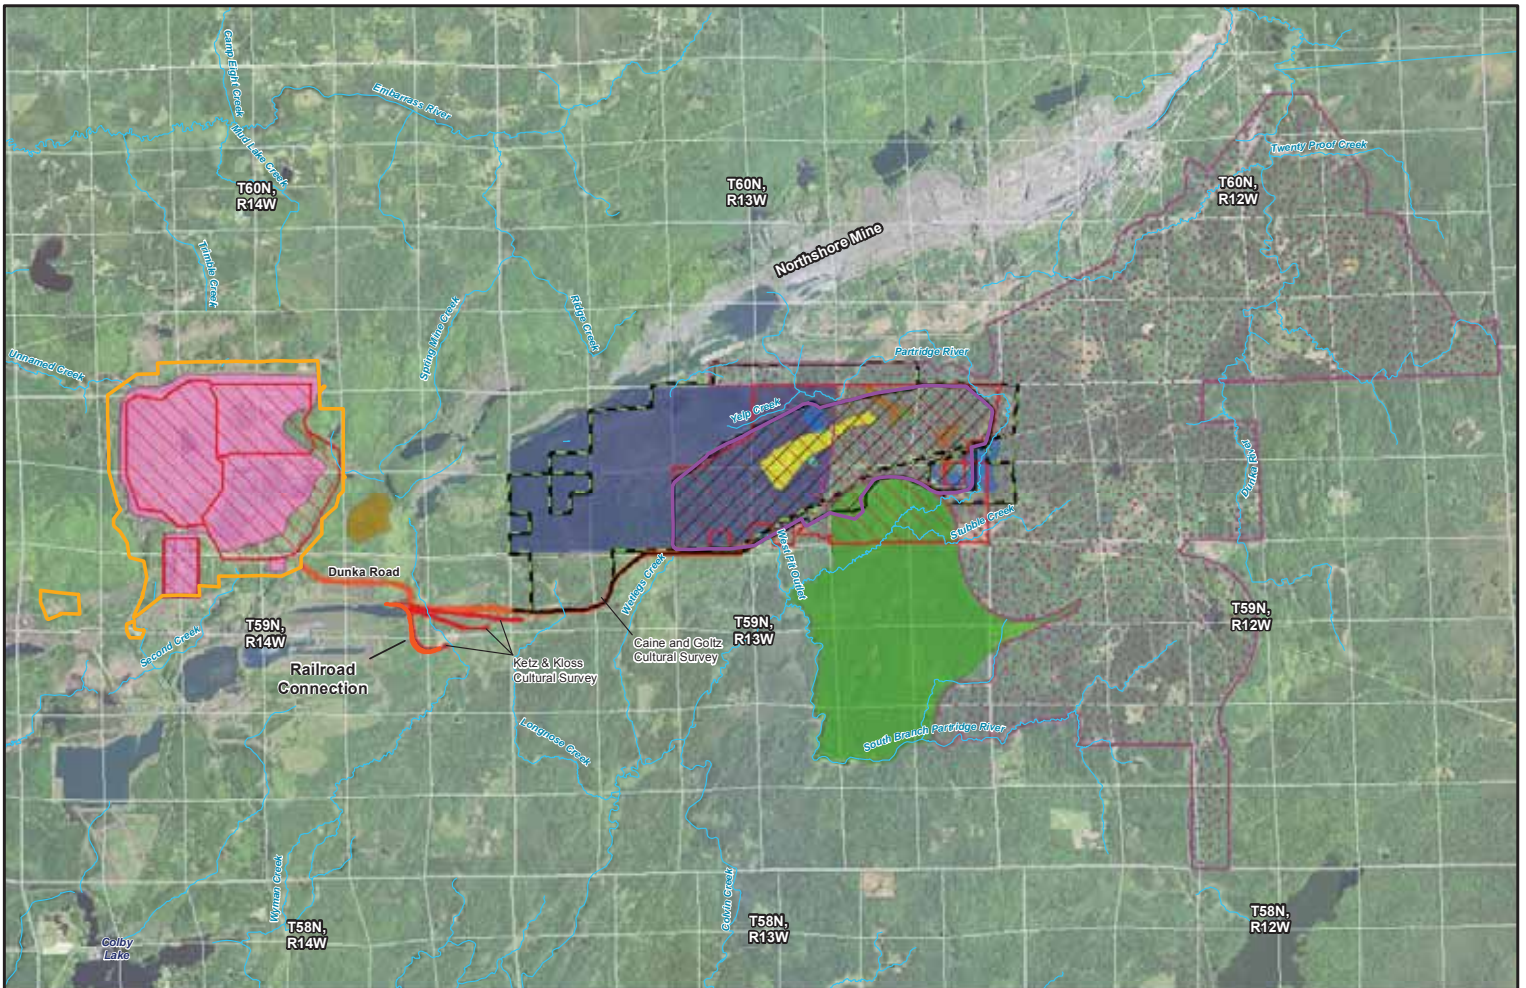

593 In 1990, the USFS conducted a Phase I cultural resources survey as part of the Stubble Creek
594 Timber Sale (USFS 1990). The survey consisted of a desktop review of historical aerial
595 photographs, helicopter flyover, and pedestrian reconnaissance survey of manmade features such
596 as clearings, roadways, trails, and structures, as well as landforms exhibiting the potential for
597 containing archaeological sites. Overall, the area was considered to have moderate potential for
598 containing historic archaeological sites and architectural structures and a low potential for
599 containing pre-contact archaeological sites, with the exception of areas adjacent to the Partridge
600 River. During the Phase I cultural resources survey, no previously recorded cultural resources
601 were noted within the NorthMet Project area; however, three new cultural resources were
602 identified (SHPO IDs 09-09-01-362, 09-09-01-363, and 09-09-01-364). All three resources are
603 associated with the historic period, though the report is unclear as to whether these resources are
604 archaeological sites, standing architectural structures, or both. The North Partridge Camp

605 (SHPO ID 09-09-01-362) and the Stubble Creek Mill (SHPO ID 09-09-01-364) were not
606 evaluated and the South Branch Bridge (SHPO ID 09-09-01-363) was recommended not eligible.
607 None of these resources fall within the current NorthMet Project or Land Exchange areas.

608 In 1997, the USFS conducted a Phase I cultural resources survey as part of the Laird/LTV II
609 Project (USFS 1997). The survey consisted of a desktop review of historical aerial photographs,
610 helicopter flyover, and pedestrian reconnaissance survey of manmade features such as clearings,
611 roadways, and trails, as well as landforms exhibiting the potential for containing archaeological
612 sites. During the Phase I cultural resources survey, no new cultural resources were identified;
613 however, five previously identified cultural resources were noted. None of these five previously
614 identified resources fall within the current NorthMet Project or Land Exchange areas.

Figure 4.2.9-8
Cultural Resources Analysis - Previous Investigations
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

June 2015

DRAFT

618 Investigations Conducted for the NorthMet Project Proposed Action

619 In 1999, Foth and Van Dyke completed a Phase I archaeological survey within the proposed
620 Mine Site where exploratory drilling was to take place (Foth and Van Dyke 1999). The survey
621 area covered approximately 20 acres. The Phase I archaeological survey involved the excavation
622 of 166 shovel tests placed at 15-meter intervals along the proposed drilling transects with
623 exception to areas exhibiting standing water or exposed bedrock. No new or previously identified
624 archaeological resources were identified within the survey area; however, the literature review
625 portion of the investigation indicated that three historic logging camps (including the Knot Camp
626 Site) and a mill were located to the south and east of the proposed Mine Site.

627 In 2004, The 106 Group Ltd (106 Group) conducted a cultural resources assessment for the
628 NorthMet Project Proposed Action (Ketz and Kloss 2004). The assessment included the lease
629 area (an area approximating the Mine Site), the former LTVSMC processing plant, the Tailings
630 Basin, and three proposed railroad interconnection alternatives. The 106 Group found that no
631 pre-contact archaeological sites had been previously identified within the 2004 study area. It was
632 also concluded that the pre-contact archaeological potential for most of the study area is poorly
633 understood, but likely of low potential. However, several upland areas located adjacent to the
634 Partridge River and large wetland complexes were considered to have high potential for pre-
635 contact archaeological resources. The 106 Group noted the presence of one previously reported
636 (not field-verified) historic archeological site, the Knot Logging Camp (21SLmn), as well as the
637 potential for two early historic Native American trails as noted on historical maps (Ketz and
638 Kloss 2004; Trygg 1966). The 2004 study also identified several architectural history resources
639 associated with the former LTVSMC processing plant. These resources include the former Erie
640 Mining Company Taconite facility and associated mining features including an associated rail
641 line. The 106 Group recommended that a Phase II architectural history evaluation be completed
642 for the LTVSMC site (Ketz and Kloss 2004).

643 In 2005, Soils Consulting conducted a Phase I archaeological survey for the NorthMet Project
644 Proposed Action (Hohman Caine and Goltz 2006). The investigation entailed the archaeological
645 survey of select landscape features determined by Hohman Caine and Goltz to have the highest
646 potential for pre-contact archaeological sites. Additionally, a survey was also carried out in areas
647 noted on historical maps and/or in previously identified archaeological site files as containing
648 historical features, such as Native American trails or logging camps. During the investigation,
649 one new archaeological site (NorthMet Archaeological Site) was identified and one previously
650 identified archaeological site (Knot Logging Camp [21SLmn]) was revisited. The NorthMet
651 Archaeological Site was found to contain four lithic artifacts. This newly identified site was
652 recommended as potentially eligible for listing on the NRHP under Criterion D for its potential
653 to yield important information regarding the pre-contact use of the region's landscape (Hohman
654 Caine and Goltz 2006). The Knot Logging Camp was reported to have been affected by recent
655 logging activities and was recommended as not eligible for listing on the NRHP due to its lack of
656 integrity.

657 Additionally, a deeply worn trail was identified during the 2005 investigation (Hohman Caine
658 and Goltz 2006). Soils Consulting suggested that the worn trail may represent a section of a
659 historical Native American trail as noted on a map compiled by John W. Trygg from the original
660 GLO surveys (Trygg 1966). There is the potential that this trail could represent a historical
661 Native American trail connecting Lake Vermilion to Beaver Bay. Shovel testing was completed

662 along the potential historical trail; however, no archaeological resources were identified
663 (Hohman Caine and Goltz 2006).

664 In 2007, Soils Consulting conducted a Phase I archaeological survey for the NorthMet Project
665 Proposed Action focusing on the Dunka Road Expansion and Substation areas, as well as a Phase
666 II archaeological evaluation of the previously identified NorthMet Archaeological Site (Hohman
667 Caine and Goltz 2008). The Phase I archaeological survey consisted of a pedestrian
668 reconnaissance survey of areas considered to have potential for containing archaeological sites.
669 No areas were designated as requiring subsurface testing. No archaeological resources were
670 identified during the Phase I archaeological survey of the Dunka Road Expansion and Substation
671 areas (Hohman Caine and Goltz 2008). The Phase II archaeological evaluation of the NorthMet
672 Archaeological Site consisted of the placement of three shovel tests and four 1-meter by 1-meter
673 excavation units and one ¼-meter by ¼-meter excavation unit. The Phase II investigation
674 rendered three potential lithic artifacts consisting of one possible basalt core, one possible
675 siltstone flake, and one fragment of quartz. No features or concentrations, such as fire-cracked
676 rock or discolored soils, were noted and the site area was documented as having been previously
677 disturbed by a 10-meter-wide road cut. Upon completion of the Phase II archaeological
678 evaluation of the NorthMet Archaeological Site, Soils Consulting found that the site was unlikely
679 to yield additional information important to the understanding of the past. Therefore, Soils
680 Consulting recommended that the NorthMet Archaeological Site be considered not eligible for
681 listing in the NRHP (Hohman Caine and Goltz 2008). The USACE and SHPO subsequently
682 concurred with this recommendation.

683 In 2007, Landscape Research LLC (Landscape Research) conducted a Phase I architectural
684 history survey and developed a historic context to evaluate the architectural resources at the
685 former LTVSMC processing plant that could be affected by the NorthMet Project Proposed
686 Action (Zellie 2007). Through consultation with the USACE and SHPO, it was determined that
687 these were the appropriate steps for evaluating the architectural resources that could be affected.
688 The Phase I architectural history survey identified 17 properties, two of which (the Erie Mining
689 Company Concentrator Building [SL-HLC-008/046] and segments of the Erie Mining Company
690 Railroad mine and track [SL-HLC-015/053]) were recommended eligible for listing in the
691 NRHP. The former LTVSMC processing plant as a whole, however, was not recommended as
692 eligible for listing as an NRHP historic district due to the previous demolition of the pelletizing
693 building. The pelletizing building was a critical component of taconite production and its
694 demolition significantly altered the historic integrity of the plant complex. Landscape Research
695 also recommended that the Erie Mining Company Concentrator Building (SL-HLC-008/046), as
696 well as other key plant buildings and structures, be appropriately recorded prior to their
697 mandated (Rule 6132-1300 E 4 c) post-mining demolition. The SHPO concurred with these
698 recommendations in 2009, but an MOA that includes these properties has yet to be finalized.

699 In 2014, Landscape Research on behalf of PolyMet examined areas that had been added to the
700 APE based on further air and water quality studies presented in the SDEIS (Zellie 2014). The
701 supplemental Phase I architectural survey work was conducted to ensure there were no survey
702 gaps as a result of the change from the original APE to the refined APE published in the SDEIS.
703 The supplemental Phase I architectural survey analyzed 12 properties, three of which (Duluth,
704 Missabe, and Iron Range [DM&IR] Segment [SL-HLC-pending], three segments of the Erie
705 Mining Company Railroad [SL-HLC-015/053], and the Erie Mining Company Administration
706 Building [SL-HLC-pending]) were recommended eligible for listing in the NRHP. The findings

707 of the investigation indicated that potential effects from the NorthMet Project Proposed Action
708 on the three additional segments of the Erie Mining Company Railroad (SL-HLC-015/053)
709 would consist of refurbishment for reuse during operations and, per state law, demolition upon
710 Project completion. At the time of the investigation, the potential effects on the DM&IR
711 Segment (SL-HLC-pending) were not known; however, the reuse of segment portions was
712 thought likely. No potential effects were identified for the Erie Mining Company Administration
713 Building (SL-HLC-pending) as a result of the NorthMet Project Proposed Action.

714 In 2015, the Co-lead Agencies carried out historical document research and Phase IA desktop
715 survey to further assess a location identified as an “Indian Encampment” on the Trygg Maps
716 (Trygg Land Office-GLO composites Map, Sheet 17, 1966). The Bands expressed concern that
717 the location, which they often referred to as a “rice camp,” might be impacted by the NorthMet
718 Project Proposed Action. The Co-lead Agencies plotted the precise location of the reported site
719 by using the running notes from the 1873 survey of Township 60 North, Range 14 West (Ketola,
720 Pers. Comm., January 26, 2015). Based on this analysis, the Co-lead Agencies confirmed that the
721 site was buried during the construction of Erie’s tailings basin. The Phase IA desktop survey,
722 which utilized the 1937 (partial coverage), 1948, and 1961 aerial images, did not identify any
723 standing structures or historic features in the analysis area.

724 Efforts to Identify Properties of Religious and Cultural Significance

725 At a consultation meeting in July 2008 to discuss the results of the surveys conducted by Soils
726 Consulting as referenced above, the Bands voiced general concerns about archaeological survey
727 coverage and specific concerns with the Indian trails shown on the Trygg Maps.

728 The Bands and USACE worked together to develop a plan for the identification of properties of
729 religious and cultural significance (Plan). In April 2010, the USACE consulted with the Bands
730 and PolyMet concerning the implementation of the Plan. The Plan consisted of four components:

- 731 1. Interviews to be conducted by the Bands with Band elders to gather information concerning
732 past use of the NorthMet Project area.
- 733 2. Baseline ethno-historical research pertaining to Ojibwe use of the APEs would be used in a
734 cultural landscape assessment of the NorthMet Project area and surrounding vicinity.
735 Background research to identify cultural and natural landscape features would include, at a
736 minimum, the original GLO survey notes and maps developed by Trygg, along with other
737 historic maps of the NorthMet Project area and surrounding vicinity, relevant historic
738 documents and literature.
- 739 3. Classification of plant communities by the identification of canopy species using aerial
740 infrared photography and the identification of understory, shrub, and herbaceous layers using
741 existing plant lists of specific community types, based on the MDNR’s ECS. This also
742 included ground-truthing to determine accuracy for classification and gathering of additional
743 information on AOCs to the Bands.
- 744 4. A field survey to locate and assess the cultural and natural features identified as a result of
745 the background research, elder interviews, and plant classification.

746 The intent of the Plan was to use plant community classification to identify plant resource areas
747 of interest to the Bands and facilitate identification of historic properties. The archival research
748 was to provide historic documentation and context for the historic Native American trail system

749 and possibly identify other places important to the Bands. The elder interviews then would be
750 used to further identify and understand tribal use areas and places of importance. The field
751 investigation component was to be informed by the results of those efforts.

752 The field review primarily focused on a reconnaissance-level investigation of the trail corridors
753 as mapped by Trygg (1966) and specific trail locations recorded during the Land Office surveys.
754 Reconnaissance of the trail corridors was conducted by the federal Co-lead Agencies with
755 participation from the Bands. Barr participated in a portion of this fieldwork to gather
756 information for completing the classification of plant communities. Barr also continued their
757 effort to gather plant data aside from the trail reconnaissance.

758 During 2010 and 2011, PolyMet contracted the Bois Forte, Fond du Lac, and Grand Portage to
759 conduct interviews with Band elders. The Fond du Lac and Grand Portage bands have not made
760 the results of the interviews available for use, though the Bois Forte interviews have been
761 considered during this identification process. The Bois Forte interviews did not provide any
762 specific locations, but some general information was provided. Elders recalled that some Band
763 members had utilized the general NorthMet Project area for hunting, fishing, and plant gathering
764 of wild rice, maple-sugar, berries, and birch bark; however, they could not provide specific
765 locations or uses within the NorthMet Project area.

766 The federal Co-lead Agencies recognize the importance of natural resources such as wild rice
767 beds as both ecological communities and as important traditional cultural resources for the
768 Ojibwe people. However, those resources must meet NRHP criteria to be considered historic
769 properties and receive further consideration under Section 106. The federal Co-lead Agencies
770 have considered effects on wild rice and other natural resources, as discussed in other resource-
771 specific sections of this FEIS and below in Sections 4.2.9.2.4 and 5.2.9.

772 The results of the elder interviews, archival research, and plant surveys are discussed in a report
773 titled *NorthMet Project Cultural Landscape Study for PolyMet* (Zellie 2012). The report has
774 been reviewed and coordinated with the USACE, USFS, and Bands. The USFS conducted a
775 historic context study of the Beaver Bay to Lake Vermilion (BBLV) overland trail, which was
776 provided as an appendix to the final report. Additional fieldwork completed by the USACE,
777 USFS, and Bands may be added to the above-referenced report or provided as a standalone
778 report, based on future consultation with the Bands. As a result of the field reconnaissance,
779 archival research, and elder interviews, a number of properties of religious and cultural
780 significance have been identified within the APE. These properties include the Spring Mine Lake
781 Sugarbush, the *Mesabe Widjiu* (Laurentian Divide), the Overlook location, and the BBLV Trail
782 Segment.

783 **4.2.9.2.4 Identified Cultural Resources**

784 Cultural resources investigated within the NorthMet Project area—such as architectural history
785 properties, archaeological sites, and properties of religious and cultural significance to the
786 Bands—are discussed in this subsection. The investigations completed to date in the NorthMet
787 Project area have identified cultural resources as summarized in Table 4.2.9-1.

788 **Table 4.2.9-1 Cultural Resources Identified in the NorthMet Project Area**

Resource ID	Resource Name	Resource Type	NRHP Determination by Co-lead Agencies	SHPO Concurrence with Co-lead Agencies' Findings
SL-HLC-002/040	Erie Mining Company Coarse Crusher	Architectural Property	Not Eligible	Concur

Note:

¹ USFS designation BBLV Trail Segment #1 (USFS #01-569).

791 **Erie Mining Company Concentration Plant Complex**

792 The historic site SL-HLC-018/056 consists of the primary Erie Mining Company Concentration
 793 Plant buildings, such as the coarse and fine crushers and the concentrator; mine and plant track
 794 segments of the Erie Mining Company railroad; a Tailings Basin; pellet stockpile area; and mine
 795 areas. Treated as a mining complex or district, the property's integrity is diminished by the loss
 796 of the pelletizing plant (SL-HLC-010/048), a central component. Its qualities of association,
 797 design, and related aspects of feeling and setting are lost without this key component (Zellie
 798 2007). Although some components of the property may be determined eligible individually, the
 799 Erie Mining Company Concentration Plant Complex (SL-HLC-018), as a complex/district, was
 800 determined not eligible for inclusion in the NRHP.

801 The Concentrator Building (SL-HLC-008/046) is a key property and reflects Erie Mining
 802 Company's decades of experimentation in production and engineering design (Zellie 2007). The
 803 Concentrator Building is recommended as being individually eligible for inclusion in the NRHP
 804 under Criterion A in the areas of Industry and Engineering, and also under Criterion C in the area
 805 of Engineering. The building retains a good level of historic integrity, including qualities of
 806 location, design, setting, materials, workmanship, and feeling. The quality of association is fair
 807 due to the removal of the pelletizer. At the interior, much of the layout and equipment dates to
 808 original construction (Zellie 2007).

809 The Administration Building (SL-HLC-pending) remains a well-preserved component of the
 810 original taconite plant design. It is significant under NRHP Criterion A in the areas of Industry
 811 and Engineering and is associated with the statewide historic context: *Minnesota's Iron Ore*
 812 *Industry, 1880s-1945*. The period of significance is 1954 to 1969.

813 The Erie Mining Company railroad (SL-HLC-015/053) is a 74-mile railroad system created
 814 solely for the transportation of ore for shipment to Taconite Harbor. The railroad was in
 815 operation during the plant's period of significance (1954 to 1969) and directly linked pellet
 816 production with shipping facilities. The period of significance spans from the start of railroad
 817 construction, circa 1954 to 1957, through 1964, the date of Dunka Railroad construction.
 818 Identified segments of the Erie Main Line Railroad and Mine and Plant Track, as well as Dunka
 819 Railroad within the APE, are recommended as eligible for inclusion in the NRHP under Criterion
 820 A in the areas of Commerce, Industry, and Transportation.

821 The following buildings, all of which are associated with the plant complex, have been
 822 determined individually not eligible for inclusion in the NRHP:

- 823 • Coarse Crusher (SL-HLC-002/040);
- 824 • Fine Crusher (SL-HLC-003/041);
- 825 • Conveyor and Drive House (SL-HLC-004/042);
- 826 • General Shops (SL-HLC-005/043);
- 827 • Reservoir (SL-HLC-006/044);
- 828 • Water Tower (SL-HLC-007/045);
- 829 • Tailings Thickener Tanks (SL-HLC-009/047);
- 830 • Pelletizing Building (SL-HLC-010/048);
- 831 • Central Heating Plant (SL-HLC-011/049);
- 832 • Fuel Oil Tanks (SL-HLC-012/050);
- 833 • Pellet Stockpile and Stacker (SL-HLC-013/051);
- 834 • Mine Area No. 2 Shops (SL-HLC-014/052);
- 835 • Tailings Basin (SL-HLC-016/054);
- 836 • Mine Area No. 1 Shops (SL-HLC-017/055);
- 837 • Colby Lake Pumping Station and Pipeline (SL-HLC-pending);
- 838 • Mine Area Nos. 2, 3, and 5 (SL-HLC-pending);
- 839 • Dunka Road Segment (SL-HLC-pending); and
- 840 • High Voltage Transmission Line Segment (SL-HLC-pending).

841 **Erie Mining Company Railroad Corridor Historic District**

842 The Erie Mining Company Railroad segments within the APE are eligible for inclusion in the
843 NRHP as a standalone railroad corridor historic district. The Erie railroad corridor historic
844 district includes the mine and plant track, the Erie mainline segment within the APE, and a
845 segment of the Dunka rail spur servicing Mine Area No. 8. This district also includes several
846 buildings in the vicinity of the Plant Site that were serviced by rail: the pellet loader, the mine
847 areas that used rail to move ore to the concentration plant, and other buildings associated with
848 rail transportation during the period of significance. The integrity and significance of the Erie
849 Railroad itself supports inclusion of many of the Erie Mining Company buildings, structures, and
850 objects as contributing resources that would otherwise not be individually eligible. Additionally,
851 it provides a significant contribution to the integrity of the larger Erie Mining Company
852 Landscape Historic District.

853 **Erie Mining Company Landscape Historic District**

854 The portion of the Erie Hoyt Lakes operation located within the APE, including the Erie
855 Concentration Plant Complex, retains the necessary elements to contribute to a larger NRHP-
856 eligible Erie Mining Company Landscape Historic District. The APE for the NorthMet Project
857 Proposed Action includes structures, topographic features, small-scale features, vegetation

858 patterns, and patterns of circulation that are associated with incipient taconite production and
859 shipment on Minnesota's Mesabi Range, circa 1954 to 1969. The features within the APE
860 associated with Erie taconite operations are also emblematic of a purposefully modified and
861 developed landscape that retains integrity and is associated with a significant historic event. In
862 addition, these features retain the ability to inform about the post-World War II industrial process
863 of low-grade iron ore extraction and refinement, and the ultimate shipment of finished taconite
864 pellets to Great Lakes steel mills.

865 Given the dynamic nature of markets and evolving technologies, mining landscapes often
866 contain complex arrangements of features that may date to several distinct mining periods. The
867 scope of this evaluation is the portion of the Erie Hoyt Lakes taconite operations located within
868 the APE for the NorthMet Project Proposed Action that are associated with the period of
869 significance from 1954 to 1969. This includes a subsidiary rail system serving the Mine Site and
870 Plant Site, as well as a segment of the Erie main line (Dunka segment), the Concentration Plant
871 Complex, expansive mine pits and stock piles representative of large-scale taconite extraction,
872 and many other still extant buildings, structures, and objects associated with power generation,
873 water supply, maintenance, administration, traffic control for both rail and vehicle, and security,
874 all of which are associated with the industrial process of taconite production on the Mesaba
875 Range from the period of 1954 to 1969.

876 The overall Erie Hoyt Lakes taconite operation conveys significance through the components
877 (Hoyt Lakes, concentration Plant Site/Mine Site, railroad system, and Taconite Harbor shipping
878 facility) that represent implementation of the comprehensive planning effort for one of the
879 largest mining operations of its time. The loss of the pelletizer does not compromise the overall
880 integrity of the larger property. The portion of the Erie Mining Company within the APE retains
881 a high degree of integrity and an ability to convey significance through the composite effects of
882 location, design, setting, materials, workmanship, feeling, and association and contributes to a
883 potentially larger Erie Mining Company Mining Landscape Historic District. The identified
884 landscape components, transportation features, and structures associated with the 1954 to 1969
885 period of significance contribute to the Erie Mining Company Landscape Historic District and
886 are eligible to the NRHP under Criterion A at a state level for their association with Mining
887 Development on the Mesaba Iron Range.

888 With respect to the integrity of the contributing historic properties identified in Erie Mining
889 Company Landscape Historic District, the structures and features associated with Erie operations
890 during the period of significance retain integrity of location, association, setting, workmanship,
891 feeling, and materials and individually contribute to an historic mining landscape. Several
892 structures, features, and transportation corridors associated with post-1969 taconite development
893 that have been identified within the NorthMet APE do not, however, contribute to this historic
894 landscape and are not considered as contributing elements for the purposes of this review. The
895 monumental scale of the concentrator building, the considerable number of buildings remaining
896 at the concentration Plant Site, and the mine pits, transportation infrastructure, stockpiles, and
897 Tailings Basin that define the landscape convey the significance of the Erie Mining Company
898 taconite operation from the 1954 to 1969 period of significance. The numerous other buildings
899 and objects associated with the Erie Mining Company within the APE, including the railroad
900 system that defines circulation patterns and provides a linkage between many of these resources,
901 also contribute.

902 Table 4.2.9-2 provides a list of historic resources from the investigations completed to date that
 903 are contributing/non-contributing components of the larger Erie Mining Company Landscape
 904 Historic District.

905 **Table 4.2.9-2 Historic Resources Associated with the Erie Mining Company Historic**
 906 **District**

Resource ID	Resource Name	Individual Eligibility	Landscape District	Railroad District
SL-HLC-002/040	Erie Mining Company Coarse Crusher	Not Eligible	Contributing	Contributing
SL-HLC-003/041	Erie Mining Company Fine Crusher	Not Eligible	Contributing	Contributing

907 **Duluth, Missabe, and Iron Range Segment**

908 This approximately 3.5-mile-long DM&IR (previously D&IR and now CN) segment within the
 909 NorthMet Project Proposed Action APE is a portion of the former 97-mile-long, primarily
 910 single-track roadbed constructed in 1884 between Two Harbors and the Soudan Mine east of
 911 Tower, Minnesota. The evaluated DM&IR segment predates the Erie Mining Company Plant at
 912 Hoyt Lakes (1957) by more than 80 years. The D&IR (and its successor line, the DM&IR) was
 913 built as a shipping line for the Vermilion iron range to the northeast. Beginning in the early
 914 1950s, it also provided Erie and its successor, LTVSMC, with construction and mining supplies
 915 and raw materials used in the Erie plant. The approximately 3.5-mile-long DM&IR segment is
 916 significant under NRHP Criterion A for its association with the development of Vermilion iron
 917 range mining and lumber industries and the development of Tower, Soudan, and Ely from 1884
 918 to 1964. The segment retains integrity of location, design, and, in some places, integrity of
 919 materials.

920 **Spring Mine and Stockpiles**

921 The Spring Mine is located northeast of the Erie Mining Company Plant Site. The Spring Mine is
922 a natural ore mine. It was opened as an underground mine in 1906, possibly by the Kingston
923 Mining Company, and it produced a soft, gray Bessemer hematite. This small, open pit natural
924 ore mine and its stockpiles appear to be typical of those on the Mesabi Iron Range and do not
925 represent advancements in mining technology. This mine does not appear to possess significance
926 as an important example of an early 20th-century natural ore mine under Criterion A in the area
927 of Industry and Engineering. The mine is not known to be associated with persons significant in
928 local, state, or national history and is not significant under Criterion B. It is not significant under
929 Criterion C in the area of Engineering. It has not yielded, nor is it likely to yield, information
930 important in prehistory or history and is significant under Criterion D. Therefore, the Co-lead
931 Agencies have determined that the Spring Mine and stockpiles are ineligible for the NRHP.

932 **Reserve Mining Company's Crusher #2**

933 Reserve Mine, originally known as Peter Mitchell Mine, is currently operated by the Northshore
934 Mining Company, which actively mines taconite adjacent to the proposed NorthMet Mine Site.
935 In relation to the APE, a waste rock stockpile from the Mine Site is within the viewshed of the
936 adjacent Northshore Mine associated with Reserve Mining Company activities circa 1956 to
937 1965. Crusher #2, built by Reserve Mining Company in 1963, appears to have served in a
938 supplemental role to Reserve Mining Company's primary crusher (Crusher #1) constructed in
939 1956. The structure is not significant under Criterion A in the areas of Industry and Engineering.
940 The federal Co-lead Agencies have determined that the structure does not possess significance
941 under Criterion B, C, or D. Therefore, the agencies have determined that Crusher #2 is ineligible
942 for the NRHP. The Co-lead Agencies believe that the inventory conducted in the visual effects
943 APE is adequate and commensurate with the anticipated effects.

944 **Spring Mine Lake Sugarbush Site**

945 Although not located within the Plant Site, the Spring Mine Lake Sugarbush Site (SL-HLC-
946 pending) is located within the APE to the west of the Mine Site. Field investigations as early as
947 1969 (Loftus 1977) had identified a "Late Historic Period Chippewa Sugar Maple Camp," south
948 of the intersection of the BBLV Trail Segment and east of the New Indian Trail (Trygg 1966).
949 This sloping, approximately 80-acre site appears to be a natural maple-basswood stand of
950 cultural use and significance. The site was reported to have a structure in the interior of a maple
951 grove that was constructed of pine logs secured with round iron nails. Stockpiled birchbark
952 baskets and basswood wedges[sic] or paddles and "various other containers" were interspersed
953 with metal pots and pans within the structure, (Loftus 1977:73). The report concluded that the
954 site was culturally significant because it allowed "for a comparison of Late Historic Chippewa
955 sugaring practices with those of the Early Historic Period." Recent visits to the site by USACE
956 staff and Band members identified it as a large multi-component site with evidence of maple
957 sugaring activity from a range of time periods. Various types of historic artifacts and features
958 demonstrated the continued use of the site into the middle part of the 20th century. The stand
959 itself contains trees that may be up to 200 years old, according to the Erie Mining Company
960 forester (Loftus 1977). During the 2010 survey, many large maple trees were observed that
961 exhibited scarring from repeated tapping. The trunks on these trees were flattened at about 4 to 8
962 ft above the ground, with visible interior decay on many trees that was most likely the result of

963 the long-term effect of repeated tapping for sap collection. Also, the site has more than
964 75 percent sugar maple, less than 5 percent basswood, and less than 1 percent yellow birch. This
965 community type in its natural state would have about 35 percent sugar maple, 10 to 25 percent
966 basswood, and some yellow birch (Zellie 2012). This difference may be the result of the
967 relationship between the maple tree and the Ojibwe. The traditional practice of sugaring includes
968 an emphasis on the use of basswood for paddles and troughs.

969 The Spring Mine Lake Sugarbush Site possesses good historic integrity, notably an integral
970 relationship to traditional cultural practices or beliefs, and retains artifactual evidence of prior
971 use as a sugarbush. Based on the site's tie to recent oral histories by Ojibwe elders, its location
972 near the BBLV and New Indian trails mapped by Trygg (1966), photographic evidence of use by
973 Ojibwe families as early as 1941 (Latady and Isham 2011), and its potential role as part of a
974 once-extensive system of sugarbush locations in St. Louis County, the Spring Mine Lake
975 Sugarbush is determined eligible for inclusion in the NRHP under Criterion A. It functioned as a
976 place for sharing and maintaining traditional Ojibwe knowledge of and spiritual connections to
977 the world, which were fundamental to the cultural identity of the Bois Forte Band. Under
978 Criterion D, the site is significant for its potential to answer important questions about possible
979 19th and 20th century Ojibwe maple sugaring practices.

980 **Mesabe Widjiu**

981 *Mesabe Widjiu*, or the Laurentian Divide (SL-HLC-pending), is regarded as a sacred place to the
982 Bands, possessing cultural significance for the Ojibwe. Often referred to by various names, such
983 as the Giant's Range or Mesabi Heights, the *Mesabe Widjiu* is a long linear landform running the
984 length of the Mesabi Iron Range and into the area of Thunder Bay, Ontario. Figure 4.2.9-9
985 depicts the location of the *Mesabe Widjiu*. It should be noted that the depiction of the culturally
986 significant landform from the eastern end of the Iron Range to Thunder Bay is only a
987 representation based on topographic features and was not informed by historical and/or
988 ethnographic information. This portion of the Mesabi Range and Laurentian Divide, parts of
989 which intersect the Plant Site, occupies the crest of a line of low, rugged, Precambrian rock hills
990 where the divide separates the watershed of streams that flow north to the Arctic Ocean from the
991 watershed of streams that flow south through the Great Lakes to the Atlantic Ocean (Ojakangas
992 and Matsch 1982). Based on the elder interviews, the *Mesabe Widjiu* is part of the Band's oral
993 history and cosmology explaining the origin of the hills and the separation of waters along the
994 divide. The *Mesabe Widjiu* is also the path that the Thunderbirds follow. The various granite-
995 capped outcrops and ledges are used for traditional practices because of the *Widjiu's* spiritual
996 significance. Despite distant views of mining features to the east that include the skyline of the
997 Erie Mining Company plant, the *Mesabe Widjiu* viewshed possesses good historic integrity,
998 notably an integral relationship to traditional cultural practices or beliefs. *Mesabe Widjiu* is
999 determined eligible for inclusion in the NRHP under Criterion A for its association with
1000 important Ojibwe spiritual and cultural practices.

1001 In connection with *Mesabe Widjiu*, a granite bedrock outcrop (SL-HLC-pending) providing an
1002 east-facing Overlook is located at the site of the proposed Tailings Basin within the Plant Site.
1003 Recent visits to the Overlook by USACE staff and Band members identified the presence of oak
1004 trees and a number of potentially important natural features, including a spring. In addition, the
1005 Overlook is situated at the junction of two trails. Although this trail feature is identified on Trygg
1006 maps, the location is not corroborated by the GLO land survey notebooks from that township.

1007 Band elders have noted the cultural significance of both oak trees and east-facing overlooks in
1008 the Ojibwe tradition. An outcrop such as this might have been used by Ojibwe for spiritual
1009 reasons. Because there is no documented use of this location, the Overlook is determined not
1010 individually eligible for inclusion in the NRHP, but included as part of the *Mesabe Widjiu*.

DRAFT

DRAFT

1013 **BBLV Trail Segment**

1014 Overland trail systems, such as the 75-mile-long BBLV Trail Segment, were frequently
1015 referenced during late 19th century GLO surveys in the western Superior Basin (Trygg 1966).
1016 Despite mention in the historic record, the trails themselves, and the role they played as
1017 transportation systems prior to development of railroad transportation in the region, are
1018 underrepresented in the literature. The available literature would suggest, however, that overland
1019 trails played a prominent role within a regional transportation system that included interior
1020 waterways, short-haul portages, and overland portages leading from Lake Superior to points
1021 inland. While the vast majority of the transportation networks in the Western Superior Basin are
1022 recognized as routes that maximized waterborne transportation, the BBLV Trail Segment
1023 represents one of the few overland trail corridors where lakes and rivers were not utilized. Within
1024 this context, it would appear that the route functioned as a winter transportation corridor, or
1025 perhaps an expedient summer route from the Lake Superior Watershed into Lake Vermilion.
1026 Support for the BBLV Trail Segment's function as a winter route comes from several sources,
1027 both primary and anecdotal in nature. Christian Wieland, who conducted the GLO survey of
1028 T59N, R13W in the winter of 1872 noted crossing the "Trail from Beaver Bay to Lake
1029 Vermilion" at three locations while conducting the survey (GLO 1873).

1030 Historic records also suggest that overland trails were utilized by both local Ojibwe and mineral
1031 prospectors from at least the mid-19th century through the early 20th century (Skillings 1972;
1032 Lancaster 2009). Historic overland trails are best viewed as a component of an interrelated
1033 transportation system where trails and water routes interconnect to form a large and intricate
1034 system of communication and transportation (Burns 1985). The southeastern head of the
1035 overland trail is situated at Beaver Bay, which had a significant Ojibwe population from at least
1036 1854 to 1930 (Davis 1968; Skillings 1972; Lancaster 2009). Beaver Bay provided access from a
1037 mid-point on Lake Superior, located about halfway between Grand Portage and Fond du Lac, the
1038 two primary, historic ingress points to the interior portions of Northeastern Minnesota.

1039 The significance of the BBLV Trail Segment to the Ojibwe of Northeastern Minnesota is perhaps
1040 more nuanced than the significance ascribed by archaeologists, whose focus remains on
1041 attaching significance to physical manifestations of historic events. Consultation with the Bands
1042 elicited the importance of both how the trails connected past Ojibwe community in a physical
1043 sense and the ability for trails to also connect communities in a contemporary sense. Statements
1044 of significance were predicated on the fact that in the late 19th century, Ojibwe residence in the
1045 newly ceded territory was highly mobile, and families enrolled at locations at which they
1046 happened to be when the rolls were being populated. "In a sense, Ojibwe from scattered
1047 locations throughout the ceded territory may have enrolled at a location that was far away from
1048 their place of primary residence ... at the time, social organization was very fluid, and marriages,
1049 disagreements, and the opportunities for wage labor caused folks to move around a lot." There is
1050 a general agreement among tribal consultation partners that the trails, or in the case of some, the
1051 trail corridors themselves, function as "physical manifestations of the social fluidity that existed
1052 among northeastern Minnesota's Ojibwe communities at that time." Consulting partners stated
1053 that the trails are "like a lifeline that permeates all aspects of history. That the overland trails are
1054 something entirely different than functional trails that are present today, trails that some would
1055 refer to as coming and going trails, in that you use them for a purpose and then you return home.
1056 The Beaver Bay to Lake Vermilion Trail is viewed as something different ... it is viewed as a

1057 trail that connects you to who you are, in that they are important signature of cultural identity and
1058 reconnection to past ways” (Berens and Raske, Pers. Comm., August 14, 2012).

1059 Although barely discernible in some cases, a few well-defined segments of the BBLV Trail
1060 Segment and two other unnamed trail segments represent the trail corridors that cross the Mine
1061 Site and Plant Site, as well as the NorthMet Project area (Zellie 2012). Although interrupted by
1062 Euro-American agriculture, logging, and mining, as well as road and townsite development, the
1063 trails remain an important cultural and spiritual connection for the Bands. Recent oral histories
1064 by Band elders substantiate this significance. These segments are potentially part of a once-
1065 extensive system of overland trails that were in use during hundreds of years of Ojibwe
1066 occupation. Therefore, the BBLV Trail Segment is significant for the role it played in the broad
1067 patterns of Ojibwe land use and early mineral exploration. It is eligible for inclusion in the
1068 NRHP under Criteria for Evaluation A and D.

1069 **NorthMet Archaeological Site**

1070 The NorthMet Archaeological Site (21SL pending) is located at the Mine Site. The site was
1071 identified through subsurface testing and consisted of pre-contact lithic artifacts. Due to the
1072 sparse nature of the artifacts and lack of features, it was believed that the site was unlikely to
1073 yield any further information significant to the understanding of past cultural history, and
1074 therefore was determined to be not eligible under Criterion D. As a result, the site was
1075 determined to be not eligible for inclusion in the NRHP.

1076 **Knot Logging Camp**

1077 The Knot Logging Camp (21SLmn) is located outside the NorthMet Project area, although
1078 within the APE of the NorthMet Project Proposed Action. The historic site was originally
1079 identified by USFS staff through historic aerial photography analysis. Field investigations at the
1080 site identified pit features and historic debris typical of a logging camp, including stove parts,
1081 cans, and other metal materials. The site had been reported to be severely affected by recent and
1082 historic logging activities. No obvious remnants of previously identified berms were evident.
1083 Historic research failed to uncover anything regarding the individual camp itself other than its
1084 affiliation with a brief period in the logging industry in northeastern Minnesota. Thus, the site
1085 was determined to be not eligible under Criterion A. Due to the sparse nature of the artifacts and
1086 lack of significant features, it was believed that the site was unlikely to yield any further
1087 information significant to the understanding of past cultural history, and therefore was
1088 determined to be not eligible under Criterion D.

1089 Effect determinations have been drafted by the federal Co-lead Agencies for review and
1090 comment by the Bands, SHPO, and PolyMet. The federal Co-lead Agencies have determined that
1091 the above properties would be eligible for inclusion in the NRHP. The agencies are working on
1092 final boundary determinations for those properties in consultation with the SHPO and the Bands.

1093 **Summary of Results Coordination**

1094 The USACE has coordinated the results of the archaeological surveys discussed above with the
1095 SHPO (USACE 2007; USACE 2009; SHPO 2007; Co-lead Agencies 2014a, 2014b, 2015) and,
1096 based on strategic sampling of the NorthMet Project area, the SHPO and USACE concurred that
1097 no further efforts were required to identify archaeological resources within the APE. However,
1098 the Bands had concerns about the survey coverage (see section above for additional detail).

1099 Through consultation with the USACE and SHPO, it was determined that Phase I architectural
1100 history surveys, coupled with the development of a historic context, were appropriate steps for
1101 evaluating the architectural resources that may be affected by the NorthMet Project Proposed
1102 Action. The initial Phase I architectural history survey identified two properties that were
1103 recommended eligible for listing in the NRHP: the Erie Mining Company Concentrator Building
1104 (SL-HLC-008/046) and segments of the Erie Mining Company Railroad mine and track (SL-
1105 HLC-015/053). Within the refined APE, additional sections of the Erie Mining Company
1106 Railroad Mine and Plant Track, Main Line Segment, and Dunka Railroad Segment were
1107 identified. The federal Co-lead Agencies consulted with SHPO concerning properties identified
1108 as part of additional Phase I architectural history survey. The federal Co-lead Agencies have
1109 determined four properties eligible for listing in the NRHP: the Erie Mining Company
1110 Administration Building (SL-HLC-pending), Erie Mining Company Landscape Historic District
1111 (SL-HLC-pending), Erie Mining Company Railroad Corridor Historic District (SL-HLC-
1112 pending), and DM&IR Segment (SL-HLC-pending).

1113 The federal Co-lead Agencies have consulted with the Bands and the SHPO concerning the
1114 results of identification efforts for properties of religious and cultural significance to the Bands.
1115 Consultation focused on applying NRHP criteria to the properties identified, discussion of
1116 property boundaries for those meeting the criteria, as well as discussions to further understand
1117 the traditional religious and cultural significance of those properties. As a result, the Spring Mine
1118 Lake Sugarbush, the BBLV Trail Segment, and *Mesabe Widjiu* were determined eligible. The
1119 Overlook location was not considered by the Co-leads to be eligible in itself, but eligible as part
1120 of the *Mesabe Widjiu*.

1121 At various times during consultation for the NorthMet Project Proposed Action, the Bands have
1122 proposed a historic district that includes the above properties as well as others that have been
1123 reported outside of the APEs. The historic district, proposed by the Grand Portage Band in a June
1124 27, 2013 letter, consists of an approximately 216,000-acre area, extends from Lake Vermilion
1125 south to Duluth by way of the St. Louis River, and is bounded on the northeast by an arbitrary
1126 line extending southeast from Lake Vermilion to Beaver Bay. The Co-lead Agencies, at this
1127 time, believe that additional identification and evaluation efforts within this area would be
1128 outside of the scope of the NorthMet Project Proposed Action.

1129 To summarize, the federal Co-lead Agencies have followed the initiation and identification
1130 processes outlined in 36 CFR 800.3 and 36 CFR 800.4, respectively, and have involved
1131 consulting parties in the finding and determination process completed to date. Multiple historic
1132 property identification efforts have occurred over a 15-year period within the proposed NorthMet
1133 Project area. These identification efforts have included both standard field inventory and
1134 assessment and identification of properties of cultural and religious significance to consulting
1135 Bands.

1136 **4.2.9.3 Cultural Identity: Natural Resources as Cultural Resources**

1137 For most Native American tribes, subsistence is synonymous with culture and identity.
1138 Subsistence activities generally constitute a way of being and relating to the world, and thus
1139 comprise an essential component of Native American identity and culture. Because Native
1140 Americans consider subsistence activities such as obtaining, processing, and distributing natural
1141 resources as essential components of maintaining their cultural customs and traditions, one
1142 cannot be arbitrarily removed from the other. Therefore, Native Americans generally consider an

1143 effect on subsistence resources and/or the ability to hunt, fish, or gather these resources as an
1144 effect on associated and perhaps fundamental aspects of cultures and traditions.

1145 The spiritual connection to subsistence resources, and the manner in which these resources are
1146 harvested, is an essential part of Ojibwe culture. Potential effects on subsistence resources could
1147 therefore impact the culture and tradition of the Ojibwe. For instance, subsistence practices in a
1148 particular area could be affected by a loss of hunting, fishing, or gathering opportunities, thereby
1149 affecting the traditional or cultural practice that takes place in that area. Effects on subsistence
1150 resources in areas where traditions are practiced may have an effect on the ability of individuals
1151 or families to pass those traditional practices, knowledge, and beliefs to future generations. The
1152 identity of Ojibwe as a people is dependent on the transmission of that knowledge and belief
1153 system to the next generation.

1154 **4.2.9.3.1 Federal Tribal Trust Responsibility**

1155 The federal government has a unique legal relationship with the federally recognized Native
1156 American tribes, which has been set forth in the U.S. Constitution, treaties, statutes, court
1157 decisions, and EOs. This legal relationship is often referred to as the “Federal Trust Doctrine” or
1158 “Federal Tribal Trust Responsibility,” which is a body of law defining the relationship of federal
1159 government with federally recognized Native American tribes.

1160 Beginning in the mid-19th century, the government of the United States made treaties with the
1161 Ojibwe that ceded areas of land in northern Minnesota to the federal government. In return,
1162 specific reservations were created for the tribes’ use and other considerations specified. The
1163 treaties also preserved the right of the Ojibwe bands to hunt, fish, and gather off the reservations
1164 within these ceded territories. The federal trust responsibility requires that federal agencies
1165 consider their actions with respect to tribal rights, particularly reserve rights, where they exist.

1166 In 1854, the Chippewa of Lake Superior entered into a treaty (1854 Treaty of La Pointe or 1854
1167 Treaty; Kappler 1904) with the United States whereby the Chippewa ceded to the United States
1168 ownership of their lands in northeastern Minnesota. These lands are generally known as the 1854
1169 Ceded Territory. Article 11 of the 1854 Treaty provides, “...and such of them as reside in the
1170 territory hereby ceded, shall have the right to hunt and fish therein, until otherwise ordered by
1171 the President.” The Chippewa of Lake Superior who reside in the 1854 Ceded Territory are the
1172 Fond du Lac, Grand Portage, and Bois Forte Bands. The NorthMet Project area is within the
1173 1854 Ceded Territory, and thus federal agencies must consult on a government-to-government
1174 basis with interested signatories to the 1854 Treaty to understand how the proposed federal
1175 actions may impinge on or abrogate treaty rights.

1176 Natural resources and the lands on which they are gathered are important to the Bands for a
1177 number of reasons, including cultural, spiritual, and/or historical meanings, and will be
1178 considered under federal agency tribal trust responsibilities as outlined above and also as cultural
1179 resources under NEPA.

1180 **4.2.9.3.2 Perspectives on the Environment**

1181 This FEIS uses different criteria and methods to describe how the NorthMet Project Proposed
1182 Action would affect the environment. These systems are used to identify, describe, and map
1183 progressively smaller areas of land with increasingly uniform ecological features. The systems

1184 primarily use associations of biotic and environmental factors, including climate, geology,
 1185 topography, soils, hydrology, and vegetation.

1186 The integration of ecosystems models with greater emphasis on the relationship of people to the
 1187 land has become popular with Tribal natural resource and landscape planning. The integration of
 1188 Native American traditional values regarding the natural world as a whole landscape system
 1189 encompasses both visible physical aspects of the land along with less apparent values such as
 1190 cultural relationships and spirituality.

1191 The wildlife and vegetation sections describe the natural environment by using the MDNR’s
 1192 ECS, which follows the NHFEU. The NorthMet Project area is within the Laurentian Mixed
 1193 Forest province, covering northern Minnesota, Wisconsin, and Michigan, as well as southern
 1194 Ontario and portions of New England. More specifically, the NorthMet Project area is located
 1195 along the border of the Laurentian Uplands and Nashwauk Uplands subsections.

1196 The Laurentian Uplands and Nashwauk Uplands subsections are characterized by till plains,
 1197 moraines, peatlands, and flat outwash plains (MDNR 2011g; MDNR 2011i). The Continental
 1198 Divide separates the Nashwauk Uplands subsection, with waters flowing north to Hudson Bay,
 1199 west to the Mississippi River, or south to Lake Superior. Land cover within these subsections is
 1200 described in Table 4.2.9-3 below.

1201 **Table 4.2.9-3 Laurentian Uplands and Nashwauk Uplands Subsections**

Subsection/Land Cover	Total Acres	Percent of Total Area in Subsection
Nashwauk Uplands	810,028	
Aquatic Environments	283,510	35
Disturbed	40,501	5
Forest	437,415	54
Cropland/Grassland	48,602	6
Laurentian Uplands	567,280	
Aquatic Environments	113,456	20
Disturbed	5,673	1
Forest	448,151	79
Cropland/Grassland	0	0

1202 Sources: MDNR 2011g; MDNR 2011i.

1203 Both subsections are dominated by forest habitat (e.g., upland and lowland deciduous and
 1204 coniferous forests) and aquatic environments (e.g., open water, wetlands), with a smaller amount
 1205 of disturbed and cropland/grassland. 1854 Treaty resources—including vegetation, wildlife, and
 1206 fish—are discussed below within the context of these land cover types.

1207 **4.2.9.3.3 1854 Treaty Resources**

1208 Another perspective on natural resources of cultural importance can be viewed through the
 1209 relationship of the federal government with the Bands. The Land Exchange Proposed Action
 1210 represents an exchange of private and federal land, but it is also represents an exchange of access
 1211 to natural resources expressed in treaties made between the United States and Bands of Ojibwe
 1212 Indians in the 19th century. The 1854 Treaty was signed by Henry C. Gilbert and David B.
 1213 Herriman for the United States and representatives of the Lake Superior Chippewa on September
 1214 30, 1854, and proclaimed on January 29, 1855. The 1854 Treaty ceded all of the Lake Superior

1215 Chippewa lands in the Arrowhead Region of Northeastern Minnesota to the United States, in
 1216 exchange for reservations for the Lake Superior Chippewa in Wisconsin, Michigan, and
 1217 Minnesota. The signatory tribes retain hunting, fishing, and gathering rights within this region.

1218 The rights to capture or gather (or take) subsistence resources within the 1854 Ceded Territory
 1219 are provided to the Bands on a usufruct basis. The concept of individuals not owning specific
 1220 land, but using the resources on land controlled by larger cultural groups, represented this
 1221 usufruct basis that was so important to the survival of the Ojibwe everywhere in Minnesota prior
 1222 to arrival of Europeans. As a usufructuary created by the 1854 Treaty, the Bands are allowed to
 1223 use resources from land owned by others. The NorthMet Project area and Land Exchange area
 1224 fall within the territory ceded as part of the 1854 Treaty between the U.S. government and the
 1225 Chippewa of Lake Superior. Rights for hunting and fishing under the 1854 Treaty are exercised
 1226 on lands within this territory. It is therefore important to address what these resources are and
 1227 what cultural importance they have to the Bands.

1228 Interpretations of the 1854 Treaty resources range from an emphasis on hunting and fishing to
 1229 efforts by the courts to determine Ojibwe land use prior to the treaties that lists virtually every
 1230 resource in the 1854 Ceded Territory that was utilized by the Ojibwe (Lac Courte Oreilles III,
 1231 653 F. Supp. 1420, 1424). While this provided an extensive list of possible resources, the
 1232 emphasis on certain natural resources such as wild rice, moose, white-tailed deer, maple sugar,
 1233 certain fish and aquatic species, and certain well-known medicinal plants heightens their level of
 1234 cultural importance. Table 4.2.9-4 shows other animal and plant species that have historically
 1235 been, and/or could potentially be, harvested in the 1854 Ceded Territory.

1236 **Table 4.2.9-4 Species Potentially Harvested in 1854 Ceded Territory**

Mammal/Reptile					
white-tailed deer	beaver	snowshoe hare	moose	otter	elk
black bear	marten	cottontail rabbit	woodchuck	lynx	bison
muskrat	mink	badger	squirrel	fox	turtles
	fisher	porcupine	raccoon	wolf	turtle eggs
Bird					
ducks	songbirds	turkeys	eagles	owls	partridges
geese	grouse (various)	hawks			
Fish					
whitefish	chubs	turbot	walleye	sturgeon	
herring	lake trout	in-shore suckers	pike	muskie	perch
Plant/Plant Materials					
adder's mouth	choke cherry	ground pine	mountain holly	shield fern	Virginia
agrimony	climbing bitter-sweet	harebell	mountain maple	shin leaf	waterleaf
alternate-leaved dogwood	cocklebur	hare's tail	mullein	shining willow	white campion
American dog violet	common burdock	hawthorn	musquash root	slender ladies' tresses	white lettuce
arbor vitae (white cedar)	common milkweed	hazelnut	nannyberry	slippery elm	white oak
arum-leaved arrow-head	common plantain	heal-all	navy bean	small bedstraw	white pine
balsam fir	common thistle	heart-leaved umbrella-wort	northern clintonia	small cleaver	white sage
balsam poplar	corn	hemlock	Norway pine	small Solomon's seal	white spruce
basswood	cow parsnip	highbush blackberry	Ojibwe potato	smooth gooseberry	white sweet clover
beaked hazelnut	cow wheat	highbush cranberry	Ojibwe squash	smooth juneberry	wild balsam-apple
		hog peanut	dogwood		wild bergamot
					wild black

beech	crack willow	hop	paper birch	smooth rose	currant
black ash	cranberry	horseweed	pearly	smooth sumac	wild cherry
black oak	cranberry pole	hound's tongue	everlasting	snowberry	wild columbine
black snakeroot	bean	Indian cup plant	Philadelphia	speckled alder	wild geranium
black spruce	creamy	Indian turnip	fleabane	speckled elder	wild ginger
black-eyed Susan	vetchling	jack pine	pin cherry	sphagnum moss	wild leek
bloodroot	cucumber	Joe-Pye weed	pitcher-plant	spotted touch-me-not	wild mint
blue cohosh	curled dock	Labrador tea	poison ivy	spreading dogbane	wild onion
blue flag	cursed crowfoot	large-flowered bellwort	prickly ash	squash	wild parsnip
blueberry	daisy fleabane	large pie pumpkin	prickly gooseberry	stag-horn sumac	wild plum
bluewood aster	dandelion	large-toothed pumpkin	prince's pine	starflower	wild red currant
bog rosemary	downy arrowwood	large-toothed aspen	purple meadow rue	star-flowered Solomon's seal	wild rice
bog willow	Dudley's rush	large toothwort	quaking aspen	steep bush	wild sarsaparilla
box elder	entire-leaved groundsel	large-leaved aster	rattlesnake grass	sugar maple	wild strawberry
brake	esser cat's foot	large-leaved aster	red ash	swamp persicaria	winterberry
bristly crowfoot	evening primrose	large-leaved aven	red baneberry	sweet cicely	wintergreen
bunch berry	primrose	aven	red elderberry	sweet fern	wood betony
bur oak	false spikenard	leather leaf lichens	red haw apple	sweet flag	wood horsetail
bush honeysuckle	female fern	lima bean	red maple	sweet gale	wood nettle
butternut	field horsetail	low birch	red oak	sweet grass	wool grass
Canada anemone	flowering spurge	Lyall's nettle	red raspberry	sweet white water lily	woolly yarrow
Canada Canada hawkweed	fragrant goldenrod	marsh bellflower	rein orchis	tamarack	yarrow
Canada mayflower	fragrant goldenrod	marsh cress	reindeer moss	tansy	yellow birch
Canada moonseed	giant puffball	marsh five-finger	river-bank grape	tansy-mustard	yellow ladies'
Canada thistle	giant puffball	marsh marigold	rough cinquefoil	thimble-weed	slipper
Canada violet	ginseng	marsh skullcap	sand cherry	tower mustard	yellow lotus
Carey's persicaria	golden corydalis	marsh vetchling	scouring rush	twisted stalk	yellow water lily
carrion flower	golden ragwort	meadow-sweet	sensitive fern	Virginia creeper	
catnip	goldthread	moosewood	sessile-leaved bellwort	Virginia grape fern	
cat-tail	goose grass		shell bark hickory		
	gourds				
	great bulrush				
	great willow-herb				

1237 Source: Appendix C.

1238 The 1854 Treaty resources can be more accurately characterized by examining how they are
 1239 being currently regulated by the Bands. Governance of hunting, fishing, trapping, management,
 1240 and gathering of natural resources by the Fond du Lac Band of Lake Superior Chippewa within
 1241 the 1854 Ceded Territory is demonstrated in the Fond du Lac Ceded Territory Conservation
 1242 Code (Fond du Lac 1992). The purpose of the Code is to provide a system for tribal control and
 1243 regulation of hunting, fishing, and gathering within the Ceded Territory, provide a means to
 1244 promote public health and safety through the conservation and management of natural resources
 1245 within the Ceded Territory, and to promote and protect the rights of the Fond du Lac retained
 1246 under the 1854 Treaty.

1247 The 1854 Treaty Authority is an Inter-tribal Natural Resources Management Organization that
 1248 manages the off-reservation hunting, fishing, and gathering rights of the Grand Portage and Bois
 1249 Forte Bands of Lake Superior Chippewa in the territory under legal agreement with the State of

1250 Minnesota. The 1854 Treaty Authority’s mission statement is to “provide an Inter-Tribal natural
1251 resource program to ensure that the rights secured to member Native American tribes by treaties
1252 of the United States to hunt, fish, and gather within the 1854 Ceded Territory shall be protected,
1253 preserved and enhanced for the benefit of present and future member Native American tribes in a
1254 manner consistent with the character of such rights, through provisions of services.” The 1854
1255 Treaty Authority’s management of natural resources generally focuses on some of the most
1256 commonly hunted, fished, or gathered natural resources; therefore, an analysis of subsistence use
1257 by the Bands cannot be all-encompassing. The 1854 Treaty Authority and the natural resources
1258 which they manage and regularly report on are being used merely as a way to better quantify an
1259 analysis of potential natural resource use by the Bands within the NorthMet Project area.

1260 As discussed above, Fond du Lac has its own regulations applicable to the 1854 Ceded Territory.
1261 The discussion of 1854 Treaty Authority-regulated species or resources presented in the sections
1262 below is not inclusive of all species important to the Bands. Instead, the lists serve as the most
1263 updated and best available data for the most common game species or tribally harvested
1264 resources within the 1854 Ceded Territory.

1265 **Vegetation**

1266 The 1854 Treaty Authority developed a Code for Treaty Gathering (2007) to facilitate Treaty-
1267 related gathering of wild plants or forest products on lands and waters open to the public within
1268 the 1854 Ceded Territory (see Table 4.2.9-5). The gathering activities conducted under this code
1269 are for subsistence use only. Subsistence levels are identified for each resource, and any
1270 gathering beyond those levels is considered commercial harvesting. Band members may gather
1271 other plant species not listed in the table below, but may not gather threatened or endangered
1272 species. If the state, county, or federal government prohibits gathering in a forest campground,
1273 wildlife management area, SNA, State of Minnesota-designated old growth stand, state park,
1274 wayside, beach, water access, plantation, or other specially designated area such as the
1275 BWCAW, then gathering by Band members is also prohibited (1854 Treaty Authority 2007).

1276 Plant species or resources discussed in this code were grouped according to their habitat or cover
1277 types, and presented along with the area (in acres) of each habitat type located in the NorthMet
1278 Project area (see Table 4.2.9-5 and Section 4.2.4). This provides an estimate of how much of
1279 each 1854 Treaty Authority-regulated resource or species could be present in the NorthMet
1280 Project area based on predominant cover types.

1281 **Table 4.2.9-5 Cover Types of Associated Species and Resources Regulated by the 1854**
 1282 **Treaty Authority in the NorthMet Project Area**

Cover Types	Associated Plant Species or Resource	Mine Site (Acres) ¹	Transportation and Utility Corridor (Acres) ¹	Plant Site (Acres) ¹
Upland coniferous forest	Conifer boughs, princess pine, birch bark, firewood, other plants or forest products	1,195.5	2.6	99.8
Lowland coniferous forest	Conifer boughs, princess pine, firewood, other plants or forest products	781.2	0.2	41.9
Upland deciduous forest	Princess pine, ginseng, birch bark, firewood, other plants or forest products	648.0	2.7	647
Shrubland	Firewood, other plants or forest products	241.7	7.7	333.8
Disturbed	NA	128.0	94.4	2,755.5
Aquatic environments	Wild rice, other plants or forest products	12.7	2.7	636.8
Cropland/Grassland	NA	4.9	9.8	0.0
Upland conifer-deciduous mixed forest	Conifer boughs, princess pine, ginseng, birch bark, firewood, other plants or forest products	2.4	0.0	0.0
Lowland deciduous forest	Princess pine, birch bark, firewood, other plants or forest products	0.1	0.0	0.0
Total	NA	3,014.5	120.2	4,514.4

1283 Source: 1854 Treaty Authority 2007.

1284 Note:

1285 ¹ Acres from Section 4.2.4.

1286 Specific plant surveys were also completed to assess “the degree to which the [NorthMet Project
 1287 area] provides opportunities to gather a variety of plant species for use in traditional Ojibwe
 1288 cultural practices” (Zellie 2012). More than 152 plant species were identified during these
 1289 surveys; the five most common plant species were identified in at least half of the 43 sample
 1290 plots, while another 21 plant species were identified in at least one-quarter of the plots. Balsam
 1291 fir (*Abies balsamea*) was the most frequently encountered species within the sample plots,
 1292 followed by black spruce (*Picea mariana*), bigleaf aster (*Eurybia macrophyllus*), bunchberry
 1293 dogwood (*Cornus canadensis*), and Canada mayflower (*Maianthemum canadense*).

1294 The 152 species identified were also grouped into seven distinct ECS community types (Zellie
 1295 2012). Three plant species were found in five of the seven ECS community types, including
 1296 balsam fir, speckled alder (*Alnus incana*), and low-bush blueberry (*Vaccinium angustifolium*).
 1297 Eleven species were found in four of the seven ECS community types, and 12 species were
 1298 found in three of the seven ECS community types (see Table 4.2.9-6). These 26 species occur in
 1299 a larger range of habitat types and are thus more likely to occur in the NorthMet Project area.
 1300 Plant species found in multiple community types would generally be more broadly available to
 1301 gatherers of plants, whereas plant species found in only one community type would require a trip
 1302 to that specific community to gather it (Zellie 2012). Of the 26 species listed in Table
 1303 4.2.9-6, only one (blue-joint grass) does not have a traditional Ojibwe use according to *Plants*
 1304 *Used by the Great Lakes Ojibwa* (Meeker et al. 1993).

1305 **Table 4.2.9-6 Plant Species Found in At Least Three ECS Vegetation Community Types**

Number of ECS Community Types Found In	Common Name (Scientific Name)
Five	Balsam fir, speckled alder, low-bush blueberry
Four	Lady fern (<i>Athyrium filix-femina</i>), paper birch (<i>Betula papyrifera</i>), creeping snowberry (<i>Gaultheria hispidula</i>), tamarack (<i>Larix laricina</i>), Labrador tea (<i>Ledum groenlandicum</i>), black spruce, blue-joint grass (<i>Calamagrostis canadensis</i>), goldthread (<i>Coptis trifolia</i>), bunchberry dogwood, beaked hazelnut (<i>Corylus cornuta</i>), wild red raspberry (<i>Rubus idaeus</i>)
Three	Northern white cedar (<i>Thuja occidentalis</i>), twinflower (<i>Linnea borealis</i>), red maple (<i>Acer rubrum</i>), mountain maple (<i>Acer spicatum</i>), serviceberry (<i>Amelanchier sanguinea</i>), wild sarsaparilla (<i>Aralia nudicaulis</i>), blue-bead lily (<i>Clintonia borealis</i>), bigleaf aster, three-lobed bedstraw (<i>Galium trifidum</i>), Canada mayflower, quaking aspen (<i>Populus tremuloides</i>), rosy twisted-stalk (<i>Streptopus roseus</i>)

1306 Source: Zellie 2012.

1307 According to the *NorthMet Project Cultural Landscape Study* (Zellie 2012), the “Ojibwe
 1308 organized their economy around wild rice and the seasonal cycle of fishing, sugaring, trapping,
 1309 and hunting.” Reliance on wild rice varied with the availability and cycle of abundance, but
 1310 because of its shelf life of up to 10 years, it was a staple food for native peoples and early
 1311 explorers and fur traders. Wild rice is included in Table 4.2.9-5 as an 1854 Treaty Authority-
 1312 regulated resource, as it is a culturally important plant species. The annual harvest of wild rice
 1313 totals more than 2 million pounds, and involves thousands of tribal members, demonstrating its
 1314 continuing role in Ojibwe spiritual practices, culture, livelihood, and identity (Zellie 2012). Wild
 1315 rice is not known to occur within the Plant Site, Transportation and Utility Corridor, or the Mine
 1316 Site. However, it was identified through surveys in isolated patches in the Upper Partridge River
 1317 upstream of Colby Lake, in the Partridge River downstream of Colby Lake, in isolated patches
 1318 on the Embarrass River above Embarrass Lake, and downstream of Embarrass Lake. See
 1319 Sections 4.2.2 and 4.2.4 for further discussions of wild rice near the NorthMet Project area.

1320 Similarly, the sugar maple (*Acer saccharum*) is a culturally important plant species, as it has
 1321 traditionally been and is still tapped to make maple syrup and sugar. “The sugar, in granular form
 1322 or syrup, provided seasoning for grains and breads, stews, teas, berries, and vegetables” (Zellie
 1323 2012). A stand of sugar maple was located southwest of Spring Mine Lake between the Mine
 1324 Site and Plant Site. This site, called the “sugarbush” or “sugar camp” site, appears to be a natural
 1325 maple-basswood stand that has been utilized during the past two centuries. Many of the sugar
 1326 maple trees at this site display evidence that they have been tapped for maple syrup in the past,
 1327 including misshapen boles from 4 to 8 ft off the ground. Small groups of sugar maple were also
 1328 identified near the overlook area northeast of the Plant Site, but nowhere else, including the Mine
 1329 Site.

1330 In addition to sugar maple and wild rice, the Ojibwe also relied on spruce root, birch and cedar
 1331 bark, sage, hazelnuts, and blueberries and other berries (Zellie 2012). Many of these species also
 1332 had medicinal uses besides being used as food sources. This is consistent with the 1854 Treaty
 1333 Authority-regulated resources listed in Table 4.2.9-5, and many of these species were identified
 1334 in multiple ECS community types during surveys (see Table 4.2.9-6).

1335 **Wildlife**

1336 The 1854 Treaty Authority developed a Ceded Territory Conservation Code (2012) to regulate
 1337 hunting, fishing, trapping, and gathering of resources for subsistence use in the 1854 Ceded
 1338 Territory. The wildlife species regulated by the 1854 Treaty Authority are listed in Table 4.2.9-6,
 1339 and are categorized by the habitat type they typically utilize. Table 4.2.9-7 also lists the acreage
 1340 of these habitats present at the Mine Site, Transportation and Utility Corridor, and Plant Site.

1341 **Table 4.2.9-7 Key Habitat, Cover Types, and Associated Species Regulated by the 1854**
 1342 **Treaty Authority in the NorthMet Project Area**

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species Regulated by the 1854 Treaty Authority	Mine Site (Acres)	Transportation and Utility Corridor (Acres)	Plant Site (Acres)
1. Mature Upland Forest, Continuous Upland/Lowland Forest: aspen forest/aspen-birch forest, jack pine forest, mixed pine-hardwood forest (MIHs 1-13)	Snowshoe hare, bobcat, fisher, pine marten, ruffed grouse, spruce grouse	2,627.2	5.5	789.3
2. Open Ground, Bare Soils: disturbed/developed (no MIH)		128.0	94.4	2,755.5
3. Grassland and Brushland, Early Successional Forest (no MIH)	American badger, sharp-tailed grouse	246.6	17.5	333.8
4. Aquatic Environments: Tailings Basin, Partridge River, Embarrass River, former LTVSMC mine pits, wetlands (MIH 14)	American mink, muskrat, beaver, river otter, sora, Virginia rail, Wilson's snipe, Canada goose, snow goose, redhead, northern pintail, canvasback, mallard, American black duck, red-breasted merganser, American coot, common gallinule	12.7	2.7	636.8

1343

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species Regulated by the 1854 Treaty Authority	Plant Site (Acres)	Mine Site (Acres)	Transportation and Utility Corridor (Acres)
5. Multiple Habitats (MIHs 1-14)	White-tailed deer ¹ (1, 3), moose (1, 3, 4), black bear (1, 3), coyote (1, 3), red fox (1, 3), raccoon (1, 3, 4), gray fox (1, 3), eastern cottontail rabbit (1, 3), eastern fox squirrel (1, 3), eastern gray squirrel (1, 3), Virginia opossum (1, 3), Canada lynx (1-4), wild turkey (1, 3, 4), American crow (1-4), mourning dove (1, 3), American woodcock (1, 3), ring-necked pheasant (3, 4), Canada goose (3, 4), snow goose (3, 4), greater white-fronted goose (3, 4), brant (3, 4), wood duck (1, 4), greater scaup (3, 4), lesser scaup (1, 3, 4), hooded merganser (1, 4), common merganser (1, 4)			
Total²		3,014.5	120.1	4,515.4

1344 Sources: 1854 Treaty Authority 2013; 1854 Treaty Authority 2012.

1345 Notes:

1346 ¹ Numbers refer to the Key Habitat Types (1-5) where those species may occur or are known to occur.

1347 ² Total acres may be more or less than presented due to rounding.

1348 Mature upland and lowland forest is the most common habitat type at the NorthMet Project area
 1349 (primarily at the Mine Site). Section 4.2.4 provides a more detailed discussion of vegetation
 1350 cover and habitat types. Species that may be present include snowshoe hare, bobcat, fisher, pine
 1351 marten, ruffed grouse, and spruce grouse. These species represent a group that generally requires
 1352 large forested blocks and/or minimal human intrusion.

1353 Areas of open ground and bare soils are rare at the Mine Site but are abundant at the Plant Site
 1354 due to former LTVSMC operations or deposition in the existing LTVSMC Tailings Basin. Both
 1355 open ground and bare soils are considered non-natural habitats. No 1854 Treaty Authority-
 1356 regulated species are specifically associated with this habitat type.

1357 Brush/grassland and very early successional forest are uncommon at the Mine Site and Plant Site
 1358 (ENSR 2005) and, where present, are typically small patches resulting from recent logging. The
 1359 revegetation of the existing LTVSMC Tailings Basin is counted as grassland, though it is
 1360 disturbed habitat and is unlikely to be heavily used by wildlife species. The species listed in
 1361 Table 4.2.9-7 include the American badger and sharp-tailed grouse, which are generally
 1362 associated with large patches of grassland and savanna habitats that are not present in the
 1363 NorthMet Project area. The USFS has indicated that American woodcock has been observed at
 1364 the Mine Site.

1365 The Mine Site and adjacent federal lands contain a large expanse of wetland habitat consisting
 1366 primarily of coniferous and open bogs. Species that utilize this habitat include semi-aquatic
 1367 mammals, shorebirds, and waterfowl. Currently, there are no bodies of open water at the Mine
 1368 Site. At the Plant Site, open water and aquatic communities are confined to the existing
 1369 LTVSMC Tailings Basin. The Tailings Basin attracts Canada geese and other waterfowl, though

1370 the NorthMet Project area does not otherwise appear to provide good habitat for waterfowl or
1371 shorebirds.

1372 Multiple habitats are not mapped as such, but are made up of combinations of other key habitat
1373 types. This category is used for 1854 Treaty Authority-regulated species that are known to use
1374 multiple habitats during a season, such as white-tailed deer, bear, moose, and multiple other
1375 species listed in Table 4.2.9-7.

1376 Other wildlife species may be considered culturally important, including but not limited to the
1377 gray wolf and bald eagle, and are discussed in Section 4.2.5.

1378 **Aquatic Species**

1379 As mentioned above, the 1854 Treaty Authority manages the off-reservation fishing rights of the
1380 Grand Portage and Bois Forte Bands of Lake Superior Chippewa in the 1854 Ceded Territory.
1381 They have developed the *1854 Treaty Authority Fishing Seasons, 2013-2014* (2013) document to
1382 address fishing seasons and limits on waters open to the public within the 1854 Ceded Territory.
1383 Fish species with a season and limit are presented in Table 4.2.9-8 below, along with fish species
1384 that have been collected at sites in the vicinity of the NorthMet Project area. Five fish species
1385 that are regulated by the 1854 Treaty Authority (i.e., northern pike, white sucker, burbot, black
1386 bullhead, and yellow perch) occur near or on the NorthMet Project areas; the remaining species
1387 collected near the Mine Site, Transportation and Utility Corridor, or Plant Site include species
1388 more typical for first- and second-order streams (e.g., minnows, darters, etc.). Section 4.2.6
1389 describes in more detail the species collected and the stream and shoreline habitat available.

1390 **Table 4.2.9-8 Fish Species Regulated by the 1854 Treaty Authority and Collected in the**
1391 **NorthMet Project Area**

1854 Treaty Authority-Regulated Fish Species¹
<i>Northern pike, white sucker, burbot, black bullhead, yellow perch, walleye, sauger, muskellunge, largemouth/smallmouth bass, rock bass, black/white crappie, sunfish/bluegill, white/yellow bass, flathead/channel catfish, yellow/brown bullhead, lake whitefish, rainbow smelt, lake sturgeon, ruffe, white perch, round goby, lake trout, chinook/pink/coho salmon, brook/brown/rainbow trout, splake, carp, bigmouth buffalo, sheepshead/freshwater drum, bowfin, cisco, gar, goldeye</i>
Species Collected in the Vicinity of the NorthMet Project Area^{1,2}
<i>Northern pike, white sucker, burbot, black bullhead, yellow perch, longnose dace, common shiner, Johnny darter, brassy minnow, northern redbelly dace, brook stickleback, blacknose dace, pearl dace, tadpole madtom, central mudminnow, fathead minnow, mottled sculpin, golden shiner, finescale dace, creek chub</i>

1392 Sources: 1854 Treaty Authority 2013; 1854 Treaty Authority 2012.

1393 Notes:

1394 ¹ Species in common between the 1854 Treaty Authority fishing season list and those collected in the NorthMet Project area are
1395 listed in italics.

1396 ² Species list from tables in Section 4.2.6.

1397 The lake sturgeon is a culturally important fish species that has a season and limits enforced
1398 (1854 Treaty Authority 2013), and it is also listed as a USFS RFSS. However, lake sturgeon are
1399 not known to occur near the NorthMet Project area, and there is no likely habitat for them on the
1400 federal lands. Though lake sturgeon have been stocked into the St. Louis River above the Fond
1401 du Lac dam, upstream migration would be blocked by a dam downstream of the Embarrass River
1402 confluence with the St. Louis River. See Section 4.2.6 for a more thorough discussion of lake
1403 sturgeon and their management.

1404 **Access to the NorthMet Project Area for Subsistence Use**

1405 The Mine Site is entirely surrounded by private restricted property, roads, and railroads. There
1406 are access points to the NorthMet Project area, however, via a Forest Service road, the Partridge
1407 River, and various trails segments. The Plant Site and the Transportation and Utility Corridor are
1408 owned by either Cliffs Erie LLC or PolyMet, and are not open to the public. Entry points are
1409 gated and/or guarded, and crossing the corridor is prohibited. As such, current subsistence use in
1410 the NorthMet Project area is limited, but not restricted.

DRAFT

1 **4.2.10 Socioeconomics**

2 The Arrowhead region of northeastern Minnesota, which includes Cook, Lake, and St. Louis
3 counties, contains the well-known Mesabi Iron Range. Precious metal mining in this region can
4 be dated to the late 1800s, with St. Louis County in particular having a long mining heritage.
5 Many local communities were established to support these iron mining operations. While mining
6 is still a major component of the area's economy and culture, the same can also be said for the
7 region's other natural resources. As with much of Minnesota, timber production has a long
8 history in this area. Tourism, much of it centered on the BWCAW and the region's other
9 outstanding public lands, is an important and growing economic sector and is deeply ingrained in
10 the region's culture.

11 The study area for socioeconomics extends beyond the area of direct potential project effects to
12 include all of Cook, Lake, and St. Louis counties (see Figure 4.2.10-1). This geography includes
13 the proposed Mine Site, Transportation and Utility Corridor, and Plant Site as well as the non-
14 federal tracts included in the Land Exchange Proposed Action.

15 Socioeconomic data are not available, and thus are not reported for the Mine Site, Transportation
16 and Utility Corridor, and Plant Site on an individual basis. Socioeconomic data in this section are
17 instead collected and analyzed at the county level and, where appropriate, for cities (Aurora,
18 Babbitt, Biwabik, Duluth, Ely, Hibbing, Hoyt Lakes, Tower, and Virginia), as well as the
19 unincorporated area known as Soudan (all of which are located in St. Louis County, and which
20 are collectively referred to hereafter as "study area communities"). While other portions of
21 northeastern Minnesota could experience some socioeconomic effects from the NorthMet Project
22 Proposed Action, these cities were chosen for several reasons. Duluth, which is approximately 2
23 hours driving distance from the NorthMet Project area, is included because its population is a
24 large share of St. Louis County's overall population. Other larger cities are those within
25 approximately a 1 hour driving distance. These are the population centers most likely to provide
26 labor and housing (temporary and permanent) and thus are the most likely to be impacted by the
27 NorthMet Project Proposed Action.

28 Data and observations for the Fond du Lac (St. Louis and Carlton counties), Grand Portage
29 (Cook County), and Bois Forte (St. Louis and Koochiching counties) reservations and off-
30 reservation areas are also included where information was available. While portions of these
31 reservations are outside of the study area, tribal members nonetheless exercise usufructuary
32 rights to hunt, fish, and gather plants within the 1854 Ceded Territory.

33 **4.2.10.1 Mine Site, Transportation and Utility Corridor, Plant Site**

34 **4.2.10.1.1 Demographics**

35 This section describes the demographics of the three-county study area in terms of population,
36 age, race, income, poverty, and educational statistics.

DRAFT

40 ***Population, Age, and Race***

41 Population and population trends for the study area from 1980 through 2010 are shown in Table
 42 4.2.10-1. The population of St. Louis County is concentrated in and around the City of Duluth,
 43 approximately 65 miles south of the NorthMet Project area, with smaller, secondary centers in
 44 the Iron Range communities of Ely, Hibbing, and Virginia. Lake and Cook counties have few
 45 large population centers near the NorthMet Project area. The population of the study area and its
 46 individual communities has declined by nearly 10 percent since 1980 (from more than 239,000
 47 in 1980 to 216,000 in 2010), while the population of the state as a whole has increased by more
 48 than 30 percent. In individual communities listed in Table 4.2.10-1, population has declined
 49 substantially compared to the study area as a whole. At least some of this population decline may
 50 be attributable to “the out-migration of previous residents after the decline in economic
 51 opportunity represented by the loss of so many iron industry jobs” (Powers 2007). The
 52 exceptions are the Fond du Lac, Grand Portage, and Bois Forte reservations, where populations
 53 have increased since 1990.

54 ***Table 4.2.10-1 Population of Study Area Communities 1980 to 2010***

Geography	Year				Change (1980–2010) ¹	
	1980	1990	2000	2010	Number	%

55 Sources: U.S. Census Bureau 1980, 1990, 2000, and 2010b.

56 Notes:

57 ¹ Population data for 1980 were not available for Soudan, Minnesota and the three Native American reservations. In these cases,
 58 the population change reflects the 1990–2010 time period.

59 na = Not available

60 As shown in Table 4.2.10-2, the median age of the population in study area counties and cities
 61 (typically age 40 to 45) is substantially higher than that of the state (age 35). Moreover, the
 62 median age of study area communities has grown at a more rapid pace than the state as a whole.
 63 Minnesota’s median age grew by two full years between 2000 and 2010, while the median age of
 64 most study area communities—with the exception of Duluth, Hibbing, and Virginia—grew by 3
 65 to 5 years. Again, with the exception of Duluth, study area communities tend to have (as a

66 percentage of the total population) fewer children under 18, fewer adults (18 to 64), and more
 67 senior citizens (age 65 or older) than the state as a whole.

68 The study area is more than 93 percent Caucasian (see Table 4.2.10-3), compared to 85 percent
 69 for the state as a whole. However, Native Americans comprise 2 percent of the study area's
 70 population compared to 1 percent of the state's overall population.

71 **Table 4.2.10-2 Age Characteristics of Study Area Residents, 2010**

Geography	Median Age,		Population Segments (% of total)

77 Source: U.S. Census Bureau 2010b.

78 Notes:

79 ¹ Hispanic status is considered separately from racial identification.

80 Percent totals may be greater or less than 100% due to rounding.

81 **Educational Attainment**

82 Table 4.2.10-4 shows the educational attainment of residents in the study area. Educational
 83 attainment in the study area as a whole and in most study area communities (as measured by the
 84 percentage of residents age 25 and over who achieved degrees beyond a high school diploma)
 85 was lower in these communities than in St. Louis County as a whole and the state in 2010.
 86 Whereas 41 percent of state residents (age 25 and older) and 37 percent of St. Louis County
 87 residents had achieved Associate's degrees or higher in 2010, approximately 15 to 30 percent of
 88 residents of study area communities (except for Duluth, Ely, and Soudan) had achieved similar
 89 degrees.

90 **Table 4.2.10-4 Educational Characteristics of Study Area Residents, 2010**

Geography	Total¹	No High School Diploma (%)	High School Diploma and/or Some College (%)	Associate's Degree (%)	Bachelor's Degree (%)	Advanced Degree (%)

91 Source: U.S. Census Bureau 2010a.

92 Notes:

93 ¹ Data are for residents age 25 or older.

94 Percent totals may be greater or less than 100% due to rounding.

95 **Income and Poverty**

96 Table 4.2.10-5 shows income and poverty characteristics for the study area communities. The
 97 median income of individual study area communities is significantly lower than that of the state
 98 as a whole, with the exception of Soudan. It is also the case that the median income of individual
 99 communities is generally lower than that of St. Louis County. The median income in Babbitt and
 100 Hoyt Lakes—the communities closest to the NorthMet Project area—are two-thirds and four-
 101 fifths, respectively, of the state median income. In some study area communities, such as Ely and
 102 Tower, the median household income is slightly more than half of the state total. Poverty rates
 103 are also higher in the study area as a whole than in the state. In many individual communities,
 104 poverty rates are as high or higher than the state (with the exceptions of Hoyt Lakes, Soudan, and
 105 Tower).

106 **Table 4.2.10-5 Income and Poverty Characteristics of Study Area Communities in 2010**

107 Source: U.S. Census Bureau 2010a.

108 Notes:

109 ¹ Percentage based on the “Population for whom poverty status is determined” which is less than the total population.

110 ² The United States Census Bureau defines poverty status using a set of monetary standards (consistent with *Office of*
 111 *Management and Budget Statistical Policy Directive 14*) that vary by family size and composition (e.g., marital status and
 112 number of children). Poverty thresholds are updated annually to reflect economic conditions. Poverty thresholds in 2009 (the
 113 year for which the data in this table are presented) can be found at:

114 <http://www.census.gov/hhes/www/poverty/data/threshld/thresh09.html>

115 Percent totals may be greater or less than 100% due to rounding.

116 na = Not available

117 **4.2.10.1.2 Employment**

118 This section evaluates two different measures of employment. At-place employment describes
 119 jobs that exist in a given location, regardless of where job-holders live. It is a measure of the
 120 economic activity in a community. However, workers in northeastern Minnesota are often
 121 accustomed to driving long distances to jobs, particularly in the mining industry (Powers 2007).
 122 Thus, information about at-place employment is supplemented with information about jobs held
 123 by residents. This second measure describes the extent to which a community’s residents are
 124 employed.

125 **At-place Employment**

126 Tables 4.2.10-6 and 4.2.10-7 show at-place employment trends for the study area by major
 127 industry classification. Data from 1980 and 1990 are reported by SIC (see Table 4.2.10-6), while
 128 2009 data reflect industries as defined by the North American Industrial Classification System

129 (NAICS) (see Table 4.2.10-7), which replaced the Standard Industrial Classification (SIC)
 130 system in 1997.

131 **Table 4.2.10-6 At-place Historical Employment by Major SIC Industry in 1980 and 1990**

144 Census Bureau in order to protect company-confidential data. As a result, study area data cannot be calculated. Flags indicate
145 approximate employment, as follows: A: 0-19 employees; B: 20-99 employees; C: 100-249 employees; E: 250-499 employees;
146 F: 500-999 employees.

147 Percent totals may be greater or less than 100% due to rounding.

148 na = Not available

149 In 2009, the top employment sectors in the study area were health care and social assistance,
150 retail trade, manufacturing, educational services (which does not include public schools or other
151 public education functions), and accommodation and food services. SIC and NAICS data are
152 available for counties, whole zip codes, and Metropolitan Statistical Areas, but not for the
153 specific geographic areas considered in this chapter (i.e., most of the study area communities
154 occupy only a portion of a zip code; thus, the data for the whole zip code are not appropriate).
155 Therefore, only county-level data are used. The U.S. Census Bureau withholds some data for
156 smaller geographies (such as cities); therefore, study area totals cannot be calculated.

157 Mining employment has declined consistently in all three study area counties, from more than
158 12,000 in 1980 to approximately 3,000 in 2009 in St. Louis County. Mining-related employment
159 is volatile and fluctuates from year to year due to the market price of commodities being
160 extracted. Since mining employment can vary greatly from one year to the next, the decline
161 observed from 1980 and 2009 does not represent a steady reduction in mining-related
162 employment. At the same time, service-related employment in the study area (which includes the
163 NAICS categories for professional services, management, health care, education,
164 arts/entertainment, and accommodation/food) has increased substantially since 1980, mirroring
165 broader state and national trends.

166 **Industry Concentrations**

167 Certain industries, particularly mining and utilities, are more concentrated in the study area,
168 particularly St. Louis County, than in the state as a whole. Sector concentration can be measured
169 by the location quotient (LQ), which is the ratio between the local economy and the economy of
170 a reference unit, such as the state. For this analysis, the LQ was calculated using each study area
171 county as a local economy and the state as the reference unit. Given the number of industry totals
172 that were suppressed by the U.S. Census Bureau in Tables 4.2.10-6 and 4.2.10-7, a combined
173 study area LQ could not be calculated. A LQ of 1.00 indicates that a given industry is exactly as
174 strong, in terms of employment, in the local economy as it is in the reference economy. A LQ
175 below 1.00 indicates a relatively weak local industry, while a LQ above 1.00 indicates a
176 relatively strong local industry.

177 As illustrated by Table 4.2.10-8, the LQ for the mining industry in St. Louis County is nearly 20,
178 meaning that mining employment in the county is approximately 20 times as concentrated as in
179 the state as a whole. As noted above, LQs for the study area as a whole could not be calculated
180 because of data confidentiality. However, this concentration has been declining in recent years.
181 In 1980 (see Table 4.2.10-6), St. Louis County accounted for approximately 75 percent of the
182 state's mining employment. In 2009 (see Table 4.2.10-7), that share had fallen to approximately
183 66 percent of state mining employment. Mining employment in other study area counties was
184 minimal.

185 The high LQ for the utilities industry is likely tied to power plants and utility infrastructure that
186 support the region's mining activity. Other relatively high LQ values vary by county, but
187 generally include educational services, health care and social assistance, and arts/entertainment.
188 Forestry, fishing, and hunting have high LQ values in St. Louis County, while Real Estate has a
189 high LQ value in Lake County. Industries with particularly low LQ values include manufacturing
190 and management. These findings support stakeholder observations about the strength of the
191 region's tourism economy (real estate in Lake County, arts, entertainment, accommodation, and
192 food).

193 **Regional Tourism**

194 Tourism is rooted in the Arrowhead region's unique recreation opportunities such as the
195 BWCAW, and is more broadly dependent on recreational opportunities such as hunting, fishing,
196 boating, sightseeing, and wilderness experiences provided by the region's high-quality natural
197 environment.

198 Mining and tourism have coexisted in the study area for decades. As shown in Table 4.2.10-7,
199 industries associated with tourism (arts, entertainment, recreation, accommodation, and food)

200 account for nearly 13 percent of all employment in St. Louis County (data could not be summed
201 for the entire study area). The “attractive landscape and climatic features [of the region have]
202 attracted recreationists, retirees, and other new residents” (Powers 2007). In particular,
203 retirement income (from individuals who move to the Arrowhead region for its recreational and
204 scenic resources) has been an important source of economic vitality for the region’s communities
205 (Powers 2007). These non-mining economic gains have occurred in the presence of active
206 mining activity (including the Northshore Mine adjacent to the NorthMet Project area) and the
207 remnant landscape of past mining activity.

208 ***Retirees***

209 The demographic data in Section 4.2.10.1.1, as well as some of the industry clusters identified
210 above, support the views, expressed by some stakeholders, that the study area is an increasingly
211 attractive location for retirees. The median ages in nearly all study area communities increased
212 between 2000 and 2010, and are, in most cases, higher than the state median (see Table
213 4.2.10-2). The relative strength of the Health Care and Social Assistance industry category is
214 also consistent with an older population in need of such services.

215 The employment status data in Table 4.2.10-9 may also support this conclusion about retirees:
216 statewide, 71 percent of residents over the age of 16 participate in the workforce (i.e., they hold
217 or are actively looking for a job). By comparison, only 62 percent of the over-16 population in
218 the study area is in the workforce. While some of this difference is likely attributable to long-
219 term unemployment (which often leads workers to drop out of the workforce entirely), this gap
220 may also suggest the presence of retired individuals, who are, by definition, no longer in the
221 workforce.

222 Research also shows links between the presence of recreation and natural amenities and
223 increased retirement throughout the United States (see McGranahan 1999). The economic data
224 cited above, combined with the amenities present in and near the study area—such as BWCAW,
225 Superior National Forest, and the other resources described throughout this FEIS—are consistent
226 with the findings of this type of research.

229 Notes:

230 LQs compare county employment to statewide employment. LQs for the entire study area cannot be calculated.

231 na = Not available

232 **Jobs Held by Residents**

233 Employment data for residents of study area communities is shown in Table 4.2.10-9.
 234 Unemployment rates in Lake and Cook counties were generally consistent with or lower than
 235 statewide unemployment. However, unemployment in St. Louis County and particularly in
 236 individual St. Louis County communities was generally much higher than in the state as a whole.
 237 These data are estimates based on information collected by the U.S. Census Bureau from 2005 to
 238 2009, and thus may not fully capture the depth of the unemployment effects that the study area
 239 has experienced as a result of the national recession during and following that time period.

240 Occupation (e.g., general type of work) and industry classifications of jobs held by study area
 241 residents are shown in Tables 4.2.10-10 and 4.2.10-11. These data show that management,
 242 science, business, arts, sales, education, health, manufacturing, and retail make up a large
 243 percentage of the jobs held by study area residents. The sectors of agriculture, forestry, fishing
 244 and hunting, and mining (including metal mining such as the NorthMet Project Proposed Action)
 245 account for a higher share of locally held jobs than the statewide average. This is especially true
 246 for communities closer to the mine (e.g., Aurora, Babbitt, Biwabik, and Hoyt Lakes).

247 Occupational categories are provided for each community per the U.S. Census Bureau's SIC
 248 definitions. The occupation categories also show the prevalence of management and service job
 249 functions as opposed to more traditional production and manufacturing activities typically
 250 associated within mining.

262 Note:
263 Percent totals may be greater or less than 100% due to rounding.

264 **Income**

265 Table 4.2.10-12 shows the average income earned by employees in each major NAICS industry.
266 Mining and utilities pay very high average wages statewide and in St. Louis County. However,
267 wages paid to health care and social services workers account for more than one-quarter of the
268 total wages paid by private companies in St. Louis County and for more than 16 percent of
269 statewide wages.

270 **4.2.10.1.3 Public Finance**

271 Sales and use tax revenues from study area counties by all industries and the mining industry are
272 summarized in Table 4.2.10-13. This table illustrates the relative sales and use tax contribution
273 from the mining industry in the state.

274 The mining and processing of base and precious metals in the state are not currently subject to
275 production tax. However, mining is subject to the following taxes (MDR 2011):

- 276 • Net proceeds tax: tax proceeds are distributed to the state general fund if mined resources do
277 not fall within the taconite assistance area. Taxes paid on mined resources within the taconite
278 assistance area (which includes the NorthMet Project area) are distributed as follows: 5
279 percent to the city or town where mined, 10 percent to the Municipal Aid Account, 10
280 percent to the school district, 20 percent to the Regular School Fund, 20 percent to Taconite
281 Property Tax Relief, 5 percent to IRRRB, 5 percent to the Douglas J. Johnson Economic
282 Protection Trust Fund, and 5 percent to the Taconite Environmental Protection Fund.
- 283 • Occupation tax: 2.45 percent of the taxable amount (typically the mine value), as determined
284 by the Minnesota Department of Revenue. Revenue generated through the occupation tax is
285 credited to the general fund, with 10 percent designated for the University of Minnesota, 40
286 percent designated for public elementary and secondary schools, and 50 percent remaining in
287 the state's general fund.
- 288 • Sales and use tax: 6.875 percent of all purchases that do not qualify for an exemption.
- 289 • Withholding tax on royalty payments: 6.25 percent of royalty payment.

290 Ad valorem tax is established and collected by the counties, local communities, and school
291 districts according to Minnesota state law.

292 **4.2.10.1.4 Housing**

293 Table 4.2.10-14 illustrates the housing characteristics of the study area. Much of the overall
294 vacancy rate reflects the large number of seasonal (vacation) homes in the region, particularly in
295 Cook and Lake counties where nearly two-thirds of vacant housing units are for seasonal use.
296 Excluding seasonal units, vacancy rates in the study area are somewhat higher than in the state as
297 a whole, although vacancy rates in individual communities vary significantly. There are
298 approximately 5,400 hotel rooms and 1,175 occupied berths and 225 vacant berths in mobile
299 home parks in the study area (Northland Connection 2012). Hotels and mobile homes are often
300 used by mine construction employees, especially those with short-term assignments. The study
301 area has a slightly lower share of owner-occupied housing units than in the state. Household
302 sizes are smaller in the study area than in the state as a whole. These data are consistent with
303 trends (see Section 4.2.10.1.2) suggesting that the study area is becoming increasingly attractive
304 to retirees, who tend to have higher home ownership rates and smaller household sizes than other
305 segments of the population.

320 Notes:

321 Percent totals may be greater or less than 100% due to rounding.

322 HU = Housing unit(s).

323 **4.2.10.1.5 Public Services and Facilities**

324 **Water and Sewer**

325 Table 4.2.10-15 summarizes the condition of public water and sewer facilities throughout the
326 study area. All of the cities evaluated have public water and wastewater systems, with varying
327 degrees of available capacity. Residents and businesses in unincorporated areas typically rely on
328 individual wells and septic systems. Potable water for municipal systems comes from either
329 groundwater or surface water (notably, Duluth obtains its drinking water from Lake Superior).
330 Most of the public water and sewer infrastructure supporting the study area communities was
331 constructed to accommodate larger populations than currently reside in the area (e.g., the 1980
332 and 1990 populations listed in Table 4.2.10-1).

DRAFT

333 **Table 4.2.10-15 Water and Wastewater Capacity**

Geography	Water			Wastewater		
	Capacity (MGD) ¹	Average Demand (MGD)	System Issues/Upgrades	Capacity (MGD)	Average Demand (MGD)	System Issues/Upgrades
Aurora	0.864	0.222	Study underway with Biwabik to identify new water source. Considering building a new facility for both.	0.900	0.200	\$7 million upgrade in the last four years.
Babbitt	0.600	0.200	None	0.500	0.200	Consulting firm hired to look into upgrading or rebuilding a new wastewater plant.
Biwabik	0.430	0.128	Study underway with Aurora to identify new water source. Considering building a new facility for both.	0.220	0.160	None
Duluth	40	19	Water tower to go online mid-May 2012 adding 900,000 gallons to the 68 million storage capacity.	100	16	The city is upgrading or replacing two wastewater lift stations each year at an annual cost of \$600,000 per year.
Ely	1	0.350	\$350,000 rehab work every year.	1.5	0.400	\$350,000 rehab work every year.
Hibbing	3.2	2.3	None	4.5	2	Wastewater inflow & infiltration concerns throughout the city; certain neighborhoods have wastewater backups during large rain events.
Hoyt Lakes	1.5	0.307	Minor upgrades to the water plant.	0.650	0.270	Began preliminary engineering for rebuilding wastewater facility.
Soudan/ Tower ²	0.300	0.0900	Needs new water tower.	0.176	0.13	None
Virginia ³	5	1.7	None	4.3	2	Starting project to expand wastewater plant and reduce mercury; projected completion 1st quarter 2013.

334 Source: Northland Connection 2012.

335 Notes:

336 ¹ MGD = million gallons per day.

337 ² Soudan and Tower share resources

338 ³ Data reflect current wastewater system. Once wastewater upgrade is complete, capacity will increase to 9.9 mg/d and average demand will go up to 3.1 mg/d.

339 **Emergency Services**

340 Table 4.2.10-16 illustrates the available public safety resources. Each county in the study area
 341 has its own sheriff's department, which provides law enforcement and other services for
 342 unincorporated areas. Municipalities provide their own police protection, except for Aurora,
 343 which contracts with the St. Louis County Sherriff's Office (SLCPD 2012) and Biwabik, which
 344 receives law enforcement from Gilbert (Northland Connection 2012). The St. Louis County
 345 Sheriff's Office also maintains countywide 911 service, coordinating police, fire, and emergency
 346 medical response. Similarly, each community maintains its own fire department, typically a
 347 volunteer department. The City of Babbitt fire department provides emergency response to the
 348 Northshore Mine, and has up-to-date equipment.

349 A variety of public and private ambulances provide emergency medical service for the study
 350 area. Ambulance service is integrated into some municipal fire departments (such as Babbitt,
 351 Duluth, Hibbing, and Virginia). Other municipalities either contract with nearby cities or with
 352 private ambulance services.

353 ***Table 4.2.10-16 Public Safety***

Geography	Police Officers	Firefighters	EMS Ambulance Personnel
Aurora	5	22	7
Babbitt	4	35	25
Biwabik	7 ⁽²⁾	21	21
Duluth	152	125	48
Ely	8	32	27
Hibbing	30	23	19
Hoyt Lakes	6	21	23
Soudan/Tower ¹	1	15	19
Virginia	18	21 ³	21 ³

354 Source: Northland Connection 2012.

355 Notes:

356 ¹ Soudan and Tower share resources.

357 ² Biwabik receives law enforcement from Gilbert.

358 ³ Firefighters are full-trained EMS and operate ambulance services from fire hall.

359 **Medical Services**

360 The study area communities are served by both medical clinics and hospital facilities. The
 361 closest medical facility to the NorthMet Project area is Essentia Health Northern Pines in Aurora.
 362 This 16-bed facility has Level IV trauma status, indicating that staff are able to stabilize patients
 363 for transport to more advanced trauma centers (Essentia 2012). Other nearby Level IV trauma
 364 centers are in Ely and Virginia, while the nearest advanced care (Level II) hospitals are Essentia
 365 Health St. Mary's Medical Center and St. Luke's Hospital, both in Duluth (MDH 2011).

366 **Education**

367 Table 4.2.10-17 shows the capacity and enrollment of public schools. As with other public
 368 services and facilities, each municipality maintains its own public school system, supplemented
 369 with county-run independent school systems. Most public schools in the region are designed to

370 accommodate larger populations. Some jurisdictions, such as the Duluth school district, are
371 choosing to close or repurpose school buildings.

372 **Table 4.2.10-17 Capacity and Enrollment of Public Schools**

Geography	Capacity	Enrollment	Facilities to be Upgraded, Replaced, Combined, or Closed
Aurora ¹	1,500	886	The district plans to replace boilers and resurface parking lots at their facilities.
Babbitt	1,200	348	None
Biwabik ¹	1,500	886	The district plans to replace boilers and resurface parking lots at their facilities.
Duluth	9,800	8,308	School district is downsizing and modernizing its facilities, resulting in one less high school, one less middle school, two less elementary schools, and one less K-8 facility.
Ely	1,775	542	None
Hibbing	2,680	2,319	None
Hoyt Lakes ¹	1500	886	The district plans to replace boilers and resurface parking lots at their facilities.
Tower/Soudan ²	175	94	None
Virginia	1,623	1,623	Considering setting up portable classrooms for fall 2012; community is in the process of securing funding and support to either add or build new facilities.

373 Source: Northland Connection 2012.

374 Notes:

375 ¹ These communities are part of the Mesabi School district.

376 ² Soudan and Tower share resources.

377 The region is also served by a number of community and technical colleges (MNSCU 2012):

- 378 • **Mesabi Range Community and Technical College (Virginia and Eveleth):** Offers 50
379 diploma, certification, or degree (A.A.) programs, with notable specialties in wind energy
380 technology, and human services.
- 381 • **Vermilion Community College (Ely):** Offers 30 programs, many focused on environmental
382 programs and outdoor careers, such as water quality science, outdoor therapeutic recreation,
383 sports management, park ranger training.
- 384 • **Hibbing Community College:** Offers a mix of more than 40 programs ranging from
385 traditional liberal arts to career-oriented programs.
- 386 • **Fond du Lac Tribal and Community College (Cloquet):** Offers nearly 40 programs,
387 ranging from liberal arts and nursing to specialty programs in American Indian studies,
388 geospatial technologies, environmental science, and clean energy technology.
- 389 • **Lake Superior College (Duluth):** Offers nearly 100 programs, with heavy emphasis on
390 nursing and other medical specialties, along with a full range of liberal arts and professional
391 training.

392 The study area is also home to two 4-year institutes of higher learning. These include the
393 University of Minnesota Duluth, with nearly 12,000 enrolled undergraduate, graduate, and other

394 students (University of Minnesota Duluth 2011); and the College of St. Scholastica in Duluth,
395 with more than 4,000 enrolled students (CSS 2012).

396 **4.2.10.1.6 Subsistence**

397 There is no nationwide federal definition of subsistence, nor has the State of Minnesota
398 developed a formal definition. Title VIII of the Alaska National Interest Lands Conservation Act
399 (P.L. 96-487) defines subsistence for rural Alaska residents (regardless of whether they are
400 Native American) as:

401 the customary and traditional uses...of wild renewable resources for direct, personal, or
402 family consumption as food, shelter, fuel, clothing, tools, or transportation; for the
403 making and selling of handicraft articles out of non-edible byproducts of fish and wildlife
404 resources taken for personal or family consumption; for barter, or sharing for personal or
405 family consumption; and for customary trade.

406 This Alaskan definition is consistent with subsistence activities within the study area as well. For
407 many study area residents, particularly members of Bois Forte, Fond du Lac, and Grand Portage,
408 as well as other Native American bands, subsistence hunting, fishing, trapping, and gathering
409 activities are a significant activity. Individuals participate in subsistence activities for numerous
410 reasons, including food supply, personal income, and the continuance of cultural customs and
411 traditions.

412 As part of the 1854 Treaty, Native American bands retain the right “to hunt, fish, trap, and gather
413 for subsistence on public lands and waters open to the public (publicly owned and accessible to
414 the public without charge) within the [1854 Ceded Territory]” (MDNR 2010a). The 1854 Treaty
415 and subsequent court interpretations also include limited rights to commercial harvest.

416 A 2002 study of subsistence activities amongst the Bois Forte and Grand Portage Bands (Vogt
417 2004) demonstrates the wide variety of species and items collected as part of subsistence
418 activities in the study area, including the following:

- 419 • fish: more than 25 species, with the most commonly harvested being walleye, northern pike,
420 lake trout, and crappie;
- 421 • birds and mammals: more than 10 species, with the most commonly harvested being deer,
422 grouse, moose, and duck; and
- 423 • plants: more than 12 species/items, with the most commonly harvested being wild rice,
424 various berries, and maple sap/syrup.

425 Among the survey respondents, subsistence activity (including hunting, fishing, and plant
426 gathering) accounted for approximately one meal per week. Subsistence activity typically occurs
427 either on Native American reservations or within other parts of the 1854 Ceded Territory.
428 Fishing and hunting occur throughout the year, although harvesting fish for consumption is more
429 prevalent during warmer months, while harvesting land animals is more prevalent during colder
430 months (Vogt 2004). Grand Portage’s subsistence fish consumption averages 144 grams/day,
431 five times higher than the MPCA assumed fish consumption rate of 30 grams/day. Fond du Lac’s
432 subsistence fish consumption is on average 60 grams/day, two times higher than the MPCA
433 assumed fish consumption rate (MPCA 2012d). The effects of mercury bioaccumulation on
434 subsistence activity are discussed in Section 5.2.10.2.6.

435 In addition to the survey results described above, Table 4.2.9-3 in Section 4.2.9 shows other
436 animal and plant species that have historically been and/or could potentially be harvested in the
437 1854 Ceded Territory.

438 The 1854 Treaty Authority manages big game (moose, deer, and bear) hunting, as well as
439 furbearer trapping (pine marten, fisher, otter, and bobcat) on behalf of the Bois Forte and Grand
440 Portage bands, in accordance with a 1988 negotiated agreement with Minnesota. Under this
441 agreement, big game harvests are limited. Harvests for all species (including big game and
442 trapping) have generally declined since 1994 (Edwards 2012).

443 The Mine Site and Transportation and Utility Corridor fall partially within the state-defined
444 moose harvest area, although no moose were harvested by the bands within approximately 20
445 miles of this location from 1994-2011. The majority of deer hunting and a portion of furbearer
446 trapping occurred in St. Louis County during this time period (Edwards 2012).

DRAFT

DRAFT

1 **4.2.11 Recreation and Visual Resources**

2 This section describes the recreational facilities and activities that typically take place in the
3 NorthMet Project area, as well as the surrounding Arrowhead region. Because recreation in this
4 region is strongly tied to the aesthetic condition of the landscape, this section also describes the
5 visual setting of the NorthMet Project area and surrounding land.

6 **4.2.11.1 Mine Site**

7 **4.2.11.1.1 Recreational Facilities and Activities**

8 Surface rights to the Mine Site and adjoining federal lands are held by the USFS, and the Mine
9 Site is part of the Superior National Forest. Management of the physical, biological, and social
10 resources of the Superior National Forest are set forth in the Forest Plan. Intended to ensure that
11 ecosystems are capable of a sustainable flow of beneficial goods and services, the Forest Plan
12 includes guidelines and standards for almost 20 activities and categories of resources within the
13 Superior National Forest including recreation and scenic, or visual, resources.

14 Recreation opportunities in the Superior National Forest are managed within the framework of
15 the Recreation Opportunity Spectrum (ROS). Using criteria that consider distance to roads,
16 motorized lakes, and trails (i.e., lakes and trails where motorized transportation is permitted), this
17 system includes five ROS classes, each of which prescribes a set of recreational settings,
18 opportunities, and experiences. At one end of the ROS, areas designated “primitive” have little
19 evidence of people and are difficult to access. At the other end of the ROS, “rural” areas are
20 more accessible and provide developed facilities as well as opportunities to interact with other
21 recreationists.

22 Most of the Mine Site is within the Semi-Primitive Motorized ROS, with a small portion falling
23 within the Roaded Natural ROS. Both ROS designations indicate areas where motor vehicles
24 may be permitted, where interactions between visitors are intended to be infrequent, but where
25 human activity such as timber harvesting may be visible.

26 While this designation permits recreational activity, the Mine Site is entirely surrounded by
27 private, restricted property, roads, and railroads. In particular, the Northshore Mine borders the
28 Mine Site to the north, the restricted-access Plant Site borders the Mine Site to the west, and the
29 Transportation and Utility Corridor isolates the Mine Site from adjacent portions of the Superior
30 National Forest to the south. Some portions of the Mine Site are contiguous with Superior
31 National Forest and state-owned public land, notably the eastern boundary of the Mine Site.
32 However, these public lands are also encircled by restricted property, roads, and railroads. The
33 Mine Site is accessible by water via the Partridge River, but there is no public land access to, and
34 no practical opportunity to engage in recreational activity at, the Mine Site.

35 The region surrounding the Mine Site and adjoining federal lands is a popular and highly valued
36 destination for recreation. Recreational activities that typically occur within 25 miles of the
37 federal lands include (but are not limited to):

- 38 • Boating and camping in the BWCAW (approximately 20 miles north of the federal lands)
39 and other local, state, and federal lands.
- 40 • Hunting, fishing (particularly in the Embarrass and Partridge Rivers), and hiking.

- 41 • Year-round recreation, including downhill skiing at the Giants Ridge Golf & Ski Resort
42 (approximately 15 miles east of the Mine Site), cross-country skiing, snowmobiling,
43 mountain biking, hiking, and golf.
- 44 • Biking, hiking, and roller-blading on the Mesabi Trail, which spans 70 miles across the Iron
45 Range.

46 These activities typically do not occur in the immediate vicinity of the Mine Site, Plant Site, and
47 Transportation and Utility Corridor. For example, the nearest designated USFS campgrounds are
48 Cadotte Lake, 16 miles southeast, and Birch Lake, 12 miles north. There are two back-country
49 camping facilities on Stone Lake and Big Lake, approximately 8 miles southeast of the Mine
50 Site. The nearest designated boat launch (Colby Lake) is 5 miles away, and the nearest
51 designated USFS trails (including the St. Louis River and Bird Lake Trails) are south and east of
52 Hoyt Lakes, more than 8 miles south of the Plant Site. The USDA Visitor Use report for the
53 Superior National Forest indicates that the forest received 1.1 million national visits in 2011,
54 with roughly 76 percent of those visits being for recreational purposes. The Visitor Use report
55 defines a visit as “the entry of one person upon a national forest to participate in recreation
56 activities for an unspecified period of time” (USFS 2012). It is important to note that the Visitor
57 Use Report does not contain information about specific types of visitation to specific parts of the
58 Superior National Forest.

59 **4.2.11.1.2 Visual Resources**

60 The NorthMet Project area lies within and adjacent to Superior National Forest, which provides
61 over 3 million acres of rich and varied visual resources (USFS 2007c). The visual character of
62 the NorthMet Project area varies from upland forests and wetlands to developed industrial areas.
63 There are several active, closed, and reclaimed mines near the NorthMet Project area, and
64 evidence of past and ongoing mining (such as reclaimed or abandoned waste rock piles) is
65 present in many parts of the area surrounding the Mine Site.

66 The Mine Site and the adjoining federal lands are located along the south flank of the Mesabi
67 Iron Range, immediately south of the Giants Range formation (see Figure 1.1-1). The Iron Range
68 supports numerous active mining operations, including the Northshore taconite mine located
69 north of the Mine Site. The Mine Site is relatively flat, with elevations between 1,570 ft and
70 1,600 ft amsl. The Giants Range formation is the dominant landscape feature in the area. It rises
71 steeply to an average elevation of approximately 1,700 ft amsl (with some elevations above
72 1,800 ft amsl) along the ridgeline (approximately 1 to 2 miles from the Mine Site), and declines
73 approximately 150 to 200 ft on its northern flank. The One Hundred Mile Swamp, Partridge
74 River, and the Northshore Mine are to the north between the Mine Site and the Giants Range.

75 The Mine Site is surrounded by wetlands (including the One Hundred Mile Swamp) and mixed
76 deciduous and coniferous upland forests to the east, south, and west. The average canopy height
77 in the upland forest is 30 to 60 ft with occasional white pine and white spruce in excess of 70 ft.
78 In the wetland areas, the coniferous canopy is approximately 30 to 40 ft while the deciduous
79 growth is less than 20 ft tall. The Partridge River makes a horseshoe bend around the north, east,
80 and south sides of the Mine Site.

81

82 The nearest potential visual receptors to the Mine Site—places where the public may be able to
83 see the Mine Site on a regular basis, such as homes or public roads with open views—are
84 illustrated on Figure 4.2.11-1. The ability to view the Mine Site is highly dependent on the
85 topography and foliage present at a viewer’s specific location, but views of the Mine Site may be
86 present at:

- 87 • clusters of rural homes, approximately 7 miles to the south near the unincorporated village of
88 Skibo;
- 89 • the City of Hoyt Lakes, approximately 9 miles to the southwest;
- 90 • along Lake County Road 2 within the incorporated limits of the City of Babbitt,
91 approximately 12 miles to the east; and
- 92 • the Skibo Vista Scenic Overlook, along Lake County Highway 15, approximately 12 miles
93 south (see Figure 4.2.11-2).

94 The Mine Site may also be visible from Forest Road 112, which passes less than 2 miles from
95 the Mine Site; however, traffic on this road is likely to be low, given the absence of population
96 centers or significant recreational sites along the road.

DRAFT

102 The USFS uses the Scenery Management System to identify desired visual conditions within
103 National Forests. The Scenery Management System uses Scenic Integrity Objectives (SIOs) to
104 express these desired conditions. The SIO designations for Superior National Forest are defined
105 in the Forest Plan. SIO definitions are as follows (based on USFS 1995):

- 106 • Low SIO: The landscape appears moderately altered, and non-natural landscape features may
107 begin to dominate.
- 108 • Moderate SIO: The landscape appears slightly altered. Non-natural features or activities may
109 be apparent, but do not dominate.
- 110 • High SIO: The landscape appears unaltered, essentially in a “natural” state, with minimal
111 evidence of non-natural features or activities.

112 The Mine Site and adjoining federal lands are designated by the USFS as areas of Low SIO.
113 Within this designation, the landscape appears altered, and non-natural landscape features may
114 begin to dominate. There are no major recreational trails within the portion of Superior National
115 Forest adjacent to the Mine Site that would expose recreational users to views of the mine on a
116 regular basis.

117 Native American tribal members exercise rights to hunt, fish, and gather on Superior National
118 Forest lands, including lands near the Mine Site. The frequency with which tribal members
119 exercise these rights in portions of Superior National Forest with views of the Mine Site is not
120 known; however, as described in Sections 4.2.9 and 5.2.9, there are several cultural resources
121 and locations adjacent to or potentially within sight of the Mine Site (as well as the Plant Site and
122 Transportation and Utility Corridor), such as the Spring Lake Mine Sugarbush, Trygg Trail
123 Corridor, and *Mesabe Widjiu*. Note that these sites are not depicted in the figures in this section
124 due to sensitivity regarding cultural resources and locations.

125 **4.2.11.2 Transportation and Utility Corridor**

126 **4.2.11.2.1 Recreational Facilities and Activities**

127 The Transportation and Utility Corridor is within an area with a Roaded Natural ROS
128 designation. This designation indicates areas that are mostly natural in appearance (with some
129 modification), and where evidence of other users and interactions between users are somewhat
130 frequent. The Transportation and Utility Corridor is owned or leased by PolyMet, and is not open
131 to the public. Entry points are gated and/or guarded, and crossing the corridor is prohibited. No
132 recreational activity is permitted along the corridor.

133 **4.2.11.2.2 Visual Resources**

134 The Transportation and Utility Corridor follows Dunka Road between the Mine Site and the
135 Plant Site and includes existing road and rail lines. Viewpoints for the corridor are the same as
136 those for the Mine Site and Plant Site. The portions of Superior National Forest near the
137 Transportation and Utility Corridor are within the Low SIO designation. As described in Section
138 4.2.11.1, users of culturally important locations may have views of the Transportation and Utility
139 Corridor.

140 **4.2.11.3 Plant Site**

141 **4.2.11.3.1 Recreational Facilities and Activities**

142 The Plant Site is located at the former LTVSMC processing plant. It is owned by PolyMet, and it
143 is not open to the public. Entry roads are gated and/or guarded. No recreational activity is
144 permitted at this site. Because the Plant Site is not in Superior National Forest, it does not have
145 an ROS designation.

146 **4.2.11.3.2 Visual Resources**

147 Topography at the Plant Site rises from approximately 1,550 ft amsl near the railroad at the south
148 end of the plant to approximately 1,780 ft amsl at the north end adjacent to the Tailings Basin
149 (on the northern flank of the Giants Range). The inactive LTVSMC industrial processing
150 buildings—including crushing, grinding, concentrating, and maintenance and pellet storage/rail
151 loading facilities—were constructed in the 1950s, and dominate the visual landscape at the Plant
152 Site. The nearest potential visual receptors are residences approximately 3.5 miles north of the
153 Plant Site on County Road 358 and County Road 615. These rural residences are outside the
154 incorporated limits of the cities of Babbitt and Hoyt Lakes. The City of Hoyt Lakes is the next
155 closest visual receptor and is approximately 5 miles south of the Plant Site. The Tailings Basin
156 and some buildings at the Plant Site would likely be visible from the ski slopes at the Giants
157 Ridge Golf and Ski Resort, approximately 8 miles west-southwest of the Plant Site.

158 The existing LTVSMC Tailings Basin is located to the north of the buildings, with legacy mine
159 pits and waste rock stockpile sites to the south and east and a railroad to the west. Second Creek
160 and its headwater wetlands also border the site immediately to the south. The Tailings Basin is
161 surrounded by wetlands and low, forested (mixed coniferous and deciduous) uplands to the
162 north, east, and west. The closest residences to the Tailings Basin are along Beckman Road and
163 Salo Road, approximately 1.5 and 2.5 miles north of the Tailings Basin, respectively. Some of
164 the culturally important locations described above and in Section 4.2.9 are closer: the Sugarbush
165 is approximately 0.5 miles from the Plant Site, the *Mesabe Widjiu* intersects the Plant Site and is
166 less than 2 miles from the Mine Site, and portions of the Trygg Trail Corridor cross both the
167 Mine Site and Plant Site. As described above for the Mine Site, users of these culturally
168 important locations may have views of the Plant Site.

169 Because the Plant Site is not in Superior National Forest, it does not have an SIO designation.

170 Figure 4.2.11-1 shows the Plant Site in relation to the Mine Site, from the Skibo Vista Scenic
171 Overlook, approximately 13 miles south of the Plant Site.

1 **4.2.12 Wilderness and Other Special Designation Areas**

2 For this analysis, the term “wilderness” is defined by the Wilderness Act of 1964 (Public Law
3 88-577) (16 USC §§ 1131-1136). In its planning, management, and monitoring, the USFS
4 identifies four characteristics of wilderness, as defined in the Wilderness Act:

- 5 • Untrammeled: The Wilderness Act states that wilderness “[is] an area where the earth and its
6 community of life are untrammeled by man,” and “generally appears to have been affected
7 primarily by the forces of nature.” This quality monitors human activities that directly control
8 or manipulate the components or processes of ecological systems inside wilderness.
- 9 • Undeveloped: The Wilderness Act states that wilderness is “an area of undeveloped Federal
10 land retaining its primeval character and influence, without permanent improvements or
11 human habitation,” “where man himself is a visitor who does not remain” and “with the
12 imprint of man’s work substantially unnoticeable.” This quality monitors the presence of
13 structures, construction, habitations, and other evidence of modern human presence or
14 occupation.
- 15 • Natural: The Wilderness Act states that wilderness is “protected and managed so as to
16 preserve its natural conditions.” This quality monitors both intended and unintended effects
17 on ecological systems inside a wilderness. The natural quality of wilderness character may
18 potentially be affected by actions located outside the wilderness through effects on water
19 quality and air quality.
- 20 • Solitude or a Primitive and Unconfined Type of Recreation: The Wilderness Act states that
21 wilderness has “outstanding opportunities for solitude or a primitive and unconfined type of
22 recreation.” This quality monitors conditions that affect the opportunity for people to
23 experience solitude or primitive, unconfined recreation in a wilderness setting. An indicator
24 of this quality is remoteness from occupied and modified areas outside the wilderness, such
25 as noise or visual effects.

26 Other federal special designation areas are identified by Presidential Designation, Congressional
27 Designation, or Administrative Designation, and define lands that are considered to have
28 remarkable ecological, paleontological, historic, scenic, recreational, geologic, or fish and
29 wildlife value. They include wilderness areas, wilderness study areas, RNAs and cRNAs,
30 national scenic or historic trails, wild or scenic rivers, UBAs, national natural landmarks,
31 national historic landmarks, and national monuments, among others. These special designation
32 areas are managed by federal land management agencies such as the BLM, USFS, National Park
33 Service, and USFWS. The state similarly designates areas for special management due to their
34 wilderness value.

35 None of the elements of the NorthMet Project Proposed Action are located within or adjacent to
36 any wilderness areas. Similarly there are no special designation areas within or adjacent to the
37 Mine Site, Plant Site, or Transportation and Utility Corridor. While recreation facilities such as
38 parks are listed in this section, recreational use of those facilities is described in Section 4.2.11.

39 **4.2.12.1 Federally Managed Areas**

40 This section discusses federally managed wilderness and special designation areas that are close
41 enough to the NorthMet Project area that they may be affected by activities related to the

42 NorthMet Project Proposed Action. Isle Royale National Park is outside of the study area for
43 evaluation of Wilderness and Other Special Designation Areas; however, the visibility analyses
44 in Section 5.2.7.2.2 do include Isle Royale National Park.

45 **4.2.12.1.1 Wilderness Areas**

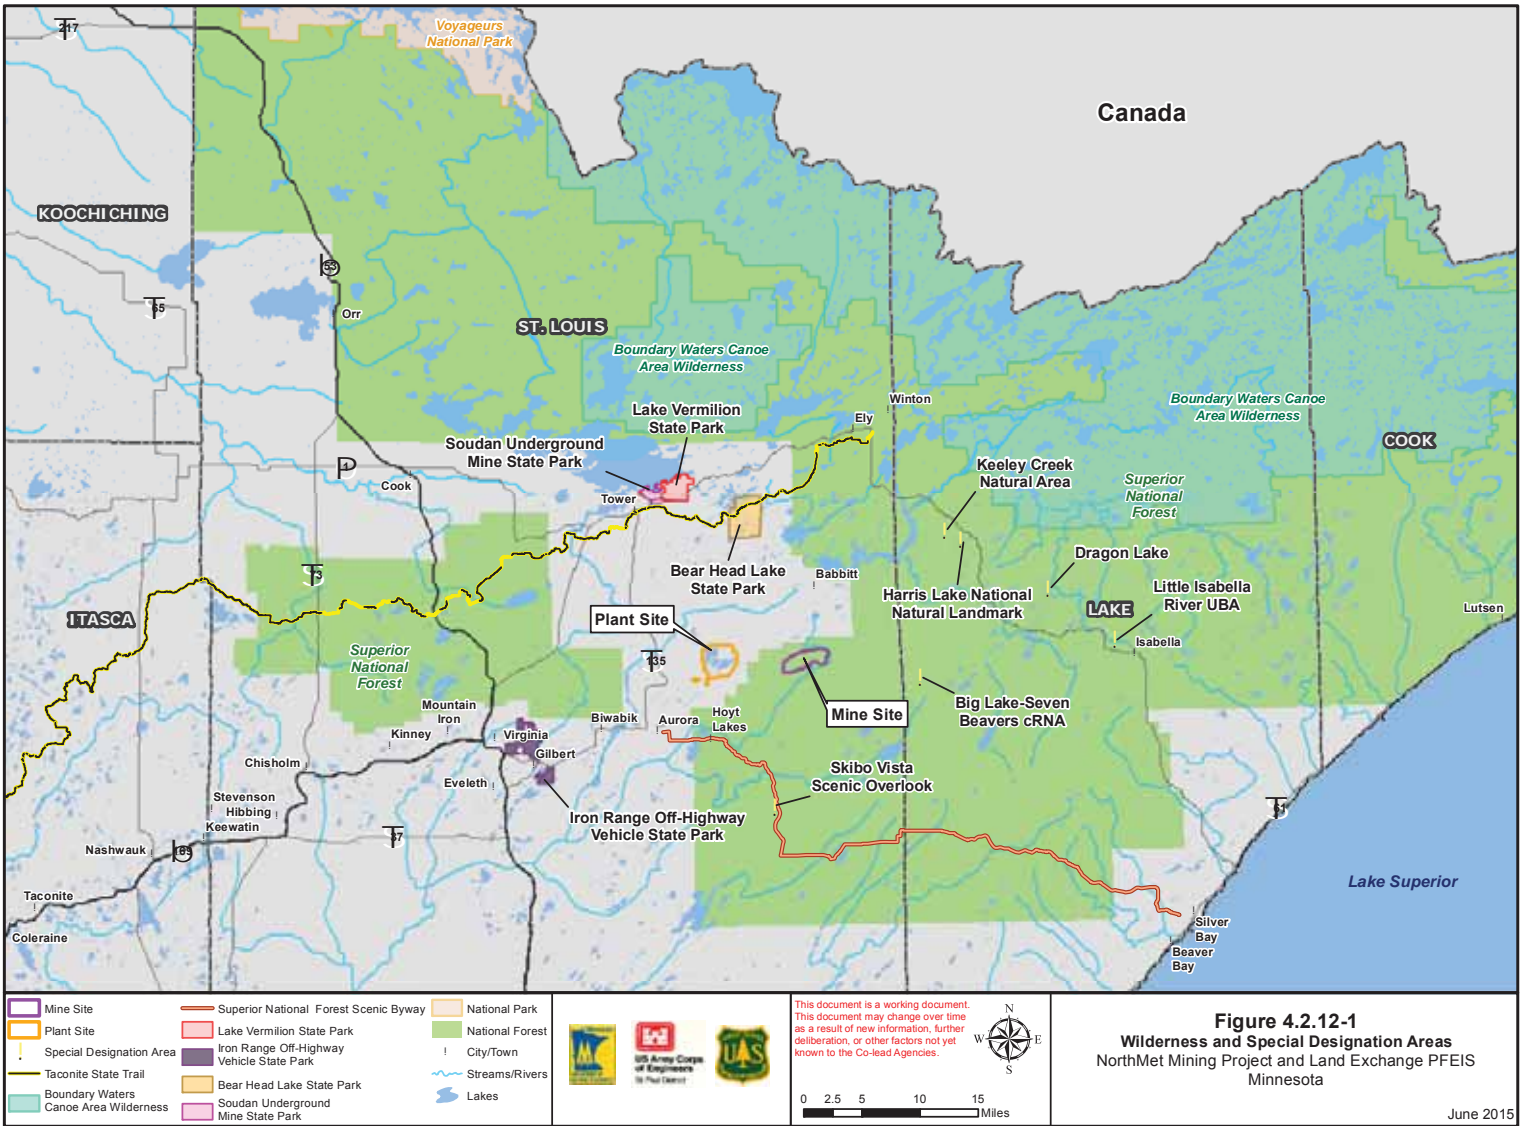

46 The NorthMet Project area is approximately 20 miles south of the BWCAW (see Figure
47 4.2.12-1). Portions of the BWCAW were formally designated as a wilderness area in 1964 under
48 the Wilderness Act. This wilderness area was further expanded and given its current name in
49 1978 under Public Law 95-495, and now encompasses more than 1 million acres along the
50 United States' international boundary with Canada. The BWCAW is managed by the USFS as
51 part of the larger Superior National Forest. It attracts more than 250,000 visitors annually and is
52 used year-round for camping, hiking, fishing, canoeing, and hunting. Motorized vehicle use is
53 limited. Activity and access are controlled by use permits managed by the USFS (USFS 2004c).

54 The BWCAW contains several hundred miles of streams and approximately 1,175 lakes that
55 vary in size from 10 to 10,000 acres. Together, there are about 190,000 acres of open water or 20
56 percent of the surface area of the BWCAW that provides opportunities for long-distance travel
57 by watercraft. The BWCAW is the only large lakeland wilderness in the National Wilderness
58 Preservation System (USHR 1978).

59 The wilderness has approximately 80 entry points that provide access to 1,200 miles of
60 designated canoe routes, 18 hiking trails, and nearly 2,200 campsites. There are numerous
61 cultural resources in the BWCAW including camp sites, villages, wild ricing sites, cemetery
62 areas, pictographs, and sites of spiritual and traditional importance. The wilderness also contains
63 evidence of a number of historic European and early Native American activities.

64 The same 1978 law that created the BWCAW also designated the BWCAW as a Mining
65 Protection Area. This designation prohibits exploration, lease, and exploitation of minerals in the
66 wilderness, and the prohibition of mineral exploration or exploitation on property owned by the
67 United States if that activity could materially change the wilderness characteristics of the
68 BWCAW (USHR 1978).

69 Voyageurs National Park is adjacent to the BWCAW and is located approximately 50 miles
70 northwest of the NorthMet Project area (see Figure 4.2.12-1). The National Park Service
71 manages nearly 127,500 acres of park lands designated for wilderness study. The BWCAW and
72 Voyageurs National Park are contiguous with Canada's Quetico Provincial Wilderness Park.
73 Together, these three areas represent 2.39 million acres of managed wilderness area.

DRAFT

76 **4.2.12.1.2 Established and Candidate Research Natural Areas**

77 The Forest Service designates and manages RNAs and cRNAs for the purpose of preserving and
78 maintaining areas for ecological research, observation, genetic conservation, monitoring, and
79 educational activities (USFS 2004b). The RNAs may serve as baseline or reference areas for
80 comparison to other similar ecosystems that are subject to a wider range of management
81 activities. They also provide opportunities for low-impact activities designed to educate people
82 about ecological processes. No recreation facilities are provided. Dispersed recreation use occurs
83 but is generally discouraged. The cRNAs are managed in similar fashion to the RNAs, with the
84 exception that semi-primitive, non-motorized recreation is permitted.

85 Three RNAs are within 25 miles of the NorthMet Project area: the Big Lake – Seven Beavers
86 cRNA, the Keeley Creek RNA, and the Dragon Lake cRNA.

87 **The Big Lake – Seven Beavers Area** includes an excellent representation of a variety of
88 characteristic upland and lowland plant communities, dominated by wetland communities
89 including lowland black spruce, lowland cedar, shrub swamp, and bog, connected to Sand Lake
90 Peatland SNA (managed by the MDNR). The 5,599 acres of the cRNA are located
91 approximately 12 miles east of the NorthMet Project area (USFS 2011h) (see Figure 4.2.12-1).
92 This cRNA (and adjacent Sand Lake Peatland SNA) is located within the Headwaters Site,
93 which is an area of ecological significance. Due to high biodiversity, low disturbance, and the
94 size and complexity of the peatlands present on the site, it is considered a blueprint for natural
95 resource management in the Laurentian Uplands subsection.

96 **Keeley Creek Natural Area**, located within the Superior National Forest in Stony River
97 Township, approximately 25 miles northeast of the NorthMet Project area (see Figure 4.2.12-1),
98 comprises 640 acres designated as an RNA within a larger 1,180-acre area designated as a
99 national natural landmark. The Keeley Creek area contains a large tract of undisturbed mixed
100 pine and black spruce forest with rare mature jack pine stands and significant upland bogs (USFS
101 2011h).

102 **Dragon Lake** is located approximately 25 miles northeast of the NorthMet Project area (see
103 Figure 4.2.12-1). The cRNA comprises 2,075 acres of old growth red pine, upland and lowland
104 black spruce, wetland bog, and wetland shrub swamp communities, as well as former Isabella
105 pinery (USFS 2011h).

106 **4.2.12.1.3 Unique Biological Areas**

107 UBAs are designated by the USFS for their outstanding biological and other special values and
108 managed within the USFS land and natural resource management plans. The common thread to
109 these areas is that they exhibit plant communities, associations, and/or individual species of
110 particular interest. UBAs are primarily managed for interpretive purposes. None are suitable for
111 timber management. The Dry Mesic Jack Pine/Black Spruce and Lowland Conifer Landscape
112 Ecosystems dominate this area in the Superior National Forest. UBAs are protected from actual
113 or potential damage due to public use. Dispersed recreation use may occur, but is generally
114 discouraged, and may be limited to bird watching, orienteering, fishing, hunting, berry picking,
115 plant identification, and wildlife viewing (USFS 2004b).

116 UBAs within the 25-mile vicinity of the NorthMet Project area include the Little Isabella River
117 UBA (approximately 25 miles east of the NorthMet Project area) and the Harris Lake National
118 Natural Landmark (approximately 20 miles northeast of the NorthMet Project area) (USFS

119 2004b) (see Figure 4.2.12-1). National Natural Landmark sites are designated by the Secretary of
120 the Interior as sites that contain outstanding biological and geological resources, based on their
121 outstanding condition, illustrative value, rarity, diversity, and value to science and education.

122 **4.2.12.1.4 National Historic Landmark**

123 National Historic Landmarks are nationally significant places designated by the Secretary of the
124 Interior as possessing exceptional value or quality in illustrating or interpreting US heritage. The
125 Soudan Iron Mine has been designated as a National Historic Landmark. It is known as the
126 state's oldest and deepest iron mine and now hosts the Soudan Underground Laboratory. It
127 resides within the Soudan Underground Mine State Park, located approximately 18 miles
128 northwest of the NorthMet Project area, near Tower, on the southern shore of Lake Vermilion
129 (see Figure 4.2.12-1). The park comprises approximately 1,300 acres and receives more than
130 33,000 visitors annually (MDNR 2011m).

131 **4.2.12.1.5 National Recreation Trail**

132 National Recreation Trails are designated by the Secretary of Interior or the Secretary of
133 Agriculture to recognize exemplary trails of local and regional significance. The Taconite State
134 Trail is designated as a National Recreation Trail and managed by the MDNR. Running from
135 Grand Rapids to the Arrowhead State Trail, the Taconite State Trail is 165 miles long. A
136 segment of the trail is 15 to 17 miles north of the NorthMet Project area, running from the City
137 of Ely westward to Tower (see Figure 4.2.12-1). Spur trails run south from this segment into the
138 City of Babbitt, and then east and west. The trail provides year-round opportunities for hiking,
139 biking, snowmobiling, in-line skating, and other recreational uses (MDNR 2011n).

140 **4.2.12.2 State-Managed Areas**

141 Like the federal government, the State of Minnesota also designates and manages for wilderness
142 values a number of areas.

143 **4.2.12.2.1 Boundary Waters Canoe Area Wilderness**

144 In 2003, Minnesota designated 18,000 acres of state-owned lands within the BWCAW as state
145 wilderness. These are state forest lands that are described as an inholding within the federally
146 designated wilderness. The definition of wilderness used by the state is similar to that set forth in
147 the federal Wilderness Act. Legislation passed in 1975 established the state's wilderness
148 program. *Minnesota Statutes* 2006, Chapter 86A.05, subdivision 6 contains management
149 guidelines for wilderness areas. However, the state lands now designated as state wilderness are
150 using the management directions of the larger BWCAW and there is no state wilderness
151 management plan for the area (Propst and Dawson 2008).

152 **4.2.12.2.2 Scenic Byway**

153 Minnesota Scenic Byways are roads that feature many of Minnesota's finest cultural, historic,
154 natural, recreational, archaeological, and cultural locations and landscapes. The Superior
155 National Forest Scenic Byway (Forest Highway 11) is a 54-mile long scenic roadway that runs
156 from Aurora to Silver Bay, with the closest segment approximately 9 miles southeast of the
157 NorthMet Project area along County Route 110 (see Figure 4.2.12-1). It is designated as a scenic
158 byway by the State of Minnesota. The majority of the Byway runs through the Superior National

159 Forest, offering access to hiking trails, historic sites, and the Superior National Forest itself. A
160 key feature of the Byway is the opportunity it provides travelers to views of 250-year-old stands
161 of white pine (US DOT 2011). Skibo Vista Scenic Overlook is one of the other key features
162 along the Superior National Forest Scenic Byway. See Section 4.2.11 for further information
163 about visual resources at the Skibo Vista Scenic Overlook.

164 **4.2.12.2.3 State Parks**

165 Soudan Underground Mine State Park is located 18 miles northwest (see Figure 4.2.12-1) of the
166 NorthMet Project area and is home to Minnesota's oldest iron ore mine. The park covers 1,322
167 acres and has 5 miles of hiking trails. The park is located on a ridge on the south shore of Lake
168 Vermilion and offers a combination of recreational opportunities, including picnicking, hiking,
169 snowmobiling, and tours of a former iron ore mine. There are stands of white and Norway
170 pine—mixed with some balsam, aspen, and birch—that cover the upland areas. The lowlands are
171 dominated by white cedar interspersed with balsam, tamarack, black spruce, ash, and muskeg
172 (MDNR 2011m).

173 Lake Vermilion State Park is 16 miles northwest of the NorthMet Project area (see Figure
174 4.2.12-1), on the eastern shores of Lake Vermilion, adjacent to Soudan Underground Mine State
175 Park. Lake Vermilion is just south of the Superior National Forest and BWCAW. The park is
176 Minnesota's newest state park, open since 2010 for recreation opportunities such as hiking,
177 snowshoeing, snowmobiling, and geocaching. It is the first major state park built in Minnesota in
178 more than 30 years. Construction is underway for boat docks, fishing platforms, picnic shelters,
179 roads, parking areas, and a paved bike route that will connect to the Mesabi Trail (MDNR
180 2012f).

181 Bear Head Lake State Park, which covers 5,685 acres, is located 11 miles north of the NorthMet
182 Project area, just south of the BWCAW (see Figure 4.2.12-1). The woods are made up of red and
183 white pine, spruce, paper birch, and fir on the highlands and tamarack, black spruce, and white
184 cedar on the lowlands. Small, clear trout lakes similar to those found in the BWCAW provide
185 recreational opportunities such as fishing, swimming, and boating. The park also offers 17 miles
186 of hiking trails, campgrounds, cross-country skiing, snowmobiling, and snowshoeing (MDNR
187 2012a).

188 Iron Range Off-Highway Vehicle State Park is located 17 miles southwest of the NorthMet
189 Project area in Gilbert, Minnesota (see Figure 4.2.12-1). The park offers 36 miles of off-highway
190 vehicle trails over 4,064 acres (MDNR 2012b).

DRAFT

1 **4.2.13 Hazardous Materials**

2 A hazardous material, as defined by the Institute of Hazardous Materials Management (2012), is
3 any biological, chemical, or physical item or agent which has the potential to cause harm to
4 humans, animals, or the environment. Categories of hazardous materials include, but are not
5 limited to, explosives, flammables, oxidizers, poisons, irritants, and corrosives. At the federal
6 level, management, handling, and transportation of these materials are regulated by laws and
7 regulations administered by the USEPA, Occupational Safety and Health Administration
8 (OSHA), and DOT, each with its own specific definition of hazardous material. The State of
9 Minnesota also has regulations related to hazardous materials.

10 In addition, wastes generated from process operations can be classified as hazardous. Minnesota
11 Statutes define a hazardous waste as any refuse, sludge, or other waste material or combinations
12 of refuse, sludge, or other waste materials in solid, semi-solid, liquid, or contained gaseous form,
13 which, because of quantity, concentration, or chemical, physical, or infectious characteristics,
14 may cause or significantly contribute to an increase in mortality or an increase in serious
15 irreversible, or incapacitating reversible illness. A waste can also be determined to be hazardous
16 if it poses a substantial present or potential hazard to human health or the environment when
17 improperly treated, stored, transported, disposed, or otherwise managed. Hazardous waste does
18 not include source, special nuclear, or byproduct material as defined by the Atomic Energy Act
19 of 1954, as amended (*Minnesota Statute* 116.06 Subdivision 11). As with hazardous materials,
20 hazardous wastes are subject to state and federal management, transportation, and disposal
21 regulations. Issues relating to the presence of hazardous materials or waste may include the
22 accidental release of these materials during transportation, storage, handling, and/or use and any
23 resulting potential effects on the environment.

24 There are no current mining or other operations or activities at either the Mine Site or Plant Site
25 that involve the use of hazardous materials. As discussed in Section 4.2.1, there are AOCs
26 associated with contamination by hazardous materials from the former LTVSMC mining
27 operations.

DRAFT

1 **4.2.14 Geotechnical Stability**

2 This section describes the existing geotechnical conditions for the proposed sites for the material
3 storage facilities proposed as part of the NorthMet Project Proposed Action: the waste rock
4 stockpiles, the Tailings Basin, and the Hydrometallurgical Residue Facility.

5 The waste rock stockpiles would be constructed on undisturbed highland and lowland areas at
6 the Mine Site that consist of varying layers (thicknesses and material types) of glacial till and
7 surficial peat. The Hydrometallurgical Residue Facility would be constructed partially on top of
8 the existing LTVSMC Emergency Basin and would extend onto the adjacent undisturbed
9 ground. The Tailings Basin constructed as part of the NorthMet Project Proposed Action would
10 be located on top of a portion of the existing LTVSMC Tailings Basin and would extend onto the
11 adjacent undisturbed ground. Geotechnical conditions are generally similar along the length of
12 the LTVSMC Tailings Basin dams, with varying layers of coarse tailings, fine tailings, and
13 slimes. The characteristics and design of the proposed material storage facilities are discussed in
14 Chapter 3.0, while the rationale of the design—including consideration for design criteria,
15 factors of safety, and modeling of geotechnical stability of the existing and proposed features—is
16 discussed in Chapter 5.0. Further information on the geology and hydrogeology associated with
17 the structures is provided in Section 4.2.2.

18 **4.2.14.1 Waste Rock Stockpiles**

19 **4.2.14.1.1 Location and Descriptive Overview**

20 The waste rock stockpiles would be located at the Mine Site, an undeveloped site currently
21 affected only by logging and exploration drilling activities.

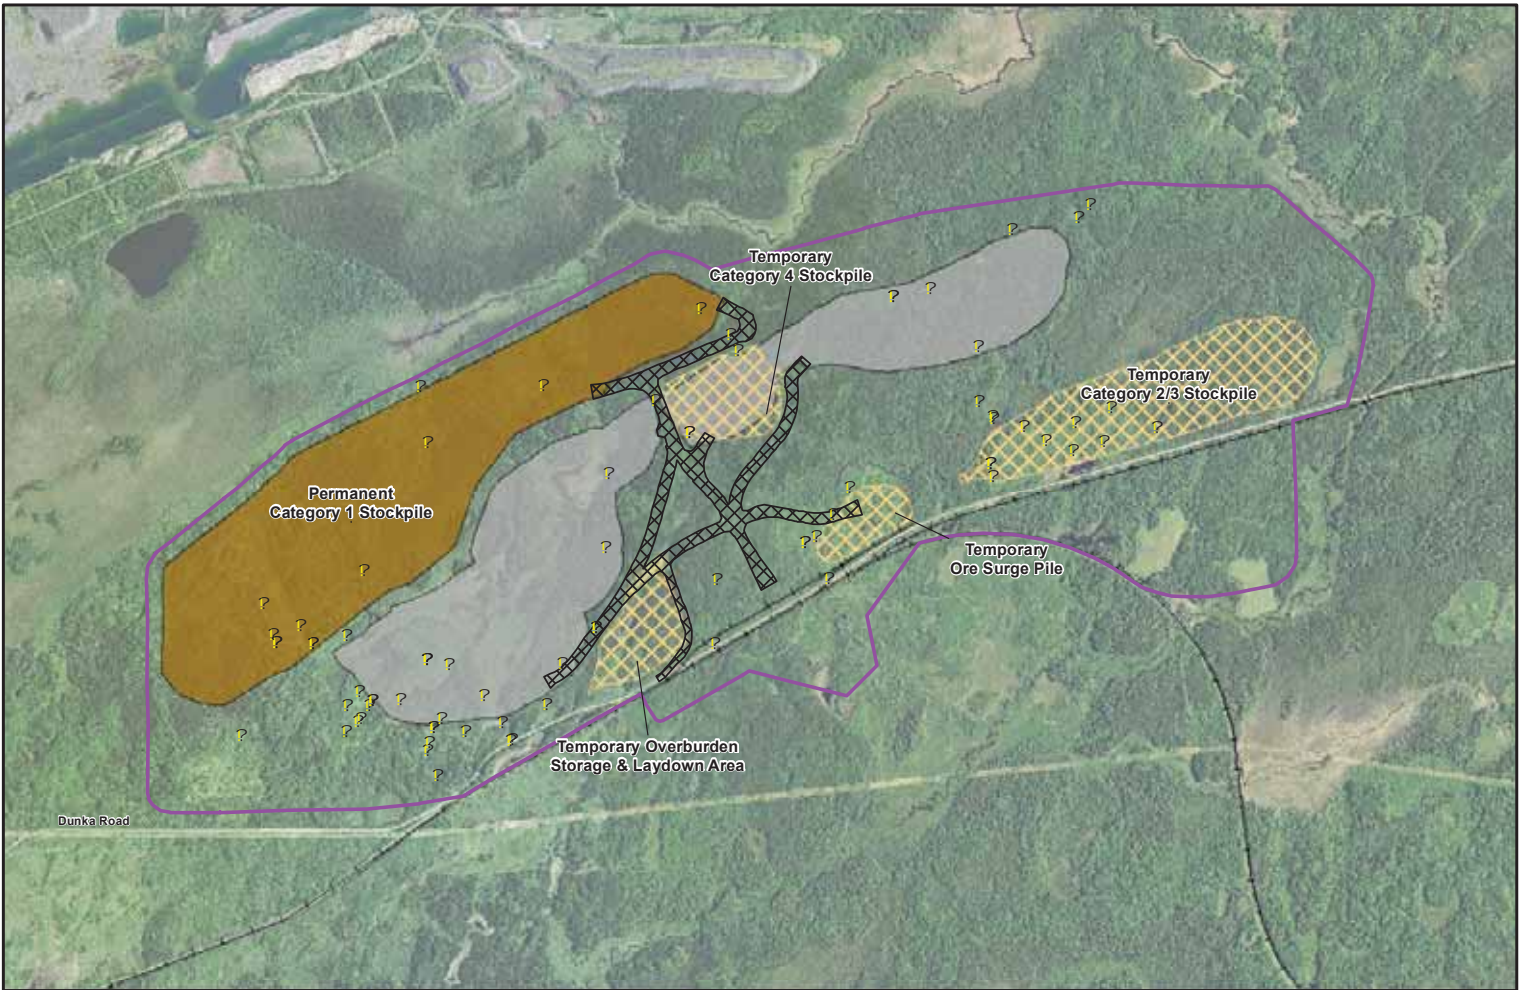

22 The locations of the proposed stockpiles are shown in Figure 4.2.14-1. The acreages for the
23 stockpiles would be as follows:

- 24 • The permanent Category 1 Stockpile would occupy 526 acres to the north of the West Pit;
- 25 • The temporary Category 2/3 Stockpile would occupy 180 acres to the south east of the East
26 Pit;
- 27 • The temporary Category 4 Stockpile would occupy 57 acres above the Central Pit (it would
28 be removed and placed into the East Pit prior to mining at the Central Pit); and
- 29 • The temporary Ore Surge Pile would occupy 32 acres to the south of the East Pit and west of
30 the Category 2/3 Stockpile.

31 In addition to the stockpiles listed above, the temporary Overburden Storage and Laydown Area
32 would occupy 31 acres to the southeast of the West Pit.

33 There are no existing mining facilities or constructed geotechnical features that are at risk of
34 geotechnical instability at the proposed stockpile locations.

DRAFT

38 **4.2.14.1.2 Investigations**

39 The site conditions at the proposed stockpile location have been evaluated and reported by
40 Golder Associates, Inc. for PolyMet (PolyMet 2014p). As shown in Figure 4.2.14-1,
41 geotechnical information for the Mine Site was gathered from a number of borings and test
42 trenches. The site exploration drilling database, drilling logs, and geophysics (electrical
43 resistivity) data were used to develop an estimated depth to bedrock isopach map. Laboratory
44 tests were also conducted to obtain index properties (American Society for Testing and Materials
45 [ASTM] C-117, C-136, D2216) of the samples recovered from the test trenches and boreholes, to
46 confirm field classifications, and for use in developing correlations with engineering properties
47 of the soils encountered.

48 **4.2.14.1.3 Surficial Soils and Geology**

49 **Site Conditions for Category 1 Stockpile**

50 Borings and mapping indicate that bedrock depths at the proposed Category 1 Stockpile range
51 from 4 ft in the central part of the northern extent up to 40 ft at the southwestern edge. Soils in
52 the highland areas are glacial tills in origin and the consistency typically varies from coarser
53 material to clays. Geotechnical testing indicates that lowland areas contain horizons of glacial,
54 alluvial, and lacustrine deposits overlain by peat and relatively finer-grained soils.

55 **Site Conditions for Category 2/3 Stockpile**

56 Borings and mapping indicate that bedrock depths at the proposed Category 2/3 Stockpile range
57 from 3.5 to 33 ft below the surface. Soils in the highland areas typically consist of sands and
58 gravel with varying amount of silt. Lowland areas typically contain surficial peat and fine
59 grained soils, underlain by glacial and alluvial deposits.

60 **Site Conditions for Category 4 Stockpile**

61 Borings and mapping indicate that bedrock depths at the proposed Category 4 Stockpile range
62 from 8.0 to 26 ft. The Category 4 Stockpile would be located on highland soils, which typically
63 consist of sands and gravels. Because the soil samples were collected only in the highland areas
64 at the northeastern and the southwestern end of the stockpile, they may differ from foundation
65 soils at other locations within the Category 4 Stockpile footprint, especially in wetland areas.

66 **Site Conditions for Ore Surge Pile**

67 Borings and mapping indicate that bedrock depths at the proposed Ore Surge Pile range from 6.5
68 to 12 ft. Soil samples were collected only from the highland areas of the stockpile, which may
69 differ from foundation soils at other locations within the Ore Surge Pile stockpile footprint,
70 especially from soils within the lowland areas located on the eastern side of the stockpile.

71 **Site Conditions for Overburden Storage and Laydown Area**

72 The conditions for the Overburden Storage and Laydown Area include wetland areas
73 interspersed with areas of glacial till (typically silty sand) overlying bedrock of varying depth.

74 **NorthMet Waste Rock and Ore Characterization**

75 Analysis of the NorthMet Deposit indicates the average dry density of the waste rock is 1.90 tons
76 per cubic yard with an assumed average of 23 percent porosity (30 percent swell).

77 Local granular material or crushed rock could be used to provide drainage layers for the
78 stockpiles. Native till could be compacted and supplemented with bentonite to achieve an
79 acceptable permeability relative to *Minnesota Rule* 6132.2400, Subpart 2. A. (1)) needed for the
80 subgrade and liner layers (along with a geomembrane layer for the Category 2/3 and 4
81 stockpiles).

82 **4.2.14.1.4 Geotechnical Summary**

83 The majority of the soils collected were non-plastic. Measured in situ moisture contents for non-
84 peat material ranged from 1.0 to 26.9 percent. The permeability of the tested (ASTM D5084,
85 D698) undisturbed native soils ranged from 3.1×10^{-7} to 9.4×10^{-7} cm/sec. The permeability of the
86 tested compacted native soils ranged from 1.1×10^{-7} to 2.0×10^{-7} cm/sec, indicating that the native
87 soils are favorable for use as a compacted soil liner. Typically, the native glacial tills have
88 sufficiently high fines content, and are considered good candidates for materials to be used with
89 the geomembrane cover construction as proposed for the reclamation of the Category 1
90 Stockpile.

91 One-dimensional consolidation test (ASTM D2435) and a consolidated-undrained (CU) triaxial
92 shear test (ASTM D4767) was undertaken for one sample taken from the Category 1 Stockpile
93 footprint area. The in situ effective stress strength parameters yielded an effective cohesion of
94 zero with an effective friction angle of 34.6 degrees. The consolidation testing indicated a
95 coefficient of consolidation of 5.3×10^{-1} to 9.6×10^{-1} ft²/day and a coefficient of compression of
96 0.05 to 0.13 under the loading range of 1 to 16 kips per square foot (ksf).

97 Additional geotechnical investigations such as soil borings, test trenches, and geotechnical
98 laboratory tests of on-site materials are required at the locations of the proposed stockpiles to
99 verify the geotechnical information currently available. Examples of information that the
100 additional investigations would yield include: confirmation of the classification of native soils;
101 identification of depths to bedrock and groundwater; identification and delineation of on-site
102 borrow sources; and procurement of additional material samples of waste rock and overburden
103 soils for laboratory testing. This information would be used to modify stockpile and foundation
104 design and confirm the design assumptions and earthwork balance computations. The additional
105 investigations would take place before stockpile construction but cannot be undertaken until the
106 land exchange has been completed, appropriate permitting has been received, and dewatering of
107 the wetland areas has been performed. PolyMet has committed to undertake further
108 investigations as necessary.

109 **4.2.14.2 Tailings Basin**

110 **4.2.14.2.1 Location and Descriptive Overview**

111 The Tailings Basin constructed as part of the NorthMet Project Proposed Action would be
112 located on top of the existing LTVSMC Tailings Basin and adjacent undisturbed ground. The
113 LTVSMC Tailings Basin is contained by constructed dams with a small portion on the east and
114 south side of the basin abutting natural higher ground, and, as shown in Figure 4.2.14-2, is
115 configured as a combination of three adjacent cells identified as Cell 1E, Cell 2E, and Cell 2W.
116 With an average dam height of 95 ft, Cell 2E is the lowest of the three cells and covers
117 approximately 620 acres in surface area. Cell 1E covers approximately 980 acres and has an
118 average height of 125 ft. Cell 2W is the largest and highest of the three cells, covering
119 approximately 1,450 acres in surface area, with an average dam height of 200 ft.

120 Additional perimeter dams would be constructed and flotation tailings would be deposited on top
121 of the LTVSMC Tailings Basin, beginning in Cell 2E and then progressing into the combined
122 Cell 2E and 1E when they achieve equal elevation, to a proposed final height of 200 ft. Cell 2W
123 is not proposed for use for tailings deposition. Refer to Chapter 3.0 and Section 5.2.14 for more
124 information on the proposed design of the Tailings Basin.

DRAFT

128 **4.2.14.2.2 Development of the Existing LTVSMC Tailings Basin**

129 The existing LTVSMC Tailings Basin was constructed in stages beginning in the 1950s.
130 Constructed perimeter dams were established using a rock, sand, and gravel starter dam over
131 natural surface material (glacial till and fibrous peat in areas). The facility was unlined such that
132 tailings from taconite processing were discharged directly on native material. The basin was
133 filled to near the crest of the original starter dam and then berms were progressively developed
134 on top of the starter dams and deposited tailings using the discharged coarse tailings (upstream
135 construction method).

136 Upstream tailings basin construction methods generally involve spigotting of tailings in a slurry
137 from the cell perimeter (or dam) into the interior of the cell using a portable spigotting system.
138 Coarse tailings tend to settle out of the slurry near the spigot point near the perimeter of the dam,
139 while the fine tailings and slimes tend to flow further into the basin. Very fine materials such as
140 slimes tend to settle in the interior pond. The base of new lifts were developed inward in the
141 upstream direction, hence the term upstream construction method.

142 During the spigotting process, some fine tailings and slimes are normally trapped within the
143 coarse tailings near the spigot point. In periods of very high water levels in the tailings pond or
144 during periods of operational difficulties or operator error, additional fines and slimes may be
145 deposited close to the perimeter dams. Typically, the material near the spigot points forms the
146 foundation of future lifts of the shell, and is preferably a well-drained, coarse material that would
147 provide a stronger base while reducing the height of the phreatic head within the shell. The
148 inclusion of relatively large zones of finer-grained tailings within this outer shell reduces the
149 drainage ability of the shell, increasing the phreatic surface, and reduces the localized shear
150 strength due to the generally weaker behavior of the finer-grained tailings. There were instances
151 during the operation of the LTVSMC Tailings Basin where significant amounts of fine tailings
152 and slimes settled near the perimeter dams. These fine tailings and slimes were then covered with
153 coarse tailings as the basin continued to be developed. Figure 4.2.14-3, Figure 4.2.14-4, and
154 Figure 4.2.14-5 show complex and varying layers of materials identified in drilling along Cross
155 Section F, G, and N. It should be noted that these figures provide idealized cross section
156 information that may not be located exactly along the section lines. As such, some information
157 was translated horizontally to provide a more detailed description of the material variability, and
158 some materials may appear out of context (e.g., for Cross Section F, the left-most boreholes
159 show layers of peat found within the tailings; however, these layers of peat are projected from
160 boreholes that have a native ground surface at a relatively higher elevation than is shown in this
161 figure). Additional investigation and modeling show similar inclusions throughout the basin.
162 This is discussed further in the Surficial Geology section below.

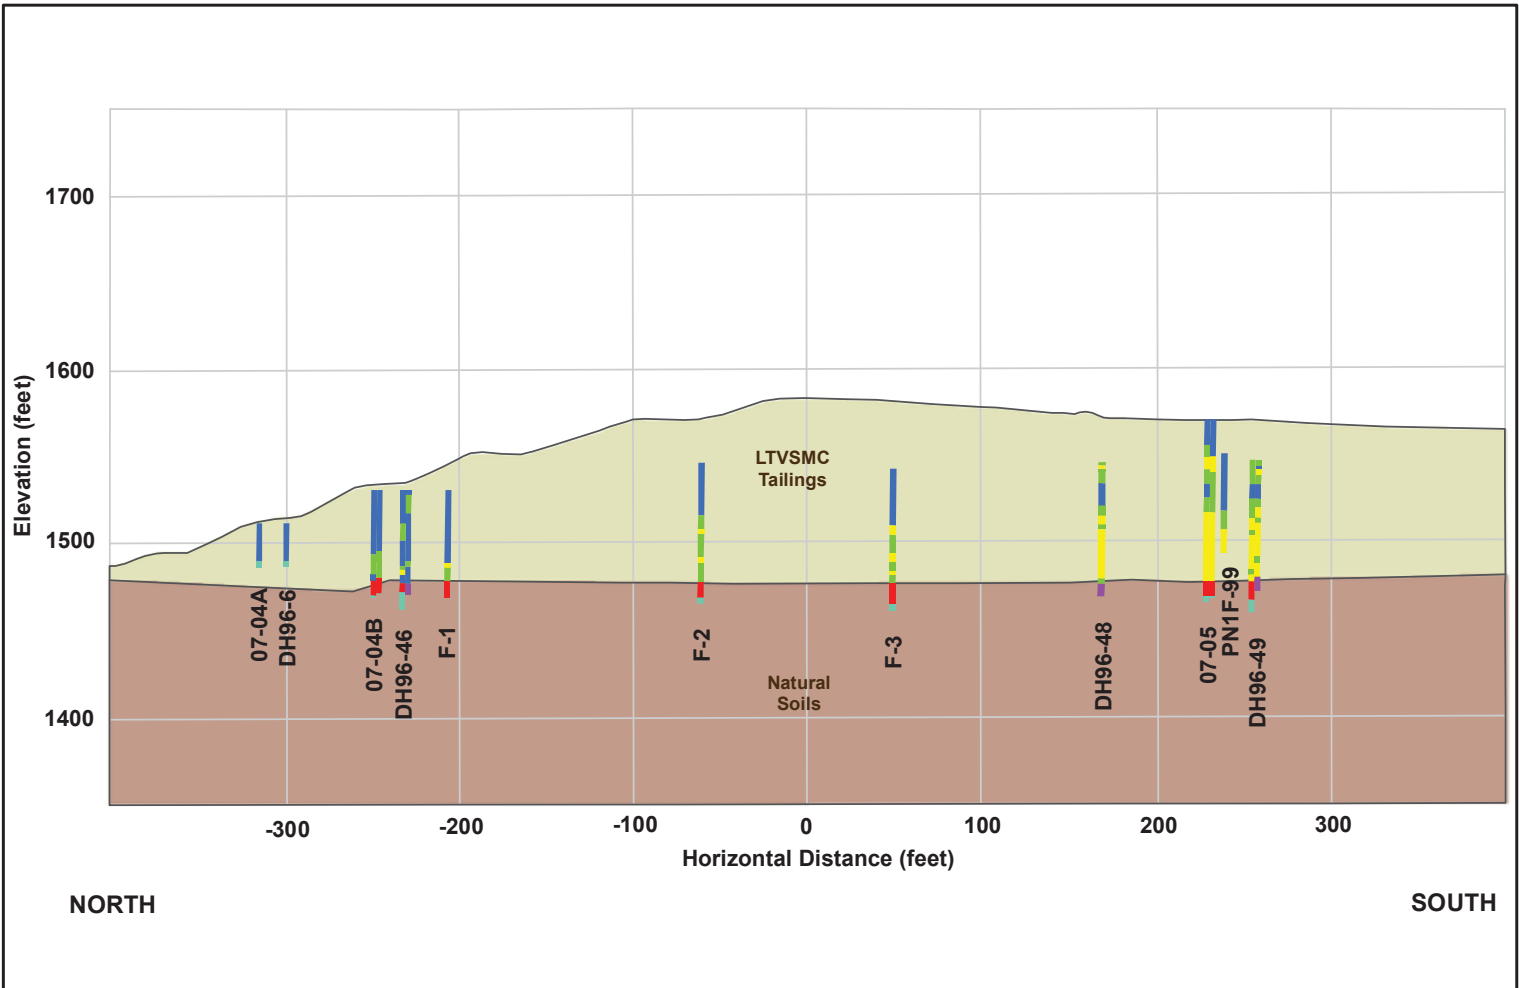

163 In 1993, approximately 260,000 long tons of higher-sulfur waste rock from the Dunka Mine was
164 mixed with approximately 29,000 tons of limestone and buried under spigotted LTVSMC
165 tailings in the southern part of Cell 2W. Additionally, in Cell 2W, rapid construction in later
166 years of development resulted in oversteepened dams on all sides of Cell 2W. Some seepage has
167 occurred from the dam in this and other areas. Other points along the dams have been subject to
168 erosion due to the leakage from and failure of LTVSMC discharge pipes, and from the natural
169 geomorphological processes such as melting snow, precipitation runoff, soil creep, wind erosion
170 and others. No large-scale failures were reported due to these events and eroded surfaces were
171 filled with available material as needed.

172 In 1995 and 1996, approximately 1,500 cubic yards of spoil material dredged from Taconite
173 Harbor in Lake Superior was placed in the south-eastern portion of Cell 1E.

174 Fly ash, dredging spoil, and coal pile cleanup material have also previously been disposed of in a
175 solid waste storage site upgradient to the east of Cell 1E. PolyMet has committed to remove this
176 material prior to inundation of that area by NorthMet tailings.

177 The LTVSMC Tailings Basin operations were shut down in January 2001 and have been inactive
178 since then except for closure and reclamation activities consistent with an MDNR-approved
179 Closure Plan. Reclamation also includes the use of some parts of Cell 2W as a land farm where
180 contaminated soil is mixed with organics for remediation. These activities are expected to be
181 completed by 2016.

DRAFT

188 **4.2.14.2.3 Investigations**

189 The site conditions at the LTVSMC Tailings Basin have been evaluated throughout its existence
190 and most recently reported by PolyMet in 2007 and 2014 (PolyMet 2015I). As shown in Figure
191 4.2.14-2, information has been gathered over several geotechnical investigation efforts at various
192 locations around the basin since its development. Collected site data include:

- 193 • cone penetrometer testing (CPT and CPTu) involving probing at 9 points in Cell 1E, 30
194 points in Cell 2E, and 12 points in Cell 2W; dissipation testing at nearly all CPT locations
195 during the probing in 2007 and 2014;
- 196 • seismic shear wave velocity testing conducted at each of the CPT locations during the
197 probing in 2007;
- 198 • dilatometer testing in borings approximately 10 ft adjacent to each CPT location in 2007;
- 199 • standard penetration test borings at a total of 27 locations near the CPT locations in 2007 and
200 12 locations along the western and northern sides of Cell 2W and Cell 2E in 2014;
- 201 • vane shear testing at various depths performed at nine locations in Cells 1E and 2E in 2007;
202 and
- 203 • solid flight auger borings near the western, northern, and eastern crests of the dams around
204 Cell 2W.

205 Laboratory testing of bulk and undisturbed materials was also undertaken to verify the data
206 collected during in situ testing, as well as to further assess the characteristics of the material for
207 its hydraulic and strength parameters.

208 Field and laboratory tests have been completed to describe the general geotechnical properties,
209 permeability, and shear strength of the NorthMet tailings. These tests include:

- 210 • Atterberg Limits tests (ASTM D4318);
- 211 • Physical model studies;
- 212 • Falling-head, flexible-wall laboratory permeability testing (ASTM D5084); and
- 213 • Triaxial tests (ASTM D2850).

214 Geotechnical modeling of the Tailing Basin uses material properties obtained in the testing of the
215 tailings for the seepage and stability analysis of future conditions. Filter criteria for the tailings
216 were also evaluated to determine the effectiveness of LTVSMC bulk tailings to control water
217 levels within the perimeter dam and to prevent piping.

218 Other studies performed to investigate the hydrogeology of the site are discussed in Section
219 4.2.2.

220 **4.2.14.2.4 Surficial Materials, Geology, and Other Existing Structures**

221 **LTVSMC Tailings**

222 The existing LTVSMC Tailings Dam generally consists of a shell of LTVSMC coarse tailings,
223 with interbedded fingers of LTVSMC fine tailings and slimes. The interior of the cells consists
224 primarily of layers of LTVSMC fine tailings and slimes, while coarse tailings are generally

225 found near the perimeter of the basin. These interbedded layers vary in thicknesses and extent
226 throughout the basin due to changing of tailings deposition points and durations. The depth of the
227 tailings to the underlying native material varies between each of the cells.

228 Sampling to date has identified that the stratigraphy is very complex. Figures 4.2.14-3, 4.2.14-4,
229 and 4.2.14-5 shows cross sections F, G, and N respectively, These cross sections illustrate the
230 complexity and variability of the tailings layers within each borehole, and between boreholes.
231 This variability between boreholes also contributes to the uncertainty in determining the depth
232 and continuity of the layers, and therefore, the extent of fine tailings and slimes at various depths
233 near the cell perimeter dams.

234 The LTVSMC coarse tailings are generally classified as poorly graded fine- to medium-grained
235 sand. The LTVSMC slimes particle sizes have been classified to range from silty sand to lean
236 clay.

237 The LTVSMC Tailings Basin is abutted in the location of Cross Section N by an existing
238 railway.

239 **Natural Soils and Geology**

240 Native, surficial deposits in the area of the LTVSMC Tailings Basin generally consist of native
241 glacial till material that ranges from clay to gravel. In places, the till is overlain by up to 20 ft of
242 organic peat.

243 The depth to bedrock (Giant's Range granite) varies throughout the Tailings Basin. The bedrock
244 at the toe of Cross Section F starts at an average of 30 ft below the top of the till. Bedrock along
245 Cross-Section G was modeled as 25 ft below the top of the till at the toe and increases in
246 elevation towards the center of the basin. No borings have been extended to bedrock along
247 Cross-Section N; however, depth to bedrock was assumed as 20 ft below the top of the till and to
248 increase in elevation towards the center of the basin.

249 **NorthMet Tailings Characterization**

250 The tailings from the NorthMet floatation process would be hydraulically deposited and are
251 expected to undergo less hydraulic segregation than the LTVSMC tailings. While some
252 segregation would occur, significant amounts of fines would be captured within the tailings
253 matrix. Therefore, for geotechnical stability modeling (Section 5.2.14), the NorthMet tailings
254 were treated as a single material, rather than defining parameters for coarser and finer portions of
255 the tailings. Based on laboratory testing, a decrease in saturated permeability of the flotation
256 tailings is anticipated with increase in overburden depth. As such, three saturated permeabilities
257 have been used in geotechnical modeling with respect to depth.

258 **4.2.14.2.5 Geotechnical Summary**

259 The selected drained and undrained strength and saturated permeability inputs for the various
260 materials used in modeling (Section 5.2.14.2.2) are summarized in Table 4.2.14-1.

261 Analyses determined that the LTVSMC coarse tailings are anticipated to behave in a dilative
262 manner (i.e., expand in volume) as they are sheared, and are therefore less conducive to pore
263 water pressure generation during shearing. The fine tailings and slimes are anticipated to behave
264 in a contractive manner (i.e., reduce in volume) as they are sheared and are therefore prone to

265 pore water pressure generation during shearing, resulting in a loss of effective strength. Organic
 266 peat has also been characterized as being prone to strength loss during shearing.

267 The northern dam in Cell 2E has been identified as a potential area of weakness as it is underlain
 268 by a layer of fibrous peat up to approximately 20 ft thick that extends north beyond the toe of the
 269 dam into a nearby wetland and due to the presence of interbedded layers of contractive fine
 270 tailings and slimes. A deposit of glacial till lies beneath the peat. The crest of the dam in this area
 271 is approximately 90 ft above the surrounding ground surface and consists mostly of coarse
 272 tailings with some weaker layers of interbedded fine tailings and slimes close to the base of the
 273 dam.

274 As part of the NorthMet Project Proposed Action, PolyMet would apply CDSM to increase the
 275 shear strength of select zones of the existing LTVSMC fine tailings, slimes, and peat layers.
 276 More information regarding the CDSM feature is provided in Sections 3.2.2.3.3 and 5.2.14.2.2.
 277 Hydrogeology suggests that the upper portion of bedrock is variably fractured and therefore has a
 278 higher saturated permeability compared to bedrock deeper in the formation.

281 Notes:
 282 ¹ Permeability of the compressed peat (below the dam) was altered for anisotropy, applying a ratio of $k_y/k_x = 0.067$.
 283 ² Drained strength of the peat was included as a shear/normal function with $\phi \approx 27$ degrees.
 284 ³ Permeability of the tailings was varied based on effective overburden pressure
 285 ESSA = Effective Stress Stability Analysis
 286 ft/sec = Feet per second
 287 pcf = Pound(s) per cubic foot
 288 psf = Pound(s) per square foot
 289 USSA = Undrained Strength Stability Analysis
 290 USSR = Undrained Shear Strength Ratio

291 Further information on the parameters used for the design and modeling of the existing
 292 LTVSMC and proposed Tailings Basins is provided in Chapter 5.0 and in the Geotechnical Data
 293 Package Volume 1 (PolyMet 2015l).

294 4.2.14.3 Hydrometallurgical Residue Facility

295 4.2.14.3.1 Location and Descriptive Overview

296 As shown in Figure 4.2.14-2, the Hydrometallurgical Residue Facility is located in a natural low
 297 point in the topography adjacent to Cell 2W of the existing LTVSMC Tailings Basin and over
 298 the LTVSMC Emergency Basin and the adjacent undisturbed ground. The southern tip of the
 299 LTVSMC Emergency Basin begins near the central portion of the Hydrometallurgical Residue
 300 Facility, widening and deepening into a former ravine that trends to the north. Seepage from the
 301 LTVSMC Emergency Basin occurs to the northwest between Cell 2W and a railroad grade
 302 located along the western perimeter of the area. This and additional seepage would be collected
 303 in a constructed drainage blanket between the LTVSMC embankment and the
 304 Hydrometallurgical Residue Facility embankment, and collected water would be conveyed away
 305 from the coincident area.

306 The southern dam of Cell 2W is approximately 160 ft in height from the surface of the LTVSMC
 307 Emergency Basin. It has an overall slope angle of 4 horizontal to 1 vertical (4:1) including mid-
 308 slope benches.

309 4.2.14.3.2 Development of the Existing LTVSMC Emergency Basin

310 The original purpose of the LTVSMC Emergency Basin was to contain taconite tailings (slimes,
 311 and fine and coarse tailings) from the main tailings thickeners in the event of a power failure or
 312 plant upset conditions which necessitated draining the tailings delivery system. Accidental
 313 overflows, spillage, and floor drainage from the former LTVSMC Concentrator Building was

314 also placed in the LTVSMC Emergency Basin. These materials were deposited by gravity
315 through an underground emergency tunnel terminating at the southeast side of the LTVSMC
316 Emergency Basin. Overflow from sumps in the former LTVSMC booster pump house number 1
317 was also directed into the LTVSMC Emergency Basin.

318 Prior to the construction of the LTVSMC Tailings Basin Cell 2W, the LTVSMC Emergency
319 Basin extended roughly 3,000 ft north from its current confinement. The southern starter dam for
320 the LTVSMC Tailings Basin Cell 2W (the same dam as the proposed Hydrometallurgical
321 Residue Facility north dam) was constructed over the unconsolidated emergency tailings in 1970
322 and 1971. An upstream construction method was used to construct the dam whereby the height
323 of the dam was advanced incrementally by constructing a new lift upstream (into the basin) and
324 above the crest of the dam. The north dam consists predominantly of LTVSMC coarse tailings
325 with occasional inclusions of fine tailings and slimes. LTVSMC tailings were deposited over the
326 emergency tailings in Cell 2W following this time.

327 **4.2.14.3.3 Investigations**

328 The site conditions at the Hydrometallurgical Residue Facility have been evaluated throughout
329 its existence and most recently reported on by PolyMet (PolyMet 2014c).

330 The geotechnical assessment of the proposed site for the Hydrometallurgical Residue Facility
331 utilized regional geological surveys and maps as well as historical and recent site surveys
332 undertaken at the LTVSMC Tailings Basin as shown in Figure 4.2.14-6.

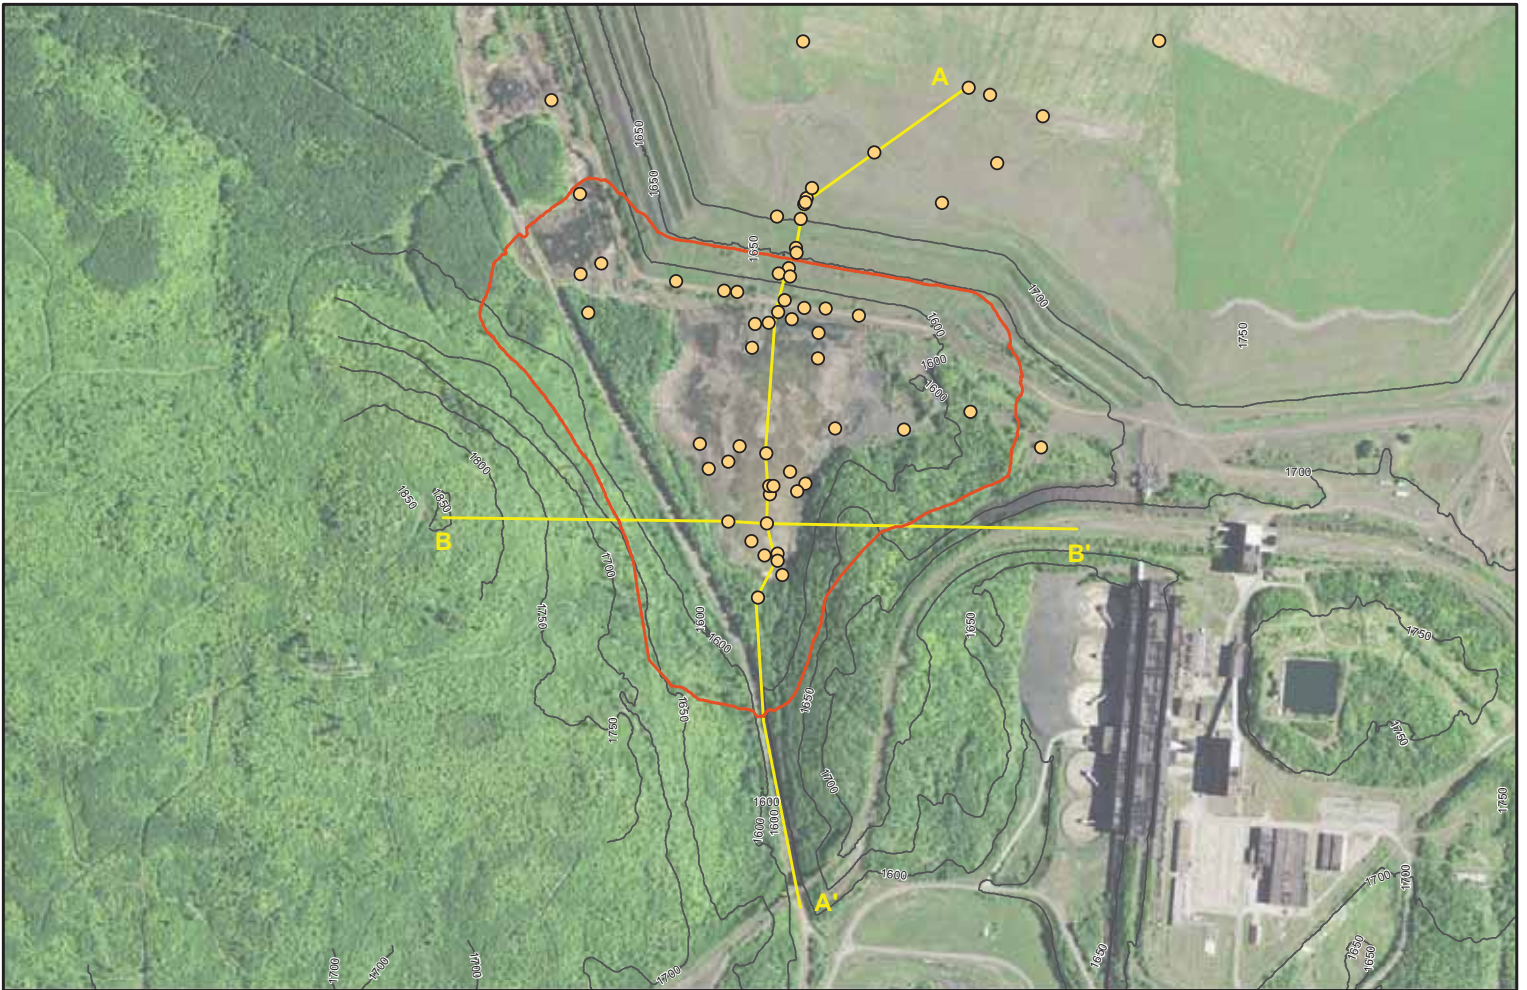

333 Residue from the hydrometallurgical process pilot-plant testing was collected to determine the
334 geochemical and geotechnical material properties. The makeup of hydrometallurgical residue
335 and other material proposed for disposal in the Hydrometallurgical Residue Facility process is
336 described in Section 3.2.2.3.7.

337 **4.2.14.3.4 Surficial Materials, Geology, and Other Existing Structures**

338 **LTVSMC Emergency Tailings**

339 Existing materials in the LTVSMC Emergency Basin consist of a mixture of coarse tailings, fine
340 tailings, and slimes. This layering is shown in Cross Section A in Figure 4.2.14-7. Deposited
341 materials have experienced relatively minor amounts of self-weight consolidation since cessation
342 of LTVSMC operations in early 2001 as no additional loading has occurred on these materials.
343 There are approximately 50 ft of tailings in the thickest part of the Emergency Basin. A railroad
344 track is also located along the western perimeter of the area.

DRAFT

350 **Natural Soils and Geology**

351 In the area of the Hydrometallurgical Residue Facility, bedrock is generally within 25 ft of the
352 native ground surface, except where surface materials have been built up either to support the
353 former LTVSMC facilities or where emergency tailings have been deposited in the LTVSMC
354 Emergency Basin (see Figure 4.2.14-7). To expedite the consolidation of the in-place LTVSMC
355 tailings so as to provide a more stable base for the Hydrometallurgical Residue Facility, wick
356 drains may be installed within the Emergency Basin. This would reduce drainage path lengths,
357 increase the drainage ability in the LTVSMC tailings and underlying compressed peat, and result
358 in a stronger foundation for the Hydrometallurgical Residue Facility.

359 Native surficial deposits, which have been sampled and logged at boring locations in and around
360 the LTVSMC Emergency Basin, include silty sands with interbedded coarser grained alluvial
361 deposits and peat. A thin layer of peat below the tailings in the LTVSMC Emergency Basin
362 thickens beneath the toe of the LTVSMC Tailings Basin.

363 The LTVSMC Emergency Basin is entirely underlain by Giant's Range granite. Bedrock granite
364 has been historically scoured by glaciers creating features such as linear valleys. The location of
365 linear valleys is sometimes interpreted to correspond with the location of potential faults in the
366 bedrock. However, on published geologic maps, the faults in these areas are dashed and
367 identified as conjectural with inferred (not exact) locations. Regional geologic maps of the Iron
368 Range do show the existence of fault lines, but hydrogeologic studies have not provided
369 evidence that any faults that may be present are active, nor do they behave as conduits for
370 groundwater flow.

371 **NorthMet Hydrometallurgical Residue Characterization**

372 The Hydrometallurgical Residue Facility is designed for the storage of residue produced during
373 mill operations. The grain size of the residue would primarily consist of material which would be
374 classified as silt and sand with a small amount of clay. Structural fill used to construct the
375 Hydrometallurgical Residue Facility dams would consist of blasted rock, sand, glacial till, or
376 LTVSMC coarse tailings. Additional materials such as gypsum from the WWTP, lime for
377 residue pH neutralization (if necessary), and coal ash would also be disposed of within the
378 Hydrometallurgical Residue Facility. These additional materials may represent approximately 5
379 to 10 percent of the facility solids volume. The chemical and physical properties of any non-
380 residue materials proposed to be stored in the Hydrometallurgical Residue Facility would be
381 tested prior to placement to ensure proper containment.

382 **4.2.14.3.5 Geotechnical Summary**

383 The values for the material properties used in geotechnical modeling are discussed in Section
384 5.2.14 and summarized in Table 4.2.14-2 and Table 4.2.14-3.

385 There are no structures at the proposed Hydrometallurgical Residue Facility site that appear to be
386 at risk of geotechnical instability.

387 Further information on the parameters used for the design and modeling of the
388 Hydrometallurgical Residue Facility is provided in Section 5.2.14.

389 **Table 4.2.14-2 Summary of Modeling Permeabilities for the Material Relevant to the**
 390 **Hydrometallurgical Residue Facility**

<i>Material</i>	Modeling Permeability	
	cm/sec	ft/sec
LTVSMC Coarse Tailings	2.44E-03	8.00E-05
LTVSMC Fine Tailings	2.00E-05	6.56E-07
LTVSMC Slimes	9.60E-07	3.15E-08
LTVSMC Bulk Tailings	8.02E-05	2.63E-06
Glacial Till	5.03E-03	1.65E-04
Sand	1.00E-02	3.28E-04
Residue (used for rate of drainage computation – quantity vs. time)	3.40E-05	1.12E-06
Residue (used for computation of time for drainage to occur)	5.50E-06 ⁽¹⁾	1.80E-07 ⁽¹⁾
Compressed Peat	3.60E-06	1.18E-07
Bedrock	8.56E-08	2.81E-09
LTVSMC Slimes – with wick drains	2.34E-06	7.69E-08
Compressed Peat – with wick drains	8.75E-07	2.87E-08

391 Note:

392 ¹ To account for anticipated consolidation (densification) of the residue within the cell and corresponding reduction in residue
 393 permeability, average permeability used to estimate time for drainage to occur is assumed.

394 **Table 4.2.14-3 Summary of Shear Strength Parameters for the Material Relevant to the**
 395 **Hydrometallurgical Residue Facility**

Material	Model	Unit Weight (pcf)	Elasticity modulus, (psf)	ϕ (deg) ⁽¹⁾	Poisson's ratio, μ	Normal Consol. line slope, λ	Consol. Line slope, Swelling line slope, κ	Initial Void Ratio, e_o
Glacial Till	Linear Elastic	135	5.00E+05	-	0.30	-	-	-

DRAFT

1 **4.3 LAND EXCHANGE**

2 **4.3.1 Land Use**

3 The federal and non-federal lands were reviewed against parameters similar to the Mine Site and
4 Plant Site, including existing land use plans, zoning designations, public access routes, mineral
5 ownership and economic potential, and title.

6 Additionally, each tract of the Land Exchange Proposed Action was evaluated for the presence
7 of known existing hazardous material effects and contaminated sites and for the potential for
8 hazardous materials to currently affect the lands. Research to evaluate potential hazardous
9 materials or hazardous material sites on these land areas consisted of review of three types of
10 data sources, depending on the size and geographic spread of the land area. The data sources
11 used include:

- 12 • An ASTM/AAI Phase I ESA;
- 13 • An Environmental Regulatory Database search, which was conducted by Environmental
14 Data Resources, Inc. (EDR), and consists of a report of federal, state, local, or tribal agency
15 databases; and
- 16 • The MPCA website database titled, “What’s In My Neighborhood?”

17 A Phase I ESA provides a comprehensive review of environmental regulatory databases and
18 includes a physical site visit, interviews with property or adjacent property owners and local
19 officials, and review of historical data such as aerial photographs, topographic maps, fire
20 insurance maps, land title records, or property tax files. Conclusions are drawn based upon the
21 findings to identify recognized environmental conditions based on the comprehensive review and
22 the opinion of the environmental professional.

23 The Environmental Regulatory Database search defines and summarizes the ASTM databases
24 reviewed in the EDR report and notes whether any sites (including the target property) were
25 identified within a specified search radius. The database sites identified in the EDR report were
26 evaluated with respect to the target land area to determine which sites indicate hazardous
27 material effects.

28 The MPCA website database identifies potentially contaminated sites through a searchable
29 inventory of properties, as well as sites that have already been cleaned up and those currently
30 being investigated or cleaned up. The website also contains a searchable inventory of businesses
31 that have applied for and received different types of environmental permits and registrations
32 from the MPCA.

33 **4.3.1.1 Federal Lands**

34 **4.3.1.1.1 Land Exchange Proposed Action**

35 The boundaries of the federal lands include the Mine Site, as well as land to the north and west,
36 but exclude the privately owned land bordering Dunka Road to the south of the Mine Site.
37 Section 4.2.1.2 provides a discussion of the existing land use on the federal lands.

38 The Land Exchange Proposed Action includes 6,495.4 acres of federal lands with a perimeter of
39 approximately 23 linear miles. By comparison, Superior National Forest comprises 4,600,831.8
40 acres, of which 2,171,603.9 acres, with a perimeter of 10,054.8 linear miles (including the
41 federal lands), are managed by the USFS (the remainder are privately owned or managed in-
42 parcels). The majority of the federal lands are within the General Forest – Longer Rotation
43 Management Area, while the remainder is within the General Forest Management Area (see
44 Figure 4.3.1-1). These management areas are defined in Section 4.2.1.2. Table 4.3.1-1
45 summarizes the acreage of the federal lands, by management area, for the Land Exchange
46 Proposed Action.

47 There is no known existing contamination by hazardous materials in the federal lands.

48 **Table 4.3.1-1 Management Area Designations for the Federal Lands under the Land**
49 **Exchange Proposed Action**

Management Area Designation	Total Acreage
General Forest – Longer Rotation	6,140.1
General Forest	355.3

50 **4.3.1.1.2 Land Exchange Alternative B**

51 Under the Land Exchange Alternative B, 4,752.6 acres of federal lands would be exchanged for
52 the 4,926.3-acre Tract 1. Table 4.3.1-2 summarizes the acreage of the federal lands, by
53 management area, for the Land Exchange Alternative B. Section 4.3.1.2.1 describes Tract 1.

54 **Table 4.3.1-2 Management Area Designations for the Federal Lands under Land Exchange**
55 **Alternative B**

Management Area Designation	Total Acreage
General Forest – Longer Rotation	4,397.3
General Forest	355.3

56 **4.3.1.2 Non-federal Lands**

57 The non-federal lands comprise five tracts—each consisting of one or more individual parcels—
58 totaling 7,075.0 acres. The land use conditions of each tract are described below. Tracts 1 and 2
59 of the Land Exchange Proposed Action include areas with potential conservation value (i.e.,
60 cRNA Management Area and Riparian Emphasis Management Area). Some of the parcels within
61 Tract 2, Tract 3, and Tract 4 have limited accessibility by either road or foot trail, although there
62 are segments that show evidence of timber harvesting (see Figures 5.3.1-1 and 5.3.1-2).

63 **4.3.1.2.1 Tract 1 – Hay Lake Lands**

64 Tract 1 is located in central St. Louis County, approximately 3 miles north-northwest of the City
65 of Biwabik. The tract consists of one parcel covering approximately 4,926.3 acres, with a
66 perimeter of approximately 15 linear miles.

67 **Land Use Regulation**

68 Land use in Tract 1 is governed by the St. Louis County zoning ordinance. It is divided among
69 the following zoning districts (St. Louis County 2011):

- 70 • **Forest Agricultural Management (FAM-1):** This district recognizes and promotes the
71 development of forestry and agricultural industry and encourages recreational activity. It is
72 typically applied to areas with very low density land development. This district is located in
73 the northeast corner and occupies approximately 5 percent of the Tract 1 lands.
- 74 • **Forest Agricultural Management (FAM-2):** This district recognizes and promotes the
75 development of forestry and agricultural industry and encourages recreational activity. It is
76 typically applied to areas with very low density land development. Whereas FAM-1 has a
77 minimum parcel size of at least 35 acres, FAM-2 has a minimum parcel size of 17 acres. This
78 district is located throughout the parcel and occupies approximately 57 percent of the Tract 1
79 lands.
- 80 • **Sensitive Areas (SENS-3):** In addition to the forestry/agriculture focus embodied in the
81 FAM-2 district, the SENS-3 district also recognizes significant areas that are unsuitable for
82 intensive development due to the potential for environmental hazards or other features to
83 negatively affect environmental conditions. This classification surrounds most of Hay Lake
84 and Little Rice Lake, as well as a large portion of the river and riparian areas. This district is
85 located throughout the parcel and occupies approximately 33 percent of the Tract 1 lands.
- 86 • **Residential (RES-3):** This district recognizes and promotes residential development with
87 limited non-residential uses. This district is located northeast and southwest of Hay Lake and
88 occupies approximately 5 percent of the Tract 1 lands.

DRAFT

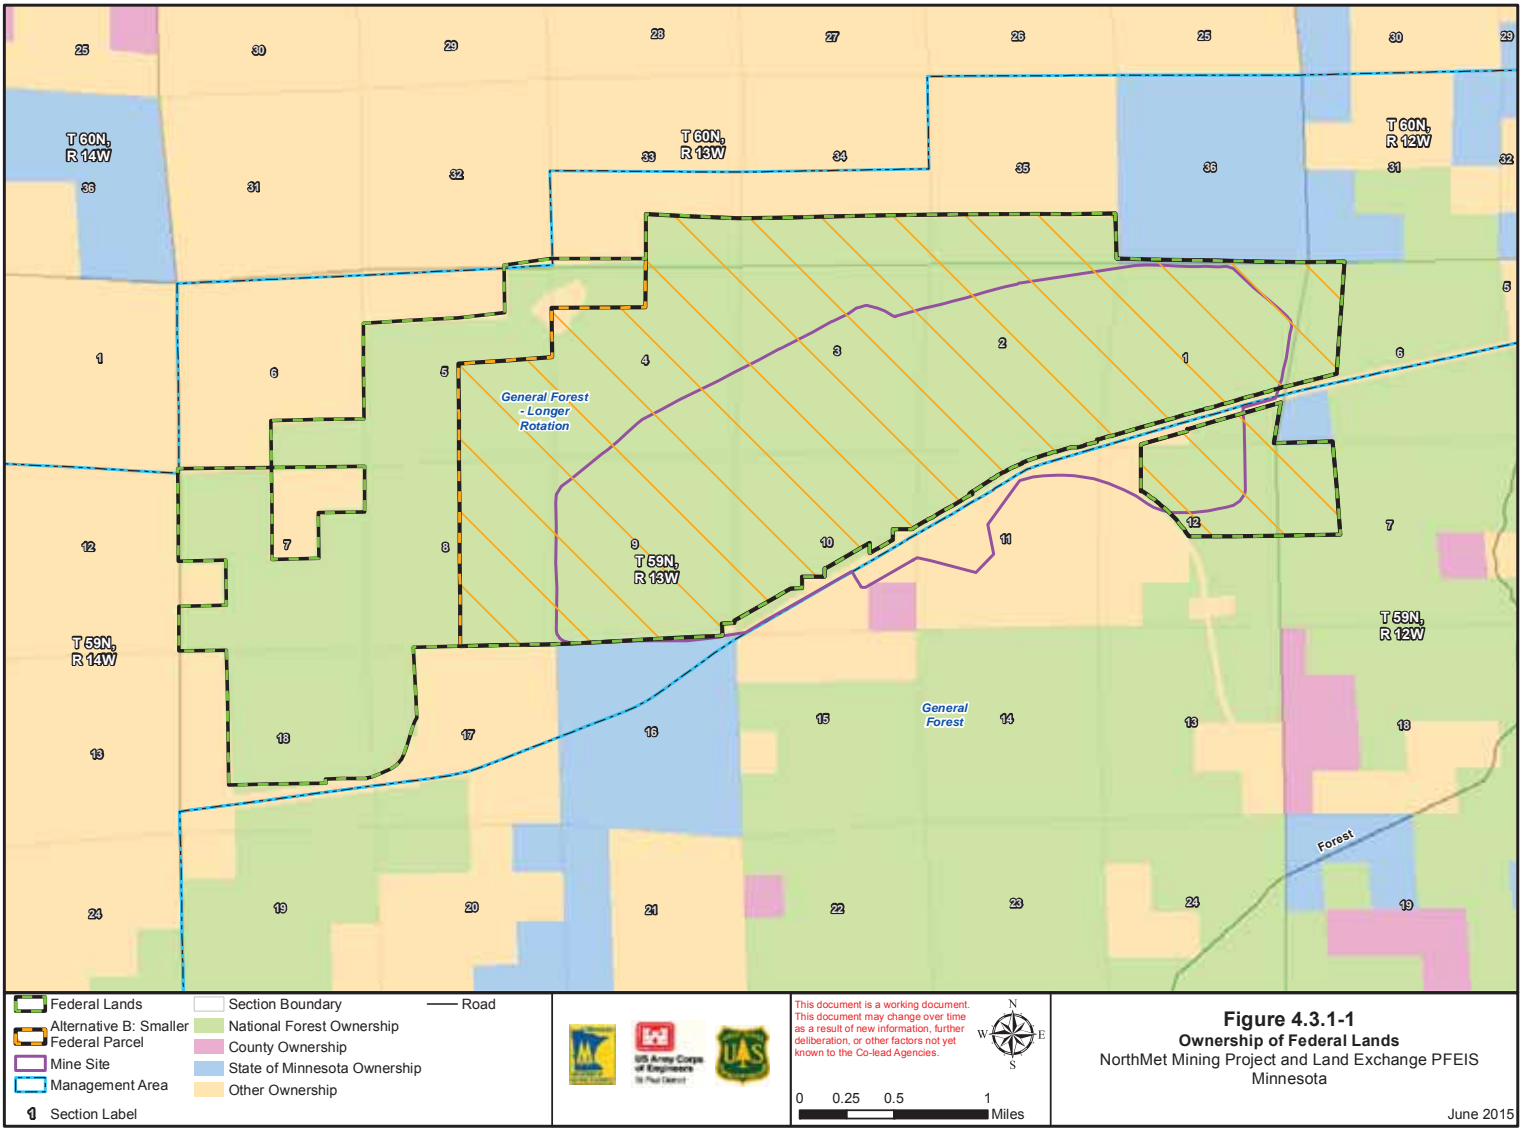

Figure 4.3.1-1
Ownership of Federal Lands
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

DRAFT

92 Adjacent to Tract 1 on the west and north are Superior National Forest lands that fall within the
93 General Forest Management Area. Two cRNA management areas adjoin the tract: Pike
94 Mountain on the southwest corner and Loka Lake on the northeast corner (USFS 2011b). The
95 cRNAs are designated by the USFS for the purpose of preserving and maintaining areas for
96 ecological research, observation, genetic conservation, monitoring, and educational activities. No
97 recreation facilities are provided in these management areas; while dispersed recreation occurs
98 (see Section 4.3.11.2.4), it is generally discouraged. The Pike Mountain cRNA is characterized
99 by a hardwoods forest plant community. The Loka Lake cRNA is characterized by high-quality
100 lowland black spruce and tamarack swamp (USFS 2011h).

101 Adjacent to Tract 1 to the south and east are privately owned lands within St. Louis County's
102 Multiple Use Non-Shoreland 4 (MUNS-4) zoning district. This designation allows for a diverse
103 array of development, such as residential, light industry, commercial, livestock, sanitary landfill,
104 airport, and utility facilities, among others (St. Louis County 2011).

105 As part of the Land Exchange Proposed Action, the non-federal lands were the subject of Phase I
106 ESAs. Potential areas of legacy contamination were discovered on Tract 1. These areas were
107 investigated and remediated through removal and disposal of potentially contaminated soil and
108 materials. Any remnant contamination (limited to two instances where less than 5 gallons of used
109 oil were spilled) is expected to degrade in situ (NTS 2011).

110 **Existing Land Use**

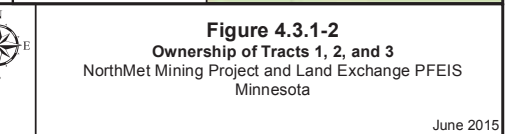

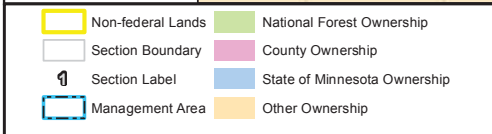

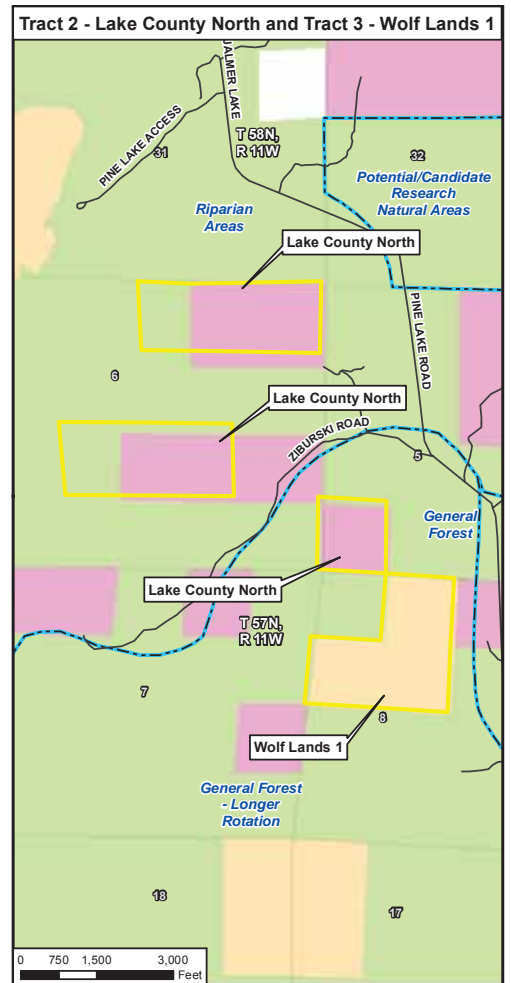

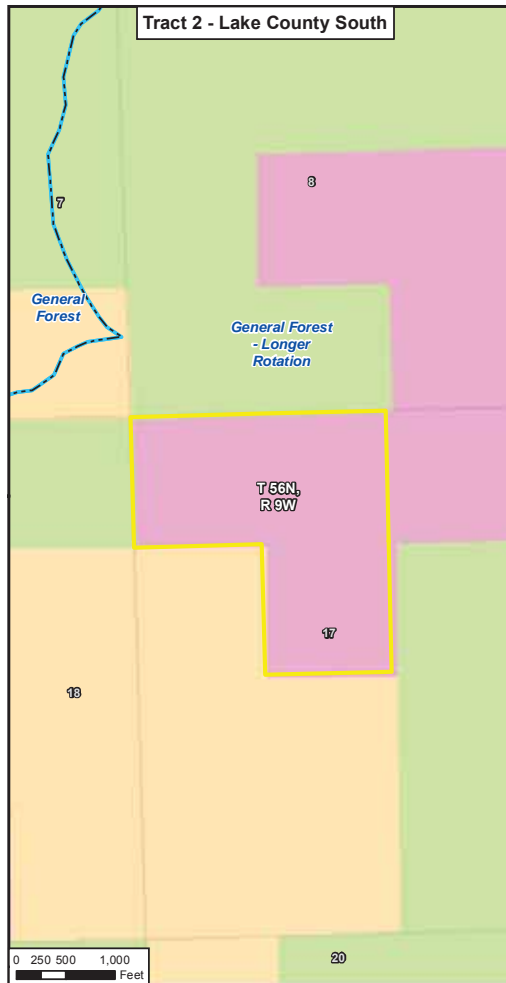

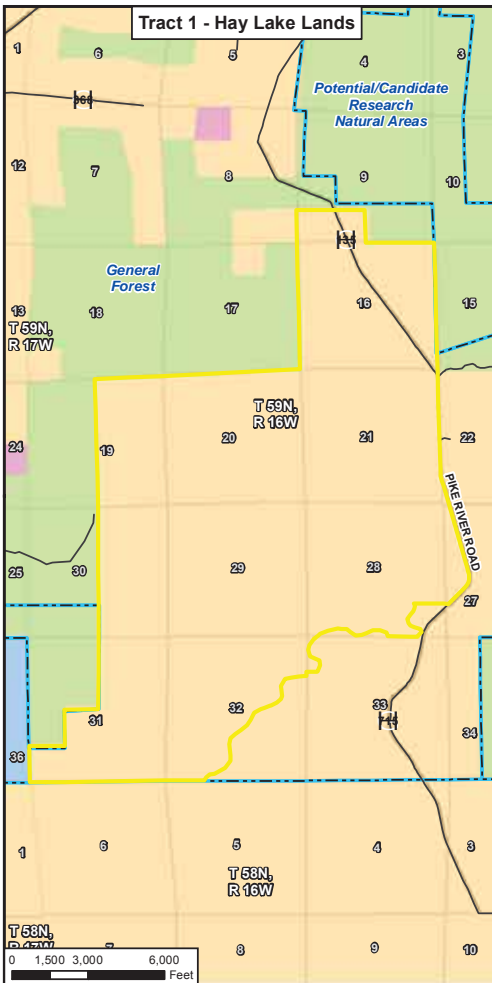

111 Tract 1 includes Hay Lake, identified as a wild rice water by the MDNR, Little Rice Lake, and
112 an unnamed lake (see Figure 4.3.1-2). Approximately eight miles of the upper Pike River flow
113 through Tract 1. An electrical transmission line crosses Sections 19, 20, 21, and a portion of
114 Section 16 (USFS 2011b). CR 715 forms part of the eastern boundary of the tract.

115 A small boat landing and primitive parking area provide access to the Pike River adjacent to CR
116 715. Several trails also emanate from CR 715, some with bridges crossing the upper Pike River;
117 all of these trails are gated or bermed. There is evidence that a sand/gravel pit near CR 715 has
118 been used as a dumping site in the recent past, but has been fully remediated and cleared of trash
119 and debris (NTS 2011). The gravel pit area is gated, but there is evidence that it has been used as
120 a shooting range. There are also numerous deer stands on the parcel (Lisson and Gawtry 2011).

121 **Property Rights, Title, and Mineral Resources**

122 PolyMet currently owns surface rights to Tract 1. The tract is subject to a mortgage in favor of
123 Iron Range Resources, which would be satisfied at closing of the Land Exchange Proposed
124 Action (USFS 2011c). Title to this parcel has been reviewed and approved by the USDA Office
125 of General Counsel so long as certain recommended affirmative title insurance is provided
126 (USFS 2011c).

DRAFT

DRAFT

131 Tract 1 was assessed for mineral resource potential as part of the Feasibility Analysis completed
132 in 2009 (USFS 2009c). The geology of the area is mostly granitic rocks with the southwestern-
133 most part underlain by metamorphosed basalts, gabbros, and sedimentary rocks. The mineral
134 potential for the tract was determined to be limited, as granitic rocks are not known to host
135 mineral deposits. The MDNR core library index showed no drilling on or near Tract 1.
136 Additional investigation in 2011 indicates potential for aggregate production from the
137 northeastern corner of the tract along the Pike River. Tract 1 appears to have a low potential for
138 exploration or development of bedrock or surficial deposits (Barr 2011c).

139 **Legacy Pollution**

140 The legacy pollution data review described in Section 4.3.1 found that hazardous materials may
141 be present on Tract 1, specifically along Pike River Drive in the northeastern portion of the tract,
142 and between Hay Lake and CR 715, west of the Pike River. The Phase I ESA for Tract 1
143 described several areas where releases of hazardous materials may exist due to unauthorized
144 dumping. The EDR report and MPCA database also identified three unauthorized or unpermitted
145 dump sites on Tract 1. The southernmost dump, west of the Pike River, is named Unauthorized
146 Dump-Biwabik. The two remaining dump sites, Unauthorized Dump-2 and Unnamed Dump-
147 Biwabik/2, are north of the first dump site and adjacent to CR 715. These types of dumps are
148 typically old farm, homestead, or municipal disposal sites that accepted household waste. There
149 are no records of inspection or enforcement actions at these sites in the MPCA database (NTS
150 2010a; EDR 2009a; MPCA 2012d); however, a subsequent Phase II investigation found no
151 evidence of spills or contamination, and found that legacy pollution had been resolved at the site
152 (NTS 2011).

153 **4.3.1.2.2 Tract 2 - Lake County Lands**

154 Tract 2 comprises four parcels in Lake County, southeast of Seven Beaver Lake, totaling 381.9
155 acres with a perimeter of approximately 7 linear miles. No hazardous material issues were
156 identified at Tract 2 (EDR 2011a; EDR 2011b; MPCA 2012d).

157 **Land Use Regulation**

158 All Lake County parcels fall within Lake County's Forest-Recreation zoning district (Nelson,
159 Pers. Comm., October 10, 2011). The Forest-Recreation district provides for remote residential
160 development distant from public services. It is intended to prevent the destruction of natural or
161 man-made resources, maintain large tracts for forest recreation purposes, provide for the
162 continuation of forest management and production programs, and foster recreational uses and
163 other compatible activities.

164 The Lake County North parcels are surrounded by land within two Superior National Forest
165 Management Areas (see Figure 4.3.1-2): the General Forest – Longer Rotation Management
166 Area (see Section 4.2.1.2) and the Riparian Emphasis Area Management Area. Lands in the
167 Riparian Emphasis Area are located along rivers and lakes that receive moderate to low levels of
168 recreation use. This designation promotes the restoration, protection, and enhancement of areas
169 sensitive to degradation. Lands surrounding Seven Beaver Lake and adjacent to Tract 2 are the
170 headwaters area of the St. Louis River, and are designated as a Riparian Emphasis Area
171 Management Area.

172 The Lake County South parcel is largely bordered by lands in the General Forest – Longer
173 Rotation Management Area. Adjacent parcels to the southwest are privately owned land; parcels
174 to the northeast are county land in the Forest-Recreation zoning district.

175 **Existing Land Use**

176 A trail provides access to the Lake County South parcels, but access to the trail is relatively
177 difficult (Lisson and Gawtry 2011). There is evidence of clearcut timber activity on the Lake
178 County North parcels.

179 There is limited access to the Lake County South parcel due to wetlands and private land
180 restrictions, and little evidence of active use (Lisson and Gawtry 2011).

181 **Property Rights, Title, and Mineral Resources**

182 Tract 2 parcels are tax forfeit lands that are being purchased in the name of Lake-Forest
183 Enterprise, Inc. on a land contract from Lake County. An assignment on file with Andresen and
184 Butterworth, PA assigns all right, title, and interest in these lands to PolyMet (USFS 2011c).

185 A review of mineral resources on Tract 2 indicates a low potential for exploration or
186 development of bedrock or surficial deposits (Barr 2011c). A title commitment review found that
187 one 40-acre parcel has one-half mineral interest outstanding and that all other minerals will be
188 reserved by the State of Minnesota and subject to the Secretary's Rules and Regulations. Within
189 the Lake County South parcel, one 40-acre parcel is subject to mineral reservation that includes
190 the right to sink, cave, disturb, or remove surface material. Another parcel has one-half
191 outstanding mineral interest with the right to remove but "doing no injury to the surface or else
192 paying for damages." The third and final 40-acre parcel and the remaining one-half mineral
193 interest would be reserved by the State of Minnesota and would be subject to the Secretary's
194 Rules and Regulations (USFS 2011c).

195 **4.3.1.2.3 Tract 3 – Wolf Lands**

196 The Wolf Lands consist of four separate parcels in Lake County totaling 1,575.8 acres with a
197 perimeter of approximately 14 linear miles. No hazardous material issues were identified at Tract
198 3 (EDR 2011b; EDR 2011c; EDR 2011d; EDR 2011e; MPCA 2012d).

199 **Land Use Regulation**

200 All Tract 3 parcels are within Lake County's Forest-Recreation zoning district, defined in
201 Section 4.3.1.2.3 (Nelson, Pers. Comm., October 10, 2011).

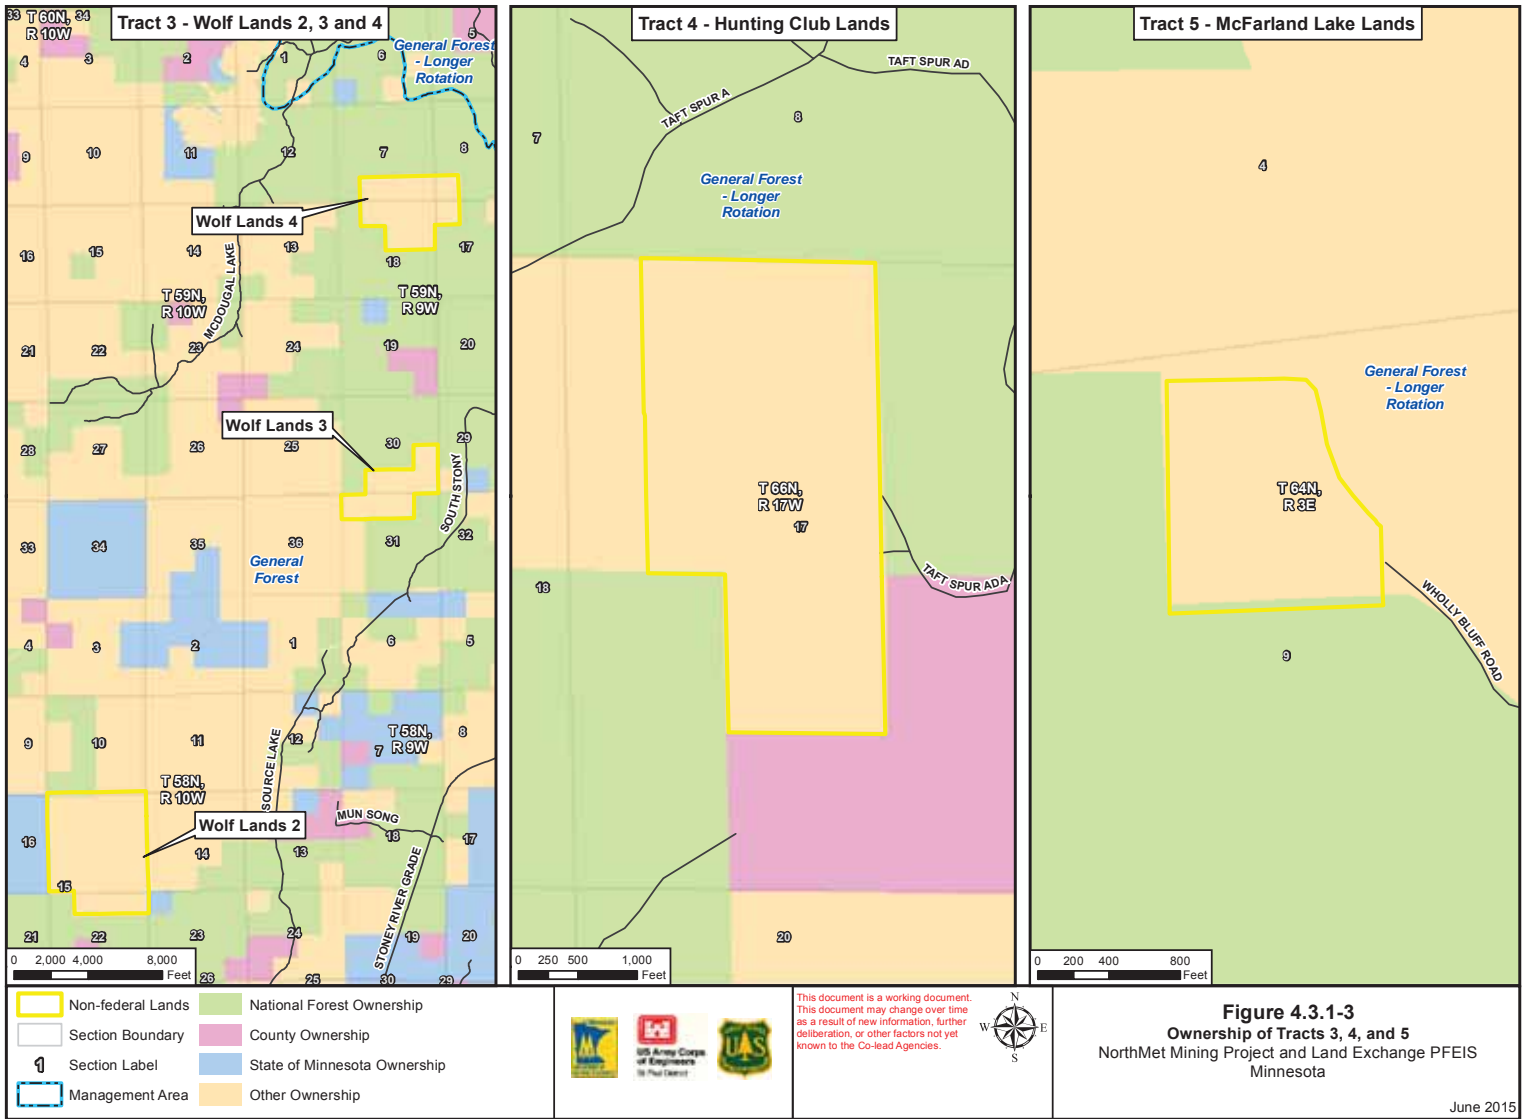

202 Wolf Lands 1, the southernmost parcel, is largely bordered by Superior National Forest land in
203 the General Forest-Longer Rotation Management Area. Adjacent parcels to the southwestern and
204 northeastern corners owned by Lake County are also within the Forest-Recreation district (see
205 Figure 4.3.1-2).

206 Wolf Lands 2 is bordered to the north and south by Superior National Forest land in the General
207 Forest Management Area. Adjacent parcels to the east are privately owned, in Lake County's
208 Forest-Recreation district. Adjacent parcels to the west and southeast are state-owned land (see
209 Figure 4.3.1-3).

210 Wolf Lands 3 is adjacent to Superior National Forest land in the General Forest Management
211 Area. Small privately owned parcels to the east and west are within Lake County's Forest-
212 Recreation district (see Figure 4.3.1-3). A timber harvest agreement currently encumbers parts of
213 this parcel (USFS 2011c).

DRAFT

DRAFT

DRAFT

218 Wolf Lands 4 is surrounded by Superior National Forest land in the General Forest Management
219 Area (see Figure 4.3.1-3).

220 **Existing Land Use**

221 Access to Wolf Lands 1 and 2 is limited by the distance from roads and the presence of wetlands
222 surrounding Wolf Lands 2. There is no evidence of any active land use on either of these parcels
223 (Lisson and Gawtry 2011).

224 Wolf Lands 3 is accessible from a trail off of Forest Road 393. There is evidence of ongoing
225 timber harvesting on this parcel (Lisson and Gawtry 2011).

226 Wolf Lands 4 is accessible via overland hiking from Forest Road 106, but there is no evidence of
227 active land use (Lisson and Gawtry 2011).

228 **Property Rights, Title, and Mineral Resources**

229 Tract 3 is being purchased in the name of Lake-Forest Enterprise, Inc., through options from
230 Wolf Lands, Inc. An assignment on file with Andersen and Butterworth, PA assigns all right,
231 title, and interest in these lands to PolyMet (USFS 2011c).

232 There appears to be low potential for exploration or development of bedrock or surficial deposits
233 on the Wolf Lands parcels. There is a moderate potential for aggregate development within Wolf
234 Lands 2, but the parcel's wetland areas and limited access may restrict this opportunity (Barr
235 2011c).

236 Within Wolf Lands 1, there is an undivided three-quarter mineral interest reserved by Anton T.
237 Anderson; all remaining mineral interests are held by Kimberly Clark with the right to cave,
238 disturb, damage, or remove the surface while accepting liability for surface damage. The title
239 commitment review indicated that this represents a poor condition of title but may be immaterial
240 because the mineral development potential is low. In addition, there is no timber reservation or
241 agreement in place (USFS 2011c).

242 Within Wolf Lands 2, 3, and 4, mineral interests are reserved by Duluth & Iron Range Railroad
243 Co. along with the right to sink, cave, disturb, and remove the surface. The title commitment
244 review indicated that this represents a poor condition of title that may be immaterial because the
245 mineral development potential is low.

246 There are no active timber reservations or agreements in place for the Wolf Lands parcels.

247 **4.3.1.2.4 Tract 4 – Hunting Club Lands**

248 Tract 4 is a single parcel southwest of Crane Lake in St. Louis County. It is composed of 160.0
249 acres, with a perimeter of approximately 2 linear miles. No hazardous material issues were
250 identified at Tract 4 (EDR 2011f; MPCA 2012d).

251 **Land Use Regulation**

252 Tract 4 is within St. Louis County's Forest Agricultural Management (FAM-1) zoning district.
253 This district is intended to promote the forestry and agricultural industries, as well as recreational
254 uses (St. Louis County 2011). Adjacent parcels on the west and southeast are also in this county
255 zoning district. Adjacent parcels to the southwest, north, and east are Superior National Forest
256 lands in the General Forest– Longer Rotation Management Area (see Figure 4.3.1-3).

257 **Existing Land Use**

258 Tract 4 is accessible by trail from a gravel road northwest of the property. The tract includes
259 portions of two small unnamed lakes. There is no evidence of active land use.

260 **Property Rights, Title, and Mineral Resources**

261 There is low potential for exploration or development of bedrock or surficial deposits within
262 Tract 4 (Barr 2011c). The only title exception is the property's enrollment in the Sustainable
263 Forest Incentive Act Covenant dated September 3, 2002. This status normally includes an 8-year
264 commitment for enrollment (USFS 2011c). The Sustainable Forest Incentive Act Covenant still
265 applies to Tract 4 according to the updated Commitment for Title Insurance for this parcel. The
266 covenant means the property is not and will not be:

- 267 • Used for residential purposes;
- 268 • Used for agricultural purposes;
- 269 • Enrolled in the Reinvest in Minnesota program or in a state or federal conservation reserve or
270 easement reserve program;
- 271 • Enrolled in the Minnesota Agricultural Property Tax Law;
- 272 • Subject to agricultural land preservation controls or restrictions or the Metropolitan
273 Agricultural Preserves Act; or
- 274 • Improved with a structure, pavement, sewer, permanent campsite, or any road (other than a
275 township road), that are used for purposes not prescribed in the forest management plan for
276 the property.

277 This covenant may need to be extinguished in order for the United States to accept title. The
278 acceptability of the covenant will be determined by the USDA, Office of General Counsel, if a
279 decision is made to proceed with the Land Exchange Proposed Action.

280 **4.3.1.2.5 Tract 5 – McFarland Lake Lands**

281 Tract 5 is a single parcel approximately 3 miles from the US-Canada border in Cook County. It
282 covers approximately 30.8 acres, with a perimeter of approximately one linear mile. No
283 hazardous material issues were identified on Tract 5 (NTS 2010b; EDR 2009b; MPCA 2012d).

284 **Land Use Regulation**

285 Tract 5 is in an unincorporated area in Cook County's Forest/Agriculture Residential (FAR 2)
286 zoning district. This designation is characterized by a mix of forestry, agriculture, residential,
287 and recreational uses (Cook County 2011). Adjacent privately owned parcels to the north and

288 southeast are also within this county zoning designation. The tract is bordered on the west and
289 south by Superior National Forest lands within the General Forest – Longer Rotation
290 Management Area (see Figure 4.3.1-3).

291 **Existing Land Use**

292 Tract 5 was formerly owned and used by Wheaton College. A bunkhouse, fire ring, outhouse,
293 and cistern are present, although these structures are not in active use and would be removed
294 prior to the completion of the Land Exchange Proposed Action. The tract’s eastern boundary is
295 formed by McFarland Lake, an entry point to the BWCAW. Access to the property is by water
296 from a landing off CR 16, or by a walking trail from the end of CR 16 (Lisson and Gawtry
297 2011).

298 **Property Rights, Title, and Mineral Resources**

299 PolyMet owns the surface rights for this tract. The tract is subject to a mortgage in favor of Iron
300 Range Resources, which would be satisfied at closing of the Land Exchange Proposed Action
301 (USFS 2011c).

302 The tract was assessed for mineral potential and encumbrances as part of the Feasibility Analysis
303 completed in 2009. The geology underlying the tract is composed of gabbro and sedimentary
304 rocks. Studies of the mineral potential in this area are rare because of the proximity to the
305 BWCAW, but this type of formation has not shown mineral potential elsewhere in the county.
306 The MDNR core library index shows no drilling in or near the area. There are no nearby gravel
307 operations that would indicate any potential for surficial materials (USFS 2009c).

308 There appears to be low potential for exploration or development of bedrock or surficial deposits
309 within Tract 5 (Barr 2011c). Mineral rights to Tract 5 are outstanding, but deeds do not appear to
310 waive the right to subjacent support (USFS 2011c) (i.e., mineral exploration and extraction may
311 not compromise the “lay of the land” by weakening underground support of the surface).

DRAFT

1 **4.3.2 Water Resources**

2 The federal lands are similar to the Mine Site area previously discussed, but excludes the
 3 privately-owned land bordering Dunka Road to the south of the Mine Site. Section 4.2.2 presents
 4 a discussion of the existing conditions on the federal lands. The water resources of the federal
 5 lands are briefly described in Section 4.3.2.1. Water resources of the non-federal lands are
 6 described in Section 4.3.2.2.

7 **4.3.2.1 Federal Lands**

8 **4.3.2.1.1 Land Exchange Proposed Action**

9 The Land Exchange Proposed Action consists of exchanging 6,495.4 acres of federal lands (see
 10 Figure 3.3-1) for 7,075.0 acres of non-federal lands. Most of the Mine Site is composed of
 11 federal lands, with a small portion located south of Dunka Road being non-federal lands. The
 12 Land Exchange Proposed Action also includes federal lands located north and west of the Mine
 13 Site.

14 **Groundwater**

15 Groundwater resources in and near the Mine Site are discussed in detail in Section 4.2.2.2.1. In
 16 general, the glacial aquifer within the Land Exchange Proposed Action federal lands is typically
 17 very thin (less than 30 ft) with limited yield; there are no large-scale regional aquifers (MPCA
 18 1995). The Duluth Complex, which immediately underlies the glacial material, is the least
 19 fractured of the bedrock units in the area, and therefore has the poorest aquifer characteristics.

20 **Surface Water**

21 Surface water resources in and near the Mine Site are discussed in detail in Section 4.2.2.2.2.
 22 Surface water resources within the Land Exchange Proposed Action federal lands include Mud
 23 Lake (PW-148P), and 3.8 miles of the Partridge River and 0.7 miles of Yelp Creek (see Table
 24 4.3.2-1), also a MDNR-designated public water resource. There are no known wild rice beds
 25 within these public waters.

26 **Table 4.3.2-1 Summary of Surface Water and Wild Rice Beds for Federal Lands**

	Federal Lands	
	Land Exchange Proposed Action	Land Exchange Alternative B
Public Water Lakes, ac. (mi. shore)	30.5 (0.9)	Approximately 8.9 (0.2)
Public Water Streams, mi. stream	4.5	4.5
Wild Rice Beds, ac.	--	--

27 Sources: PW data from MDNR 2012j; Wild Rice data from MDNR 2008c.

28 **4.3.2.1.2 Land Exchange Alternative B**

29 Land Exchange Alternative B: Smaller Federal Parcel lands are somewhat smaller than the Land
30 Exchange Proposed Action, totaling 4,752.6 acres, which excludes the far western portion of the
31 Land Exchange Proposed Action federal land area (see Figure 3.3-1). The Land Exchange
32 Alternative B consists of exchanging 4,752.6 acres of federal lands for 4,926.3 acres of non-
33 federal lands.

34 **Groundwater**

35 Groundwater resources of the Land Exchange Alternative B: Smaller Federal Parcel lands are
36 essentially the same as those of the Land Exchange Proposed Action.

37 **Surface Water**

38 Surface water resources of the Land Exchange Alternative B: Smaller Federal Parcel lands are
39 essentially the same as those of the Land Exchange Proposed Action, with the exception that the
40 northwest boundary of the Land Exchange Alternative B bisects Mud Lake, including only about
41 30 percent of its shoreline.

42 **4.3.2.2 Non-federal Lands**

43 Water resources considered in this evaluation of the five non-federal land tracts proposed for
44 exchange include the following:

- 45 • Quality and flow of groundwater;
46 • Quality and flow of surface water; and
47 • Quantity of wild rice beds.

48 **4.3.2.2.1 Regional Groundwater Resources**

49 **Regional Groundwater Water Quality**

50 There are no known, site-specific groundwater quality data for any of the non-federal Land
51 Exchange Proposed Action lands. However, there were two studies that collected surficial
52 groundwater quality data throughout the region that may be used to generally characterize
53 potential groundwater quality at the exchange sites. The MPCA studied groundwater quality
54 throughout the state, and published several documents that describe the general condition of the
55 groundwater resource in northeast Minnesota. They note that glacial aquifers in this part of the
56 state are commonly thin and limited in their extent and yield; there are no large-scale regional
57 aquifers (MPCA 1995). The Regional Copper-Nickel Study (Seigel and Ericson 1980) generally
58 focused on the area around the Duluth Complex, so data from that study may not be as broadly
59 applicable.

60 In addition, between 1992 and 1996, the MPCA's Ground Water Monitoring and Assessment
61 Program sampled 21 wells completed in surficial sand and gravel aquifers and 64 completed in
62 buried, confined sand and gravel aquifers within MPCA Region 1, which encompasses seven
63 counties in northeastern Minnesota including St. Louis County (MPCA 1999a). The MPCA
64 study concluded that groundwater quality across the region is generally good. Concentrations of
65 major cations and anions were lower in surficial and buried drift aquifers compared to similar

66 aquifers statewide, while concentrations of trace metals were higher. They noted that since
 67 geology controls groundwater quality in the region, trace inorganic constituents commonly found
 68 in the bedrock, such as beryllium, manganese, boron, arsenic, and selenium may have naturally
 69 elevated concentrations locally. Of the 85 surficial and buried aquifer samples that were
 70 collected, MPCA recorded five exceedances of the state drinking water criteria for beryllium,
 71 four for manganese, and one for boron. There were no exceedances noted for arsenic or
 72 selenium.

73 Although these data may not be directly applicable to any one of the Land Exchange Proposed
 74 Action lands, they can be used to draw general conclusions about the probable range of water
 75 quality. Table 4.2.2-6 summarizes Mine Site groundwater quality data and compares it with the
 76 MPCA (i.e., Northeast MN Baseline) and copper-nickel (i.e., Cu-Ni Baseline) study data for
 77 surficial aquifers. The range of values across the region for the five constituents of concern noted
 78 by the MPCA was generally comparable to the ranges monitored at the Mine Site, with the
 79 exception of manganese, which was higher for some of the regional samples.

80 ***Probable Groundwater Source Areas for the Exchange Lands***

81 As suggested by the MPCA study for the northeast region, all of the exchange tracts, with the
 82 possible exception of the Tract 1, appear to be characterized by thin glacial aquifers with limited
 83 yield. Source areas of surficial groundwater also appear to be limited, usually within a mile or
 84 two of each tract.

85 The general applicability of the regional, surficial data to the exchange lands is somewhat
 86 dependent on the potential for local anthropogenic (man-made) contamination of groundwater. A
 87 cursory evaluation of the surficial groundwater source area for each parcel is made in the
 88 groundwater discussion for each of the tracts below.

89 **4.3.2.2.2 Surface Water Resources**

90 The five tracts drain either south to the Lake Superior Watershed or north to the Hudson Bay
 91 Watershed. Except for timber harvest, they are all generally undisturbed with native forest cover.
 92 Little, if any, hydrologic or water quality data has been collected for any of the tracts. The
 93 surface water resources of each tract are described below. Table 4.3.2-2 summarizes the surface
 94 water and wild rice beds of each tract.

95 ***Table 4.3.2-2 Summary of Surface Water and Wild Rice Beds for all Land Exchange***
 96 ***Proposed Action Tracts***

	Non-federal Lands					Non-federal Totals
	Tract 1 – Hay Lake Lands	Tract 2 – Lake County Lands	Tract 3- Wolf Lands	Tract 4 – Hunting Club Lands	Tract 5 – McFarland Lake Lands	
Public Water Lakes, ac. (mi. shore)	125.7 (2.8)	--	--	--	0 (0.2)	125.7 (3.0)
Public Water Streams, mi. stream	8.1	--	1.0	--	--	9.1
Wild Rice Beds, acres.	125.7	--	--	--	--	125.7

97 Sources: PW data from MDNR 2012j; Wild Rice data from MDNR 2008c.

98 **4.3.2.2.3 Tract 1 – Hay Lake Lands**

99 **Groundwater**

100 This tract would appear to be the most susceptible of all the tracts to anthropogenic influences
101 since it is located only a few miles away from the Mesabi Iron Range and several local
102 communities. However, a natural topographic and bedrock divide separates most of the Mesabi
103 Iron Range mining activities from the tract, meaning that surficial groundwater flow to the tract
104 is isolated from most mining and community influences. One mining feature within the same
105 watershed (Pike River) is ArcelorMittal Steel’s Tailings Basin, located about 0.5 miles to the
106 west. The general topography of the area suggests that groundwater flow from the Tailings Basin
107 is to the northeast, away from the Hay Lake lands. Limited surface water quality data from Hay
108 Lake and Rice Lake indicate that sulfate concentrations vary between less than 1.0 and 3.6 mg/L
109 (Barr 2012a), indicating no influence from the Tailings Basin.

110 Three piles of household waste and soil with minor oil impacts were removed from the Hay Lake
111 tract by PolyMet. Confirmation soil sampling and analyses indicated all impacted soils were
112 removed, and found no evidence that contamination had migrated to groundwater (NTS 2011).

113 **Surface Water**

114 Hay Lake lands drain to the Pike River, which flows into Lake Vermilion near Tower, Minnesota
115 (see Figure 4.3.2-1). The lands contain two MDNR-designated public water lakes—Hay Lake
116 (PW 69-579P) and Rice Lake (PW 69-578W). Hay Lake is 96.2 acres with 1.9 miles of
117 shoreline; Rice Lake is 29.5 acres with about 1 mile of shoreline. This tract also contains about
118 8 miles of the Pike River, an MDNR-designated public water stream. Hay Lake, Rice Lake, and
119 the Pike River, all of which contain wild rice beds, lie within the Hay Lake lands. These are the
120 only waterbodies within the proposed non-federal land exchange tracts known to contain wild
121 rice beds. These waterbodies were included in four annual wild rice surveys performed from
122 2009 to 2012 (Barr 2011a; 2012a; 2013m); survey results were similar for 2009-2011 with no
123 apparent trends in density or distribution. Hay Lake was found to have small, low density wild
124 rice beds (density factor 1 of 5) across the entire lake. Rice Lake was found to have many beds
125 across the entire lake with density factor ratings of 3 to 5. Pike River was also found to have beds
126 with density factor ratings of 3 to 5 across the entire river near Rice Lake, with near-bank beds
127 further upstream. The survey performed in 2012 found lower densities of wild rice beds. Hay
128 Lake, Rice Lake, and the Pike River all had density factor ratings of 1. The decreases in density
129 in Rice Lake and the Pike River were consistent with a decrease in wild rice bed density across
130 all areas surveyed in 2012.

131 ArcelorMittal Steel’s Tailings Basin is located about 2 miles northwest of Hay Lake (see Figure
132 4.3.2-1). Seepage from the basin flows north into Wouri Creek, which is also a tributary to Pike
133 River. Three water quality samples taken from Hay Lake during the summer of 2009 all had a
134 sulfate concentration of 1.1 mg/L, and one sample taken in 2010 had a sulfate concentration less
135 than 1 mg/L (Barr 2011a), suggesting that seepage from the ArcelorMittal Steel’s Tailings Basin
136 is not reaching the lake. Water clarity was estimated at 6 to 12 ft based on 1999-2001 satellite
137 imagery. Sulfate concentrations in Rice Lake and in the Pike River just downstream of Rice Lake
138 were measured annually from 2009 to 2012 during the wild rice surveys. Sulfate concentrations
139 in Rice Lake ranged from 2.1 to 2.4 mg/L. Sulfate concentrations in the Pike River just

140 downstream of Rice Lake ranged from 2.1 to 3.6 mg/L (Barr 2013l). There are no other known
141 water quality data for this tract.

142 **4.3.2.2.4 Tract 2 – Lake County Lands**

143 **Groundwater**

144 The Lake County lands are located near the headwaters of small, tributary streams with local
145 source areas for groundwater. There are no known land-use activities within the source areas that
146 suggest the potential for detrimental effects to groundwater quality.

147 **Surface Water**

148 This tract contains four parcels; three are located in close proximity to each other with a fourth
149 parcel located about 14 miles to the southeast (see Figure 4.3.2-2 and Figure 4.3.2-3). There are
150 no DNR-designated public waters within Tract 2. The three clustered parcels flow to the
151 southwest through a series of small streams that are tributaries to the Cloquet River. The Cloquet
152 River drains into the St. Louis River, which ultimately drains into Lake Superior. The Lake
153 County South parcel flows to a tributary of the Beaver River (MDNR-designated public water
154 stream), which ultimately drains into Lake Superior. There are no known water quality data for
155 this tract.

156 **4.3.2.2.5 Tract 3 – Wolf Lands**

157 **Groundwater**

158 The Wolf Lands are located near the headwaters of small, tributary streams with local source
159 areas for groundwater. There are no known land-use activities within the source areas that
160 suggest the potential for detrimental effects to groundwater quality.

161 **Surface Water**

162 This tract consists of four parcels (see Figure 4.3.2-3, Figure 4.3.2-4, Figure 4.3.2-5, and Figure
163 4.3.2-6). Wolf Lands 1 is located immediately adjacent to the Lake County lands, contains no
164 protected waters, and discharges to the same Cloquet River tributary as the Lake County lands.

165 Wolf Lands 2 is located adjacent to two creeks that are tributaries to Greenwood Lake; Mary
166 Ann Creek is located to the west and an unnamed creek is located to the southeast. Greenwood
167 Lake flows northerly to the Stony River. There are no public waters within this parcel.

168 Coyote Creek flows within the northern portion of Wolf Lands 3 and bifurcates Wolf Lands 4.
169 Coyote Creek is a tributary and a MDNR-designated public water stream to McDougal Lake,
170 which eventually flows into Stony River. Wolf Lands 3 contains 0.1 mile and Wolf Lands 4
171 contains 0.9 mile of Coyote Creek. There are no known water quality data for this tract.

172 **4.3.2.2.6 Tract 4 – Hunting Club Lands**

173 **Groundwater**

174 The Hunting Club lands are located near the headwaters of small, tributary streams with local
175 source areas for groundwater. There are no known land-use activities within the source areas that
176 suggest the potential for detrimental effects to groundwater quality.

177 **Surface Water**

178 This entire tract drains into an unnamed tributary of the Vermilion River, which flows north to
179 Crane Lake (see Figure 4.3.2-7). There are no DNR-designated public waters within this land.
180 There are no known water quality data for this tract.

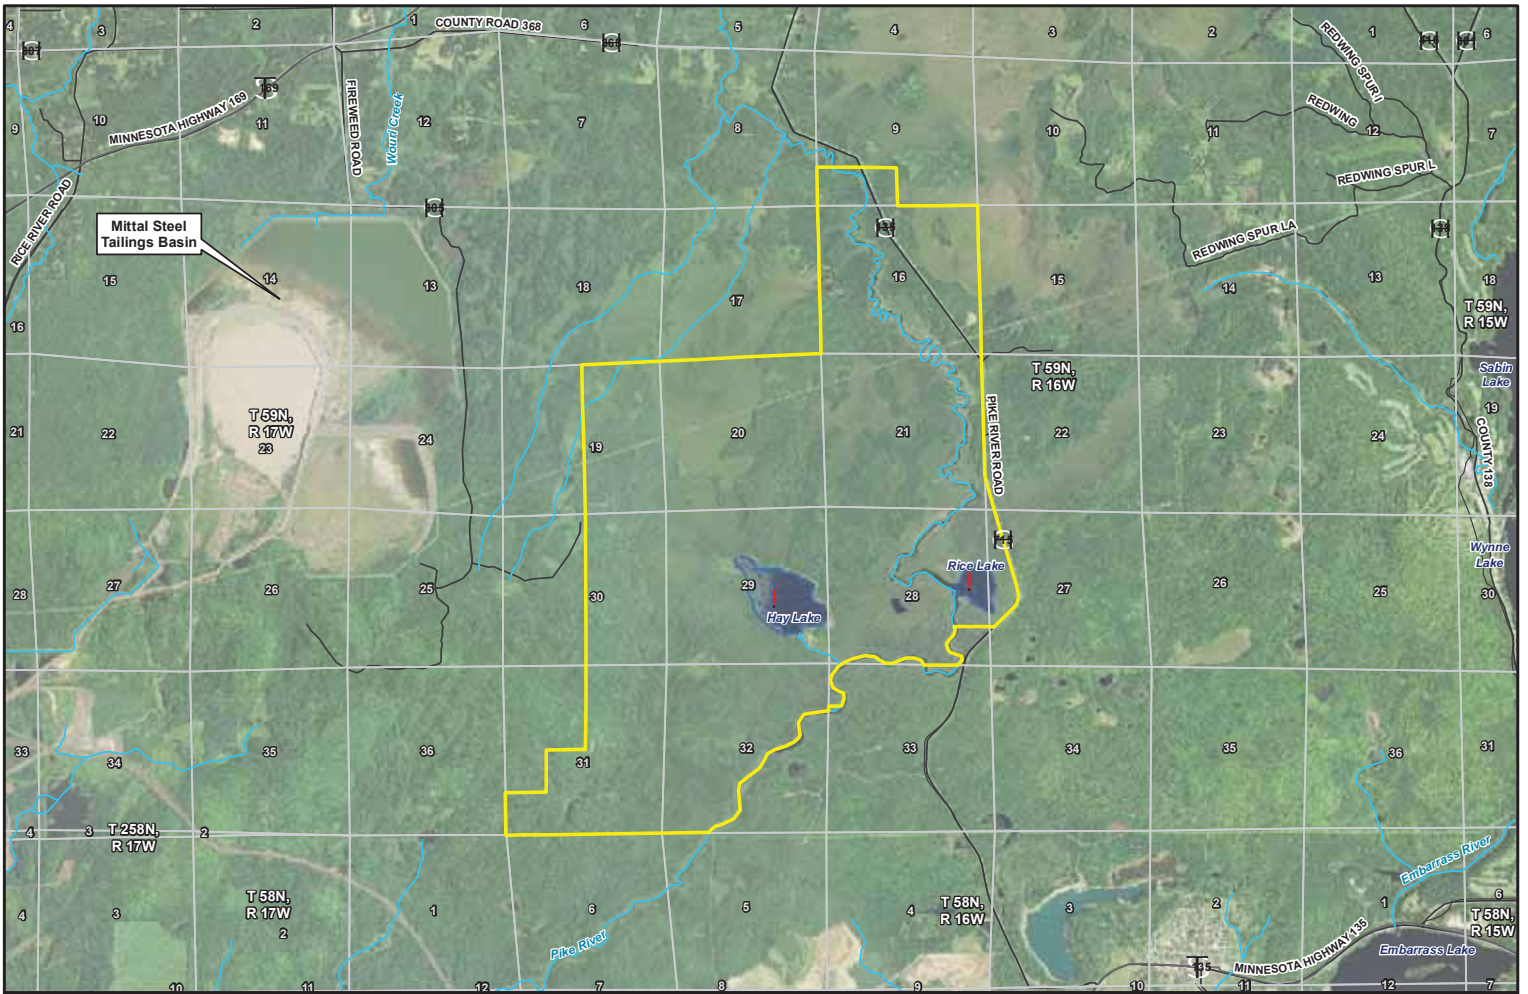

181 **4.3.2.2.7 Tract 5 – McFarland Lake Lands**

182 **Groundwater**

183 The McFarland Lake lands may have the most limited groundwater resource of all the tracts due
184 to very shallow glacial material over bedrock. Source areas for groundwater flow to the tract
185 appear to be limited to the tract itself and a small, undeveloped drainage 0.5 mile northwest of
186 the tract. There are no known land-use activities within the source area that could potentially
187 affect groundwater quality.

188 **Surface Water**

189 This tract is tributary to McFarland Lake (MDNR PW 027P), which drains into the border lakes
190 of the BWCAW (see Figure 4.3.2-8). It contains about 0.2 mile of McFarland Lake shoreline.
191 There is no known water quality data for this tract or for McFarland Lake, other than 13 secchi
192 disk (water clarity) readings taken from 1989 through 2008. The average secchi disk reading was
193 16.1 ft, which is near the high end of the typical range for water clarity in this region of
194 Minnesota. This secchi disk reading indicates that McFarland Lake is about mid-way between
195 oligotrophic and mesotrophic, which suggests that the lake has relatively low nutrient
196 enrichment.

DRAFT

1 **4.3.3 Wetlands**

2 **4.3.3.1 Federal Lands**

3 The federal lands, both the Land Exchange Proposed Action and Land Exchange Alternative B
4 boundaries, are located in the Partridge River Watershed, about 3 miles south of the Laurentian
5 Divide (see Figures 4.3.3-1 and 4.2.2-1). As previously stated, the Partridge River is located in
6 the East St. Louis River Watershed, which discharges into Lake Superior. Much of the federal
7 lands consist of wetlands and the Land Exchange Proposed Action boundary includes a portion
8 of the One Hundred Mile Swamp. The One Hundred Mile Swamp (see Figure 4.3.3-1) is a large
9 wetland of approximately 3,028 acres that was aerially surveyed by the MDNR as part of a larger
10 study (MDNR 1997); however, no delineated boundary exists for the One Hundred Mile Swamp.
11 The following sections provide baseline information on the Land Exchange Proposed Action and
12 Land Exchange Alternative B boundaries.

13 **4.3.3.1.1 Land Exchange Proposed Action**

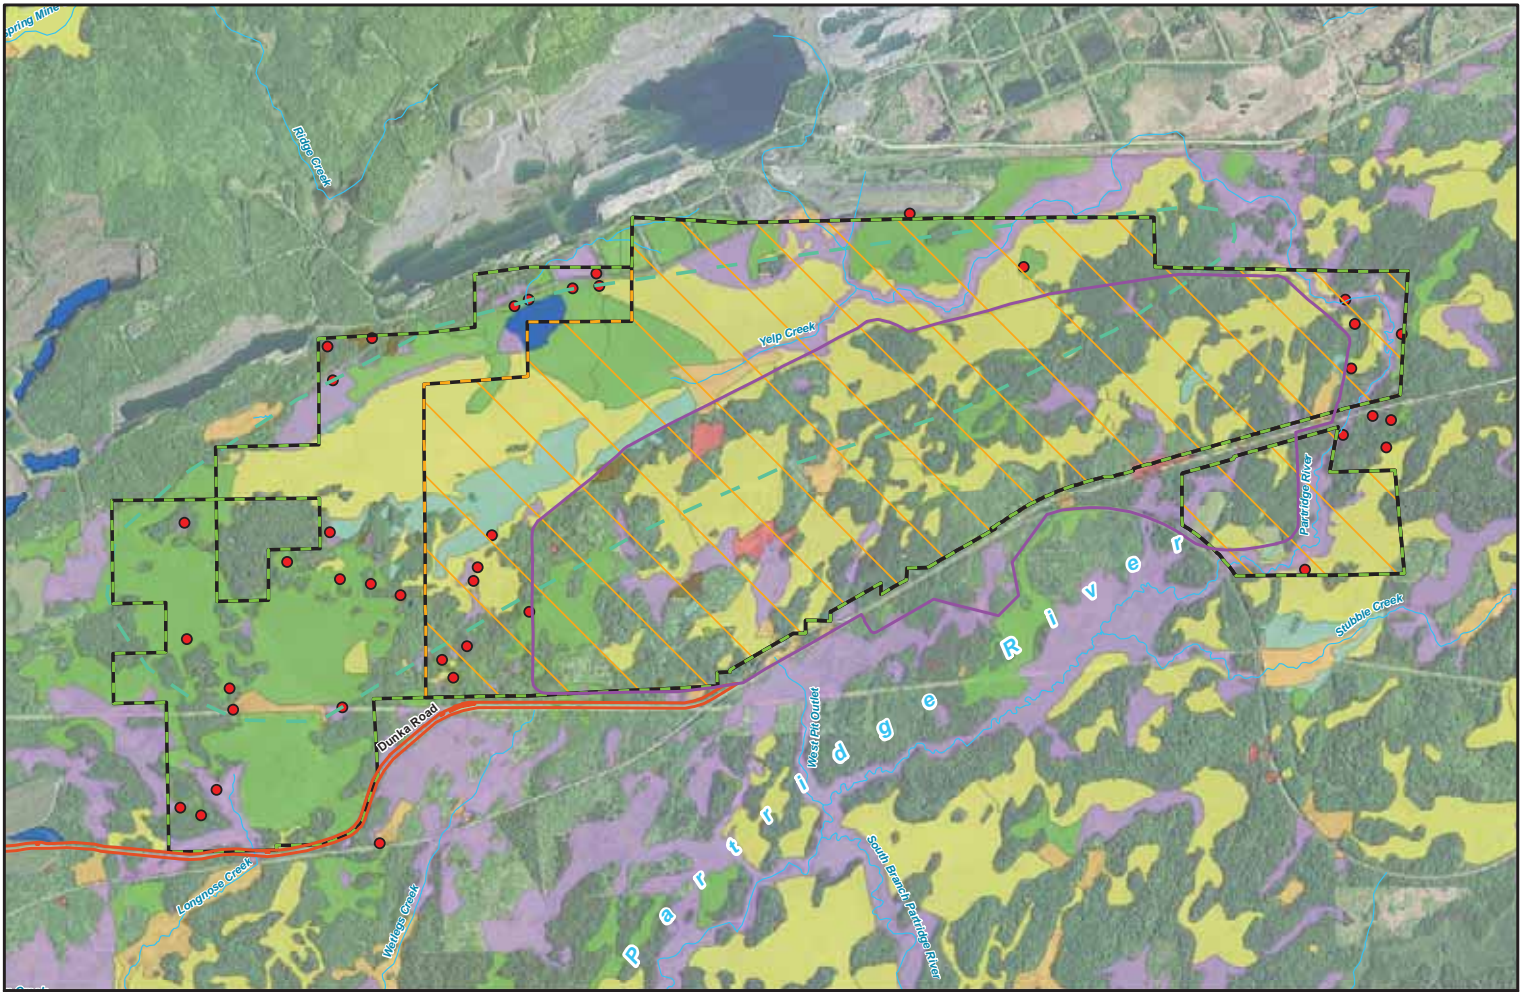

14 **Wetland Delineation and Classification**

15 Wetland characterization, mapping, and surveys for the federal lands were conducted between
16 2004 and 2010. The wetland delineation and classification is the same as described in Section
17 4.2.3.1.1. The federal lands within the Land Exchange Proposed Action encompass 6,495.4 acres
18 (see Figure 4.3.3-1).

19 A wetland delineation of the federal lands surrounding the Mine Site was subsequently
20 conducted in August 2004, June 2005, and July 2006. Between 2007 and 2010, additional
21 wetlands within the federal lands adjacent to the Mine Site were identified from aerial
22 photographic interpretation and field studies. In August 2008, additional upland and wetland
23 habitat surveys were conducted on the areas outside the Mine Site on the adjoining federal lands.
24 Initially, potential wetland locations were determined by reviewing CIR aerial photographs,
25 USGS topographic maps, and wetland maps previously prepared. Aerial photographs and field
26 maps were then used in the field to verify cover types. Upon completion of field studies, cover
27 types were mapped as habitat polygons. Polygons were digitized using GIS and overlaid onto
28 habitat maps created from aerial photographs. These maps and the associated GIS database were
29 used to determine the approximate acreage of each wetland type.

30 During the field surveys, data was collected related to the overall functions and values of the
31 wetlands within the federal lands associated with the Mine Site (see Section 4.2.3.1.3) and of
32 representative wetlands within the federal lands adjacent to the Mine Site. Wetland functions and
33 values were rated using the guidelines in the MnRAM, Versions 3.0-3.2.

DRAFT

37 **Hydrology, Wetland Vegetation, and Community Types**

38 The hydrology, wetland vegetation, and community types of the federal lands within the Land
39 Exchange Proposed Action include those elements within the Mine Site boundary (see Section
40 4.2.3.1.2), as well as the adjoining federal lands to the northwest. The hydrology, wetland
41 vegetation, and community types are discussed below.

42 Bogs in the federal lands consist of leatherleaf and bog Labrador-tea, with scattered speckled
43 alder, swamp birch, tamarack, and, in some areas, cattail and sedges. Sphagnum moss was
44 observed to cover 80 to 90 percent of the bogs. Other species encountered during the field work
45 include: black spruce, tamarack, blueberry, small fruited bog cranberry, willows, purple pitcher
46 plant, marsh cinquefoil, cottongrass, round sundew, starflower, bunchberry, and Solomon's seal
47 (AECOM 2011a).

48 Shrub swamp communities on the adjoining federal lands surrounding the Mine Site were
49 observed to consist of a dense cover of speckled alder. These wetlands typically include sapling
50 balsam fir, jack pine, black spruce, willow, and the occasional American mountain-ash.
51 Dominant low shrubs include bog Labrador-tea, leatherleaf, lowbush blueberry, prickly rose,
52 raspberry, and red-osier dogwood. Mountain maple saplings were also present during the field
53 work in a few wetlands. Herbaceous layer species include club and sphagnum mosses, woolly
54 sedge, bluejoint, horsetail, wood fern, bunchberry, bluebead lily, starflower, and creeping
55 snowberry (AECOM 2011a).

56 The forested swamp communities (coniferous swamps and hardwood swamps) for the federal
57 lands surrounding the Mine Site are also dominated by black spruce and northern white cedar,
58 with scattered tamarack. Deciduous and mixed forest wetlands are uncommon; aspen is the
59 dominant deciduous species found in these forests. Much of One Hundred Mile Swamp consists
60 of mature (80-plus years) black spruce and northern white cedar. Bog Labrador-tea, leatherleaf,
61 and blueberry are prevalent, as is spruce regeneration. In some areas with dense stands of spruce,
62 few shrubs were seen during field surveys, but sphagnum and club mosses often covered nearly
63 100 percent of the ground. More open stands may have an understory comprised of shrubs and
64 scattered sapling white cedar, tamarack, and black spruce, along with speckled alder and willow.
65 Common species include bluebead lily, Solomon's seal, horsetail, starflower, and creeping
66 snowberry. Some areas also have cottongrass and bog laurel. An area in the southern portion of
67 One Hundred Mile Swamp has a large number of purple pitcher plants. Forest and shrub cover
68 typically range from 40 to 70 percent, while moss and other understory vegetation cover from 60
69 to 90 percent of the ground (AECOM 2011a).

70 There were several ponds/inland fresh meadow (emergent) wetlands identified on the federal
71 lands surrounding the Mine Site that were created by logging activities, road construction, or
72 beaver dams, or were natural depressions or associated with the Partridge River. These wetlands
73 were often dominated by bluejoint, sedges, and cattails. Water depths were several feet in deeper
74 areas. Spruce and other trees associated with the wetland were often killed when flooded as a
75 result of the rising water level. Willows, tamarack, and speckled alder were often found along the
76 border of these wetlands, but comprised less than 20 percent of the cover. Wild iris is common in
77 some inland fresh meadow wetlands, as was horsetail, burreed, spikerush, and woolly sedge
78 (AECOM 2011a).

79 The wetland assessment identified 200 wetlands covering 4,164.4 acres (64 percent) within the
 80 6,495.4 acre federal lands boundary (see Figure 4.3.3-1). Table 4.3.3-1 below summarizes the
 81 wetland areas within the federal lands represented by each Eggers and Reed (1997; 2014)
 82 wetland community type. A large portion of the wetlands within the federal lands are located in
 83 the floodplains of Yelp Creek and the Partridge River or one of their associated tributaries. The
 84 most common wetland types within the federal lands are coniferous bogs (approximately
 85 47 percent), coniferous swamps (31 percent), and shrub swamps (approximately 13 percent),
 86 which includes alder thickets and shrub-carrs.

87 Other wetland community types present within the federal lands include open bog, shallow
 88 marsh, hardwood swamp, open water, and sedge/wet meadows. Section 4.2.3.1.2 provides a
 89 discussion on the hydrology, wetland vegetation, and community types of the federal lands.

90 **Table 4.3.3-1 Wetland Acreage by Wetland Community Type for the Federal Lands within**
 91 **the Land Exchange Proposed Action and within the Land Exchange**
 92 **Alternative B**

Eggers and Reed Class ¹	Land Exchange Proposed Action		Land Exchange Alternative B	
	Acres	%	Acres	%
Coniferous bog	1,961.4	47	1,677.0	59
Coniferous swamp	1,287.8	31	476.1	17
Deep marsh	0.0	0	0.0	0
Hardwood swamp	21.1	<1	13.7	<1
Open bog	209.5	5	175.0	6
Open water (includes shallow, open water, and lakes)	30.8	1	8.6	<1

Shrub swamp (includes alder thicket and shrub-carr)	521.1	13	394.7	14
Total	4,164.4	100	2,860.9	100

93 Note:
 94 ¹ Eggers and Reed 1997; 2014.

95 **Wetland Functional Assessment**

96 The Land Exchange Proposed Action federal lands include the Mine Site area as well as the
 97 adjoining federal lands to the northwest. The wetland function and values assessment for the
 98 Mine Site is described in 4.2.3.1.3 and wetlands function and values for the federal lands
 99 surrounding the Mine Site are provided below.

100 During the surveys conducted for the federal lands surrounding the Mine Site, the primary
 101 wetland functions rated by MnRAM 3.2 were evaluated based on a review of the following:
 102 1) wetland soil, hydrology, and vegetation; 2) outlet characteristics; 3) watershed and adjacent
 103 upland land uses and conditions; 4) erosion and sedimentation; and 5) human disturbances
 104 (AECOM 2011a). The Eggers and Reed (1997; 2014) classification system was used to classify
 105 wetland communities for the wetland function and value evaluation. Landscape factors were
 106 typically evaluated on a larger scale. Sixty-three questions given in MnRAM 3.2 were addressed
 107 for the August 2008 field surveys, and all factors were evaluated for each wetland surveyed.
 108 Based on this assessment methodology, wetlands were rated high, medium, or low.

109 The wetland functions that were typically most applicable to the federal lands include the
110 following:

- 111 • Maintenance of characteristic hydrologic regime;
- 112 • Maintenance of wetland water quality;
- 113 • Vegetative diversity/integrity;
- 114 • Maintenance of characteristic wildlife habitat structure;
- 115 • Downstream water quality;
- 116 • Groundwater interaction; and
- 117 • Aesthetics/recreation/education/cultural.

118 During 2008, 40 wetlands, or portions of wetlands, were evaluated for their functions and values
119 at representative wetland locations within the federal lands outside the Mine Site boundary (see
120 Figure 4.2.3-2 and Table 4.3.3-2); nearly all wetlands were rated with a high value
121 (approximately 93 percent) for wetland functions based on minimal or no current disturbance.
122 Only a small subset (approximately 7 percent) of the wetlands was disturbed wetlands (AECOM
123 2011d). Vegetation diversity/integrity was high for 93 percent of the wetlands because they have
124 been minimally altered by recent anthropogenic factors and had a relatively constant supply of
125 water. Wetland vegetation around the Mine Site needed no active management and provided
126 quality habitat for fish and wildlife. The overall rating was based on the highest rated community
127 for vegetation diversity and integrity, rather than the average or weighted value for community
128 vegetation diversity and integrity. MnRAM 3.2 guidance states that this is the appropriate
129 measure for assessing wetland quality for regulatory purposes (AECOM 2011a).

130 Wildlife habitat was rated high for most wetlands on the basis of natural wildlife corridors and
131 upland communities relatively untouched by recent human disturbances or effects. Wildlife
132 habitat was rated lower in areas where there were few plant communities (AECOM 2011d).

133 Fish habitat was rated as not applicable for most wetlands, primarily because they did not have
134 enough standing water throughout the year to support fish. Other characteristics associated with
135 the rating include isolated wetlands that are not permanently flooded, or forested wetlands where
136 the water table was below the surface for all or part of the year (AECOM 2011d).

137 Amphibian habitat was rated high for most wetlands, primarily because they stayed inundated
138 long enough in most years to allow amphibians to successfully reproduce. Amphibian habitat
139 was rated not applicable for some wetlands if conditions needed to support amphibian
140 reproduction did not occur at the site. Forested wetlands with little or no standing water during
141 the mating season would likely not support amphibians (AECOM 2011d).

142 Aesthetic, recreational, educational, and cultural values were rated medium. All wetlands were
143 aesthetically pleasing and could be used for recreation, education, and cultural purposes.
144 However, road access to the federal lands surrounding the Mine Site is only available via a
145 private mining road and is not easily accessible to the general public (AECOM 2011d). Access to
146 the federal lands is discussed in Section 4.3.1.

147 **Table 4.3.3-2 Wetland Functions and Values Assessment for the Federal Lands**
 148 **Surrounding the Mine Site, 2008**

149 Source: AECOM 2011a.

150 **Floodplains**

151 Floodplains are lowland areas adjacent to lakes, wetlands, and rivers that are prone to being
 152 inundated by water during a flood. Floodplains carry and store water and help to attenuate water
 153 flows. Floodplains also provide important habitat for fish and wildlife; filter sediments, nutrients,
 154 and pollutants from the water; and are important for public uses, such as fishing and hunting.

155 There are several definitions people use to estimate the limits of a floodplain. These include an
 156 ecological definition, a zoning or regulatory definition, and a hydrologic definition based upon
 157 the frequency of flood inundation. Ecologically defined floodplains are considered and described
 158 as wetlands. Federal EO 11988, Section 2(a)(1), states that the “[d]etermination [of a floodplain]
 159 shall be made according to a Department of Housing and Urban Development (HUD) floodplain
 160 map or a more detailed map of an area, if available. If such maps are not available, the agency
 161 shall make a determination of the location of the floodplain based on the best available
 162 information.”

163 A Flood Insurance Rate Map (FIRM) developed by the Federal Emergency Management Agency
 164 (FEMA) for most of St. Louis County estimates the floodplain areas of inundation. The areas
 165 identified on the FIRM are considered “mapped floodplains.” The mapped floodplains can be the
 166 result of a detailed hydrologic investigation associated with a 100-year (1 percent chance) return
 167 frequency flood elevation or an approximation based upon topography of floodplains. Wetlands
 168 were not generally mapped as floodplains by FEMA because they had relatively less
 169 development pressure with less need for regulation and establishment of insurance rates. Smaller
 170 streams with a contributing drainage area of less than 1 square mile were not prioritized by
 171 FEMA for mapping. In addition, some areas adjacent to lakes were not mapped because the land
 172 use was managed by shoreland ordinances.

173 The Land Exchange Proposed Action federal lands are within a portion of St. Louis County that
 174 is unmapped by FEMA. Therefore, there is no FEMA estimate of the areas of inundation and
 175 there are no FEMA-mapped floodplains on the federal lands. However, a hydrologic model
 176 (XP-SWMM) was developed as part of the hydrologic analysis needed for the design of the
 177 NorthMet Project Proposed Action. The area of inundation associated with the 500-year

178 (or 0.2 percent chance) floodplain of the Partridge River was estimated as part of this analysis.
179 This estimate of the floodplain area in the federal lands was used for the effects analysis.

180 Floodplain importance was determined by measuring the number of acres of floodplain per acre
181 of parcel as an index to the relative importance of floodplains on the parcels. The unmapped
182 floodplain area on the federal lands associated with the Partridge River and Yelp Creek,
183 estimated using the XP-SWMM, was estimated to total 1,889.4 acres of floodplain (500-year
184 floodplain) (see Figure 4.3.3-2). The ratio of the number of acres of floodplain per acre of parcel
185 for the federal lands is 0.3. The proposed mining activity associated with the NorthMet Project
186 Proposed Action would be managed by the MDNR Permit to Mine to manage the flood damage
187 potential for upstream and downstream property owners.

188 **Frontage of Waterways**

189 Lakes, streams, and rivers/creeks and their associated riparian habitat provide important habitat
190 for fish and wildlife and provide for additional recreational and social functions and values for
191 humans. Lake, stream, and river/creek frontage and associated habitat are not typically evaluated
192 during a wetland assessment, and were not considered during the wetland assessment field
193 studies conducted for the NorthMet Project Proposed Action. However, the linear distance of
194 lake and river/stream frontage for the federal lands was determined using GIS, and the length of
195 frontage per acre of parcel was calculated as an index of the relative importance of frontage on
196 the parcels.

197 Mud Lake, the dominant lake feature on the federal lands, is located within the One Hundred
198 Mile Swamp and is 30.5 acres in size. Mud Lake was determined to have a frontage of
199 approximately 4,550 ft. The length of lake frontage per acre of federal lands is 0.7 ft.

DRAFT

DRAFT

203 Yelp Creek flows out of the One Hundred Mile Swamp, while Yelp Creek and the Partridge
204 River flow through portions of the federal lands. Collectively, the creek and river are 5.3 miles in
205 length. Since both sides of the river provide riparian habitat, the length of the river on the federal
206 lands was doubled to determine the importance of river frontage. It was determined that there
207 were 55,968.0 linear ft of creek/river frontage on the federal lands. The length of creek/river
208 frontage per acre of federal lands is 8.6 ft.

209 **4.3.3.1.2 Land Exchange Alternative B**

210 **Wetland Delineation and Classification**

211 Land Exchange Alternative B is a reduced area of the Land Exchange Proposed Action federal
212 lands boundary, and the wetland delineation and classification is the same as described in
213 Section 4.3.3.1.1. The Land Exchange Alternative B is 4,752.6 acres (see Figure 4.3.3-1).

214 **Hydrology, Wetland Vegetation, and Community Types**

215 The hydrology, wetland vegetation, and community types of the smaller federal parcel are a
216 subset of the Land Exchange Proposed Action federal lands, and the hydrology, wetland
217 vegetation, and community types are the same as described above in Section 4.3.3.1.1. The
218 wetland assessment identified 143 wetlands covering 2,860.9 acres (60 percent) within the
219 4,752.6 acre smaller federal parcel boundary (see Figure 4.3.3-1). Table 4.3.3-1, above,
220 summarizes the wetland areas within the Land Exchange Alternative B parcel represented by
221 each Eggers and Reed (1997; 2014) wetland community type. A large portion of the wetlands
222 within the Alternative B: Smaller Federal Parcel is located in the floodplains of Yelp Creek and
223 the Partridge River or one of their associated tributaries. The most common wetland types within
224 the Land Exchange Alternative B include coniferous bogs (approximately 59 percent),
225 coniferous swamps (17 percent), and shrub swamps (approximately 14 percent), which includes
226 alder thickets and shrub-carrs.

227 Other wetland community types present within the Land Exchange Alternative B include open
228 bog, hardwood swamps, shallow marsh, and sedge/wet meadows. The sedge/wet meadows may
229 receive some portion of its hydrology from groundwater. The shallow marsh community
230 generally results from artificial impoundment by beaver dams, roads, and railroads and is
231 primarily dependent on surface waters for hydrology.

232 **Wetland Functional Assessment**

233 Land Exchange Alternative B is a subset of the Land Exchange Proposed Action federal lands,
234 and the wetland function and values assessment is the same as described in Section 4.3.3.1.1.

235 **Floodplains**

236 The Land Exchange Alternative B federal lands are within a portion of St. Louis County that is
237 unmapped by FEMA. Therefore, there is no FEMA estimate of the areas of inundation and there
238 are no FEMA-mapped floodplains on the federal lands. However, a hydrologic model
239 (XP-SWMM) was developed as part of the hydrologic analysis needed for the design of the
240 NorthMet Project Proposed Action. The area of inundation associated with the 500-year
241 (or 0.2 percent chance) floodplain of the Partridge River was estimated as part of this analysis.
242 This estimate of the floodplain area in the federal lands was used for the effects analysis. The

243 unmapped floodplain area on the federal lands associated with the Partridge River and Yelp
244 Creek, estimated using the XP-SWMM, was estimated to total 1,412.9 acres of floodplain
245 (500-year floodplain) (see Figure 4.3.3-2). The ratio of the number of acres of floodplain per acre
246 of parcel for the Land Exchange Alternative B is 0.3.

247 ***Frontage of Waterways***

248 A portion of Mud Lake, 8.9 acres, is located within the Land Exchange Alternative B. The
249 portion of Mud Lake was determined to have a frontage of approximately 1,200 ft. The length of
250 lake frontage per acre of the Land Exchange Alternative B is 0.3 ft.

251 As with the Land Exchange Proposed Action, Yelp Creek flows out of the One Hundred Mile
252 Swamp, while Yelp Creek and the Partridge River flow through portions of the Land Exchange
253 Alternative B. Collectively, the creek and river are 5.3 miles in length in the Land Exchange
254 Alternative B, corresponding to 55,968.0 linear ft of creek/river frontage (counting both sides of
255 the water feature). The length of creek/river frontage per acre of the Land Exchange Alternative
256 B is 11.8 ft.

257 **4.3.3.2 Non-federal Lands**

258 **4.3.3.2.1 Non-federal Lands**

259 The Land Exchange Proposed Action must comply with two EOs that are related to wetlands and
260 floodplains. EO 11990 was signed by President Jimmy Carter on May 24, 1977 “in order to
261 avoid to the extent possible the long and short term adverse impacts associated with the
262 destruction or modifications of wetlands...” This order applies to land exchanges such that, as
263 much as practicable, the exchange does not result in the loss of wetland resources. EO 11988 was
264 signed by President Jimmy Carter on May 24, 1977 “in order to avoid to the extent possible the
265 long and short term adverse impacts associated with the occupancy and modification of
266 floodplains and to avoid direct or indirect support of floodplain development wherever there is a
267 practicable alternative...” This order applies to land exchanges such that, as much as practicable,
268 the exchange does not result in an increase in the flood damage potential.

269 The USFS policy is that the following three conditions satisfy the requirements of EOs 11990
270 and 11988 (FSH 5409.13 § 33.43c):

- 271 1. The value of the wetlands or floodplains for properties received and conveyed is equal
272 (balancing test) and the land exchange is in the public interest.
- 273 2. Reservations or restrictions are retained on the unbalanced portion of the wetlands and
274 floodplains on the federal lands when the land exchange is in the public interest but does not
275 meet the balancing test.
- 276 3. The federal property is removed from the exchange proposal when the conditions described
277 in the preceding paragraphs 1 or 2 cannot be met.

278 The USFS is also required, by both EOs 11990 and 11988, to reference in a conveyance those
279 uses that are restricted under identified federal, state, or local wetland and floodplain regulations.
280 In Minnesota, the CWA (USACE/EPA/MPCA), Protected Waters Permit Program (MDNR), and
281 the WCA; Board of Water and Soil Resources regulate certain activities in wetlands. Floodplain
282 management ordinances are administered at the local (county) level.

283 In addition to the evaluating wetlands in accordance with these EOs (acres for acres of wetland
284 and no increase in flood hazards), analysis for the Land Exchange Proposed Action includes
285 information on wetland community types as well as the ecological floodplain. Furthermore, the
286 analysis evaluates the net change of shoreline frontage along rivers, streams, and lakes. Although
287 such analysis is not required by EO 11990, it is consistent with the USFS's strategic goal to
288 sustain and enhance outdoor recreation opportunities and with the management direction to
289 protect water resources.

290 **Wetland Delineation and Classification**

291 Wetland boundaries and community types for the non-federal lands were identified from aerial
292 photographic interpretation and field studies; no federal or state delineation protocols were used,
293 as it was primarily a habitat assessment (AECOM 2011b; AECOM 2011c). Infrared and true
294 color aerial photographs and topographic maps of the parcels were reviewed to identify areas that
295 could have wetlands based on vegetative characteristics and topography. In addition, wetlands
296 identified by the NWI were overlaid onto aerial photographs to assist in wetland identification.
297 Field studies were conducted subsequent to the initial desktop study in June 2009 for the Hay
298 Lake Lands and McFarland Lands (AECOM 2011b) and in November 2010 for the Hunting
299 Club Lands, Lake County Lands, and Wolf Lands (AECOM 2011c); this was done to better
300 delineate wetland boundaries on the parcels using the same methods as used for the federal lands
301 surrounding the Mine Site. Mapping information from the field work was then used to modify
302 the NWI wetland types and boundaries.

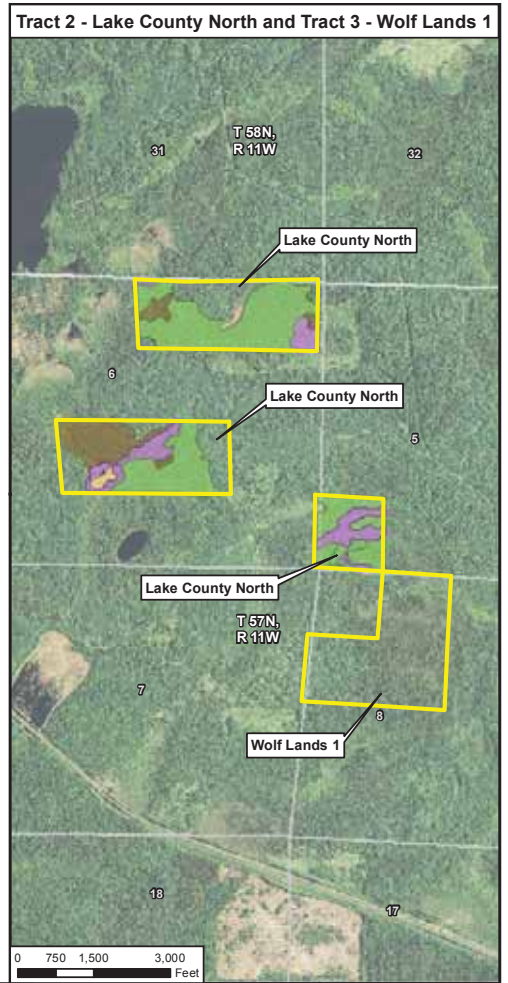

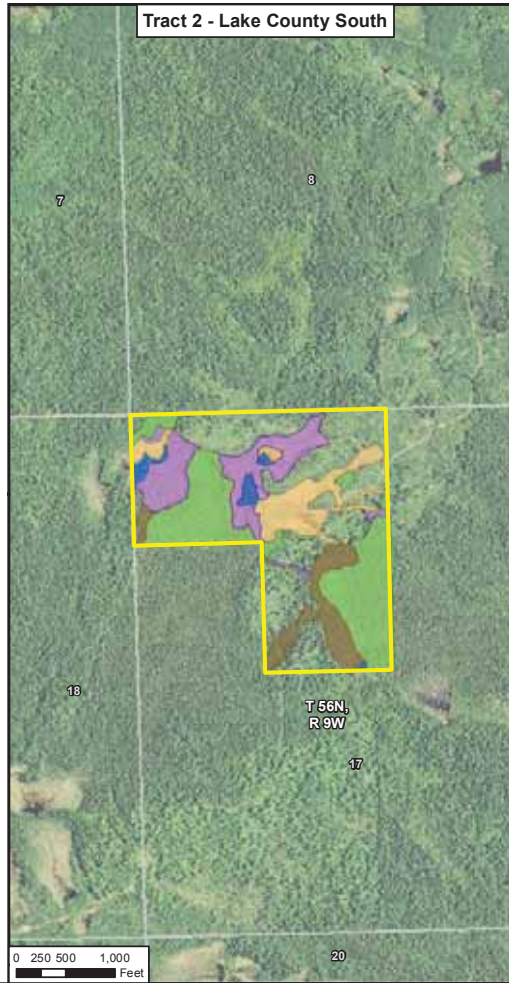

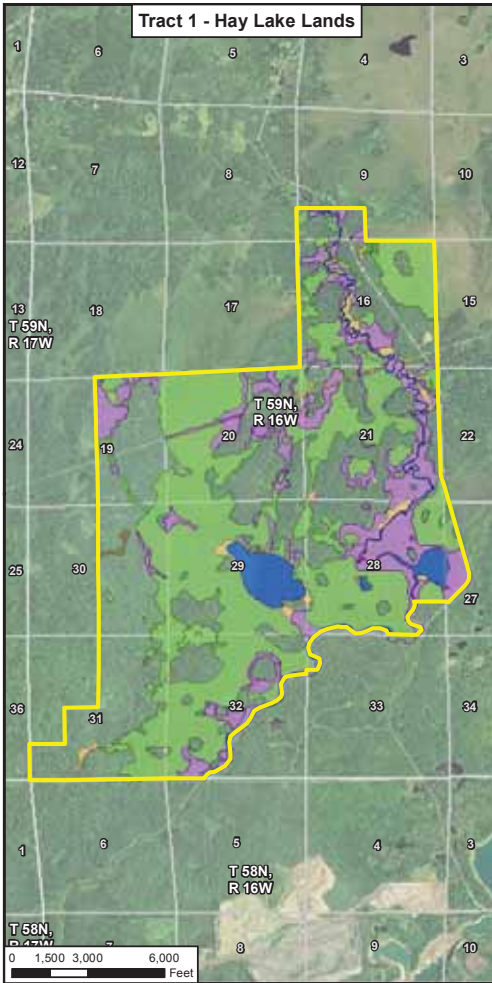

303 Wetland surveys were conducted along transects located on primary roads (parcel access and
304 logging) and secondary access routes (skid trails, stream corridors, wetlands, other natural
305 corridors) in order to maximize the amount of area covered during the survey period. Additional
306 surveys were conducted off of the primary and secondary access routes in an effort to better
307 determine wetland boundaries and types (AECOM 2011b; 2011c).

308 The boundaries of wetlands were determined based on aerial photograph interpretation and NWI
309 mapping, with some refining of wetland boundaries during field studies. Wetland boundaries
310 were determined in the field based on hydrologic and vegetative characteristics and were more
311 accurate where survey routes crossed or were near wetland boundaries. Approximate wetland
312 boundaries and wetland types based on habitat mapping are shown on Figures 4.3.3-3 and
313 4.3.3-4. Surveys covered nearly all portions of the parcels, although not all wetlands were field
314 surveyed (AECOM 2011b; AECOM 2011c).

315 During the field surveys in June 2009 and November 2010, data were collected using the
316 guidelines in MnRAM 3.2 (BWSR 2008) related to the functions and values of representative
317 wetlands within the tracts (AECOM 2011b; AECOM 2011c). The primary wetland functions
318 were evaluated based on a review of the 1) wetland soil, hydrology, and vegetation; 2) outlet
319 characteristics; 3) watershed and adjacent upland land uses and conditions; 4) erosion and
320 sedimentation; and 5) human disturbances. The Eggers and Reed (1997; 2014) classification
321 system was used to classify wetland communities for the wetland function and value evaluation.
322 Landscape factors were typically evaluated on a larger scale. For instance, soil and vegetation
323 conditions within the watershed were usually similar for large groups of wetlands. The
324 anthropogenic factors were also typically similar across broad areas. Based on the responses to
325 questions addressed by MnRAM 3.2 and the assessment of special features, a function value of

326 high, medium, or low was given for each primary function (AECOM 2011b; AECOM 2011c).
327 See below for more information on MnRAM scoring for the non-federal lands.

DRAFT

Non-federal Lands	Eggers & Reed Wetland Types	Open Bog

 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota

DRAFT

DRAFT

332 ***Hydrology, Wetland Vegetation, and Community Types***

333 Habitat and wetland community types within the five tracts were found to be consistent with
 334 habitats in much of the Mesabi Iron Range and northeastern Minnesota, including coniferous,
 335 deciduous, and mixed coniferous and deciduous forests, and a variety of wetland habitats.
 336 Generally, the parcels consisted of a mosaic of slightly elevated upland areas surrounded by
 337 wetland areas.

338 The surveys identified that the majority of the tracts' total area consists of wetlands (66 percent;
 339 4,669.9 acres). Individual tracts with a higher percentage of upland areas include the Hunting
 340 Club parcel (60 percent upland), Hay Lake (41 percent upland), and McFarland Lake (100
 341 percent upland) (see Table 4.3.3-3). The most common wetland types within the five non-federal
 342 tracts are coniferous swamps (approximately 69 percent) and shrub swamps (approximately
 343 23 percent), which includes both alder thickets and shrub-carr wetlands. Wetland types based on
 344 Eggers and Reed (1997; 2014) classification system for the non-federal lands are presented in
 345 Table 4.3.3-4 below (AECOM 2011b; AECOM 2011c).

346 **Table 4.3.3-3 Total Wetland and Upland Acreage for the Non-federal Lands**

Tract	Wetland Acres¹	Upland Acres¹	Total Acres¹	% of Wetlands	% of Upland
Tract 1 – Hay Lake	2,930.8	1,995.6	4,926.4	59	41
Tract 2 – Lake County					
Lake County North	209.3	55.9	265.2	79	21
Lake County South	73.6	43.4	117.0	63	37
Tract 3 – Wolf Lands					
Wolf Lands 1	90.4	35.4	125.8	72	28
Wolf Lands 2	706.2	61.5	767.7	92	8
Wolf Lands 3	233.2	44.3	277.5	84	16
Wolf Lands 4	362.8	41.9	404.7	90	10
Tract 4 - Hunting Club	63.6	96.5	160.1	40	60
Tract 5 – McFarland Lake	0.0	30.8	30.8	0	100
Total	4,669.9	2,405.3	7,075.2	66	34

347 Note:
 348 ¹ Total acres may be more or less than presented due to rounding.

349 **Table 4.3.3-4 Total Wetland Acreage by Wetland Type for the Non-federal Lands**

Eggers and Reed Class¹	Total Non-federal Lands	
	Acres	%
Coniferous swamp ²	3,242.4	69
Hardwood swamp ³	58.0	1
Open bog	7.1	<1
Open water (includes shallow, open water, and lakes)	182.5	4
Shallow marsh ⁴	117.5	3
Shrub swamp (includes alder thicket and shrub-carr)	1,062.4	23
Total	4,669.9	100

350 Notes:
 351 ¹ Eggers and Reed 1997; 2014.
 352 ² Field data for coniferous bogs and coniferous swamps was combined.
 353 ³ Coniferous tree species may be present within some hardwood swamps.
 354 ⁴ Shallow marsh areas may contain deep marshes.

355 **Wetlands Functional Assessment**

356 Wetland functions and values for the non-federal lands were determined during the June 2009
357 and November 2010 field surveys. Wetland functions and values were evaluated at 64 sites
358 within the five non-federal tracts (AECOM 2011b; AECOM 2011c; AECOM 2011d). The
359 wetlands on the five non-federal lands share characteristics similar to those found on the federal
360 lands. All wetlands on the non-federal lands were rated high for most wetland functions and
361 values.

362 During the field surveys, data were collected related to the functions and values of representative
363 wetland locations. A few survey locations were for individual wetlands, while for larger wetland
364 complexes several locations were surveyed. An attempt was made to survey a variety of wetland
365 types across the entire parcel (AECOM 2011b; AECOM 2011c). Survey locations for the
366 wetland functions and values assessment are shown on Figures 4.3.3-3 through 4.3.3-4.

367 Table 4.3.3-5 summarizes the functional value ratings for the 64 wetlands that were evaluated for
368 primary wetland functions rated by MnRAM 3.2. Wetlands were rated high for nearly all
369 wetland functional values. Vegetation diversity/integrity was rated high for all wetlands. The
370 overall rating for vegetation diversity/integrity was based on the highest rated community for
371 vegetation diversity and integrity, rather than the average or weighted value for community
372 vegetation diversity and integrity. MnRAM 3.2 guidance states that this is the appropriate
373 measure for assessing wetland quality for regulatory purposes.

374 According to MnRAM scores (AECOM 2011b; AECOM 2011c), the following ratings were
375 determined:

- 376 • Wetland hydrology and water quality were rated high for all wetlands, and high for all
377 wetlands except three for downstream water quality. Most wetlands on Tracts 1 and 5
378 provide moderate to high flood attenuation value and most wetlands on Tracts 2, 3, and 4
379 provide moderate flood attenuation value, with two wetlands rated high for this function.
- 380 • Wildlife habitat was rated high for all but one wetland, as natural wildlife corridors and
381 upland communities are relatively untouched by recent human disturbances or effects. There
382 are no barriers to wildlife movement. Wildlife habitat was rated moderate in an area where
383 there are few plant communities and large amounts of water.
- 384 • Fish habitat was rated high for wetlands that provide fish habitat. Fish habitat was rated as
385 not applicable for some wetlands where the wetland does not have enough standing water
386 throughout the year to support fish. Some other characteristics that might limit wetland value
387 for fish would include isolated wetlands that are not permanently flooded, or forested
388 wetlands where the water table is below the surface for all or part of the year.
- 389 • Amphibian habitat was rated high for most wetlands. This indicated that the wetland stays
390 inundated long enough in most years to allow amphibians to successfully reproduce.
391 Amphibian habitat was rated medium for some wetlands if ideal conditions needed to support
392 amphibian reproduction do not occur at the parcels. Forested wetlands with little or no
393 standing water or not enough woody vegetation during the mating season would likely not
394 support amphibians. Wetlands with predatory fish may also not support amphibians. Other
395 wetlands were rated not applicable for amphibian habitat, indicating that the parcel is not
396 inundated long enough in most years to support successful breeding.

- 397 • Aesthetic, recreational, educational, and cultural values were rated medium for all but one
 398 wetland. All wetlands are aesthetically pleasing, and could be used for recreation, education,
 399 and cultural purposes. However, access by the general public access is limited to overland by
 400 foot or on snowmobile/all-terrain vehicle from Pike River Road or from USFS roads. A few
 401 wetlands have human influences on the viewshed due to close proximity to Pike River Road;
 402 however, due to their remote locations, most of the wetlands have little human influence on
 403 the viewshed.

404 **Table 4.3.3-5 Wetland Functional Value Assessment for the Non-federal Lands**

Wetland Functions and Value Rating	Functional Value Ratings (%)									
	Vegetation Diversity/Integrity	Hydrology	Flood Attenuation	Downstream Water Quality	Wetland Water Quality	Wildlife Habitat	Fish Habitat	Amphibian Habitat	Aesthetics/Education/Cultural	
High	100	100	8	97	100	98	55	69	2	
Moderate	0	0	92	3	0	2	0	9	98	
Low	0	0	0	0	0	0	0	6	0	
Not Available or Applicable	0	0	0	0	0	0	45	16	0	
Total	100	100	100	100	100	100	100	100	100	

405 Sources: AECOM 2011b; AECOM 2011c.

406 **4.3.3.2.2 Tract 1 – Hay Lake Lands**

407 **Hydrology, Wetland Vegetation, and Community Types**

408 Tract 1 is moderately hilly and consists primarily of second- or third-growth deciduous and
 409 coniferous forest uplands and emergent, shrub swamp, and forested wetlands. This parcel is
 410 adjacent to the Superior National Forest (AECOM 2011b). The wetland assessment identified
 411 2,930.8 acres of wetlands within Tract 1 (approximately 59 percent of the land area) (see Figure
 412 4.3.3-3 and Table 4.3.3-6). The most common wetland types within Tract 1 are coniferous
 413 swamps (approximately 67 percent) and shrub swamps (approximately 24 percent), which
 414 includes both alder thickets and shrub-carr wetlands.

415 **Table 4.3.3-6 Total Wetland Acreage by Wetland Type for Tract 1**

Eggers and Reed Class¹	Total Hay Lake	
	Acres	%
Coniferous swamp ²	1,953.9	67
Hardwood swamp ³	8.0	<1
Open bog	2.1	<1
Open water (includes shallow, open water, and lakes)	176.6	6
Shallow marsh ⁴	84.1	3
Shrub swamp (includes alder thicket and shrub-carr)	706.1	24
Total	2,930.8	100

416 Notes:

417 ¹ Eggers and Reed 1997; 2014.

418 ² Field data for coniferous bogs and coniferous swamps was combined.

419 ³ Coniferous tree species may be present within some hardwood swamps.

420 ⁴ Shallow marsh areas may contain deep marshes.

421 Wetlands on Tract 1 consist primarily of early successional coniferous swamps, shrub wetlands,
 422 and open water wetlands. Hay Lake, Rice Lake, an unnamed lake, and the Pike River are the
 423 dominant water features. Large bogs dominate much of the east-central portion of Tract 1.
 424 Several wetlands were created or enlarged due to impoundment of streams by beaver dams.
 425 Raised water levels resulted in stands of dead and dying spruce along portions of the Pike River
 426 (AECOM 2011b).

427 Bogs within Tract 1 are dominated by leatherleaf and bog Labrador-tea, with scattered young
 428 speckled alder, bog birch, tamarack, and in some areas, narrow-leaved cattail and sedges.
 429 Sphagnum and club moss often cover 80 to 90 percent of the bog. Scattered (less than 5 percent)
 430 black spruce (some dead) and immature tamarack are found in the tree layer. Lowbush blueberry,
 431 small-fruited bog cranberry, bog rosemary, and small willows are also common. Other species
 432 encountered include cottongrass, wild iris, wild raspberry, bunchberry, and northern bog orchid
 433 (AECOM 2011b).

434 Emergent wetlands are primarily limited to disturbed areas on Tract 1, floodplains associated
 435 with the Pike River, wetlands associated with abandoned logging roads, transmission line
 436 ROWs, and beaver ponds. These emergent wetlands are often dominated by Canada bluejoint
 437 grass, various sedge species, and narrow-leaved cattail (70 to 80 percent cover) and generally are
 438 characterized by water depths of 1 ft or greater. Spruce, tamarack, and northern white cedar
 439 associated with these wetlands are often killed when flooded due to the rising water level behind
 440 beaver dams. Willows, tamarack, red-osier dogwood, and speckled alder are often found along
 441 the border of these wetlands, but comprised less than 30 percent of the total cover. Wild iris is
 442 encountered in some wetlands, as is horsetail, bur reed, spikerush, water arum, broad-leaved
 443 arrowhead, and woolly sedge (AECOM 2011b).

444 Shrub swamp wetlands usually consist of a dense (60 to 90 percent) cover of speckled alder,
 445 meadowsweet, and bog birch, with alder often 6 ft or taller in height. Some of the wetlands have
 446 scattered black spruce, tamarack, and willow saplings, but tree cover does not exceed 25 percent.
 447 Dominant low shrubs are bog Labrador-tea, leatherleaf, lowbush blueberry, prickly rose, wild
 448 raspberry, and red-osier dogwood. Mountain maple saplings are also present in a few wetlands.
 449 Herbaceous layer species include club and sphagnum mosses, woolly sedge, Canada bluejoint
 450 grass, horsetail, bunchberry, and clintonia (AECOM 2011b).

451 Forested wetlands (coniferous and hardwood swamps) are dominated by black spruce and
 452 tamarack, with some scattered northern white cedar, red pine, and black ash also present.
 453 Coniferous wetland forests are the most common habitat type on the parcel; deciduous and
 454 mixed forest wetlands are uncommon. In some areas with dense stands of spruce, few shrubs are
 455 seen, but sphagnum and club mosses often cover nearly 100 percent of the ground. Some open
 456 stands have an understory comprised of shrubs and scattered sapling northern white cedar,
 457 tamarack, and black spruce, along with speckled alder and willow. Mountain maple is also
 458 encountered among tree species on Tract 1, primarily in deciduous and mixed forests. Common
 459 species encountered in the shrub layer include specked alder, leatherleaf, bog Labrador-tea,
 460 lowbush blueberry, and bog birch. Species found near the ground include clintonia, bracken fern,
 461 horsetail, bunchberry, wild raspberry, cottongrass, wild sarsaparilla, wild strawberry, and false
 462 lily-of-the-valley. Forest and shrub cover typically range from 30 to 60 percent, while moss and
 463 other understory vegetation cover ranges from 50 to 90 percent (AECOM 2011b).

464 **Wetland Functional Assessment**

465 Table 4.3.3-7 summarizes the 30 wetland functional value ratings that were obtained for Tract 1
 466 for the primary wetland functions rated by MnRAM 3.2. Tract 1 wetlands were rated high for
 467 nearly all wetland functional values with the exception of flood attenuation and aesthetic,
 468 recreational, educational, and cultural values.

469 **Table 4.3.3-7 Wetland Functional Value Assessment for Tract 1**

Wetland Functions and Value Rating	Functional Value Ratings (%)									
	Vegetation Diversity/Integrity	Hydrology	Flood Attenuation	Downstream Water Quality	Wetland Water Quality	Wildlife Habitat	Fish Habitat	Amphibian Habitat	Aesthetics/Education/Cultural	
High	100	100	13	93	100	97	53	87	0	
Moderate	0	0	87	7	0	3	0	3	100	
Low	0	0	0	0	0	0	0	10	0	
Not Available or Applicable	0	0	0	0	0	0	47	0	0	
Total	100	100	100	100	100	100	100	100	100	

470 Source: AECOM 2011b.

471 **Floodplains**

472 Non-federal and non-state-owned lands mapped as floodplains are regulated by a county
 473 floodplain overlay zoning district. In St. Louis County, the mapped floodplains are regulated by
 474 the County Floodplain Ordinance. The only non-federal parcel with a mapped floodplain
 475 identified in the existing effective FEMA FIRM is located in St. Louis County for Tract 1 along
 476 the Pike River. The mapped floodplain was not part of a detailed study area along the Pike River
 477 and the area of floodplain has been estimated on the FIRM. Tract 1 also has unmapped
 478 floodplains associated with Hay Lake itself (Figure 4.3.3-5) (AECOM 2011d). The mapped
 479 floodplain has been estimated to be approximately 376.2 acres, while the unmapped area
 480 including and near Hay Lake has been estimated to be approximately 175.0 acres. The total

481 floodplain associated with Tract 1 is approximately 551.2 acres. The ratio of the number of acres
482 of floodplain per acre of parcel for Tract 1 is 0.11.

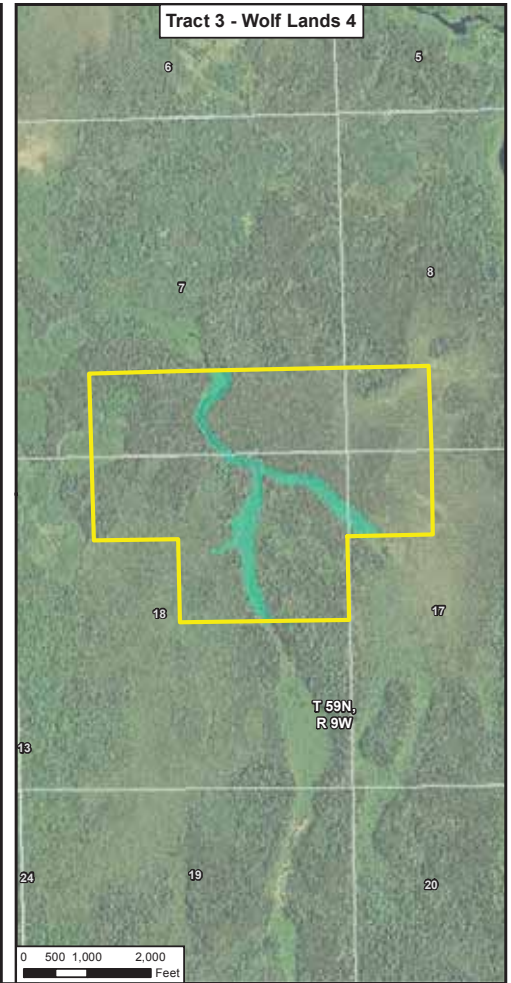

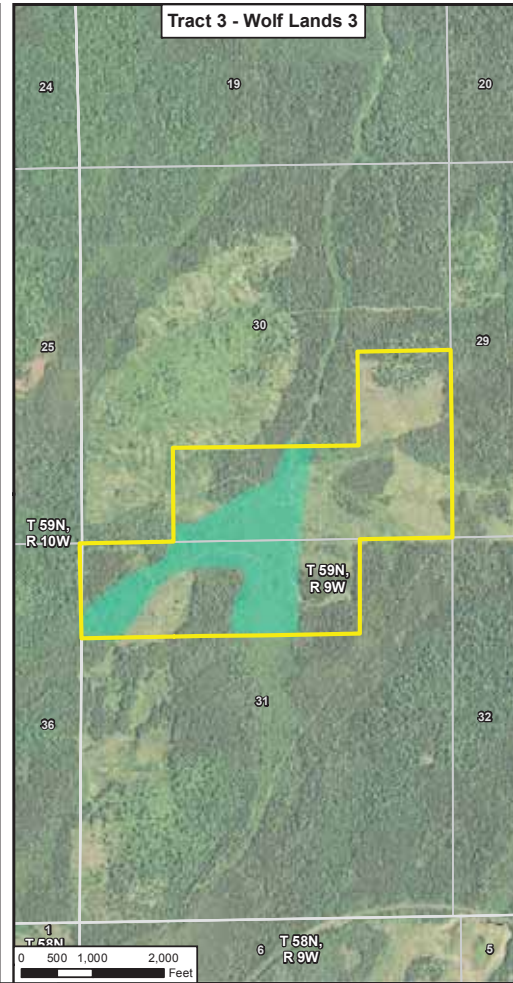

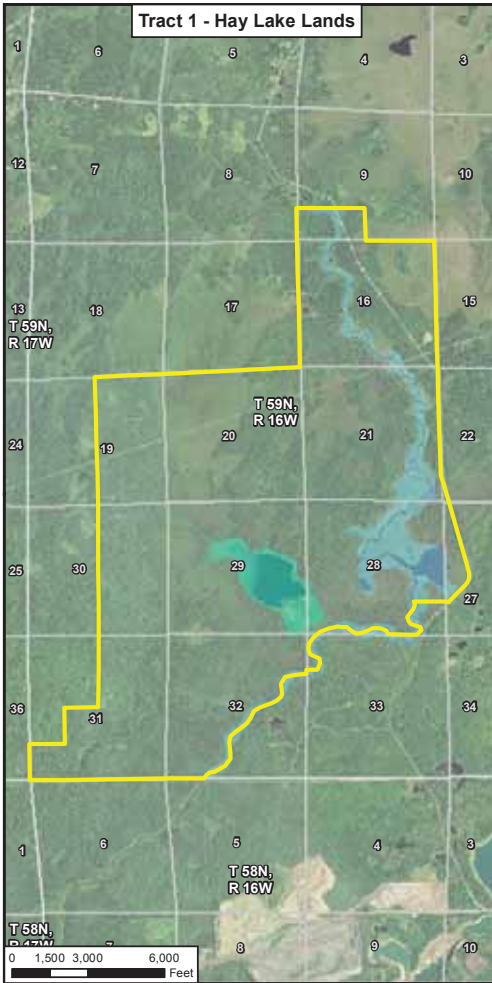

483 **Frontage of Waterways**

484 Within Tract 1, Hay Lake, 96.2 acres, has a frontage of 9,894.4 ft. Rice Lake, 29.5 acres, has a
485 frontage of 4,829.6 ft. An unnamed lake between Hay Lake and Rice Lake is 3.9 acres in area
486 and has a frontage of approximately 1,700 ft.

487 The Pike River flows from the southern boundary to the northern boundary of Tract 1 and is
488 8.1 miles in length. Riparian habitat is found on both sides of the river for 5.7 miles, and on only
489 one side for 2.4 miles where the river formed the boundary of the parcel. The linear distance of
490 river frontage for Tract 1 is approximately 72,864 linear ft (AECOM 2011d).

491 The length of lake and river frontage per acre on Tract 1 was calculated to be 3.5 ft per acre and
492 15.3 ft per acre, respectively.

DRAFT

495 **4.3.3.2.3 Tract 2 – Lake County Lands**

496 ***Hydrology, Wetland Vegetation, and Community Types***

497 Tract 2 consists of 381.9 acres located in Lake County and is comprised of two parcels. Tract 2
 498 identified 282.9 acres of wetlands (74 percent of Tract 2) (see Figure 4.3.3-3 and Table 4.3.3-8).
 499 The most common wetland types within Tract 2 are coniferous swamps (approximately
 500 59 percent); shrub swamps (approximately 18 percent), which includes both alder thickets and
 501 shrub-carr wetlands; and hardwood swamps, which includes some coniferous swamps
 502 (approximately 16 percent). The two parcels (Lake County North and Lake County South) are
 503 nearly level and consist predominantly of second- and third-growth mixed deciduous and
 504 coniferous forest uplands and bog, emergent, shrub, and forested wetlands. Much of the Lake
 505 County South parcel has been recently logged (AECOM 2011c; AECOM 2011d).

506 ***Lake County North***

507 The Lake County North parcel consists of 265.0 acres, of which 209.3 acres are identified as
 508 wetlands (approximately 79 percent) (see Figure 4.3.3-3 and Table 4.3.3-8). The most common
 509 wetland types within the Lake County North parcel are coniferous swamps (approximately
 510 65 percent); shrub swamps (approximately 17 percent), which includes alder thickets and shrub-
 511 carr wetlands; and hardwood swamps, which includes some coniferous swamps (approximately
 512 17 percent).

513 **Table 4.3.3-8 Total Wetland Acreage by Wetland Type for Tract 2**

Eggers and Reed Class¹	Lake County North		Lake County South		Total Lake County	
	Acres	%	Acres	%	Acres	%
Coniferous swamp ²	135.0	65	32.4	44	167.4	59
Hardwood swamp ³	34.7	17	9.9	13	44.6	16
Open bog	1.8	1	0.0	0	1.8	1
Open water (includes shallow, open water, and lakes)	0.2	<1	2.5	3	2.7	1
Shallow marsh ⁴	2.5	1	12.3	17	14.8	5
Shrub swamp (includes alder thicket and shrub-carr)	35.1	17	16.5	22	51.6	18
Total	209.3	100	73.6	100	282.9	100

- 514 Notes:
 515 ¹ Eggers and Reed 1997; 2014.
 516 ² Field data for coniferous bogs and coniferous swamps was combined.
 517 ³ Coniferous tree species may be present within some hardwood swamps.
 518 ⁴ Shallow marsh areas may contain deep marshes.

519 The Lake County North parcel has moderate topography, with the terrain generally sloping
 520 toward the southwest toward Pine Lake. This parcel consists of two smaller subparcels to the
 521 north and a single, small subparcel to the south that is adjacent to the Wolf Lands 1 parcel (see
 522 Figure 4.3.3-3). The subparcels are comprised of mostly wetland habitat, except for an area of
 523 upland habitat in the northern portion of the northern subparcel and in portions of the southern
 524 subparcel. Portions of the subparcels have recently been logged. Wetland habitat consists mostly
 525 of immature coniferous forest, with lesser amounts of mature mixed forest and shrubland
 526 (AECOM 2011c).

527 The Lake County North parcel encompasses several wetland types, including forested wetlands
528 comprised of coniferous swamps and hardwood swamps, shrub swamps, and open bog/palustrine
529 emergent wetlands, open water, and shallow marshes (collectively, emergent wetlands). Forested
530 wetlands are comprised primarily of sapling northern white cedar and black spruce with lesser
531 amounts of tamarack, although several drainages also contain black ash. Northern white cedar is
532 predominant in the more southerly portions of the northern two subparcels, while black spruce is
533 more common in the northern and northwestern portion of these two subparcels. Shrub wetland
534 habitat is associated with several drainages, a beaver pond, a bog area, and recently logged areas,
535 while emergent wetland habitat is found near the beaver pond and in recently logged areas.
536 Shrub wetlands within the Lake County North parcel are dominated by speckled alder.
537 Vegetation in the emergent wetlands consists of various sedge species and Canada bluejoint
538 grass, with scattered black spruce, northern white cedar, tamarack, and speckled alder (AECOM
539 2011c).

540 Canopy cover in forested wetlands ranges from 50 to 80 percent and most canopy trees are 6 to
541 10 inches dbh. The midstory consists of balsam fir and black spruce (approximately 40 percent
542 cover), while speckled alder, leatherleaf, and bog Labrador-tea are found in the shrub layer
543 (40 percent cover) and club moss and sphagnum moss cover most of the ground (AECOM
544 2011c).

545 In general, the southern subparcel consists of forested wetland stands of immature black spruce
546 and northern white cedar with northern white cedar to 20 inches dbh and black spruce to
547 14 inches dbh. Canopy cover is 50 percent, while the midstory cover is 60 percent and comprised
548 of sapling balsam fir. The nearly continuous ground cover is dominated by sphagnum moss and
549 club moss. Another immature forested wetland in the northern subparcel includes black ash trees
550 to 16 inches dbh (AECOM 2011c).

551 Shrub and emergent wetland habitats are also found on the subparcels. Shrub wetland habitat is
552 associated with several drainages, a beaver pond, a bog area, and recently logged areas, while
553 emergent wetland habitat is found near the beaver pond and in recently logged areas. Shrub
554 wetlands are dominated by speckled alder (to 80 percent cover). Two wetlands are classified as
555 shrub wetlands because speckled alder covered 70 percent of the area, but the wetlands also have
556 open bog characteristics since bog Labrador-tea also covers 70 to 80 percent of the wetlands, and
557 sphagnum moss covers most of the ground. Scattered sapling black spruce, northern white cedar,
558 and red-osier dogwood are also found in these wetlands. Vegetation in the emergent wetlands
559 consists of various sedge species and Canada bluejoint (40 percent cover), with scattered black
560 spruce, northern white cedar, tamarack, and speckled alder (AECOM 2011c).

561 ***Lake County South***

562 The Lake County South parcel consists of 116.9 acres, of which 73.6 acres are identified as
563 wetlands (approximately 63 percent) (see Figure 4.3.3-3 and Table 4.3.3-8). The most common
564 wetland types within the Lake County South parcel are coniferous swamps (approximately
565 44 percent); shrub swamps (approximately 22 percent), which includes both alder thickets and
566 shrub-carr wetlands; shallow marshes (approximately 17 percent); and hardwood swamps
567 (approximately 13 percent).

568 Lake County South is relatively flat in the northwestern section, rises in elevation to the
569 northeast, and then falls in elevation to the southeast. Water flows from west to east. At the time

570 of the survey, a series of beaver dams and ponds dominated the landscape, as did areas that had
 571 been recently logged. Although shrubland dominates upland habitats, several habitat types
 572 comprise wetland habitats within this parcel (AECOM 2011c).

573 Forested wetlands dominate the western and southeastern portions of the parcel and are
 574 comprised of black spruce and northern white cedar. However, tamarack is found in some forest
 575 stands and black ash is an important component of several drainages. The overstory cover is
 576 about 50 to 70 percent, while the midstory coverage of balsam fir and black spruce is about
 577 20 percent. Speckled alder, leatherleaf, bog Labrador-tea, and red-osier dogwood are common
 578 shrubs (to 80 percent cover), while sphagnum moss covers most of the ground. Forests in the
 579 northwestern section contain a dense mix of northern white cedar and black spruce with scattered
 580 black ash in the canopy (50 percent cover), and black spruce, northern white cedar, balsam fir,
 581 and speckled alder in the midstory and shrub layer (80 percent cover). Five beaver ponds were
 582 found on the parcel creating wetlands, which are comprised of open water with scattered dead
 583 spruce. These open-water wetlands are surrounded by emergent wetlands dominated by various
 584 sedge species, narrow-leaved cattail, woolgrass, and Canada bluejoint grass, or by dense stands
 585 of speckled alder in more shallow areas (AECOM 2011c).

586 **Wetland Functional Assessment**

587 Table 4.3.3-9 summarizes the 13 wetland functional value ratings (8 Lake County North and 5
 588 Lake County South) that were obtained for Tract 2 for the primary wetland functions rated by
 589 MnRAM 3.2. Tract 2 wetlands were rated high for nearly all wetland functional values with the
 590 exception of flood attenuation and aesthetic, recreational, educational, and cultural values.

591 **Table 4.3.3-9 Wetland Functional Value Assessment for Tract 2**

Wetland Functions and Value Rating	Functional Value Ratings (%)									
	Vegetation Diversity/Integrity	Hydrology	Flood Attenuation	Downstream Water Quality	Wetland Water Quality	Wildlife Habitat	Fish Habitat	Amphibian Habitat	Aesthetics/Education/Cultural

593

594 **Floodplains**

595 Lake County has an older Flood Hazard Boundary Map developed by the HUD to estimate the
596 areas of frequent inundation. FEMA rescinded the map in 1985 and is not considered to be an
597 effective FEMA FIRM map; therefore, it is not used as part of the management of flood-prone
598 areas. Lake County does not have a floodplain overlay ordinance; therefore, there are no
599 “regulatory floodplains” within Lake County. While the floodplains identified using the older
600 map are not considered to be the effective FEMA FIRM maps of flood-prone areas, they can
601 offer an approximation of floodplains within the county for the effects analysis.

602 Mapped floodplain identification for the effects analysis of non-federal lands in Lake County
603 was done using this older, rescinded map and it was determined that Tract 2 has no mapped or
604 unmapped floodplains.

605 **Frontage of Waterways**

606 Tract 2 does not include any streams, rivers, creeks, or lakes.

607 **4.3.3.2.4 Tract 3 – Wolf Lands**

608 **Hydrology, Wetland Vegetation, and Community Types**

609 Tract 3 consists of a total of 1,575.8 acres located in Lake County and is comprised of four
610 individual parcels. A total of 1,392.6 acres (88 percent) of wetlands were identified within Tract
611 3 (see Figures 4.3.3-3 and 4.3.3-4, and Table 4.3.3-10). The most common wetland types within
612 the Wolf Lands are coniferous swamps (approximately 79 percent) and shrub swamps
613 (approximately 20 percent), which includes alder thickets and shrub-carr wetlands. The four
614 parcels are nearly level and consist predominantly of second- and third-growth mixed deciduous
615 and coniferous forested uplands and bog, emergent, shrub, and forested wetlands. Much of the
616 area of the parcels comprising the Wolf Lands has been recently logged (AECOM 2011c;
617 AECOM 2011d).

618 **Table 4.3.3-10 Total Wetland Acreage by Wetland Type for Tract 3**

Eggers and Reed Class ¹	Wolf Lands 1		Wolf Lands 2		Wolf Lands 3		Wolf Lands 4		Total Wolf Lands	
	Acres	%	Acres	%	Acres	%	Acres	%	Acres	%
Coniferous swamp ²	75.4	84	627.4	89	82.6	35	320.3	88	1,105.7	79

Shrub swamp (includes alder thicket and shrub-carr)	12.0	13	73.0	10	145.4	63	42.3	12	272.7	20
Total	90.4	100	706.2	100	233.2	100	362.8	100	1,392.6	100

- 619 Notes:
 620 ¹ Eggers and Reed 1997; 2014.
 621 ² Field data for coniferous bogs and coniferous swamps was combined.
 622 ³ Coniferous tree species may be present within some hardwood swamps.
 623 ⁴ Shallow marsh areas may contain deep marshes.

624 **Wolf Lands 1**

625 The Wolf Lands 1 parcel consists of 122.8 acres, of which 90.4 acres are mapped as wetlands
 626 (approximately 72 percent) (see Figure 4.3.3-3 and Table 4.3.3-10). The most common wetland
 627 types within this parcel are coniferous swamps (approximately 84 percent) and shrub swamps
 628 (approximately 13 percent), which includes alder thickets and shrub-carr wetlands.

629 Most of the upland habitat consists of mature mixed forest, while most wetland habitats consist
 630 of coniferous forest. The parcel is relatively flat but slopes gently downward toward the
 631 southwest. The Wolf Lands 1 parcel is adjacent to Lake County North (AECOM 2011c). The
 632 eastern half of the parcel is wetland, while upland comprises most of the western portion of the
 633 parcel. Pine Lake is about 0.5 mile northwest of the parcel (AECOM 2011c).

634 Immature forested wetland communities on the parcel are comprised primarily of black spruce,
 635 with scattered northern white cedar and tamarack. More mature forested wetlands have
 636 characteristics of more open bogs, as tree cover is sparse at about 30 percent, while 80 percent of
 637 the area is covered by bog Labrador-tea and leatherleaf, and sphagnum moss covers most of the
 638 ground. In more immature forests, tree cover ranges from 60 to 80 percent, with a canopy
 639 dominated by 6 to 10 inches dbh black spruce, with tamarack and northern white cedar also
 640 present. The midstory consists of balsam fir and black spruce (about 40 percent cover), while
 641 speckled alder, leatherleaf, bog Labrador-tea, and red-osier dogwood dominate the shrub layer
 642 (40 percent cover) and club moss and sphagnum moss cover most of the ground (AECOM
 643 2011c).

644 **Wolf Lands 2**

645 The Wolf Lands 2 parcel consists of 767.9 acres, of which 706.2 acres are mapped as wetlands
 646 (approximately 92 percent) (see Figure 4.3.3-4 and Table 4.3.3-10). The most common wetland

647 types within Wolf Lands 2 are coniferous swamps (approximately 89 percent) and shrub swamps
648 (approximately 10 percent), which includes both alder thickets and shrub-carr wetlands.

649 The Wolf Lands 2 parcel, which slopes toward the southwest, can generally be characterized by
650 gently undulating terrain. Overland water flows to the southwest and to Mary Ann Creek, Wenho
651 Creek, and Greenwood Lake. The Wolf Lands 2 parcel consists primarily of forested wetlands
652 comprised of black spruce and northern white cedar, with a black ash component in a few
653 drainages; shrubland comprised of speckled alder is also common on the parcel. Most upland
654 habitat consists of mixed forest. Several drainages are dominated by speckled alder, while
655 emergent wetland habitat is associated with beaver ponds. Black spruce is the dominant tree in
656 wetlands in the northern and eastern portions of the parcel, while northern white cedar is more
657 prevalent in other portions of the parcel (AECOM 2011c).

658 Forested wetlands are of three types: black spruce dominant, a mix of black spruce and northern
659 white cedar, or northern white cedar dominant. Canopy trees range from four to eight inches dbh,
660 with total canopy cover from 70 to 80 percent. The midstory consists of sapling black spruce,
661 northern white cedar, and balsam fir. Midstory cover is patchy, ranging from 10 to 40 percent.
662 Bog Labrador-tea comprises 10 to 30 percent of the low shrub cover, while sphagnum moss
663 often covers more than 80 percent of the ground. In areas with a dense canopy, the midstory and
664 ground cover are poorly developed (AECOM 2011c).

665 Several drainages are dominated by shrub swamp vegetation. These parcels generally have a
666 sparse overstory, with approximately 20 percent aerial cover of black spruce, northern white
667 cedar, and tamarack. Speckled alder and sapling trees usually cover 60 percent or more of the
668 midstory, while low shrub cover consists of bog Labrador-tea (40 to 60 percent cover) (AECOM
669 2011c).

670 Beaver dams and ponds were found in the southeastern portion of the parcel during the field
671 survey. Typically, open water is adjacent to the dams, with emergent wetland surrounding the
672 open water and shrub wetlands upstream of the dams (AECOM 2011c).

673 ***Wolf Lands 3***

674 The Wolf Lands 3 parcel consists of 277.4 acres, of which about 233.2 acres are mapped as
675 wetlands (approximately 84 percent) (see Figure 4.3.3-4 and Table 4.3.3-10). The most common
676 wetland types within the Wolf Lands 3 parcel are shrub swamps (approximately 63 percent),
677 which includes alder thickets and shrub-carr wetlands, and second most common are coniferous
678 swamps (approximately 35 percent).

679 The Wolf Lands 3 parcel is relatively flat. Coyote Creek begins its flow north within the parcel.
680 Uplands consist of mostly shrubland and deciduous forest, while wetlands are dominated by
681 shrub wetland and coniferous forested wetland habitats (AECOM 2011c). About half of the
682 parcel had been recently logged. Logged wetlands are dominated by grasses, forbs, and low-
683 growing shrubs, including red-osier dogwood and speckled alder. In the unlogged areas, forested
684 wetlands are comprised primarily of black spruce. In the northern portion of the parcel, black
685 spruce is co-dominant with tamarack; in the rest of the parcel, tamarack is present in the canopy
686 but in much lower quantity (AECOM 2011c).

687 In shrub swamp wetlands, speckled alder covers from 20 to 80 percent of the area. In some areas,
688 bog Labrador-tea covers 80 to 90 percent of the ground, especially in areas with a dense cover of
689 speckled alder. In areas with a lower density of speckled alder, grasses, forbs, and ferns are the

690 dominant vegetation, but due to snow cover at the time of survey, it was not possible to
691 determine percent ground cover or species composition. Scattered sapling black spruce and paper
692 birch are also seen on logged wetlands. Woody debris from the recent logging operations is
693 abundant in logged areas (AECOM 2011c).

694 In the unlogged areas, wetland forests are comprised of black spruce. In the northern part of the
695 parcel, the black spruce is co-dominant with tamarack; in the rest of the parcel, tamarack is
696 present in the canopy but in much lower amounts. Total canopy cover ranges from 60 to
697 80 percent, with canopy trees ranging from 4 to 10 inches dbh. The midstory consists of balsam
698 fir and black spruce (20 to 30 percent cover), while the shrub layer is dominated by bog
699 Labrador-tea (80 percent), over a ground layer of nearly continuous (80 percent cover or more)
700 sphagnum moss with scattered grasses and forbs (AECOM 2011c).

701 Coyote Creek is bordered by an emergent sedge meadow wetland complex comprised of sedges,
702 narrow-leaved cattail, and Canada bluejoint (collectively about 90 percent cover). There is also
703 scattered sapling tamarack and northern white cedar, as well as scattered patches of speckled
704 alder and bog Labrador-tea. The emergent wetland is bordered by dense (80 percent cover)
705 speckled alder. Water depth in the emergent and shrub wetlands is approximately 18 to 24 inches
706 (AECOM 2011c).

707 Logging roads on the parcel have become emergent wetland habitat dominated by narrow-leaved
708 cattail, woolgrass, Canada bluejoint, scattered sedges, and speckled alder. Herbaceous vegetation
709 covers about 70 to 80 percent of the wetland area, while alder shrubs cover approximately
710 10 percent of the wetlands (AECOM 2011c).

711 ***Wolf Lands 4***

712 The Wolf Lands 4 parcel consists of 404.7 acres of which 362.8 acres are mapped as wetlands
713 (approximately 90 percent) (see Figure 4.3.3-4 and Table 4.3.3-10). The most common wetland
714 types within the Wolf Lands 4 parcel are coniferous swamps (approximately 88 percent) and
715 shrub swamps (approximately 12 percent).

716 Coyote Creek bisects the parcel, while the Stony River is about 2,000 ft northwest of the parcel.
717 Timber harvests recently occurred along the western border of the parcel. Upland habitats consist
718 primarily of mature deciduous forest, while forested and shrub wetland community types
719 dominate wetland habitats (AECOM 2011c).

720 Wetland types include coniferous forest, shrub wetlands, and emergent. Black spruce forests are
721 the most prevalent community type in the northern half of the parcel, while northern white cedar
722 is more prevalent in the southern half of the parcel. Emergent wetland communities that include
723 various species of sedge, Canada bluejoint grass, and shrub wetlands comprised primarily of
724 speckled alder are found in floodplains that border Coyote Creek. Shrub wetlands also occur in
725 two drainages to Coyote Creek in the southeastern portion of the parcel and in a drainage to the
726 Stony River in the northeastern portion of the parcel (AECOM 2011c).

727 Coniferous wetlands composed of black spruce and black spruce/northern white cedar are
728 dominated by trees ranging from four to eight inches dbh, with a patchy canopy cover of about
729 50 percent. Scattered tamaracks are also found in these wetlands. The low shrub layer is nearly
730 continuous (80 to 90 percent cover), and is comprised of leatherleaf, bog Labrador-tea, and other
731 vegetation. Sphagnum and club mosses cover most of the ground. Other forests have a more
732 developed midstory, with 60 percent cover by black spruce, northern white cedar, tamarack, and

733 speckled alder, and a similarly dense shrub layer, with 60 to 70 percent cover by leatherleaf and
 734 bog Labrador-tea (AECOM 2011c).

735 Shrub wetlands are dominated by speckled alder (60 to 80 percent cover), with scattered black
 736 spruce, tamarack, and northern white cedar in the overstory. Leatherleaf and bog Labrador-tea
 737 cover about 40 to 50 percent of the shrub layer (AECOM 2011c).

738 **Wetland Functional Assessment**

739 Table 4.3.3-11 summarizes the 18 wetland functional value ratings (three for Wolf Lands 1, six
 740 for Wolf Lands 2, six for Wolf Lands 3, and three for Wolf Lands 4) that were obtained for Tract
 741 3 for the primary wetland functions rated by MnRAM 3.2. Tract 3 wetlands were rated high for
 742 nearly all wetland functional values with the exception of flood attenuation on Wolf Lands 2, 3,
 743 and 4; amphibian habitat on Wolf Lands 3; and aesthetic, recreational, educational, and cultural
 744 values for all four sub-parcels.

745 **Table 4.3.3-11 Wetland Functional Value Assessment for Tract 3**

Wetland Functions and Value Rating	Functional Value Ratings (%)								
	Vegetation Diversity/Integrity	Hydrology	Flood Attenuation	Downstream Water Quality	Wetland Water Quality	Wildlife Habitat	Fish Habitat	Amphibian Habitat	Aesthetics/Education/Cultural

746 Source: AECOM 2011c.

747 **Floodplains**

748 As previously indicated, there are no mapped floodplains in Lake County; therefore, there are no
 749 mapped floodplains on the Wolf Lands tracts. However, the extent of unmapped floodplains
 750 along Coyote Creek for Tract 3 was made based upon topography and estimated to be
 751 112.2 acres (see Figure 4.3.3-5). Wolf Lands 3 was estimated to have 32.8 acres of floodplains
 752 and Wolf Lands 4 was estimated to have 79.4 acres. The ratio of the number of acres of
 753 floodplain per acre of parcel is 0.1 and 0.2, respectively (AECOM 2011d).

754 **Frontage of Waterways**

755 Coyote Creek begins in Wolf Lands 3, flows north into Wolf Lands 4, and continues north of
 756 Wolf Lands 4. The creek is 0.1 mile in length in Wolf Lands 3, and 0.9 miles in length in Wolf
 757 Lands 4. Riparian habitat is found on both sides of the river. The linear distance of river frontage
 758 for Wolf Lands 3 and Wolf Lands 4 is 1,056.0 and 9,504 linear ft, respectively. The length of
 759 river frontage per acre on Wolf Lands 3 and Wolf Lands 4 was calculated to be 3.8 and 23.5 ft,
 760 respectively.

761 **4.3.3.2.5 Tract 4 – Hunting Club Lands**

762 **Hydrology, Wetland Vegetation, and Community Types**

763 Tract 4 consists of 160.2 acres, of which 63.6 acres are mapped as wetland (approximately 40
 764 percent) (see Figure 4.3.3-4 and Table 4.3.3-12). The most common wetland types within Tract 4
 765 are shrub swamps (approximately 50 percent), which includes alder thickets and shrub-carr
 766 wetlands; coniferous swamps (approximately 24 percent); and shallow marshes (approximately
 767 20 percent). The parcel is nearly level and consists predominantly of second- and third-growth
 768 deciduous and mixed deciduous and coniferous forested uplands and emergent, shrub, and
 769 forested wetlands (AECOM 2011c).

770 **Table 4.3.3-12 Total Wetland Acreage by Wetland Type for Tract 4**

Eggers and Reed Class¹	Total Hunting Club	
	Acres	%
Coniferous swamp ²	15.4	24
Hardwood swamp ³	0.4	1
Open bog	0.0	0
Open water (includes shallow, open water, and lakes)	2.8	5
Shallow marsh ⁴	13.0	20
Shrub swamp (includes alder thicket and shrub-carr)	32.0	50
Total	63.6	100

771 Notes:

772 ¹ Eggers and Reed 1997; 2014.

773 ² Field data for coniferous bogs and coniferous swamps was combined.

774 ³ Coniferous tree species may be present within some hardwood swamps.

775 ⁴ Shallow marsh areas may contain deep marshes.

776 A wetland complex bisects the parcel and drains to the north and then northeast. From this low
 777 area, the land slopes upward to the east and west. Several beaver dams were found during field
 778 surveys along the creek on or near the parcel. The parcel consists primarily of wetland

779 shrublands, with lesser amounts of emergent and shrub wetlands and upland deciduous forests
 780 (AECOM 2011c).

781 Beaver ponds and dams are the dominant wetland features on the parcel. Open water habitat is
 782 typical near the dams. Emergent vegetation, consisting of Canada bluejoint grass, narrow-leaved
 783 cattail, and various sedge species, are found in water from 12 to 24 inches deep, while speckled
 784 alder shrub wetlands are located near ponds at water depths from 6 to 18 inches. A large black
 785 spruce forest is located in the middle of the parcel. Overstory cover is about 60 percent, with
 786 most of the cover resulting from black spruce, with scattered tamarack occasionally present. The
 787 midstory consists of speckled alder (50 percent cover), while leatherleaf and bog Labrador-tea
 788 (80 percent cover) and sphagnum moss (about 80 percent cover) are found below the speckled
 789 alder (AECOM 2011c).

790 **Wetland Functional Assessment**

791 Table 4.3.3-13 summarizes the three wetland functional value ratings that were obtained for
 792 Tract 4 for the primary wetland functions rated by MnRAM 3.2. Tract 4 wetlands were rated
 793 high for nearly all wetland functional values with the exception of flood attenuation, amphibian
 794 habitat, and aesthetic, recreational, educational, and cultural values.

795 **Table 4.3.3-13 Wetland Functional Value Assessment for Tract 4**

Wetland Functions and Value Rating	Functional Value Ratings (%)									
	Vegetation Diversity/Integrity	Hydrology	Flood Attenuation	Downstream Water Quality	Wetland Water Quality	Wildlife Habitat	Fish Habitat	Amphibian Habitat	Aesthetics/Education/Cultural	
High	100	100	0	100	100	100	100	33	0	
Moderate	0	0	100	0	0	0	0	33	100	
Low	0	0	0	0	0	0	0	0	0	
Not Available or Applicable	0	0	0	0	0	0	0	33	0	
Total	100	100	100	100	100	100	100	99	100	

796 Source: AECOM 2011c.

797 **Floodplains**

798 Tract 4 is located within St. Louis County, where there are no mapped floodplains identified on
 799 the county’s FIRM. There were no unmapped floodplains associated with Tract 4.

800 **Frontage of Waterways**

801 Tract 4 does not include any streams, rivers, creeks, or lakes.

802 **4.3.3.2.6 Tract 5 – McFarland Lake Lands**

803 **Hydrology, Wetland Vegetation, and Community Types**

804 Tract 5 is a single parcel of 30.8 acres. The entire parcel is mapped as upland. The parcel is
 805 approximately 3 miles west of the U.S.-Canada border. This parcel is mostly on a hill slope and

806 consists of second- and third-growth deciduous and coniferous forested uplands. There are no
807 wetlands located on Tract 5. This parcel is surrounded by the Superior National Forest.
808 McFarland Lake borders Tract 5 and provides lake habitat (AECOM 2011b).

809 **Wetland Functional Assessment**

810 No wetlands are associated with Tract 5; therefore, there are no functional assessment values.

811 **Floodplains**

812 Cook County has an older Flood Hazard Boundary Map developed by the HUD to estimate the
813 areas of frequent inundation. FEMA rescinded the map in 1985 and is not considered to be an
814 effective FEMA FIRM map; therefore, it is not used as part of the management of flood-prone
815 areas. Cook County does not have a floodplain overlay ordinance; therefore, there are no
816 “regulatory floodplains” within Cook County. While the floodplains identified using the older
817 map are not considered to be the effective FEMA FIRM maps of flood-prone areas, they can
818 offer an approximation of floodplains within the county for the effects analysis.

819 Mapped floodplain identification for the effects analysis of non-federal lands in Cook County
820 was done using this older, rescinded map and it was determined that Tract 5 has no mapped or
821 unmapped floodplains.

822 **Frontage of Waterways**

823 Tract 5 borders McFarland Lake. The parcel has a lake frontage of approximately 990 ft along
824 McFarland Lake. The length of lake frontage per acre on Tract 5 was calculated to be 32.1 ft.

DRAFT

1 **4.3.4 Vegetation**

2 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
3 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
4 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
5 associated with the updated list. A BE has been prepared that contains further information about
6 RFSS. The BE is included in Appendix D and is posted on the USFS website
7 (<http://www.fs.usda.gov/goto/superior/northmet>).

8 **4.3.4.1 Federal Lands**

9 The federal lands include a large tract of mostly forested land, up to 6,495.4 acres in size.
10 The tract is located in the west-central part of the Superior National Forest (PolyMet 2015a).

11 **4.3.4.1.1 Land Exchange Proposed Action**

12 **Cover Types**

13 Cover types consist of several categories of classification, including MDNR GAP land cover
14 types, specific plant community survey results, MBS Sites of Biodiversity Significance, SNAs,
15 USFS Management Areas, USFS ELTs, USFS MIH types, and USFS landscape ecosystems.

16 ***Habitat Types***

17 The federal land cover types are similar to the Mine Site described in Section 4.2.4.2.1 (see
18 Figure 4.2.4-1). Specific acreages for MDNR GAP land cover types on the federal lands are
19 presented in Table 4.3.4-1 below. In the past, portions of the federal lands have been logged to
20 varying degrees, depending on the management area allocation. The MDNR GAP land cover
21 types below may not fully represent the extent of mixed forest types, since the cover type level
22 below is fairly specific, so there may be more mixed forest types than indicated.

23 **Table 4.3.4-1 Federal Lands Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	2,978.6	46
Upland coniferous forest ²	1,618.9	25
Upland deciduous forest ³	1,091.8	17
Shrubland	645.6	10
Disturbed	63.8	1
Aquatic environments	60.1	1
Upland conifer-deciduous mixed forest ⁴	20.9	<1
Lowland deciduous forest ⁵	9.5	<1
Cropland/grassland	6.2	<1
Total	6,495.4	100

24 Source: MDNR 2006b.

25 Notes:

26 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

27 ² Includes pine and spruce/fir forest cover types.

28 ³ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

29 ⁴ Includes all mixed coniferous-deciduous forest cover types.

30 ⁵ Includes black ash forest cover types.

31 **Plant Community Surveys**

32 Wetlands are dominated by immature black spruce and northern white cedar, with scattered
 33 tamarack (*Larix laricina*) and aspen (AECOM 2011d). There are several areas of open water,
 34 including Mud Lake, the Partridge River, Yelp Creek, and scattered small ponds. Bogs are
 35 dominated by leatherleaf (*Chamaedaphne calyculata*) and bog-Labrador tea (*Ledum*
 36 *groenlandicum*). Uplands are dominated by immature mixed pine-hardwood forests, including
 37 jack pine, black spruce, trembling aspen (*Populus tremuloides*), paper/white birch (*Betula*
 38 *papyrifera*), and balsam fir. Grassland/shrubland habitat is uncommon and is primarily
 39 associated with the transmission line ROW in the western portion and recent logging in the
 40 southeastern portion of the federal lands. Disturbed areas are associated with roads and landings,
 41 waste rock storage areas immediately north of the federal lands, and a rail route along the
 42 southern portion of the federal lands.

43 The majority of forest stand trees on the federal lands are characterized as immature, or
 44 12 inches dbh or less, which corresponds to trees from 10 to 60 years in age (AECOM 2011d).
 45 For both coniferous and deciduous trees, the largest ones are approximately 18 to 20 inches dbh,
 46 but a 24-inch dbh red pine was found on the federal lands. Much of the One Hundred Mile
 47 Swamp north and west of the Mine Site consists of mature (80-plus years in age) black spruce
 48 and northern white cedar.

49 Of the wetlands that are located on the federal lands, the majority are determined to have high
 50 overall quality due to minimal or no current disturbance (AECOM 2011a). Of the wetlands that
 51 are located on the Mine Site, the majority (92 percent) is rated as having a high overall wetland
 52 quality and 8 percent are of moderate overall wetland quality. Wetlands on the federal lands are
 53 rated high for nearly all wetland functions, based on the MnRAM 3.2 criteria (AECOM 2011d).
 54 Vegetation diversity and integrity are rated moderate to high for all wetlands because recent
 55 human contact and alteration are minimal and the wetlands have a relatively constant supply of
 56 water. See Section 4.3.3 for a more detailed discussion on wetlands.

57 ***Minnesota Biological Survey***

58 The majority (6,142.7 acres) of the federal lands consist of MBS Sites of High Biodiversity
 59 Significance, including the One Hundred Mile Swamp site (53 percent of federal lands) and the
 60 Upper Partridge River site (41 percent of federal lands). The Upper Dunka Peatlands site (less
 61 than 1 percent of federal lands) is a Site of Moderate Biodiversity Significance and is also
 62 located on the federal lands (see Figure 4.2.4-1) (MDNR 2008a). These sites are located in the
 63 Laurentian Uplands subsection.

64 Three vegetation communities, white pine-red pine forest (FDn43a; less than 1 percent of federal
 65 lands), black spruce-Jack pine woodlands (FDn32c; 17 percent of federal lands), and rich black
 66 spruce swamps (FPn62a; 5 percent of federal lands) have been characterized by the MBS as
 67 “imperiled,” “imperiled/vulnerable,” and “vulnerable” native plant communities, respectively
 68 (MDNR 2008b). Black ash-conifer swamps (WFn64a), black spruce bogs (APn80a), graminoid
 69 bogs (APn90b1), poor tamarack-black spruce swamps (APn81b), and white cedar swamps
 70 (FPn63a) are ranked as “apparently secure” in Minnesota based on abundance, distribution,
 71 trends, and threats. Aspen-birch forests: balsam fir subtype (FDn43b1), alder swamps (FPn73a),
 72 poor black spruce swamps (APn81a), rich tamarack-alder swamps (FPn82a), willow-dogwood
 73 shrub swamps (WMn82a), and low shrub poor fens (APn91a) are all considered “widespread and
 74 secure.”

75 ***Scientific and Natural Areas***

76 Similar to the Mine Site, there are no lands designated or nominated for designation as SNAs on
 77 the federal lands (MDNR 2006c; Wilson, MDNR, Pers. Comm., February 14, 2012).

78 ***Culturally Important Plants***

79 Natural resources culturally important to the Bands are discussed in Section 4.2.9.3.3.

80 ***Management Areas***

81 The USFS manages its forests by assigning various management area allocations. The federal
 82 lands are currently managed under the General Forest – Longer Rotation Management Area
 83 (95 percent) and the General Forest Management Area (5 percent) (see Table 4.3.4-2)
 84 (USFS 2011j). Section 4.3.1 describes the management areas in detail.

85 ***Table 4.3.4-2 Management Areas for the Federal Lands***

Category	Federal Lands	
	Acres	Percent
General Forest	355.3	5
General Forest – Longer Rotation	6,140.1	95
Potential/Candidate Research Natural Areas	0.0	0
Riparian Areas	0.0	0

86 Source: USFS 2011j.

87 ***Ecological Land Types***

88 USFS ELT data for the federal lands are not fully developed, but provide data for over half of the
 89 parcel. The federal lands contain five different categories of ELTs, including Lowland Loamy

90 Moist (ELT 1), Lowland Loamy Wet (ELT 2), Lowland Organic Acid to Neutral (ELT 6),
 91 Upland Deep Loamy Dry Coarse (ELT 13), and Upland Shallow Loamy Dry (ELT 16). Almost
 92 all of the federal lands are included within the Big-Bird Lake Moraine LTA, with the small
 93 remaining portion included in the Mesabi Range LTA.

94 ***Management Indicator Habitats***

95 As mentioned previously, the USFS also tracks MIH types. The most abundant MIH type on the
 96 federal lands is lowland black spruce-tamarack forest (MIH 9; 3,060.2 acres), but upland forest
 97 (MIH 1; 1,330.0 acres) and upland conifer forest (MIH 5; 1,252.4 acres) is also present (see
 98 Table 4.3.4-3) (USFS 2010b). Aquatic habitats (MIH 14) are not tracked on the federal lands,
 99 though several open water features occur on the federal lands (see Figure 4.2.4-3). Though not
 100 considered MIH types, the federal lands contain 492.3 acres of lowland shrub habitat and 185.5
 101 acres of lowland emergent wetlands, as well. The remaining acres present on the federal lands
 102 have no corresponding MIH classification.

103 The USFS Forest Stand data also contain information about forest stand ages. The majority of
 104 the federal lands consist of mature (3,854.2 acres) forest stands, with smaller amounts of
 105 immature (1,539.2 acres) stands and young (271.1 acres) stands (USFS 2011i). Additionally, the
 106 USFS tracks large (greater than 300 acres) contiguous patches of mature upland forest (MIH 13)
 107 on the Superior National Forest. There are currently no patches of mature upland forest over 300
 108 acres on the federal lands (USFS 2012c). However, since smaller patches will grow over time
 109 into larger contiguous patches, the USFS predicts that in 2020, there would be two patches
 110 (707.8 acres and 322.1 acres) over 300 acres on the federal lands (USFS 2012d).

111 ***Table 4.3.4-3 MIH Types and Age Classes (Acres) for the Federal and Non-federal Lands***

MIH Type	Total		Tract 2		Tract 2		Tract 3		Tract 3		Tract 4 - Hunting Club	Tract 5 - McFarland Lake
	Total of Federal Lands ¹	of Non-federal Lands ²	Tract 1 - Hay Lake	- Lake North	- Lake South	- Wolf 1	- Wolf 2	- Wolf 3	- Wolf 4

112 Sources: USFS 2010b; USFS 2011i.

113 Note:

114 ¹ Determined based on: AECOM 2011c; AECOM 2011b; USFS 2010b; USFS 2011i.

115 ***Landscape Ecosystems***

116 In order for the USFS to sustainably and ecologically manage National Forest System lands, it
117 must consider areas based on historical and current ecosystem functions. The USFS tracks and
118 manages the Superior National Forest and other National Forest System lands on several levels,
119 but to maintain a broader ecosystem view it uses a landscape ecosystem basis. A landscape
120 ecosystem is an area that shares similar habitat composition, structure, and functions and occurs
121 naturally on the landscape (USFS 2004a). The federal lands are located within three landscape
122 ecosystem types, including Jack Pine-Black Spruce, Lowland Conifer, and Mesic Red and White
123 Pine (see Table 4.3.4-4).

124 The Jack Pine-Black Spruce landscape ecosystem occupies 3,000.1 acres of the federal lands
125 (represents less than 0.01 percent of Jack Pine-Black Spruce landscape ecosystem). It is
126 dominated by both jack pine and black spruce, but aspen and paper birch are also occasionally
127 present (USFS 2004a). Typically, jack pine dominates areas after fire disturbances and black
128 spruce dominates areas after wind disturbances.

129 The Lowland Conifer landscape ecosystem occupies 3,460.3 acres of the federal lands
130 (represents 0.01 percent of Lowland Conifer landscape ecosystem). It is dominated by one or all
131 three species of black spruce, tamarack, and northern white cedar (USFS 2004a). Typically,
132 black spruce occupies acidic organic soils, northern white cedar occupies neutral sites, and
133 tamarack occupies areas between both types. Fire disturbances are more frequent than wind
134 disturbances.

135 The Mesic Red and White Pine landscape ecosystem occupies less than one acre of the federal
136 lands (represents less than 0.01 percent of Mesic Red and White Pine landscape ecosystem). It is
137 dominated by mixed stands of red pine, white pine, aspen, paper birch, northern white cedar,
138 white spruce, and balsam fir (USFS 2004a). Severe fire disturbances typically result in
139 aspen/birch stands with red and white pine also present. Succession generally reduces the
140 aspen/birch component, which leaves pines as the dominant species. White spruce and balsam fir
141 typically regenerate in the understory.

142 **Table 4.3.4-4 Landscape Ecosystem Types (Acres) on Federal and Non-federal Lands^{1,2}**

Landscape Ecosystem Type	Total of Federal Lands	Total of Non-Federal Lands	Tract 1 – Hay Lake	Tract 2 – Lake County North	Tract 2 – Lake County South	Tract 3 – Wolf 1	Tract 3 – Wolf 2	Tract 3 – Wolf 3	Tract 3 – Wolf 4	Tract 4 - Hunting Club	Tract 5 - McFarland Lake

143 Source: USFS 2011g.

144 Notes:

145 ¹ Total acres may be more or less than presented elsewhere due to rounding or GIS layers used.

146 ² Data may not have complete coverage of parcels.

147 **Invasive Non-native Plants**

148 The federal lands have the same invasive non-native species as the Mine Site since they occupy
 149 the same area. Section 4.2.4.2.2 provides a list of invasive non-native species likely located on
 150 the federal lands.

151 **Threatened and Endangered Plant Species**

152 **Endangered, Threatened, and Special Concern Plant Species**

153 No federally listed threatened and endangered plant species are known to occur on the federal
 154 lands. The federal lands contain the same state-listed ETSC plant species as the Mine Site, with
 155 the exception of *Botrychium campestre*, which is located south of the federal lands on the Mine
 156 Site; an additional species, *Pyrola minor*, is found north of the Mine Site on the federal lands.
 157 Section 4.2.4.2.3 provides a list and discussion of the ETSC species on the federal lands.

158 Ten state-listed ETSC plant species are known to occur on the federal lands. Based on a review
 159 of the MDNR NHIS and field investigations (AECOM 2009b; Barr 2007i; Johnson-Groh 2004;
 160 Pomroy and Barnes 2004; Walton 2004), one state endangered species, and nine state species of
 161 special concern have been identified on the federal lands (see Table 4.3.4-5 and Figure 4.2.4-2).
 162 Some colonies of species listed for the Mine Site may be located outside of the federal lands but
 163 within the Mine Site. As a result, numbers of individuals may be smaller than the Mine Site.

164 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
 165 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
 166 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
 167 associated with the updated list.

168 **Table 4.3.4-5 Endangered, Threatened, and Special Concern Plant Species Identified on**
 169 **the Federal Lands**⁵

Common Name	Scientific Name	State Status ¹	No. of Populations ²	No. of Individuals ^{2,3}	Habitat and Location
Pale moonwort ⁴	<i>Botrychium pallidum</i>	SC	1	2	Full to shady exposure, edge of alder thicket, along Dunka Road.
Ternate, or St. Lawrence, grapefern ⁴	<i>Botrychium rugulosum (ternatum)</i>	SC	1	4	Early successional habitats, fields, open woods, forests, and along Dunka Road.
Least grapefern ⁴	<i>Botrychium simplex</i>	SC	3	905	Full to shady exposure, edge of alder thicket, forest roads, along Dunka Road.
Floating marsh marigold ⁴	<i>Caltha natans</i>	E	1	29	Shallow water in ditches and streams, alder swamps, shallow marshes, beaver ponds, and Partridge River mudflat.
Neat spikerush ⁴	<i>Eleocharis nitida</i>	SC	1	~486 ft ²	Full exposure, moist ditches along Dunka Road, wet area between railroad grades, and railroad ditch.
Bog rush ⁴	<i>Juncus stygius</i> var. <i>americanus</i>	SC	1	Unknown	Open-patterned peatlands, rich and poor fens, northern spruce bog within the One Hundred Mile swamp.
Club-spur orchid	<i>Platanthera clavellata</i>	SC	1	Unknown	Black spruce and/or tamarack swamps, northern spruce bog within the One Hundred Mile swamp.
Small shinleaf ⁴	<i>Pyrola minor</i>	SC	1	10	Rich black spruce swamps, cedar swamps, on Sphagnum hummocks in forested peatlands within the One Hundred Mile swamp.
Lapland buttercup	<i>Ranunculus lapponicus</i>	SC	1	~919 ft ²	On and adjacent to Sphagnum hummocks in black spruce stands, up to 60 percent shaded with alder also dominant.
Torrey's manna-grass	<i>Torreyochloa pallida</i>	SC	1	~25 ft ²	In muddy soil along shore and in water within shallow channels, beaver ponds, shallow marshes, along Partridge River.

170 Sources: AECOM 2009b; Barr 2007i; Johnson-Groh 2004; MDNR 2005; MDNR 2011k; MDNR 2014d; Pomroy and Barnes
 171 2004; Walton 2004.

- 172 Notes:
173 ¹ E - Endangered, T - Threatened, SC - Species of Special Concern.
174 ² Note that the number of populations may differ from those given in the NHIS data because of populations found during other
175 surveys.
176 ³ Where the number of individuals could not be determined without damaging the population, then patch size was used as a
177 representative abundance measure.
178 ⁴ These species are also RFSS as tracked by the USFS.
179 ⁵ Data included here were provided by the Division of Ecological Resources, MDNR, and were current as of August 5, 2014.
180 These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be
181 construed to mean that no significant features are present.

182 ***Species Life Histories***

183 The species life histories are provided in Section 4.2.4.2.3 for all species except the additional
184 one listed below.

185 Small shinleaf (*Pyrola minor*) is listed as a species of special concern in Minnesota and as an
186 RFSS in the Superior National Forest. The species was first reported in Lake County in 1914
187 near the North Kawishiwi River. It has since only been documented in Cook, St. Louis, Lake
188 (Bell Museum of Natural History 2011), and Carlton counties (NatureServe 2014b). *P. minor* is a
189 circumpolar species occurring across Canada and the western United States in boreal and alpine
190 habitats (MDNR 2011k). It usually occurs in conifer swamps, including black spruce and
191 northern white cedar swamps, and black spruce-balsam fir woodlands. Small shinleaf can also be
192 found along moist ecotones between wetlands and uplands or between streams and slopes. It is a
193 perennial evergreen forb species that is rhizomatous and flowers in mid-July. It may be semi-
194 tolerant to disturbance, since healthy populations exist along well-traveled portage routes and at
195 sites that have experienced timber harvesting around 20 years prior (MDNR 2011k). Threats to
196 *P. minor* include climate change, since it is a circumpolar species, and competition from non-
197 native species.

198 ***Regional Foresters Sensitive Species***

199 Seven state-listed ETSC plant species that occur on the federal lands (*Botrychium pallidum*,
200 *Botrychium rugulosum*, *Botrychium simplex*, *Caltha natans*, *Eleocharis nitida*, *Juncus stygius*,
201 and *Pyrola minor*) are also RFSS plants. A species description for *Pyrola minor* is provided
202 above, and for the other six ETSC species in Section 4.2.4.2.3. The other RFSS plants that are
203 likely located on the federal lands using MIH types and suitable habitat as indicators are
204 discussed in Section 4.2.4.2.3.

205 **4.3.4.1.2 Land Exchange Alternative B**

206 ***Cover Types***

207 A smaller portion of the federal lands (up to 4,752.6 acres) would be exchanged into private
208 ownership under this alternative.

209 ***Habitat Types***

210 The Alternative B: Smaller Federal Parcel contains similar MDNR GAP land cover types as the
211 federal lands, but smaller acreages of them, with lowland coniferous forest making up the
212 majority of the parcel and cropland/grassland occupying the least amount (see Table 4.3.4-6).
213 The MDNR GAP land cover types below may not fully represent the extent of mixed forest

214 types, since the cover type level below is fairly specific, so there may be more mixed forest types
 215 than indicated.

216 **Table 4.3.4-6 Alternative B: Smaller Federal Parcel Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	2,064.8	43
Upland coniferous forest ³	1,366.1	29
Upland deciduous forest ⁴	804.7	17
Shrubland	436.9	9
Disturbed	29.1	1
Aquatic environments	26.3	1
Upland conifer-deciduous mixed forest ⁵	17.8	<1
Lowland deciduous forest ²	4.7	<1
Cropland/grassland	2.2	<1
Total	4,752.6	100

217 Source: MDNR 2006b.

218 Notes:

219 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

220 ² Includes black ash forest cover types.

221 ³ Includes pine and spruce/fir forest cover types.

222 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

223 ⁵ Includes all mixed coniferous-deciduous forest cover types.

224 **Minnesota Biological Survey**

225 Lands as part of the Alternative B: Smaller Federal Parcel would be mostly classified as MBS
 226 Sites of High Biodiversity Significance, including the Upper Partridge River (56 percent of
 227 Alternative B: Smaller Federal Parcel lands) and the One Hundred Mile Swamp (40 percent of
 228 Alternative B: Smaller Federal Parcel lands) (see Figure 4.2.4-1) (MDNR 2008a). Less than 1
 229 percent of Alternative B: Smaller Federal Parcel would contain the Upper Dunka Peatlands MBS
 230 Site of Moderate Biodiversity Significance. These sites are located in the Laurentian Uplands
 231 subsection.

232 The Alternative B: Smaller Federal Parcel would also contain “imperiled,”
 233 “imperiled/vulnerable,” and “vulnerable” native plant communities, including white pine-red
 234 pine forests (FDn43a; less than 1 percent), rich black spruce swamp (FPn62a; 6 percent), and
 235 black spruce-Jack pine woodlands (FDn32c; 23 percent), respectively (MDNR 2008b). Black
 236 ash-conifer swamps (WFn64a), black spruce bogs (APn80a), graminoid bogs (APn90b1), poor
 237 tamarack-black spruce swamps (APn81b), and white cedar swamps (FPn63a) are ranked as
 238 “apparently secure” and are located in the Alternative B: Smaller Federal Parcel lands. Aspen-
 239 birch forests: balsam fir subtype (FDn43b1), alder swamps (FPn73a), poor black spruce swamps
 240 (APn81a), rich tamarack-alder swamps (FPn82a), willow-dogwood shrub swamps (WMn82a),
 241 and low shrub poor fens (APn91a) are all considered “widespread and secure” and are also on
 242 the Alternative B: Smaller Federal Parcel.

243 **Scientific and Natural Areas**

244 There are no SNAs located on or near the Alternative B: Smaller Federal Parcel lands.

245 ***Culturally Important Plants***

246 Similar to the federal lands, natural resources culturally important to the Bands are discussed in
 247 Section 4.2.9.3.3.

248 ***Management Areas***

249 The Alternative B: Smaller Federal Parcel lands are currently managed under the General Forest
 250 – Longer Rotation Management Area (93 percent) and the General Forest Management Area
 251 (7 percent; see Table 4.3.4-7) (USFS 2011j). Section 4.3.1 describes the management areas in
 252 detail.

253 ***Table 4.3.4-7 Management Areas for the Land Exchange Alternative B Lands***

Category	Land Exchange Alternative B Lands	
	Acres	Percent
General Forest	355.3	7
General Forest – Longer Rotation	4,397.3	93
Potential/Candidate Research Natural Areas	0.0	0
Riparian Areas	0.0	0

254 Source: USFS 2011j.

255 ***Ecological Land Types***

256 The Alternative B: Smaller Federal Parcel lands contain the same five categories of ELTs as the
 257 federal lands. Section 4.3.4.1.1 provides a discussion of these ELT types.

258 ***Management Indicator Habitats***

259 The Alternative B: Smaller Federal Parcel consists mostly of lowland black spruce-tamarack
 260 forest (MIH 9; 2,078.7 acres), with lesser amounts of upland conifer forest (MIH 5; 1,138.8
 261 acres) and upland forest (MIH 1; 954.2 acres) (see Table 4.3.4-8 and Figure 4.2.4-3) (USFS
 262 2010b). Aquatic habitats (MIH 14) are not tracked on the Alternative B: Smaller Federal Parcel
 263 lands, though several open water features are present. Though not considered an MIH type, the
 264 smaller federal parcel contains 385.4 acres of lowland shrub habitat and 115.4 acres of lowland
 265 emergent habitat, as well. The remaining acres present on the federal lands have no
 266 corresponding MIH classification.

267 The Alternative B: Smaller Federal Parcel consists of mostly mature (2,574.7 acres) forest
 268 stands, with smaller amounts of immature (1,325.9 acres) stands and young (271.1 acres) stands
 269 (see Table 4.3.4-8). There are currently no patches of mature upland forest over 300 acres on the
 270 Alternative B: Smaller Federal lands (USFS 2012c). However, since smaller patches will grow
 271 over time into larger contiguous patches, the USFS predicts that in 2020, there would be one
 272 patch (707.8 acres) over 300 acres on the Alternative B: Smaller Federal lands (USFS 2012d).

273 **Table 4.3.4-8 MIH Types and Age Classes (Acres) for the Land Exchange Alternative B**
 274 **Lands**

MIH Type	Total of Land Exchange Alternative B Parcel Lands
MIH 1	954.2
MIH 5	1,138.8
MIH 9	2,078.7
MIH 14	0.0
Lowland Shrub	385.4
Lowland Emergent	115.4
Upland Grass	0.0
Age Class	
Young	271.1
Immature	1,325.9
Mature	2,574.7

275 Sources: USFS 2010b; USFS 2011i.

276 ***Landscape Ecosystems***

277 The Alternative B: Smaller Federal Parcel lands are located within two landscape ecosystem
 278 types. The Jack Pine-Black Spruce landscape ecosystem occupies 2,395.1 acres of the smaller
 279 federal parcel lands (represents less than 0.01 percent of Jack Pine-Black Spruce landscape
 280 ecosystem), while the Lowland Conifer landscape ecosystem occupies 2,349.1 acres (represents
 281 less than 0.01 percent of Lowland Conifer landscape ecosystem) (see Table 4.3.4-9).

282 **Table 4.3.4-9 Landscape Ecosystem Types (Acres) on the Land Exchange Alternative B**
 283 **Lands and Tract 1 Lands¹**

Landscape Ecosystem Type	Alternative B: Smaller Federal Parcel Lands²	Tract 1 – Hay Lake
Dry-Mesic Red and White Pine	0.0	589.2
Mesic Red and White Pine	0.0	528.0
Jack Pine-Black Spruce	2,395.1	983.5
Lowland Conifer	2,349.1	2,835.3
Mesic Birch-Aspen-Spruce-Fir	0.0	0.9
Lowland Hardwood	0.0	0.0
Sugar Maple	0.0	0.0

284 Source: USFS 2011g.

285 Notes:

286 ¹ Total acres may be more or less than presented elsewhere due to rounding or GIS layers used.

287 ² Data may not have complete coverage of parcel.

288 ***Invasive Non-native Plants***

289 The Alternative B: Smaller Federal Parcel lands contain similar invasive non-native species as
 290 those that are part of the Land Exchange Proposed Action, since they occupy a smaller portion of
 291 the federal lands.

292 ***Threatened and Endangered Plant Species***

293 ***Endangered, Threatened, and Special Concern Plant Species***

294 The Alternative B: Smaller Federal Parcel contains the same threatened and endangered species
 295 as the federal lands since it occupies the same general area, and the ETSC species located on the
 296 federal lands are also located within the boundary of the smaller federal parcel. Section 4.3.4.1.1
 297 provides the list of species that occur on the Alternative B: Smaller Federal Parcel lands.

298 ***Regional Foresters Sensitive Species***

299 The RFSS plants located on the smaller federal parcel are the same as those located on the
 300 federal lands and Mine Site. Sections 4.2.4.2.3 and 4.3.4.1.1 provide a list and discussion of
 301 these species.

302 **4.3.4.2 Non-federal Lands**

303 **4.3.4.2.1 Cover Types**

304 The non-federal lands portion of the Land Exchange Proposed Action includes five different
 305 private tracts of land that total up to 7,075.0 acres. These lands, which include forest and wetland
 306 habitat, are located throughout the Superior National Forest in St. Louis, Lake, and Cook
 307 counties.

308 **4.3.4.2.2 Habitat Types**

309 The MDNR GAP land cover types of the combined non-federal lands consist of mostly lowland
 310 coniferous forests, shrublands, and upland deciduous forests (see Table 4.3.4-10).

311 **Table 4.3.4-10 Non-federal Lands Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	2,920.5	41
Shrubland	1,845.0	26
Upland deciduous forest ⁴	1,232.9	17
Upland coniferous forest ³	699.4	10
Aquatic environments	266.6	4
Upland conifer-deciduous mixed forest ⁵	50.4	1
Cropland/grassland	31.7	<1
Lowland deciduous forest ²	28.6	<1
Disturbed	0.0	0
Total	7,075.0⁽⁶⁾	99⁽⁷⁾

312 Source: MDNR 2006b.

313 Notes:

314 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

315 ² Includes black ash forest cover types.

316 ³ Includes pine and spruce/fir forest cover types.

317 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

318 ⁵ Includes all mixed coniferous-deciduous forest cover types.

319 ⁶ Total acres may be more or less than presented due to rounding.

320 ⁷ Percent totals less than 100 percent due to rounding.

321 **Management Areas**

322 The non-federal lands currently do not have any management area designations, as they are not
323 managed by the federal government. Section 4.3.1 describes the management areas in detail.

324 **Management Indicator Habitats**

325 MIH types and age classes were determined and mapped for the non-federal lands using several
326 data sources, including field survey maps, aerial maps, surrounding federal MIH data,
327 topographic maps, and USFS review. This analysis limited the MIH types to those mentioned
328 above in Section 4.2.4.2.3, due to risk of misidentification of further subcategories of forests.
329 Lowland shrub habitat, while not an MIH type, was also considered due to its importance to
330 several wildlife species such as moose (Greenlee, USFS, Pers. Comm., October 26, 2011).
331 Additionally, lowland emergent wetlands and upland grass types were included. The non-federal
332 lands are dominated by lowland black spruce-tamarack forest (MIH 9; 3,308.5 acres) and upland
333 forest (MIH 1; 2,694.5 acres), with lesser amounts of aquatic habitats (MIH 14; 226.7 acres) and
334 upland conifer forest (MIH 5; 79.9 acres) (see Table 4.3.4-3). Though not considered MIH types,
335 the non-federal lands also contain 385.7 acres of lowland emergent wetlands, 332.2 acres of
336 lowland shrub habitat, and 43.3 acres of upland grassland.

337 Of forested plant communities on the non-federal lands, immature forest stands (3,539.7 acres)
338 are most abundant, with lesser amounts of mature (1,824.6 acres) and young (778.2 acres) forest
339 types.

340 **Landscape Ecosystems**

341 The non-federal lands are located within seven landscape ecosystem types, including Jack Pine-
342 Black Spruce, Lowland Conifer, Mesic Red and White Pine, Dry-Mesic Red and White Pine,
343 Lowland Hardwood, Mesic Birch-Aspen-Spruce-Fir, and Sugar Maple (see Table 4.3.4-4). All
344 landscape ecosystem types on each tract represent less than 0.01 percent of that landscape
345 ecosystem type within the Northern Superior Uplands Section.

346 **4.3.4.2.3 Invasive Non-native Plants**

347 The non-federal lands contain similar invasive non-native species as the federal lands, although
348 there are also different species. The subsections on each tract below provide more detailed
349 discussions of these species.

350 **4.3.4.2.4 Threatened and Endangered Plant Species**

351 **Endangered, Threatened, and Special Concern Plant Species**

352 The non-federal lands contain three state-listed ETSC plant species according to the MDNR
353 NHIS, including *Woodsia scopulina*, *Saxifraga paniculata*, and *Carex ormostachya*. The former
354 two of these species are located on Tract 5, and the latter species is located on Tract 1.
355 Additional information about these three species is presented in the discussion of Tracts 1 and 5
356 below. Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota*
357 *Rules*, parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
358 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
359 associated with the updated list.

360 **Regional Foresters Sensitive Species**

361 The non-federal lands are located outside the current boundaries of the Superior National Forest;
362 however, following the Land Exchange Proposed Action, some or all of the non-federal lands
363 could become National Forest System lands. The USFS currently manages 58 vascular and non-
364 vascular plant species that are listed as RFSSs in the Superior National Forest (see Table
365 4.2.4-5). Detailed RFSS plant surveys have not been conducted on the private non-federal lands,
366 but information from other field surveys and habitat preferences (MIH types) for each species is
367 used to determine potential habitat or occurrences of RFSS plant species on the non-federal
368 lands.

369 *Saxifraga paniculata* is located on the non-federal lands and it is also an RFSS plant. The non-
370 federal lands consist of mostly lowland black spruce-tamarack forests (MIH 9), which means
371 there is generally more habitat available for the 13 RFSS species listed under that category to
372 occur on the non-federal lands, if suitable habitat exists for them (see Table 4.2.4-5). One of
373 these species is *Pyrola minor*, which is a state-listed ETSC plant species that occurs on the
374 federal lands. The non-federal lands also contain a large portion of upland forest (MIH 1), which
375 means there are many acres for the 17 RFSS species listed under that category to occur on the
376 non-federal lands as well. Three of these species are state-listed ETSC species on the federal
377 lands and include *Botrychium pallidum*, *Botrychium rugulosum*, and *Botrychium simplex*.
378 *Botrychium lanceolatum* is also known to occur near the southwest corner of the Tract 1 lands,
379 and is associated with MIH 1. There is a smaller amount of aquatic habitat (MIH 14) available on
380 the non-federal lands, so there is less available habitat for the eight RFSS species listed under
381 that category. One of these species is *Caltha natans*, which is a state-listed ETSC plant species
382 and occurs on the federal lands. There is very little upland conifer forest habitat (MIH 5)
383 available, meaning there are likely fewer occurrences of some species in the MIH 5 category.
384 There are also 385.7 acres of lowland emergent wetland habitat on the non-federal lands, so the
385 five RFSS plant species listed under this category may occur on the non-federal lands as well.
386 This includes *Eleocharis nitida* and *Juncus stygius*, which are both state-listed ETSC plant
387 species that occur on the federal lands.

388 **4.3.4.2.5 Tract 1 – Hay Lake Lands**

389 The largest non-federal tract is Tract 1, which is 4,926.3 acres in size. It is located in the
390 Laurentian Ranger District (USFS 2011n). The parcel has moderate topographic relief and slopes
391 toward the east-northeast, in the direction of the Pike River (AECOM 2011b).

392 **Cover Types**

393 Tract 1 is located in the Nashwauk Uplands subsection of the Laurentian Mixed Forest Province
394 ecoregion (MDNR 2006a). See Section 4.2.4.1 for a description of the Nashwauk Uplands
395 subsection.

396 **Habitat Types**

397 The primary MDNR GAP land cover types for Tract 1 include shrublands and lowland conifer
398 forests (see Table 4.3.4-11). There are fewer acres of cropland/grassland and lowland deciduous
399 forests. The MDNR GAP land cover types below may not fully represent the extent of mixed
400 forest types, since the cover type level below is fairly specific, so there may be more mixed
401 forest types than indicated.

402 **Table 4.3.4-11 Tract 1 – Hay Lake Lands Cover Types**

Cover Types	Total Acres	Percent of Area
Shrubland	1,664.6	34
Lowland coniferous forest ¹	1,524.2	31
Upland deciduous forest ⁴	999.9	20
Upland coniferous forest ³	437.3	9
Aquatic environments	251.1	5
Cropland/grassland	31.7	1
Lowland deciduous forest ²	17.4	<1
Disturbed	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	4,926.3⁽⁶⁾	100

403 Source: MDNR 2006b.

404 Notes:

405 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

406 ² Includes black ash forest cover types.

407 ³ Includes pine and spruce/fir forest cover types.

408 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

409 ⁵ Includes all mixed coniferous-deciduous forest cover types.

410 ⁶ Total acres may be more or less than presented due to rounding.

411 **Plant Community Surveys**

412 Much of Tract 1 (59 percent) is wetlands (AECOM 2011b). All of the 33 wetlands evaluated are
 413 rated high for wetland functions and values, according to MnRAM 3.2 (AECOM 2009b;
 414 AECOM 2011b). Most of the wetland habitats consist of scrub-shrub habitat dominated by
 415 speckled alder (*Alnus incana* ssp. *rugosa*), beaked hazel (*Corylus cornuta*), willows (*Salix* spp.),
 416 and bog birch (*Betula pumila*); pole and immature size coniferous forests dominated by black
 417 spruce, northern white cedar, and tamarack; and emergent/bog wetlands dominated by sedges
 418 (*Carex* spp.), cattail (*Typha* spp.), bog-Labrador tea, and leatherleaf (AECOM 2011b). There are
 419 several open water features on the parcel as well, including Hay Lake, Little Rice Lake, and the
 420 Pike River. See Section 4.3.3 for a more detailed description of wetland habitat types present.

421 Uplands consist of pole and immature deciduous forests, dominated by trembling aspen and
 422 paper birch, with midstories of sapling mountain maple (*Acer spicatum*), trembling aspen, paper
 423 birch, balsam fir, and black spruce. Shrub species include beaked hazel, with scattered speckled
 424 alder, twining honeysuckle (*Lonicera dioica*), and prickly rose (*Rosa acicularis*) (AECOM
 425 2011b). The ground cover includes sedges, wild strawberry (*Fragaria virginiana*), bunchberry
 426 (*Cornus canadensis*), wild raspberry (*Rubus* spp.), horsetail (*Equisetum* spp.), clintonia
 427 (*Clintonia borealis*), twinflower (*Linnaea borealis*), large-leaved aster (*Aster macrophyllus*),
 428 rose twisted stalk (*Streptopus roseus*), skunk currant (*Ribes glandulosum*), spotted coralroot
 429 (*Corallorhiza maculata*), wood anemone (*Anemone quinquefolia*), tall buttercup (*Ranunculus*
 430 *acris*), bracken fern (*Pteridium aquilinum*), and interrupted fern (*Osmunda claytoniana*)
 431 (AECOM 2011b).

432 Disturbed areas and grasslands are primarily associated with abandoned logging roads, landings,
 433 and powerline ROWs and are dominated by forbs and grasses, including cow parsnip
 434 (*Heracleum lanatum*), white clover (*Trifolium repens*), ox-eye daisy (*Leucanthemum vulgare*),
 435 tall buttercup, common sow thistle (*Sonchus arvensis* ssp. *uliginosus*), orange hawkweed

436 (*Hieracium aurantiacum*), American vetch (*Vicia americana*), wild strawberry, wild raspberry,
437 and common tansy (AECOM 2011b).

438 Almost all forest stands on Tract 1 consist of trees that are 8 to 11 inches dbh, having been
439 harvested in relatively recent years (AECOM 2011b). Upland deciduous trees range up to 16
440 inches dbh, while upland coniferous trees range up to 10 inches dbh. Upland forest stands in the
441 northern, central, and southwestern portions of the parcel are pole to immature, while upland
442 stands in the western portion of the parcel are sapling to young pole. The majority of the trees on
443 the parcel are estimated to be 60 years or younger (AECOM 2011b).

444 ***Minnesota Biological Survey***

445 There are no lands designated as MBS Sites of Biodiversity Significance on Tract 1 (see Figure
446 4.3.4-1); however, the entire parcel is located within the preliminary Pike Range and Peatlands
447 MBS Site of Outstanding Biodiversity Significance and could potentially be the only site ranked
448 as Outstanding in the Nashwauk Uplands subsection upon final designation by the MDNR
449 (Wilson, MDNR, Pers. Comm., February 14, 2012; MDNR *In progress*). The preliminary site is
450 approximately 26,000 acres in size, approximately half of which is owned or managed by the
451 Superior National Forest. On a larger landscape level, this site is one of the largest and most
452 contiguous high-quality areas within the subsection or LTA scale. The Pike Mountain cRNA and
453 Loka Lake cRNA abut Tract 1 and are included within this preliminary MBS site.

454 Native plant community designations are not available for Tract 1. However, native plant
455 communities of the preliminary Pike Range and Peatlands MBS site are generally of high quality
456 and include representative examples of almost all communities known to exist in the subsection
457 (Holmstrom, MDNR, Pers. Comm., April 9, 2012; MDNR n.d.).

458 ***Scientific and Natural Areas***

459 There are no lands designated as SNAs on Tract 1; however, state, federal, and private land near
460 the southwest corner of the parcel has been identified as a “potential” SNA site (Wilson, MDNR,
461 Pers. Comm., February 14, 2012). The federal lands bordering the southwest corner of the parcel
462 are designated as the Pike Mountain cRNA, and this designation could be extended onto Tract 1
463 due to high-quality mature hardwood forest stands, rare cliff and rock outcrop features, and low
464 human disturbance.

465 ***Culturally Important Plants***

466 Wild rice has been observed on Tract 1, including on Hay Lake, Little Rice Lake, and the Pike
467 River (Barr 2011a; 2012a; 2013m). Small populations of wild rice have been found on Hay Lake
468 with less than 10 percent coverage, while Little Rice Lake has several locations with greater than
469 75 percent coverage of wild rice and continuous growth throughout the lake. Wild rice was also
470 found along the Pike River flowing north into Little Rice Lake. The survey performed in 2012
471 found lower densities of wild rice beds. Hay Lake, Rice Lake, and the Pike River all had density
472 factor ratings of 1. The decreases in density in Rice Lake and the Pike River were consistent with
473 a decrease in wild rice bed density across all areas surveyed in 2012. Section 4.2.2 provides
474 further discussion of wild rice on the Tract 1 lands.

475 As with the federal lands, natural resources culturally important to the Bands are discussed in
476 Section 4.2.9.3.3.

477 ***Management Areas***

478 The non-federal lands currently do not have any management area designations, as they are not
479 managed by the federal government. Section 4.3.1 describes the management areas in detail.

480 ***Ecological Land Types***

481 Tract 1 contains six categories of ELTs, including Lowland Loamy Moist (ELT 1), Lowland
482 Loamy Wet (ELT 2), Lowland Organic Acid to Neutral (ELT 6), Upland Deep Loamy Over
483 Sandy Dry (ELT 11), Upland Shallow Loamy Dry (ELT 16), and Upland Extremely Shallow
484 Loamy Droughty (ELT 18). The majority of Tract 1 is included within the Pike-Sandy River
485 Sand Plain LTA and the remainder is within the Mesabi Range LTA.

486 ***Management Indicator Habitats***

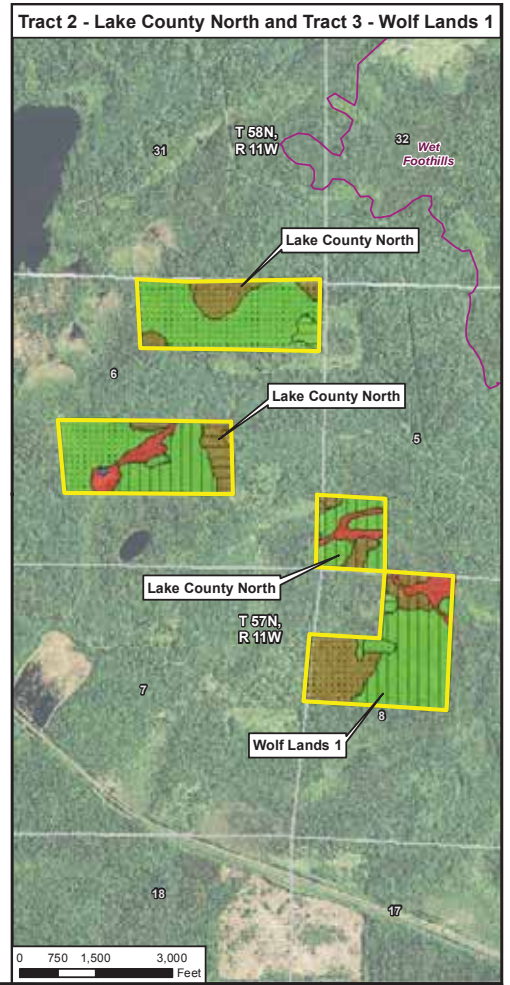

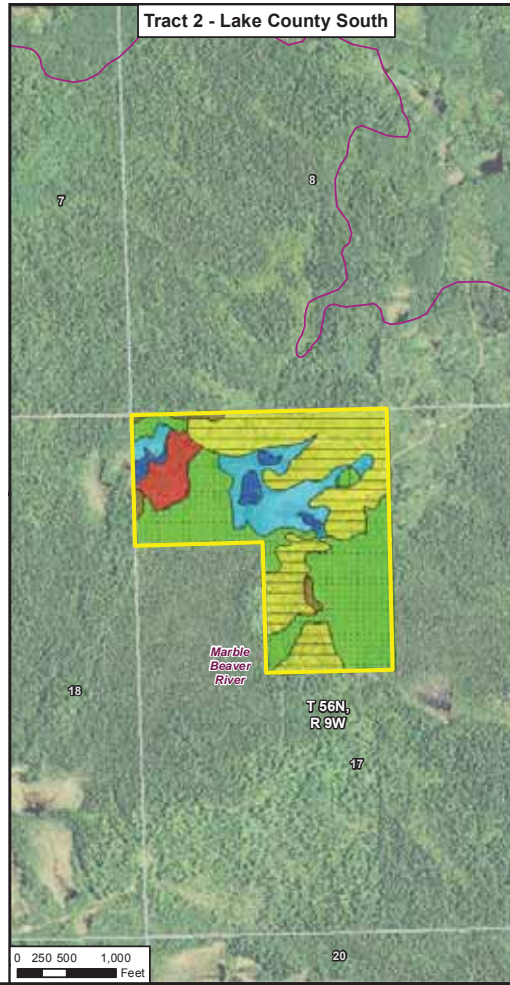

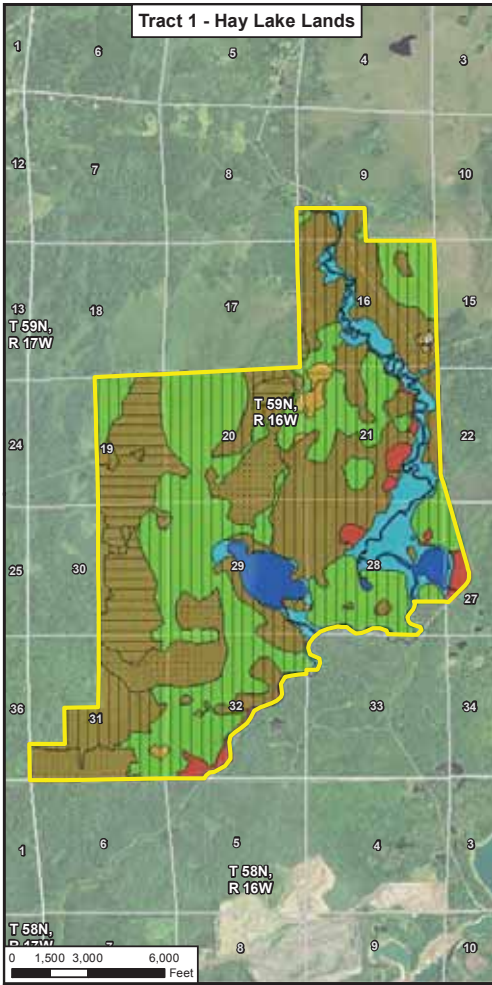

487 Table 4.3.4-3 provides a summary of the MIH types and age classes present on the Tract 1 lands
488 (see Figure 4.3.4-1) (USFS 2010b). Though not considered MIHs, Tract 1 also contains 365.0
489 acres of lowland emergent wetlands and 113.3 acres of lowland shrub habitat.

Management Indicator Habitat Types and Age Classes -
Tracts 1, 2 and 3
 NorthMet Mining Project and Land Exchange PFEIS
 Minnesota
 June 2015

494 ***Landscape Ecosystems***

495 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 1.

496 The Lowland Conifer landscape ecosystem occupies 2,835.3 acres of Tract 1. The Jack Pine-
497 Black Spruce landscape ecosystem occupies 983.5 acres of Tract 1. The Mesic Red and White
498 Pine landscape ecosystem occupies 528.0 acres of Tract 1. See the previous federal lands section
499 above (see Section 4.3.4.1.1) for a description of these landscape ecosystem types.

500 The Dry-Mesic Red and White Pine landscape ecosystem occupies 589.2 acres of Tract 1. It
501 comprises the following species: aspen, paper birch, red pine, white pine, jack pine, balsam fir,
502 black spruce, white spruce, bigtooth aspen, and red maple (USFS 2004a). On drier sites, jack
503 pine, red pine, and black spruce dominate, while the other species dominate on mesic sites.
504 Succession after fire disturbances is similar to the Mesic Red and White Pine landscape
505 ecosystem described above.

506 The Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies less than 1 acre of Tract 1. It
507 is dominated by mixed stands of aspen, paper birch, balsam fir, and white spruce, though
508 northern white cedar, bigtooth aspen, and red maple are sometimes also present (USFS 2004a).
509 Fire disturbances usually result in aspen/birch-dominated stand regeneration, while wind
510 disturbances usually result in balsam fir and white spruce forests. The climax tree stage consists
511 of a multi-aged white spruce and balsam fir forest with components of paper birch and northern
512 white cedar.

513 ***Invasive Non-native Plants***

514 According to the Superior National Forest invasive plant geodatabase, Tract 1 contains two
515 known occurrences of common tansy (USFS 2010a). Common tansy can spread vegetatively or
516 reproductively via tufted seeds that are dispersed by wind or water (MDNR 2011b). It is
517 widespread and common along roadsides or abandoned farmyards in northern Minnesota.
518 Common tansy was observed during field investigations along trails near recently installed gates
519 and disturbed earthen berms. Additionally, AECOM (2011b) identified common tansy, orange
520 hawkweed, common sow thistle, and ox-eye daisy within disturbed logging roads, landings, and
521 power line rights-of-way. Orange hawkweed primarily spreads vegetatively through runners,
522 rhizomes, and root buds, but can also spread reproductively (MDNR 2011b). It colonizes newly
523 disturbed sites and early successional habitats quickly. Ox-eye daisy spreads vegetatively and
524 reproductively, but often cannot invade intact grasslands (MDNR 2011b). It can, however,
525 invade newly disturbed areas quickly. Common sow thistle spreads vegetatively and through
526 wind-borne seeds or root cuttings. It colonizes fields, woodlands, and roadsides, but generally is
527 not a threat to intact native plant communities (MDNR 2011b).

528 ***Threatened and Endangered Plant Species***

529 ***Endangered, Threatened, and Special Concern Plant Species***

530 No federally listed ETSC plant species are known to occur on the Tract 1 lands according to field
531 investigations (AECOM 2011b). Based on a review of the MDNR NHIS (MDNR 2014d), one
532 state-listed species of special concern has been identified on Tract 1 (see Table 4.3.4-12 and
533 Figure 4.3.4-3). Necklace sedge (*Carex ormostachya*) is not tracked by the USFS as an RFSS.
534 No other state-listed species are known to occur on Tract 1.

535 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
 536 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
 537 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
 538 associated with the updated list.

539 **Table 4.3.4-12 Endangered, Threatened, and Special Concern Plant Species Identified on**
 540 **the Tract 1 Lands³**

Common Name	Scientific Name	State Status ¹	No. of Populations	No. of Individuals ²	Habitat and Location
Necklace sedge	<i>Carex ormostachya</i>	SC	1	>20	Dry/mesic shallow soils on rock outcrop in red oak-dominated forest

541 Sources: MDNR 2014d.

542 Notes:

543 ¹ E - Endangered, T - Threatened, SC - Species of Special Concern.

544 ² Where the number of individuals cannot be determined without damaging the population, then patch size is used as a
 545 representative abundance measure.

546 ³ Data included here were provided by the Division of Ecological Resources, MDNR, and were current as of August 5, 2014.
 547 These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be
 548 construed to mean that no significant features are present.

549 Species Life Histories

550 The following summary provides a description of the life history, state-wide distribution, and
 551 sensitivity to disturbance for the species of special concern found on Tract 1.

552 Necklace sedge (*Carex ormostachya*) is listed as a species of special concern in Minnesota and is
 553 globally ranked as apparently secure; it is not listed as an RFSS in the Superior National Forest.
 554 The species was first documented in Cook County, Minnesota in 1938, and has since been
 555 reported across northern Minnesota (Bell Museum of Natural History 2014). *C. ormostachya*
 556 reaches the southwest corner of its range in Minnesota (NatureServe 2014b). It typically occurs
 557 in moist to dry deciduous, evergreen, or mixed forests, often in sandy gravel or disturbed soils
 558 (eFlora 2014). *C. ormostachya* is a perennial herbaceous species that flowers and fruits in spring
 559 to summer.

560 **Regional Foresters Sensitive Species**

561 There is more upland forest (MIH 1) and lowland black spruce-tamarack forest (MIH 9) habitat
 562 available than any other type, so the RFSS plants associated with these types would be most
 563 likely to occur on Tract 1. *Botrychium lanceolatum* is known to occur near the southwest corner
 564 of the Tract 1 lands, and is associated with MIH 1. There is a moderate amount of aquatic habitat
 565 (MIH 14) and a smaller amount of upland conifer forest (MIH 5), so RFSS plants associated with
 566 these would be less likely to occur.

567 **4.3.4.2.6 Tract 2 – Lake County Lands**

568 Tract 2 is 381.9 acres in size and includes several subparcels ranging in size from 44 to 117 acres
 569 on the Laurentian Ranger District southeast of Seven Beaver Lake that are mostly surrounded by
 570 the Superior National Forest (USFS 2011n). Tract 2 is divided into north (Lake County North)
 571 and south (Lake County South) parcels, with the north parcel being the larger of the two. Lake

572 County North consists of three subparcels, which are made up of mostly wetland habitats; the
 573 majority of Lake County South lands consists of wetland habitats as well (AECOM 2011c).

574 **Lake County North**

575 **Cover Types**

576 The Tract 2 is located in the Laurentian Mixed Forest Province ecoregion. Lake County North is
 577 located in the Laurentian Uplands subsection of the Laurentian Mixed Forest Province ecoregion
 578 (MDNR 2006a). Section 4.2.4.1 provides a description of the Laurentian Uplands subsection.

579 **Habitat Types**

580 The primary MDNR GAP land cover type on the Tract 2 – Lake County North lands is lowland
 581 coniferous forest (see Table 4.3.4-13). It contains very few acres of aquatic environments or
 582 lowland deciduous forests. The MDNR GAP land cover types below may not fully represent the
 583 extent of mixed forest types, since the cover type level below is fairly specific, so there may be
 584 more mixed forest types than indicated.

585 **Table 4.3.4-13 Tract 2 – Lake County North Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	133.0	50
Upland conifer-deciduous mixed forest ⁵	34.0	13
Upland deciduous forest ⁴	34.0	13
Upland coniferous forest ³	32.8	12
Shrubland	28.1	11
Aquatic environments	1.8	1
Lowland deciduous forest ²	1.4	1
Cropland/grassland	0.0	0
Disturbed	0.0	0
Total	265.1⁽⁶⁾	101⁽⁷⁾

586 Source: MDNR 2006b.

587 Notes:

588 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

589 ² Includes black ash forest cover types.

590 ³ Includes pine and spruce/fir forest cover types.

591 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

592 ⁵ Includes all mixed coniferous-deciduous forest cover types.

593 ⁶ Total acres may be more or less than presented due to rounding.

594 ⁷ Percent totals are greater than 100 percent due to rounding.

595 **Plant Community Surveys**

596 The primary cover types are pole coniferous forest on the wetlands and mature and pole
 597 deciduous forests on the uplands (AECOM 2011c). Wetlands are dominated by northern white
 598 cedar, black spruce, and tamarack; balsam fir is a common understory species. Lake County
 599 North also contains scrub-shrub habitats that are dominated by speckled alder and contain
 600 emergent wetlands that consist of sedges and Canada bluejoint (*Calamagrostis canadensis*).
 601 Lake County North has several open bog areas, a beaver pond, and drainages as well. See
 602 Section 4.3.3 for a more detailed description of wetland habitat types present.

603 Upland habitats are dominated by immature paper birch and black spruce, but recently logged
604 areas support sapling paper birch stands or shrub habitats. The midstory is comprised of balsam
605 fir, black spruce, and beaked hazel. Areas that have been recently logged are dominated by
606 sapling paper birch with scattered sapling trembling aspen and pole paper birch. Beaked hazel
607 forms a patchy shrub layer, with several grasses and forbs in the ground layer (AECOM 2011c).
608 Older forests near logged areas contain large amounts of downed woody debris, and have a
609 midstory dominated by dense stands of balsam fir, black spruce, and northern white cedar.

610 Lake County North wetland canopy trees range from 6 to 10 inches dbh, but northern white
611 cedar up to 20 inches dbh and black spruce up to 14 inches dbh are found on the subparcels
612 (AECOM 2011c). The north parcel also contains an immature forested wetland containing black
613 ash (*Fraxinus nigra*) trees up to 16 inches dbh.

614 Minnesota Biological Survey

615 There are no MBS Sites of Biodiversity Significance located on the Lake County North
616 subparcels (see Figure 4.3.4-1) (MDNR 2008a). However, Lake County North is located on the
617 potential Seven Beavers MBS Site, which has not yet been finalized by the MDNR but is ranked
618 as having Moderate to High Biodiversity Significance (MDNR 2007a).

619 Native plant community rankings for Lake County North are not available.

620 Scientific and Natural Areas

621 There are no lands designated as SNAs on Tract 2 – Lake County North.

622 Culturally Important Plants

623 A discussion of natural resources culturally important to the Bands is presented in Section
624 4.2.9.3.3.

625 Management Areas

626 The non-federal lands currently do not have any management area designations, as they are not
627 managed by the federal government. Section 4.3.1 describes the management areas in detail.

628 Ecological Land Types

629 The Lake County North parcel contains five categories of ELTs, including Lowland Loamy
630 Moist (ELT 1), Lowland Loamy Wet (ELT 2), Lowland Organic Acid to Neutral (ELT 6),
631 Upland Deep Loamy Dry Course (ELT 13), and Upland Deep Medium Loamy Dry (ELT 14).
632 All three subparcels of the Lake County North parcel are included in the Greenwood Lake Till
633 Plain LTA.

634 Management Indicator Habitats

635 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 2 (see
636 Figure 4.3.4-1) (USFS 2010b). Though not considered an MIH, the Lake County North parcel
637 also contains 20.6 acres of lowland shrub habitat.

638 Landscape Ecosystems

639 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 2.

640 The Lowland Conifer landscape ecosystem occupies 227.6 acres of Lake County North. The
 641 Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies 37.4 acres of the Lake County
 642 North lands. See the federal or non-federal lands sections above for a description of these
 643 landscape ecosystem types.

644 Lake County South

645 Cover Types

646 The Lake County South parcel is located in the North Shore Highlands subsection of the
 647 Laurentian Mixed Forest Province ecoregion (MDNR 2006a). Most of the vegetative cover types
 648 in the North Shore Highlands subsection grow in thin, rocky red and brown glacial till (MDNR
 649 2011g). Upper Precambrian bedrock is often exposed at the surface. The most common soils are
 650 loams and sandy loams, which support forest communities of white pine, red pine, jack pine,
 651 balsam fir, white spruce, and aspen-birch.

652 Habitat Types

653 The primary MDNR GAP land cover types on Tract 2 – Lake County South are lowland
 654 coniferous forest and upland coniferous forest (see Table 4.3.4-14). There are fewer acres of
 655 aquatic environments. The MDNR GAP land cover types below may not fully represent the
 656 extent of mixed forest types, since the cover type level below is fairly specific, so there may be
 657 more mixed forest types than indicated.

658 **Table 4.3.4-14 Tract 2 – Lake County South Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	53.1	45
Upland coniferous forest ³	38.8	33
Shrubland	10.8	9
Upland deciduous forest ⁴	10.1	9
Aquatic environments	4.0	3
Cropland/grassland	0.0	0
Disturbed	0.0	0
Lowland deciduous forest ²	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	116.8⁽⁶⁾	99⁽⁷⁾

659 Source: MDNR 2006b.

660 Notes:

661 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

662 ² Includes black ash forest cover types.

663 ³ Includes pine and spruce/fir forest cover types.

664 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

665 ⁵ Includes all mixed coniferous-deciduous forest cover types.

666 ⁶ Total acres may be more or less than presented due to rounding.

667 ⁷ Percent totals are less than 100 percent due to rounding.

668 Plant Community Surveys

669 The primary cover types on Tract 2 – Lake County South are similar to Tract 2 – Lake County
670 North, with wetlands dominated by pole coniferous forest and upland areas dominated by
671 immature paper birch, black spruce, jack pine, eastern white pine, and northern white cedar.
672 There are five beaver ponds, surrounded by emergent wetland species, including sedges, narrow-
673 leaved cattail (*Typha angustifolia*), woolgrass (*Scirpus cyperinus*), and Canada bluejoint
674 (AECOM 2011c). Please see Section 4.3.3 for a more detailed description of wetland habitat
675 types present.

676 Most upland areas on Tract 2 – Lake County South have been recently clear-cut, except the
677 southwest portion of the parcel. This area has been partially thinned, leaving areas where
678 immature paper birch, black spruce, jack pine, eastern white pine, and northern white cedar trees
679 remain ranging from 12 to 24 inches dbh (AECOM 2011c). The midstory includes balsam fir and
680 beaked hazel. Grasses and forbs dominate the ground layer.

681 Minnesota Biological Survey

682 The entire 116.9 acres of the Tract 2 – Lake County South parcel are located within the Marble
683 Beaver River MBS Site of High Biodiversity Significance (see Figure 4.3.4-1) (MDNR 2008a).
684 This site is located within the North Shore Highlands subsection.

685 Native plant communities have been identified for the Lake County South parcel. It contains one
686 vegetation community, sugar maple (*Acer saccharum*) forest (MHn45c; 8 percent of parcel),
687 which has been characterized as “vulnerable” in the state (MDNR 2008b). Black ash-conifer
688 swamps (WFn64a; less than 1 percent of parcel) and lowland white cedar forests (WFn53a;
689 29 percent of parcel) are also present on the parcel and are ranked as “apparently secure” in
690 Minnesota based on abundance, distribution, trends, and threats (MDNR 2008b).

691 Scientific and Natural Areas

692 There are no lands designated as SNAs on Tract 2 – Lake County South.

693 Culturally Important Plants

694 A discussion of natural resources culturally important to the Bands is presented in Section
695 4.2.9.3.3.

696 Management Areas

697 The non-federal lands currently do not have any management area designations, as they are not
698 managed by the federal government. Section 4.3.1 describes the management areas in detail.

699 Ecological Land Types

700 Tract 2 – Lake County South contains two categories of ELTs, including Lowland Loamy Wet
701 (ELT 2), and Upland Deep Medium Loamy Dry (ELT 14). The entire Lake County South parcel
702 is included in the Tettegouche Till Plain LTA.

703 *Management Indicator Habitats*

704 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 2 lands (see
705 Figure 4.3.4-1) (USFS 2010b). Though not considered MIHs, the Tract 2 – Lake County South
706 parcel also contains 43.3 acres of upland grassland, 15.6 acres of lowland emergent wetland, and
707 6.4 acres of lowland shrub habitat.

708 *Landscape Ecosystems*

709 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 2 lands.

710 The Lowland Conifer landscape ecosystem occupies 80.2 acres of Tract 2 – Lake County South.
711 See the federal or non-federal lands sections above for a description of this landscape ecosystem
712 type.

713 The Sugar Maple landscape ecosystem occupies 36.7 acres of Tract 2 – Lake County South. It
714 generally is located in a band within 15 miles of Lake Superior and is dominated by sugar maple
715 with yellow birch, although northern white cedar, basswood, red maple, and northern red oak
716 may also be present (USFS 2004a). Fire and wind disturbances are very infrequent, leaving
717 individual tree mortality as the principal disturbance.

718 *Invasive Non-native Plants*

719 According to the Superior National Forest invasive plant geodatabase, there are no known
720 occurrences of invasive species on the Tract 2 lands (USFS 2010a). Field studies indicate that
721 one area of Tract 2 – Lake County North and several areas in the Tract 2 – Lake County South
722 parcel contain occurrences of thistles and ox-eye daisy in a recently clear-cut habitat (AECOM
723 2011c).

724 *Threatened and Endangered Plant Species*

725 *Endangered, Threatened, and Special Concern Plant Species*

726 Based on a review of the MDNR NHIS and field investigations, no federally or state-listed ETSC
727 plant species are known to occur on the Tract 2 lands.

728 *Regional Foresters Sensitive Species*

729 There is more lowland black spruce-tamarack forest (MIH 9) and upland forest (MIH 1) habitat
730 available than any other type, so the RFSS plants associated with these types would be most
731 likely to occur on the Tract 2 lands. There is a very small amount of upland conifer forest
732 (MIH 5) or aquatic habitat (MIH 14) so RFSS plants associated with these would be less likely to
733 occur.

734 **4.3.4.2.7 Tract 3 – Wolf Lands**

735 Tract 3 is 1,575.8 acres in size and is located on the Laurentian and Tofte Ranger Districts. Tract
736 3 includes four separate parcels ranging in size from 126 to 768 acres, referred to here as Tract 3
737 – Wolf Lands 1 through 4, which would complement Superior National Forest ownership by
738 reducing federal exterior boundaries and eliminating several private ownership patterns (USFS
739 2011n). Tract 3 lands are located east to southeast of the federal lands and Tract 3 – Wolf Lands
740 1 is adjacent to Tract 2 – Lake County North.

741 **Cover Types**

742 Tract 3 lands are located in the Laurentian Uplands subsection of the Laurentian Mixed Forest
 743 Province ecoregion (MDNR 2006a). Section 4.2.4.1 provides a description of the Laurentian
 744 Uplands subsection.

745 ***Tract 3 – Wolf Lands 1***

746 **Habitat Types**

747 The primary MDNR GAP land cover type on the Tract 3 – Wolf Lands 1 parcel is lowland
 748 coniferous forest (see Table 4.3.4-15). It has fewer acres of shrubland and mixed upland forests.
 749 The MDNR GAP land cover types below may not fully represent the extent of mixed forest
 750 types, since the cover type level below is fairly specific, so there may be more mixed forest types
 751 than indicated.

752 **Table 4.3.4-15 Tract 3 – Wolf Lands 1 Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	74.8	59
Upland deciduous forest ⁴	27.2	22
Upland coniferous forest ³	13.3	11
Shrubland	6.9	5
Upland conifer-deciduous mixed forest ⁵	3.7	3
Aquatic environments	0.0	0
Cropland/grassland	0.0	0
Disturbed	0.0	0
Lowland deciduous forest ²	0.0	0
Total	125.9⁽⁶⁾	100

753 Source: MDNR 2006b.

754 Notes:

755 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

756 ² Includes black ash forest cover types.

757 ³ Includes pine and spruce/fir forest cover types.

758 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

759 ⁵ Includes all mixed coniferous-deciduous forest cover types.

760 ⁶ Total acres may be more or less than presented due to rounding.

761 **Plant Community Surveys**

762 The primary cover types on Tract 3 – Wolf Lands 1 are pole coniferous forest on the wetlands,
 763 and immature mixed forest on the uplands (AECOM 2011c). The wetlands contain equal
 764 amounts of open, bog-like communities of sapling black spruce, northern white cedar, and
 765 tamarack, and denser pole forests of these same species, in addition to balsam fir. Please see
 766 Section 4.3.3 for a more detailed description of wetland habitat types present. Uplands are
 767 dominated by deciduous and coniferous immature forest with paper birch, trembling aspen, and
 768 balsam fir. Shrub species include beaked hazel and red-osier dogwood (*Cornus stolonifera*)
 769 (AECOM 2011c).

770 The majority of the Tract 3 – Wolf Lands 1 consists of wetland pole coniferous trees from 6 to
771 10 inches dbh, while the mature mixed forest trees on uplands are 12 inches dbh or greater
772 (AECOM 2011c).

773 Minnesota Biological Survey

774 There are no designated MBS Sites of Biodiversity Significance located on the Tract 3 –Wolf
775 Lands 1 parcel (see Figure 4.3.4-1) (MDNR 2008a). However, Tract 3 – Wolf Lands 1 is located
776 on a potential MBS Site of Moderate to High Biodiversity Significance that has not yet been
777 finalized by the MDNR (MDNR 2007a).

778 Native plant community rankings for Tract 3 are not available.

779 Scientific and Natural Areas

780 There are no SNAs located on the Tract 3 parcels.

781 Culturally Important Plants

782 A discussion of natural resources culturally important to the Bands is presented in Section
783 4.2.9.3.3.

784 Management Areas

785 The non-federal lands currently do not have any management area designations, as they are not
786 managed by the federal government. Section 4.3.1 describes the management areas in detail.

787 Ecological Land Types

788 Tract 3 – Wolf Lands 1 contains three categories of ELTs, including Lowland Loamy Wet (ELT
789 2), Lowland Organic Acid to Neutral (ELT 6), and Upland Deep Medium Loamy Dry (ELT 14).
790 The entire Tract 3 – Wolf Lands 1 parcel is included in the Greenwood Lake Till Plain LTA.

791 Management Indicator Habitats

792 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 3 lands (see
793 Figure 4.3.4-1) (USFS 2010b). Though not considered an MIH, the Tract 3 – Wolf Lands 1
794 parcel also contains 9.7 acres of lowland shrub habitat.

795 Landscape Ecosystems

796 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 3 lands.

797 The Lowland Conifer landscape ecosystem occupies 84.3 acres of the Tract 3 – Wolf Lands 1
798 parcel. The Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies 41.5 acres of the Tract
799 3 – Wolf Lands 1 parcel. See the federal or non-federal lands sections above for a description of
800 these landscape ecosystem types.

801 ***Tract 3 – Wolf Lands 2***

802 ***Habitat Types***

803 The primary MDNR GAP land cover type on the Tract 3 – Wolf Lands 2 parcel is lowland
 804 coniferous forest (see Table 4.3.4-16). The least abundant cover types include lowland deciduous
 805 forest and mixed upland forests. The MDNR GAP land cover types below may not fully
 806 represent the extent of mixed forest types, since the cover type level below is fairly specific, so
 807 there may be more mixed forest types than indicated.

808 ***Table 4.3.4-16 Tract 3 – Wolf Lands 2 Cover Types***

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	586.2	76
Upland coniferous forest ³	86.5	11
Shrubland	54.0	7
Upland deciduous forest ⁴	29.9	4
Lowland deciduous forest ²	5.8	1
Upland conifer-deciduous mixed forest ⁵	5.5	1
Aquatic environments	0.0	0
Cropland/grassland	0.0	0
Disturbed	0.0	0
Total	767.9	100

809 Source: MDNR 2006b.

810 Notes:

811 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

812 ² Includes black ash forest cover types.

813 ³ Includes pine and spruce/fir forest cover types.

814 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

815 ⁵ Includes all mixed coniferous-deciduous forest cover types.

816 ***Plant Community Surveys***

817 Tract 3 – Wolf Lands 2 consists of mostly wetland habitats dominated by either pole black
 818 spruce, northern white cedar, or a mix of the two (AECOM 2011c). Midstory cover types in
 819 these forests consist of sapling black spruce, northern white cedar, or balsam fir. Scrub-shrub
 820 habitats of speckled alder dominate drainage areas. Some bogs, emergent wetlands, and beaver
 821 ponds exist on the parcel. Section 4.3.3 presents a more detailed description of wetland habitat
 822 types present.

823 Upland habitats consist of pole or immature mixed coniferous-deciduous forest types, including
 824 paper birch, trembling aspen, and black spruce, with a midstory of balsam fir and shrub layer of
 825 beaked hazel (AECOM 2011c).

826 The majority of Tract 3 – Wolf Lands 2 consists of wetland coniferous forests with canopy trees
 827 ranging from 4 to 8 inches dbh. An upland area in the northern portion of the parcel was logged
 828 in the past, and so the canopy cover in this area consists of immature coniferous and deciduous
 829 trees ranging from 5 to 12 inches dbh (AECOM 2011c).

830 Minnesota Biological Survey

831 The entire 767.9 acres of the Tract 3 – Wolf Lands 2 parcel is located within the East Greenwood
832 MBS Site of Moderate Biodiversity Significance (see Figure 4.3.4-2) (MDNR 2007a; MDNR
833 2008a). This site is located in the Laurentian Uplands subsection. Sites of Moderate Biodiversity
834 Significance are sites that contain occurrences of rare species and/or moderately disturbed native
835 plant communities or landscapes that have a strong potential for recovery.

836 Native plant community rankings for Tract 3 are not available.

837 Scientific and Natural Areas

838 There are no SNAs located on the Tract 3 parcels.

DRAFT

842 Culturally Important Plants

843 A discussion of natural resources culturally important to the Bands is presented in Section
844 4.2.9.3.3.

845 Management Areas

846 The non-federal lands currently do not have any management area designations, as they are not
847 managed by the federal government. Section 4.3.1 describes the management areas in detail.

848 Ecological Land Types

849 Tract 3 – Wolf Lands 2 contains four categories of ELTs, including Lowland Loamy Moist (ELT
850 1), Lowland Loamy Wet (ELT 2), Upland Deep Loamy Dry Course (ELT 13), and Upland Deep
851 Medium Loamy Dry (ELT 14). The entire Wolf Lands 2 parcel is included in the Greenwood
852 Lake Till Plain LTA.

853 Management Indicator Habitats

854 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 3 lands (see
855 Figure 4.3.4-2) (USFS 2010b). Though not considered an MIH, the Tract 3 – Wolf Lands 2
856 parcel also contains 76 acres of lowland shrub habitat. The Tract 3 – Wolf Lands 2 parcel
857 contains one patch of mature forest over 300 acres (598.2 acres), which is an important habitat
858 type. However, this is different from the USFS Patch layer discussed in Section 4.3.4.1.1.

859 Landscape Ecosystems

860 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 3 lands.

861 The Lowland Conifer landscape ecosystem occupies 653.2 acres of the Tract 3 – Wolf Lands 2
862 parcel. The Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies 114.7 acres of the
863 Tract 3 – Wolf Lands 2 parcel. Previous federal or non-federal land sections present descriptions
864 of these landscape ecosystem types.

865 ***Tract 3 – Wolf Lands 3***

866 Habitat Types

867 The primary MDNR GAP land cover type on the Tract 3 – Wolf Lands 3 parcel is lowland
868 coniferous forest (see Table 4.3.4-17). The upland deciduous forest and mixed upland forest
869 types are least represented. The MDNR GAP land cover types below may not fully represent the
870 extent of mixed forest types, since the cover type level below is fairly specific, so there may be
871 more mixed forest types than indicated.

872 **Table 4.3.4-17 Tract 3 – Wolf Lands 3 Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	183.8	66
Upland coniferous forest ³	46.4	17
Shrubland	31.7	11
Upland deciduous forest ⁴	12.4	4
Upland conifer-deciduous mixed forest ⁵	3.1	1
Aquatic environments	0.0	0
Cropland/grassland	0.0	0
Disturbed	0.0	0
Lowland deciduous forest ²	0.0	0
Total	277.4	99⁽⁶⁾

873 Source: MDNR 2006b.

874 Notes:

875 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

876 ² Includes black ash forest cover types.

877 ³ Includes pine and spruce/fir forest cover types.

878 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

879 ⁵ Includes all mixed coniferous-deciduous forest cover types.

880 ⁶ Percent totals less than 100 percent due to rounding.

881 *Plant Community Surveys*

882 The Tract 3 – Wolf Lands 3 parcel also consists of mostly wetland habitats (AECOM 2011c).
 883 Coyote Creek runs through the parcel and is bordered by sedge meadow wetlands, consisting of
 884 sedges, narrow-leaved cattail, and Canada bluejoint. Roughly half of the parcel has been recently
 885 logged. Logged wetlands are dominated by grasses, forbs, and shrubs, including red-osier
 886 dogwood and speckled alder. Unlogged wetlands consist of pole black spruce, with tamarack and
 887 balsam fir also present. Please see Section 4.3.3 for a more detailed description of wetland
 888 habitat types.

889 Upland areas within the parcel have been recently logged and most of these areas have few
 890 remaining trees. Logged uplands are dominated by grasses, forbs, and beaked hazel, but some
 891 areas still support paper birch and scattered balsam fir. The upland habitat bordering the parcel
 892 consists of young and mature paper birch with scattered black spruce and northern white cedar
 893 over an understory of balsam fir (AECOM 2011c).

894 Tract 3 – Wolf Lands 3 consists of pole coniferous trees in wetlands and sapling or mature mixed
 895 forest trees on uplands, which range from 0 to 4 inches dbh or 12 inches dbh or greater,
 896 respectively (AECOM 2011c). Unlogged wetland forests on the Tract 3 – Wolf Lands 3 parcel
 897 range from 4 to 10 inches dbh. Logged upland areas still support paper birches that are up to 16
 898 inches dbh.

899 *Minnesota Biological Survey*

900 There are no designated MBS Sites of Biodiversity Significance located on the Tract 3 – Wolf
 901 Lands 3 parcel (see Figure 4.3.4-2) (MDNR 2008a). However, Tract 3 – Wolf Lands 3 is located
 902 on a potential MBS Site of Moderate to High Biodiversity Significance that has not yet been
 903 finalized by the MDNR (MDNR 2007a).

904 Native plant community rankings for Tract 3 are not available.

905 Scientific and Natural Areas

906 There are no SNAs located on the Tract 3 parcels.

907 Culturally Important Plants

908 A discussion of natural resources culturally important to the Bands is presented in Section
909 4.2.9.3.3.

910 Management Areas

911 The non-federal lands currently do not have any management area designations, as they are not
912 managed by the federal government. Section 4.3.1 describes the management areas in detail.

913 Ecological Land Types

914 Tract 3 – Wolf Lands 3 contains three categories of ELTs, including Lowland Loamy Moist
915 (ELT 1), Lowland Loamy Wet (ELT 2), and Lowland Organic Acid to Neutral (ELT 6). The
916 entire Tract 3 – Wolf Lands 3 parcel is included in the Greenwood Lake Till Plain LTA.

917 Management Indicator Habitats

918 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 3 lands (see
919 Figure 4.3.4-2) (USFS 2010b). Though not considered MIHs, the Tract 3 – Wolf Lands 3 parcel
920 also contains 48.6 acres of lowland shrub habitat and less than an acre of lowland emergent
921 habitat.

922 Landscape Ecosystems

923 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 3 lands.

924 The Lowland Conifer landscape ecosystem occupies 217.7 acres of the Tract 3 – Wolf Lands 3
925 parcel. The Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies 59.7 acres of the Tract
926 3 – Wolf Lands 3 parcel. Please see previous federal or non-federal lands sections above for a
927 description of these landscape ecosystem types.

928 ***Tract 3 – Wolf Lands 4***

929 Habitat Types

930 The primary MDNR GAP land cover type on the Tract 3 – Wolf Lands 4 parcel is lowland
931 coniferous forest (see Table 4.3.4-18). The shrubland and mixed upland forest cover types are
932 least represented. The MDNR GAP land cover types below may not fully represent the extent of
933 mixed forest types, since the cover type level below is fairly specific, so there may be more
934 mixed forest types than indicated.

935 **Table 4.3.4-18 Tract 3 – Wolf Lands 4 Cover Types**

Cover Types	Total Acres	Percent of Area
Lowland coniferous forest ¹	356.5	88
Upland coniferous forest ³	32.0	8
Upland deciduous forest ⁴	8.2	2
Upland conifer-deciduous mixed forest ⁵	4.1	1
Shrubland	3.9	1
Aquatic environments	0.0	0
Cropland/grassland	0.0	0
Disturbed	0.0	0
Lowland deciduous forest ²	0.0	0
Total	404.7	100

936 Source: MDNR 2006b.

937 Notes:

938 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

939 ² Includes black ash forest cover types.

940 ³ Includes pine and spruce/fir forest cover types.

941 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

942 ⁵ Includes all mixed coniferous-deciduous forest cover types.

943 Plant Community Surveys

944 The Tract 3 – Wolf Lands 4 parcel consists of approximately 90 percent wetland habitats
 945 (AECOM 2011c). Coyote Creek bisects the parcel and is bordered on either side by emergent
 946 wetland habitats similar to Tract 3 – Wolf Lands 3. Wetlands are dominated by pole black spruce
 947 in the northern half of the parcel and pole northern white cedar in the southern half. Scrub-shrub
 948 wetlands consist of speckled alder, leatherleaf, and bog-Labrador tea. See Section 4.3.3 for a
 949 more detailed description of wetland habitat types present.

950 Upland habitats consist of immature paper birch and black spruce, with balsam fir, beaked hazel,
 951 and raspberry also present. In areas that have been logged recently, sapling trembling aspen and
 952 paper birch are common over a shrub layer of beaked hazel, raspberry, and bog Labrador-tea
 953 (AECOM 2011c).

954 The majority of the black spruce/northern white cedar wetlands are dominated by trees ranging
 955 from 4 to 8 inches dbh (AECOM 2011c). Upland mature coniferous and deciduous trees range
 956 up to 18 inches dbh, although a 30-inch-dbh jack pine and several red pines up to 24 inches dbh
 957 have been found.

958 Minnesota Biological Survey

959 There are no designated MBS Sites of Biodiversity Significance located on the Tract 3 – Wolf
 960 Lands 4 parcel (see Figure 4.3.4-2) (MDNR 2008a). However, Tract 3 – Wolf Lands 4 is located
 961 on a potential MBS Site of Moderate to High Biodiversity Significance that has not yet been
 962 finalized by the MDNR (MDNR 2007a).

963 Native plant community rankings for Tract 3 are not available.

964 Scientific and Natural Areas

965 There are no SNAs located on the Tract 3 parcels.

966 *Culturally Important Plants*

967 A discussion of natural resources culturally important to the Bands is presented in Section
968 4.2.9.3.3.

969 *Management Areas*

970 The non-federal lands currently do not have any management area designations, as they are not
971 managed by the federal government. Section 4.3.1 describes the management areas in detail.

972 *Ecological Land Types*

973 Tract 3 – Wolf Lands 4 contains four categories of ELTs, including Lowland Loamy Moist (ELT
974 1), Lowland Loamy Wet (ELT 2), Lowland Organic Acid to Neutral (ELT 6), and Upland Deep
975 Medium Loamy Dry (ELT 14). The entire Tract 3 – Wolf Lands 4 parcel is included in the
976 Greenwood Lake Till Plain LTA.

977 *Management Indicator Habitats*

978 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 3 lands (see
979 Figure 4.3.4-2) (USFS 2010b). Though not considered an MIH, the Tract 3 – Wolf Lands 4
980 parcel also contains 31.0 acres of lowland shrub habitat.

981 *Landscape Ecosystems*

982 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 3 lands.

983 The Lowland Conifer landscape ecosystem occupies 356.7 acres of the Tract 3 – Wolf Lands 4
984 parcel. The Mesic Birch-Aspen-Spruce-Fir landscape ecosystem occupies 47.9 acres of the Tract
985 3 – Wolf Lands 4 parcel. Please see previous federal or non-federal lands sections above for a
986 description of these landscape ecosystem types.

987 *Invasive Non-native Plants*

988 According to the Superior National Forest invasive plant geodatabase, there are no known
989 occurrences of invasive species on any of the Tract 3 parcels (USFS 2010a). Field studies
990 indicate that one area of Tract 3 – Wolf Lands 3 contains an occurrence of thistles and ox-eye
991 daisy in a recently clear-cut habitat (AECOM 2011c).

992 *Threatened and Endangered Plant Species*

993 *Endangered, Threatened, and Special Concern Plant Species*

994 Based on a review of the MDNR NHIS and field investigations, no federally or state-listed ETSC
995 plant species are known to occur on the Tract 3 – Wolf Lands.

996 *Regional Foresters Sensitive Species*

997 There is more lowland black spruce-tamarack forest (MIH 9) and upland forest (MIH 1) habitat
998 available than any other type, so the RFSS plants associated with these types would be most
999 likely to occur on the Tract 3 lands. There is a very small amount of upland conifer forest
1000 (MIH 5) or aquatic habitats (MIH 14) so RFSS plants associated with these would be less likely
1001 to occur.

1002 **4.3.4.2.8 Tract 4 – Hunting Club Lands**

1003 Tract 4 is 160.2 acres in size, located on the LaCroix Ranger District, 5 miles southwest of Crane
 1004 Lake. Tract 4 is surrounded by the Superior National Forest, St. Louis County lands, and
 1005 privately owned lands (USFS 2011n).

1006 ***Cover Types***

1007 Tract 4 is located in the Laurentian Mixed Forest Province Ecoregion and in the Border Lakes
 1008 subsection of the Laurentian Mixed Forest Province ecoregion (MDNR 2006a). Most of the
 1009 vegetative cover types in this subsection grow in thin, acid, cobbly to gravelly glacial materials
 1010 over Precambrian bedrock (MDNR 2011g). Lakes and rocky ridges dominate this type of
 1011 landscape. Soils vary from coarse-loamy to coarse texture, and support forest communities of
 1012 aspen-birch, aspen-birch-conifer, and, on dry sites, jack pine barrens. Many such communities
 1013 within this subsection are fire-dependent.

1014 ***Habitat Types***

1015 The primary MDNR GAP land cover type on Tract 4 is upland deciduous forest (see Table
 1016 4.3.4-19). The upland conifer forest and lowland deciduous forest types are least represented.
 1017 The MDNR GAP land cover types below may not fully represent the extent of mixed forest
 1018 types, since the cover type level below is fairly specific, so there may be more mixed forest types
 1019 than indicated.

1020 ***Table 4.3.4-19 Tract 4 – Hunting Club Lands Cover Types***

Cover Types	Total Acres	Percent of Area
Upland deciduous forest ⁴	84.6	53
Shrubland	45.0	28
Aquatic environments	9.6	6
Lowland coniferous forest ¹	8.9	6
Upland coniferous forest ³	8.2	5
Lowland deciduous forest ²	4.0	2
Cropland/grassland	0.0	0
Disturbed	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	160.3⁽⁶⁾	100

1021 Source: MDNR 2006b.

1022 Notes:

1023 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

1024 ² Includes black ash forest cover types.

1025 ³ Includes pine and spruce/fir forest cover types.

1026 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

1027 ⁵ Includes all mixed coniferous-deciduous forest cover types.

1028 ⁶ Total acres may be more or less than presented due to rounding.

1029 ***Plant Community Surveys***

1030 The primary cover types on Tract 4 are pole and mature deciduous forests on the uplands and
 1031 scrub-shrub and emergent wetlands (AECOM 2011c). An unnamed creek bisects the parcel, and
 1032 beaver ponds and dams are common wetland features. Emergent vegetation surrounding open

1033 water consists of Canada bluejoint, narrow-leaved cattail, and sedges, while speckled alder
1034 dominates scrub-shrub wetlands. Pole black spruce and scattered tamarack dominate the
1035 wetlands on the interior of the parcel. Please see Section 4.3.3 for a more detailed description of
1036 wetland habitat types present.

1037 Upland habitats in the northwestern, northeastern, and southern portions of the parcel are
1038 dominated by mature white pine, red pine, paper birch, and trembling aspen, with balsam fir and
1039 beaked hazel also present, though some areas consist of sapling and immature trees. The upland
1040 habitats in the eastern and southern portions of the parcel consist of patches of sapling and pole
1041 trembling aspen, with beaked hazel, black spruce, and balsam fir. An “island” of immature white
1042 pine, trembling aspen, and black spruce exists within this patch of sapling trembling aspen
1043 (AECOM 2011c).

1044 The Tract 4 uplands are dominated by mostly deciduous sapling trees from 0 to 4 inches dbh, but
1045 mature white pines up to 24 inches dbh, and paper birch and trembling aspen up to 12 inches dbh
1046 occupy a large area as well (AECOM 2011c). Other upland areas on the parcel contain trembling
1047 aspen and white pine up to 16 inches dbh, and black spruce up to 12 inches dbh. Wetlands are
1048 dominated by immature coniferous forest trees ranging from 5 to 12 inches dbh.

1049 ***Minnesota Biological Survey***

1050 There are no lands designated as MBS Sites of Biodiversity Significance on Tract 4 (see Figure
1051 4.3.4-2) (MDNR 2008a).

1052 Native plant community rankings are not available for Tract 4.

1053 ***Scientific and Natural Areas***

1054 There are no lands designated as SNAs on Tract 4.

1055 ***Culturally Important Plants***

1056 A discussion of natural resources culturally important to the Bands is presented in Section
1057 4.2.9.3.3.

1058 ***Management Areas***

1059 The non-federal lands currently do not have any management area designations, as they are not
1060 managed by the federal government. Section 4.3.1 describes the management areas in detail.

1061 ***Ecological Land Types***

1062 Tract 4 contains seven different categories of ELTs, including Lowland Clayey Moist (ELT 3),
1063 Lowland Clayey Wet (ELT 4), Lowland Organic Acid to Neutral (ELT 6), Upland Deep Clayey
1064 Dry (ELT 10), Upland Shallow Loamy Dry (ELT 16), Upland Very Shallow Loamy Droughty
1065 (ELT 17), and Upland Extremely Shallow Loamy Droughty (ELT 18). The entire Tract 4 is
1066 included in the Johnson Lake Bedrock Complex LTA.

1067 ***Management Indicator Habitats***

1068 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 4 (see
1069 Figure 4.3.4-2) (USFS 2010b). Though not considered MIHs, Tract 4 also contains 26.6 acres of
1070 lowland shrub habitat and 4.2 acres of lowland emergent habitat.

1071 ***Landscape Ecosystems***

1072 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 4.

1073 The Dry-Mesic Red and White Pine landscape ecosystem occupies 93.7 acres of Tract 4. Please
1074 see previous federal or non-federal lands sections above for a description of this landscape
1075 ecosystem type.

1076 The Lowland Hardwood landscape ecosystem occupies 66.5 acres of Tract 4. It is dominated by
1077 black ash and/or balsam poplar, although elm, green ash, paper birch, aspen, yellow birch,
1078 balsam fir, northern white cedar, and white spruce may also be present (USFS 2004a). This
1079 landscape ecosystem typically occurs on sites that are seasonally wet or wet year-round. Stand
1080 replacement disturbances are infrequent, resulting in a multi-aged stand of black ash and balsam
1081 poplar.

1082 ***Invasive Non-native Plants***

1083 According to the Superior National Forest invasive plant geodatabase, there are no known
1084 occurrences of invasive species on Tract 4 (USFS 2010a).

1085 ***Threatened and Endangered Plant Species***

1086 ***Endangered, Threatened, and Special Concern Plant Species***

1087 Based on a review of the MDNR NHIS and field investigations, no federally or state-listed ETSC
1088 plant species are known to occur on Tract 4.

1089 ***Regional Foresters Sensitive Species***

1090 There is more upland forest (MIH 1) habitat available than any other type, so the RFSS plants
1091 associated with this type would be most likely to occur on Tract 4. There is a similar smaller
1092 amount of upland conifer forest (MIH 5), lowland black spruce-tamarack forest (MIH 9), and
1093 aquatic habitats (MIH 14), so RFSS plants associated with these would be less likely to occur.

1094 **4.3.4.2.9 Tract 5 – McFarland Lake Lands**

1095 Tract 5 is 30.8 acres in size on the Gunflint Ranger District in northeastern Cook County. The
1096 tract adds to Superior National Forest ownership and includes lakefront property on McFarland
1097 Lake, which is an entry point to the BWCAW. The parcel reaches an approximate maximum
1098 elevation of 1,762 ft amsl and the topography slopes steeply to the east toward its eastern border
1099 of McFarland Lake (NTS 2010b).

1100 ***Cover Types***

1101 Tract 5 is located in the Border Lakes subsection of the Laurentian Mixed Forest Province
1102 ecoregion (MDNR 2006a). See Tract 4 above for a description of the Border Lakes subsection.

1103 **Habitat Types**

1104 The primary MDNR GAP land cover type on Tract 5 is upland deciduous forest (see Table
 1105 4.3.4-20). The remaining cover types on the parcel are upland conifer forest and aquatic
 1106 environments. The MDNR GAP land cover types below may not fully represent the extent of
 1107 mixed forest types, since the cover type level below is fairly specific, so there may be more
 1108 mixed forest types than indicated.

1109 **Table 4.3.4-20 Tract 5 – McFarland Lake Lands Cover Types**

Cover Types	Total Acres	Percent of Area
Upland deciduous forest ⁴	26.6	86
Upland coniferous forest ³	4.0	13
Aquatic environments	0.2	1
Cropland/grassland	0.0	0
Disturbed	0.0	0
Lowland coniferous forest ¹	0.0	0
Lowland deciduous forest ²	0.0	0
Shrubland	0.0	0
Upland conifer-deciduous mixed forest ⁵	0.0	0
Total	30.8	100

1110 Source: MDNR 2006b.

1111 Notes:

1112 ¹ Includes lowland black spruce, lowland northern white cedar, and tamarack forest cover types.

1113 ² Includes black ash forest cover types.

1114 ³ Includes pine and spruce/fir forest cover types.

1115 ⁴ Includes aspen/aspen-white birch, maple/basswood, and oak forest cover types.

1116 ⁵ Includes all mixed coniferous-deciduous forest cover types.

1117 **Plant Community Surveys**

1118 Tract 5 consists of upland habitats, dominated by pole and mature deciduous and coniferous
 1119 forests (AECOM 2009b; AECOM 2011b). The parcel is located on McFarland Lake, and a
 1120 narrow band of horsetail and white cedar was observed along the shoreline (AECOM 2011b).
 1121 Section 4.3.3 presents a more detailed description of wetland habitat types present.

1122 Upland forest types on the hill slope of the parcel consist of trembling aspen, paper birch,
 1123 mountain maple, northern white cedar, black spruce, and balsam fir. Mountain maple and
 1124 northern white cedar are common on the lower hill slopes, while red pine and trembling aspen
 1125 are more prevalent at the top of the hill slope. The shrub layer includes smooth sumac (*Rhus*
 1126 *glabra*) and beaked hazel, while the ground layer includes forbs such as bunchberry, twining
 1127 honeysuckle, clintonia, large-leaved aster, twinflower, false lily-of-the-valley (*Maianthemum*
 1128 *canadense*), ox-eye daisy, thimbleberry (*Rubus parviflorus*), wild raspberry, wild strawberry,
 1129 bog rosemary (*Andromeda glaucophylla*), bog cranberry (*Vaccinium oxycoccus*), wild
 1130 sarsaparilla (*Aralia nudicaulis*), bracken fern and other ferns, and club moss (*Lycopodium* spp.)
 1131 (AECOM 2011b). Some recent logging has occurred along the hill slope of the western boundary
 1132 of the parcel. Steep rocky cliffs about 150 ft in height exist toward this western boundary
 1133 (AECOM 2011b). Enchanter’s nightshade (*Circaea quadrisulcata*) and wild columbine
 1134 (*Aquilegia canadensis*) have been observed on the rocky cliffs.

1135 Upland forests on the parcel contain trembling aspen, red pine, and eastern white pine up to
1136 18 inches dbh, balsam fir up to 16 inches dbh, and paper birch up to 12 inches dbh (AECOM
1137 2011b). Wetland forests along McFarland Lake contain northern white cedar up to 24 inches
1138 dbh.

1139 ***Minnesota Biological Survey***

1140 There are no lands designated as MBS Sites of Biodiversity Significance on the Tract 5 lands
1141 (see Figure 4.3.4-2) (MDNR 2008a).

1142 Native plant community rankings are not available for the Tract 5 lands.

1143 ***Scientific and Natural Areas***

1144 There are no lands designated as SNAs on the Tract 5 lands.

1145 ***Culturally Important Plants***

1146 A discussion of natural resources culturally important to the Bands is presented in Section
1147 4.2.9.3.3.

1148 ***Management Areas***

1149 The non-federal lands currently do not have any management area designations, as they are not
1150 managed by the federal government. Section 4.3.1 describes the management areas in detail.

1151 ***Ecological Land Types***

1152 Tract 5 contains four different categories of ELTs, including Lowland Loamy Wet (ELT 2),
1153 Upland Deep Medium Loamy Dry (ELT 14), Upland Shallow Loamy Dry (ELT 16), and Upland
1154 Extremely Shallow Loamy Droughty (ELT 18), though categories are not available for the entire
1155 parcel. All of Tract 5 is included in the Rove Slate Bedrock Complex LTA.

1156 ***Management Indicator Habitats***

1157 Table 4.3.4-3 provides a summary of the MIH types and age classes present on Tract 5 (see
1158 Figure 4.3.4-2) (USFS 2010b).

1159 ***Landscape Ecosystems***

1160 Table 4.3.4-4 provides a summary of the landscape ecosystem types present on Tract 5.

1161 The Mesic Red and White Pine landscape ecosystem occupies 30.8 acres of the Tract 5. See the
1162 federal or non-federal lands sections above for a description of these landscape ecosystem types.

1163 ***Invasive Non-native Plants***

1164 According to the Superior National Forest invasive plant geodatabase, there are no known
1165 occurrences of invasive species on the Tract 5 lands (USFS 2010a).

1166 **Threatened and Endangered Plant Species**

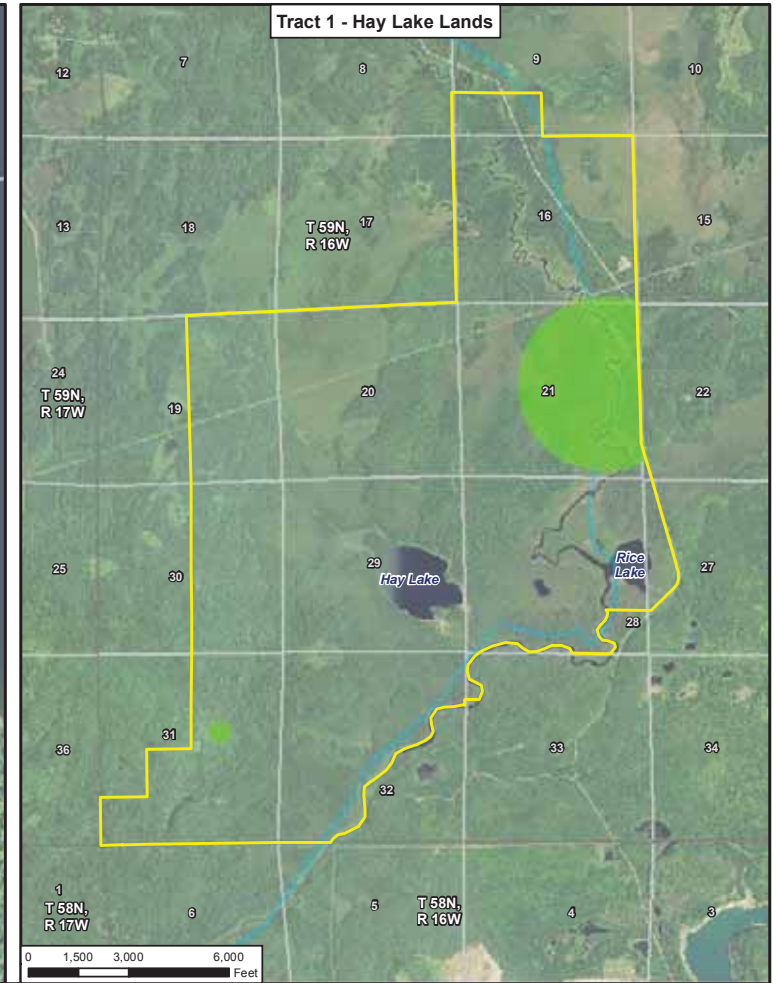

1167 ***Endangered, Threatened, and Special Concern Plant Species***

1168 No federally listed ETSC plant species are known to occur on Tract 5. Based on a review of the
1169 MDNR NHIS, one state-listed threatened species and one species of special concern have been
1170 identified on Tract 5 (see Table 4.3.4-21 and Figure 4.3.4-3). Encrusted saxifrage is also tracked
1171 by the USFS as an RFSS. No other state-listed species are known to occur on Tract 5.

1172 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
1173 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
1174 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
1175 associated with the updated list.

DRAFT

1179 **Table 4.3.4-21 Endangered, Threatened, and Special Concern Plant Species Identified on**
 1180 **the Tract 5 Lands⁴**

Common Name	Scientific Name	State Status ¹	No. of Populations	No. of Individuals ²	Habitat and Location
Encrusted saxifrage ³	<i>Saxifraga paniculata</i> (= <i>aizoon</i>)	SC	1	1000+	Shaded rock crevices and mossy ledges of north-facing sedimentary rock cliffs.
Rocky Mountain woodsia	<i>Woodsia scopulina</i>	T	1	2+	Cool, moist moss-covered chutes of north-facing sedimentary rock cliffs.

1181 Sources: MDNR 2014d; MDNR 2011k.

1182 Notes:

1183 ¹ E - Endangered, T - Threatened, SC - Species of Special Concern.

1184 ² Where the number of individuals cannot be determined without damaging the population, then patch size is used as a
 1185 representative abundance measure.

1186 ³ These species are also RFSS as tracked by the USFS.

1187 ⁴ Data included here were provided by the Division of Ecological Resources, MDNR, and were current as of August 5, 2014.

1188 These data are not based on an exhaustive inventory of the state. The lack of data for any geographic area shall not be
 1189 construed to mean that no significant features are present.

1190 Species Life Histories

1191 The following summary provides descriptions of the life histories, state-wide distributions, and
 1192 sensitivity to disturbance for each of the two threatened species found on Tract 5.

1193 Encrusted saxifrage (*Saxifraga paniculata*) (synonyms: *Saxifraga aizoon* var. *neogaea*, white
 1194 mountain saxifrage) is listed as a species of special concern in Minnesota and as an RFSS in the
 1195 Superior National Forest. The species was first documented in Cook County, Minnesota in 1932,
 1196 and has since only been reported in Cook and Lake counties (Bell Museum of Natural History
 1197 2011).

1198 *S. paniculata* is an arctic-alpine species that reaches the southern end of its range in Minnesota
 1199 (MDNR 2011k). It typically occurs in rock crevices and on ledges of shaded north-facing cliffs
 1200 with bedrock of diabase, gabbro/diorite, basalt, or Rove Formation rocks. *S. paniculata* is a
 1201 perennial herb species that flowers from early June to July and bears fruit from late July through
 1202 August, though it can also spread vegetatively via stolons. There is very little suitable cliff
 1203 habitat for *S. paniculata* in Minnesota, and threats to the species could include climate change,
 1204 changes in the biotic community, and recreational exploration of vulnerable cliff faces.

1205 Rocky Mountain woodsia (*Woodsia scopulina*) (Synonyms: *Woodsia scopulina* ssp. *laurentiana*)
 1206 is listed as a threatened species in Minnesota; it is not listed as an RFSS in the Superior National
 1207 Forest. The species was first documented in Cook County, Minnesota in 1929 amidst slate rocks,
 1208 and has since only been reported in Cook County (Bell Museum of Natural History 2011).
 1209 Though it is common in the Rocky Mountains, it is limited primarily to cool, moist north-facing
 1210 cliffs of the Rove Slate Formation in northeast Minnesota (MDNR 2011k). *W. scopulina* is a
 1211 perennial fern that grows in small clumps, and produces spores from summer to fall (eFlora
 1212 2011). There is very little suitable cliff habitat for *W. scopulina* in Minnesota, as it requires
 1213 diabase and slate bedrock and east-west oriented valleys. Threats to the species could include
 1214 climate change, introduction of non-native species, erosion events, forest management activities
 1215 that alter the biotic community, or recreational exploration of vulnerable cliff faces.

1216 ***Regional Foresters Sensitive Species***

1217 Based on a review of the MDNR NHIS, *Saxifraga paniculata* is located on Tract 5, and it is also
1218 an RFSS plant. There is more upland forest (MIH 1) habitat available than any other type, so the
1219 RFSS plants associated with this type would be most likely to occur on the Tract 5 lands. There
1220 is a smaller amount of upland conifer forest (MIH 5) and aquatic habitats (MIH 14) so RFSS
1221 plants associated with these would be less likely to occur. There is no lowland black spruce-
1222 tamarack forest (MIH 9) available, and so RFSS plants associated with this habitat would likely
1223 not exist. The cliff habitat present on Tract 5 is important to the 12 RFSS plants that utilize
1224 exposed rock habitats in the Superior National Forest (see Table 4.2.4-5), including *Saxifraga*
1225 *paniculata*, as there is very little suitable cliff microhabitat for these species in Minnesota.
1226 *Woodsia scopulina* also utilizes this habitat type.

DRAFT

1 **4.3.5 Wildlife**

2 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota Rules*,
 3 parts 6134.0100 to 6134.0400), with new listings becoming effective on August 19, 2013
 4 (MDNR 2013h). This FEIS considers any new listings, or changes in the previous listings,
 5 associated with the updated list. A BA that provides further information on federally listed
 6 species, and a BE that contains further information about RFSS have been prepared. The BA and
 7 BE are included in Appendix D and are posted on the USFS website
 8 (<http://www.fs.usda.gov/goto/superior/northmet>).

9 **4.3.5.1 Federal Lands**

10 **4.3.5.1.1 Land Exchange Proposed Action**

11 The federal land portion of the Land Exchange Proposed Action is similar to the Mine Site
 12 previously discussed, but extends further north and west and excludes the privately owned land
 13 bordering Dunka Road to the south of the Mine Site. Section 4.2.5.1 provides further discussion
 14 of the existing conditions on the Mine Site and associated federal lands.

15 The acres of key habitat present on the federal lands, along with the associated SGCN (and
 16 RFSS), are included in Table 4.3.5-1 below (see Figure 4.2.4-3).

17 **Table 4.3.5-1 Key Habitat, Cover Types, and Associated Species for the Federal Lands**
 18 **under the Land Exchange Proposed Action and Land Exchange**
 19 **Alternative B**

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species ¹	Land Exchange Proposed Action (Acres)	Land Exchange Alternative B (Acres)
1. Mature Upland Forest, Continuous Upland/Lowland Forest: aspen forest/aspen-birch forest, jack pine forest, mixed pine-hardwood forest (MIHs 1-13)	Rock vole, <i>northern goshawk</i> , veery, whip-poor-will, eastern wood-pewee, yellow-bellied sapsucker, ovenbird, Canada warbler, spruce grouse, Cape May warbler, winter wren, boreal chickadee, <i>boreal owl</i> , wood thrush, black-backed woodpecker, <i>bald eagle</i> , black-throated blue warbler, <i>bay-breasted warbler</i> , <i>great gray owl</i> , <i>three-toed woodpecker</i>	5,719.7	4,258.1
2. Open Ground, Bare Soils: disturbed/ developed (no MIH)	Laurentian tiger beetle	63.8	29.1
3. Grassland and Brushland, Early Successional Forest (no MIH)	Franklin's ground squirrel, American badger, Le Conte's sparrow, eastern meadowlark, brown thrasher, white-throated sparrow, sharp-tailed grouse, golden-winged warbler, American woodcock, northern harrier, sedge wren, common nighthawk, black-billed cuckoo, bobolink, tawny crescent	651.8	439.1

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species ¹	Land Exchange Proposed Action (Acres)	Land Exchange Alternative B (Acres)
4. Aquatic Environments: rivers, lakes, ponds, wetlands, etc. (MIH 14)	American black duck, American bittern, swamp sparrow, common loon, northern rough-winged swallow, semipalmated sandpiper, American golden-plover, greater yellowlegs, buff-breasted sandpiper, eastern red-backed salamander, common snapping turtle, bog copper, <i>taiga alpine</i>	60.1	26.3
5. Multiple Habitats (MIHs 1-14)	Gray wolf ² (1-4 ⁽³⁾), <i>Canada lynx</i> ² (1-4), rose-breasted grosbeak (1, 3), Macoun's arctic (1, 3), least flycatcher (1, 3), <i>Connecticut warbler</i> (1, 3), <i>olive-sided flycatcher</i> (1, 4), <i>grizzled skipper</i> (2, 3), <i>Nabokov's blue</i> (2, 4), wood turtle ² (1, 3, 4)	NA	NA
Total		6,495.4	4,752.6

20 Source: MDNR 2006b.

21 Notes:

22 ¹ Plain text indicates SGCN species; italicized text indicates RFSS; plain text indicates SGCN species identified as likely to be
 23 present at the Mine Site or Plant Site but not targeted in surveys.

24 ² Canada lynx, gray wolf, bald eagle, and wood turtle are or have recently been listed as ETSC species as discussed in detail in
 25 the ETSC species section.

26 ³ Numbers refer to the Key Habitat Types (1-4) where those species may occur or are known to occur.

27 4.3.5.1.2 Land Exchange Alternative B

28 As shown on Table 4.3.5-1, each of the key habitat types and MIH categories that are found on
 29 the federal lands of the Land Exchange Proposed Action are also found on the smaller federal
 30 parcel of the Land Exchange Alternative B. Acreages of each habitat category are
 31 correspondingly reduced for the Land Exchange Alternative B.

32 4.3.5.2 Non-federal Lands

33 4.3.5.2.1 Tract 1 – Hay Lake Lands

34 Federally and State-listed Species and Species of Special Concern

35 Tract 1 is not located in an LAU but is located in designated lynx critical habitat. No Canada
 36 lynx or their sign have been observed on the non-federal lands during surveys (AECOM 2011b;
 37 AECOM 2011c). The Tract 1 parcel is located in Wolf Zone 2 and the Minnesota Northeast
 38 Wolf Zone. Radio-collared wolves have been recorded in the vicinity and evidence of wolves
 39 was observed during 2009 wildlife surveys (AECOM 2009b). Moose sign, including droppings,
 40 tracks, and browsing evidence, were observed on the Tract 1 lands in speckled alder and shrub
 41 wetlands (AECOM 2011b). Trumpeter swans, state-listed as species of special concern, were
 42 identified on the Tract 1 lands during wildlife surveys (AECOM 2011b) and habitat for the
 43 Laurentian tiger beetle, state-listed as a species of special concern, is present at the former sand
 44 and gravel pit on the parcel. An active northern goshawk territory is present on Tract 1, and is
 45 currently being monitored by the MDNR. Though northern goshawks were not seen or heard
 46 during 2011 field surveys (AECOM 2011b), NHIS records indicate one chick was observed on a
 47 new nest in 2013. Bats were recorded at several echolocation survey sites on or near the Tract 1

48 lands, but the species of the bats recorded was not determined (AECOM 2011b). Both NHIS
49 records and surveys of the parcel failed to identify individuals or signs of the remaining federally
50 and state-listed species and species of special concern, including wood turtle, horned grebe,
51 Wilson's phalarope, common tern, boreal owl, American white pelican, marbled godwit, yellow
52 rail, smoky shrew, eastern heather vole, least weasel, and mountain lion (AECOM 2011b).

53 **Species of Greatest Conservation Need**

54 As discussed in Section 4.2.5.1.2, the potential presence of SGCN can be correlated to the
55 presence of their corresponding habitat. Table 4.3.5-2 below lists the SGCN (and RFSS) by the
56 key habitat types and cover types present in the Nashwauk Uplands ecological subsection.

57 Tract 1 is located in the Nashwauk Uplands ecological subsection. The species found in this
58 subsection are listed in Table 4.3.5-2 below.

DRAFT

59 **Table 4.3.5-2 Key Habitat and Cover Types of Species of Greatest Conservation Need and**
 60 **Regional Forester Sensitive Species for Tract 1 in the Nashwauk Ecological**
 61 **Subsection**

Key Habitat Type, Cover Types, and Management	Indicator Habitats	Associated Wildlife Species ¹	Tract 1 (Acres)
1. Mature Upland Forest, Continuous Upland/Lowland Forest: aspen forest/aspen-birch forest, jack pine forest, mixed pine-hardwood forest (MIHs 1-13)		<i>Northern goshawk</i> , veery, whip-poor-will, eastern wood-pewee, yellow-bellied sapsucker, ovenbird, Canada warbler, spruce grouse, Cape May warbler, winter wren, boreal chickadee, wood thrush, black-backed woodpecker, <i>bald eagle</i> , <i>great gray owl</i> , <i>three-toed woodpecker</i>	2,978.8
2. Open Ground, Bare Soils: disturbed/developed (no MIH)			0.0
3. Grassland and Brushland, Early Successional Forest (no MIH)		Franklin's ground squirrel, American badger, Le Conte's sparrow, eastern meadowlark, brown thrasher, white-throated sparrow, sharp-tailed grouse, golden-winged warbler, American woodcock, northern harrier, sedge wren, common nighthawk, black-billed cuckoo, red-headed woodpecker, bobolink, tawny crescent	1,696.3
4. Aquatic Environments: rivers, lakes, ponds, wetlands, etc. (MIH 14)		American black duck, American bittern, swamp sparrow, common loon, red-necked grebe, northern rough-winged swallow, dunlin, semipalmated sandpiper, short-billed dowitcher, American golden-plover, Virginia rail, greater yellowlegs, buff-breasted sandpiper, eastern red-backed salamander, common snapping turtle, bog copper, <i>taiga alpine</i> , <i>ebony boghaunter</i>	251.1
5. Multiple Habitats (MIHs 1-14)		Gray wolf ² (1-4 ⁽³⁾), Canada lynx ² (1-4), <i>eastern pipistrelle</i> (1,3), rose-breasted grosbeak(1,3), least flycatcher (1,3), <i>olive-sided flycatcher</i> (1,4), <i>Connecticut warbler</i> (1,3), peregrine falcon(1-3), Macoun's arctic (1,3), <i>Nabokov's blue</i> (2,4), <i>grizzled skipper</i> (2,3), <i>Quebec emerald</i> (3,4)	NA
Total⁴			4,926.2

62 Source: MDNR 2006b.

63 Notes:

64 ¹ Plain text indicates SGCN species, italicized text indicates RFSS.

65 ² Canada lynx, gray wolf, bald eagle, and wood turtle are or have recently been listed as ETSC species as discussed in detail in
 66 the ETSC species section.

67 ³ Numbers refer to the Key Habitat Types (1-4) where those species may occur or are known to occur.

68 ⁴ Total acres may be more or less than presented due to rounding.

69 **Regional Forester Sensitive Species**

70 RFSS that are also state-listed or species of special concern are discussed above. With the
 71 possible exception of RFSS bat species, no other RFSS were observed during surveys of Tract 1
 72 (AECOM 2011b). Potential Superior National Forest RFSS and their habitat on Tract 1 are listed
 73 on Table 4.3.5-2.

74 **Other Wildlife Species**

75 Other wildlife species, including species of concern to the Bands, were observed during surveys
76 of Tract 1. Species observed, or their sign, include black bear, white-tailed deer, red fox, river
77 otter, beaver, marten, red squirrel, snowshoe hare, ruffed grouse, American woodcock, common
78 loon, hooded merganser, ring-necked duck, red-tailed hawk, broad-winged hawk, barred owl,
79 great horned owl, pileated woodpecker, several passerine bird species, snapping turtle, and
80 painted turtle (AECOM 2011b).

81 Sections 4.2.5, 4.2.9, 5.2.5, and 5.2.9 discuss species of importance to the Bands.

82 **4.3.5.2.2 Tract 2 – Lake County Lands**

83 **Federally and State-listed Species and Species of Special Concern**

84 Tract 2 is split into two parcels, Lake County Lands North and Lake County Lands South. Lake
85 County North is located in LAU 16 and Lake County South is located in LAU 22. Both are in
86 designated lynx critical habitat. No Canada lynx or their sign have been observed on the non-
87 federal lands during surveys (AECOM 2011b; AECOM 2011c). While no lynx or their sign have
88 been observed on the Tract 2 parcels, denning habitat may be present. Areas of blowdown or
89 logging slash where there is both vertical and horizontal cover may be used by lynx for denning
90 sites (Moen 2009). Moose sign, including droppings, tracks, and browsing evidence, were
91 observed on the Lake County South parcel in speckled alder and shrub wetlands (AECOM
92 2011c).

93 Both Tract 2 parcels are located in federal Wolf Zone 2 and the Minnesota Northeast Wolf Zone.
94 Wolf sign was observed on Lake County North during 2010 wildlife surveys (AECOM 2011c).
95 Both NHIS records and surveys of the parcel failed to identify individuals or signs of the
96 remaining federally and state-listed species or species of special concern (MDNR 2014d;
97 AECOM 2011c).

98 **Species of Greatest Conservation Need**

99 The Lake County North parcel is located in the Laurentian Uplands ecological subsection and the
100 Lake County South parcel is located in the North Shore Highlands ecological subsection. Table
101 4.3.5-3 below lists the SGCN (and RFSS) by the key habitat types and cover types present at
102 Tract 2.

103 **Table 4.3.5-3 Key Habitat and Cover Types of Species of Greatest Conservation Need and**
104 **Regional Forester Sensitive Species for Tract 2 in the Laurentian Uplands**
105 **and North Shore Highlands Ecological Subsections**

Key Habitat Type, Cover Types, and Management Indicator Habitats	Associated Wildlife Species¹	Tract 2 (Acres)
1. Mature Upland Forest, Continuous Upland/Lowland Forest: aspen forest/aspen-birch forest, jack pine forest, mixed pine-hardwood forest (MIHs 1-13)	Rock vole, <i>northern goshawk</i> , veery, whip-poor-will, eastern wood-pewee, yellow-bellied sapsucker, ovenbird, Canada warbler, spruce grouse, Cape May warbler, winter wren, boreal chickadee, <i>boreal owl</i> , wood thrush, black-backed woodpecker, <i>bald eagle</i> , black-throated blue warbler, <i>bay-breasted warbler</i> , <i>great gray owl</i> , <i>three-toed woodpecker</i>	337.2
2. Open Ground, Bare Soils: disturbed/ developed (no MIH)	Laurentian tiger beetle	0.0
3. Grassland and Brushland, Early Successional Forest (no MIH)	Franklin's ground squirrel, American badger, Le Conte's sparrow, eastern meadowlark, brown thrasher, white-throated sparrow, sharp-tailed grouse, golden-winged warbler, American woodcock, northern harrier, sedge wren, common nighthawk, black-billed cuckoo, bobolink, red-headed woodpecker, tawny crescent	38.9
4. Aquatic Environments: rivers, lakes, ponds, wetlands, etc. (MIH 14)	American black duck, American bittern, swamp sparrow, common loon, northern rough-winged swallow, dunlin, semipalmated sandpiper, short-billed dowitcher, American golden-plover, Virginia rail, greater yellowlegs, buff-breasted sandpiper, ruddy turnstone, white-rumped sandpiper, marsh wren, Hudsonian godwit, whimbrel, common tern, eastern red-backed salamander, common snapping turtle, Blanding's turtle, bog copper, <i>taiga alpine</i> , extra-striped snaketail, <i>ebony boghaunter</i>	5.8
5. Multiple Habitats (MIHs 1-14)	Gray wolf ² (1-4 ⁽³⁾), Canada lynx ² (1-4), <i>eastern heather vole</i> (1,3), smoky shrew (1,3), <i>northern long-eared bat</i> (1,4), <i>eastern pipistrelle</i> (1,3,4), eastern spotted skunk (1,3), rose-breasted grosbeak (1,3), least flycatcher (1,3), <i>olive-sided flycatcher</i> (1,4), <i>Connecticut warbler</i> (1,3), peregrine falcon(1-3), <i>wood turtle</i> ² (1,3,4), four-toed salamander (1,4), Macoun's arctic (1,3), <i>Nabokov's blue</i> (2,4), <i>grizzled skipper</i> (2,3), <i>Quebec emerald</i> (3,4)	NA

106 Source: MDNR 2006b.

107 Notes:

108 ¹ Plain text indicates SGCN species, italicized text indicates RFSS.

109 ² Canada lynx, gray wolf, bald eagle, and wood turtle are or have recently been listed as ETSC species as discussed in detail in
110 the ETSC species section.

111 ³ Numbers refer to the Key Habitat Types (1-4) where those species may occur or are known to occur.

112 **Regional Forester Sensitive Species**

113 RFSS that are also state-listed or species of special concern are discussed above. No other RFSS
114 were observed during surveys of Tract 2. Potential Superior National Forest RFSS and their
115 habitat on Tract 2 are listed on Table 4.3.5-3.

116 **Other Wildlife Species**

117 Other wildlife species, including species of concern to the Bands, were observed during surveys
118 of Tract 2. Species observed, or their sign, include white-tailed deer, beaver, snowshoe hare,
119 marten, mink, red squirrel, raven, ruffed grouse, pileated woodpecker, and several passerine bird
120 species (AECOM 2011c).

121 Sections 4.2.5, 4.2.9, 5.2.5, and 5.2.9 discuss species of importance to the Bands.

122 **4.3.5.2.3 Tract 3 – Wolf Lands**

123 **Federally and State-listed Species and Species of Special Concern**

124 Tract 3 is split into four parcels, Wolf Lands 1, 2, 3, and 4. Wolf Lands 1 is located in LAU 16
125 and Wolf Lands 2 through 4 are located in LAU 22. All are within designated lynx critical
126 habitat. No Canada lynx or their sign have been observed on the non-federal lands during
127 surveys (AECOM 2011b; AECOM 2011c). While no lynx or their sign have been observed on
128 the Tract 3 parcels, denning habitat may be present. Areas of blowdown or logging slash where
129 there is both vertical and horizontal cover may be used by lynx for denning sites (Moen 2009).
130 Moose sign, including droppings, tracks, and browsing evidence, were observed on the Wolf
131 Lands 3 and 4 parcels in speckled alder and shrub wetlands (AECOM 2011c).

132 All Tract 3 parcels are located in federal Wolf Zone 2 and the Minnesota Northeast Wolf Zone.
133 Wolf sign was observed on Wolf Lands 3 and 4 during 2010 wildlife surveys (AECOM 2011c).
134 Both NHIS records and surveys of the parcel failed to identify individuals or signs of the
135 remaining federally and state-listed species or species of special concern (MDNR 2014d;
136 AECOM 2011c).

137 **Species of Greatest Conservation Need**

138 The Wolf Lands parcels are located in the Laurentian Uplands ecological subsection. The species
139 of greatest conservation need and habitat that may be found in this subsection are listed on Table
140 4.3.5-4.

141 **Table 4.3.5-4 Key Habitat and Cover Types of Species of Greatest Conservation Need and**

145 Notes:

146 ¹ Plain text indicates SGCN species, italicized text indicates RFSS.

147 ² Canada lynx, gray wolf, and bald eagle are or have recently been listed as ETSC species as discussed in detail in the ETSC species section.

148 ³ Numbers refer to the Key Habitat Types (1-4) where those species may occur or are known to occur.

149 ⁴ Total acres may be more or less than presented due to rounding.

151 ***Regional Forester Sensitive Species***

152 RFSS that are also state-listed or species of special concern are discussed above. No other RFSS
 153 were observed during surveys of Tract 3. Potential Superior National Forest RFSS and their
 154 habitat on Tract 3 are listed on Table 4.3.5-4.

155 **Other Wildlife Species**

156 Other wildlife species, including species of concern to the Bands, were observed during surveys
157 of Tract 3. Species observed, or their sign, include white-tailed deer, red fox, marten, snowshoe
158 hare, beaver, red squirrel, ruffed grouse, pileated woodpecker, and several passerine bird species
159 (AECOM 2011c).

160 Sections 4.2.5, 4.2.9, 5.2.5, and 5.2.9 discuss species of importance to the Bands.

161 **4.3.5.2.4 Tract 4 – Hunting Club Lands**

162 **Federally and State-listed Species and Species of Special Concern**

163 Tract 4 is located in LAU 4 and is located in designated lynx critical habitat. No Canada lynx or
164 their sign have been observed on the non-federal lands during surveys (AECOM 2011b;
165 AECOM 2011c). The Tract 4 parcel is located in federal Wolf Zone 2 and the Minnesota
166 Northeast Wolf Zone. Both NHIS records and surveys of the parcel failed to identify individuals
167 or signs of federally and state-listed species or species of special concern (MDNR 2014d;
168 AECOM 2011c).

169 **Species of Greatest Conservation Need**

170 Tract 4 is located in the Border Lakes ecological subsection. Table 4.3.5-5 lists the species of
171 greatest conservation need and habitat that may be found in this subsection.

172 **Table 4.3.5-5 Key Habitat and Cover Types of Species of Greatest Conservation Need and**

176 Notes:

177 ¹ Plain text indicates SGCN species, italicized text indicates RFSS.

178 ² Canada lynx, gray wolf, and bald eagle are or have recently been listed as ETSC species as discussed in detail in the ETSC
179 species section.

180 ³ Numbers refer to the Key Habitat Types (1-4) where those species may occur or are known to occur.

181 ⁴ Total acres may be more or less than presented due to rounding.

182 **Regional Forester Sensitive Species**

183 RFSS that are also state-listed or species of special concern are discussed above. No other RFSS
184 were observed during surveys of Tract 4 (AECOM 2011c). Potential Superior National Forest
185 RFSS and their habitat on Tract 4 are listed on Tables 4.3.5-5.

186 **Other Wildlife Species**

187 Other wildlife species, including species of concern to the Bands, were observed during surveys
188 of Tract 4. Species observed, or their sign, include white-tailed deer, red fox, marten, snowshoe
189 hare, beaver, red squirrel, pileated woodpecker, and several passerine bird species (AECOM
190 2011c).

191 Sections 4.2.5, 4.2.9, 5.2.5, and 5.2.9 discuss species of importance to the Bands.

192 **4.3.5.2.5 Tract 5 – McFarland Lake Lands**

193 **Federally and State-listed Species and Species of Special Concern**

194 Tract 5 is located in LAU 42 and is located in designated lynx critical habitat. No Canada lynx or
195 their sign have been observed on the non-federal lands during surveys (AECOM 2011b;
196 AECOM 2011c). Though bats were observed on the parcel, the species of bats were not
197 determined and may potentially include eastern pipistrelle and/or northern long-eared bat
198 (AECOM 2011b). The Tract 5 parcel is located in federal Wolf Zone 2 and the Minnesota
199 Northeast Wolf Zone. Wolf sign was observed on the parcel in October 2011. Both NHIS
200 records and surveys of the parcel failed to identify individuals or signs of the remaining federally
201 and state-listed species or species of special concern (MDNR 2014d; AECOM 2011c).

202 **Species of Greatest Conservation Need**

203 Like Tract 4, Tract 5 is located in the Border Lakes ecological subsection. Table 4.3.5-5 provides
204 a list of species of greatest conservation need and habitat that may be found in this subsection.

205 **Regional Forester Sensitive Species**

206 RFSS that are also state-listed or species of special concern are discussed above. With the
207 possible exception of RFSS bat species, no other RFSS were observed during surveys of Tract 5
208 (AECOM 2011b). Potential Superior National Forest RFSS and their habitat on Tract 5 are listed
209 on Table 4.3.5-5.

210 **Other Wildlife Species**

211 Other wildlife species, including species of concern to the Bands, were observed during surveys
212 of Tract 5. Species observed, or their sign, include black bear, white-tailed deer, red fox, beaver,
213 red squirrel, raven, ruffed grouse, common loon, hooded merganser, broad-winged hawk, barred
214 owl, pileated woodpecker, and several passerine bird species (AECOM 2011b).

215 Sections 4.2.5, 4.2.9, 5.2.5, and 5.2.9 discuss species of importance to the Bands.

DRAFT

1 **4.3.6 Aquatic Species**

2 This section discusses aquatic resources located on the non-federal parcels considered for
3 acquisition by the USFS through the Land Exchange Proposed Action. The federal lands are
4 discussed in Section 4.2.6.1 along with the Mine Site. The Alternative B: Smaller Federal Parcel
5 contains similar surface waters, but smaller acreages or linear distances than the federal lands.

6 Some of the non-federal lands contain streams, creeks, rivers, and lakes. Tract 1 contains three
7 lakes and one river, comprising approximately 90,000 linear ft of shoreline and approximately
8 129 acres of surface area. Tract 3 – Wolf Lands 3 and Wolf Lands 4 contain Coyote Creek, with
9 approximately 12 linear ft of river frontage per acre. Tract 5 includes 506 ft of McFarland Lake
10 frontage. Tract 2 and Tract 4 do not contain surface water features.

11 There are no SGCN, state, federal, or RFSS species known to occur at or in the immediate
12 vicinity of the non-federal lands. According to available data, however, there are several SGCN
13 or RFSS that are associated with the Superior National Forest or various ecoregions on which the
14 non-federal lands are located.

15 Rulemaking was conducted with the intent to update the list of ETSC species (*Minnesota*
16 *Rules*, parts 6134.0100 to 6134.0400), with new listings becoming effective on
17 August 19, 2013 (MDNR 2013h). The FEIS considers any new listings, or changes in
18 the previous listings, associated with the updated list. The FEIS also considers any federal
19 listing changes. A BE has been prepared that contains further information about RFSS
20 species. The BE is included in Appendix D and is posted on the USFS website
21 (<http://www.fs.usda.gov/goto/superior/northmet>).

22 **4.3.6.1 Federal Lands**

23 **4.3.6.1.1 Land Exchange Proposed Action**

24 The existing conditions found within the federal lands area are discussed in Section 4.2.6.1.

25 **4.3.6.1.2 Land Exchange Alternative B**

26 The existing conditions found within the Alternative B area are discussed in Section 4.2.6.1.
27 However, site-specific information is presented below.

28 **Surface Water Features**

29 A portion of Mud Lake, covering 8.9 acres with approximately 1,200 ft of lake frontage, is
30 located within the Alternative B lands. The length of lake frontage per acre of this alternative
31 boundary is 0.3 ft.

32 As with the federal lands within the Land Exchange Proposed Action, Yelp Creek and the
33 Partridge River, which originates at the Northshore Mine, flow out of the One Hundred Mile
34 Swamp and through portions of the smaller federal parcel within the Land Exchange Alternative
35 B. Collectively, the creek and river are 5.3 miles in length in the Alternative B, corresponding to
36 55,968 linear ft of creek/river frontage (counting both shores). The combined Yelp Creek and
37 Partridge River frontage per acre of the smaller federal parcel within the Land Exchange
38 Alternative B is 11.8 ft (see Table 4.3.6-1).

39 The MIH represented within the boundaries of the Alternative B: Smaller Federal Parcel includes
 40 8.9 acres for Mud Lake and 55,968 linear ft for the combined Yelp Creek and Partridge River.

41 **Table 4.3.6-1 Alternative B Surface Water Characteristics**

Surface Water	Size on Parcel	Approximate Shoreline Frontage (ft)	MIH	Frontage Index (ft/acre)
Mud Lake	8.9 acres	1,200.0	8.9 acres	0.3
Yelp Creek	1.1 miles	*	*	*
Partridge River	4.2 miles	55,968.0	55,968.0 linear ft	11.8

42 Source: Adapted from AECOM 2011d.

43 * Combined with Partridge River.

44 **4.3.6.2 Non-federal Lands**

45 **4.3.6.2.1 Tract 1 – Hay Lake Lands**

46 **Surface Water Features**

47 Surface water features on Tract 1 include three lakes and one river. Aerial photograph review of
 48 the three lakes associated with the parcel indicates a mix of deep water and shallow,
 49 submergent/emergent vegetation habitats in the open water portions of the lakes, which provide
 50 fish and macroinvertebrate habitats.

51 The Pike River, which flows north through the tract, is classified as a third-order stream (see
 52 Figure 4.3.6-1) within Tract 1 and includes approximately 376.2 acres of mapped floodplain. The
 53 heavily vegetated riparian habitats and associated floodplains adjacent to the river’s edge likely
 54 provide important fish and macroinvertebrate habitats. Tract 1 also has unmapped floodplains
 55 associated with Hay Lake itself, which has been estimated to be approximately 175.0 acres.

56 The USFS MIH categories within Tract 1 include 129.6 acres of lakes, 16,424 linear ft of lake
 57 shoreline, and 72,864 linear ft of river shoreline (see Table 4.3.6-2).

58 Riparian habitats, which surround all surface water features on the parcel, include shrub-carr,
 59 coniferous swamp, sedge meadow, alder thicket, shallow open water, and deep marsh wetlands
 60 (AECOM 2011d). Aerial photograph review indicates a wide riparian buffer and minimal
 61 disturbance along each surface water feature. All wetlands adjacent to the surface water features
 62 scored high for fish habitat according to the MnRAM 3.2 rating (AECOM 2011d).

DRAFT

65 **Table 4.3.6-2 Tract 1 Surface Water Characteristics**

Surface Water	Surface Area (acres)	Approximate Shoreline Frontage (linear ft)	MIH
Hay Lake	96.2	9,894.4	96.2 acres
Rice Lake	29.5	4,829.6	29.5 acres
Unnamed lake	3.9	1,700	3.9 acres
Pike River	na	72,864 ¹	72,864 linear ft
Total	129.6	89,288	

66 Source: Adapted from AECOM 2011d.

67 Notes:

68 na = Not available

69 ¹ Includes riparian distance on both sides of river except along property boundary to the southeast where only the west side of
70 the river is included.

71 **Aquatic Biota Studies**

72 No aquatic biota studies were performed within the surface water features associated with Tract
73 1; however, studies were completed by the MPCA (MPCA 2011c) for two locations downstream
74 from the parcel's northern boundary (see Figure 4.3.6-1). Aquatic biota sampling station
75 MPCAB_05RN029 is located in a first-order section of an unnamed tributary to the Pike River
76 approximately 1 river mile downstream from Tract 1's northern boundary. The sampling station
77 MPCAB_05RN077 is located approximately 12 river miles downstream of the parcel's northern
78 boundary in a fourth-order section of the Pike River. These aquatic biota sampling stations
79 recorded predominant stream substrate and fish assemblages at both locations and benthic
80 macroinvertebrate assemblages at station MPCAB_05RN029, as summarized in Table 4.3.6-3
81 and 4.3.6-4.

85 Notes:

86 ¹ Adapted from NCDENR 2006, Ohio EPA 1989, and Hubbs and Lagler 2007. Tolerance values indicate qualitative tolerances
87 of physical and chemical disturbances.

88 ² IBI is the sum of study specific metrics where 0 represents the worst fish assemblage conditions and 100 represents the best
89 fish assemblage conditions (USEPA 2011a).

90 -- = no designation assigned.

91 **Table 4.3.6-4 Benthic Macroinvertebrate Attributes for Aquatic Biota Sampling Site**
92 **MPCAB_05RN029**

Benthic Macroinvertebrate Attributes ¹	MPCAB_05RN029
EPT (mayfly, stonefly, caddisfly) Taxa	1
Ephemeroptera (mayfly) Taxa	1
Hilsenhoff's Biotic Index (HBI)	5.7
Intolerant Families	2
Percent Pollution Tolerant	3
Percent Chironomidae (midges)	69.5
Percent Diptera (true flies)	71.3
Percent Dominant Taxa	69.5
Percent Dominant Two Taxa	91.1
Percent Filterers	0.9
Percent Gatherers	92.3
Percent Hydropsychidae (net-spinning caddisflies)	0
Percent Scraper	0
Plecoptera (stonefly) Families	0
Total Families	11
Trichoptera (caddisfly) Families	0

93 Source: MPCA 2011c.

94 The majority of fish species found at the two sample sites were designated pollution-tolerant and
95 intermediate species (Table 4.2.6-3). The IBI score of 25 at sample location MPCAB_05RN029
96 was at the low end of the scale, indicating below-average fish communities existed. This is likely
97 a function of the sampling location, as less diverse fish habitat may exist at headwater stream
98 locations (Barbour et al. 1999).

99 The MPCAB_05RN077 fourth-order stream sampling site results did not identify any intolerant
100 fish species; however, with increasing stream order, fish diversity increases (Barbour et al. 1999)
101 but is variable, as exhibited by the abundance values of 28 and 89 fish, respectively, in the first-
102 and fourth-order study site locations. The IBI score of 60 at this fourth-order sampling location
103 indicates above-average fish communities and habitat exist. The dominant sand substrates, as
104 opposed to silt substrate, and apparent wide riparian shoreline characteristics at these two
105 sampling sites would also indicate quality fish habitat exists at the sampling sites.

106 The third-order sections of the Pike River within Tract 1 likely display some similar fish habitats
107 and communities compared to the two study locations.

108 Macroinvertebrate assemblages exhibited low Ephemeroptera, Plecoptera, and Trichoptera (EPT)
109 taxa and were dominated by midges and true flies at the headwater sampling location referenced
110 above for fish assemblages. The attributes collected for macroinvertebrates at this sampling site
111 suggest diverse macroinvertebrate habitats were not present, which may be attributed to the
112 headwater characteristics and substrate of the sampling site. The macroinvertebrate habitat
113 available for the third-order segments of the Pike River within the Tract 1 parcel likely exhibit
114 more diverse and high-quality habitats than the headwater macroinvertebrate sampling location.

115 **Special Status Fish and Macroinvertebrates**

116 No SGCN, state, federal, or RFSS species are known to occur within or in the immediate vicinity
117 of Tract 1. Of the species listed as potentially occurring in the Nashwauk Uplands ecoregion or
118 Superior National Forest (see Table 4.3.6-5), the northern brook lamprey and creek heelsplitter
119 are the most likely species to occur at this parcel.

120 Suitable habitat for northern brook lamprey is likely to exist within Tract 1; however, the nearest
121 known occurrence of this species is more than 19 miles from Tract 1.

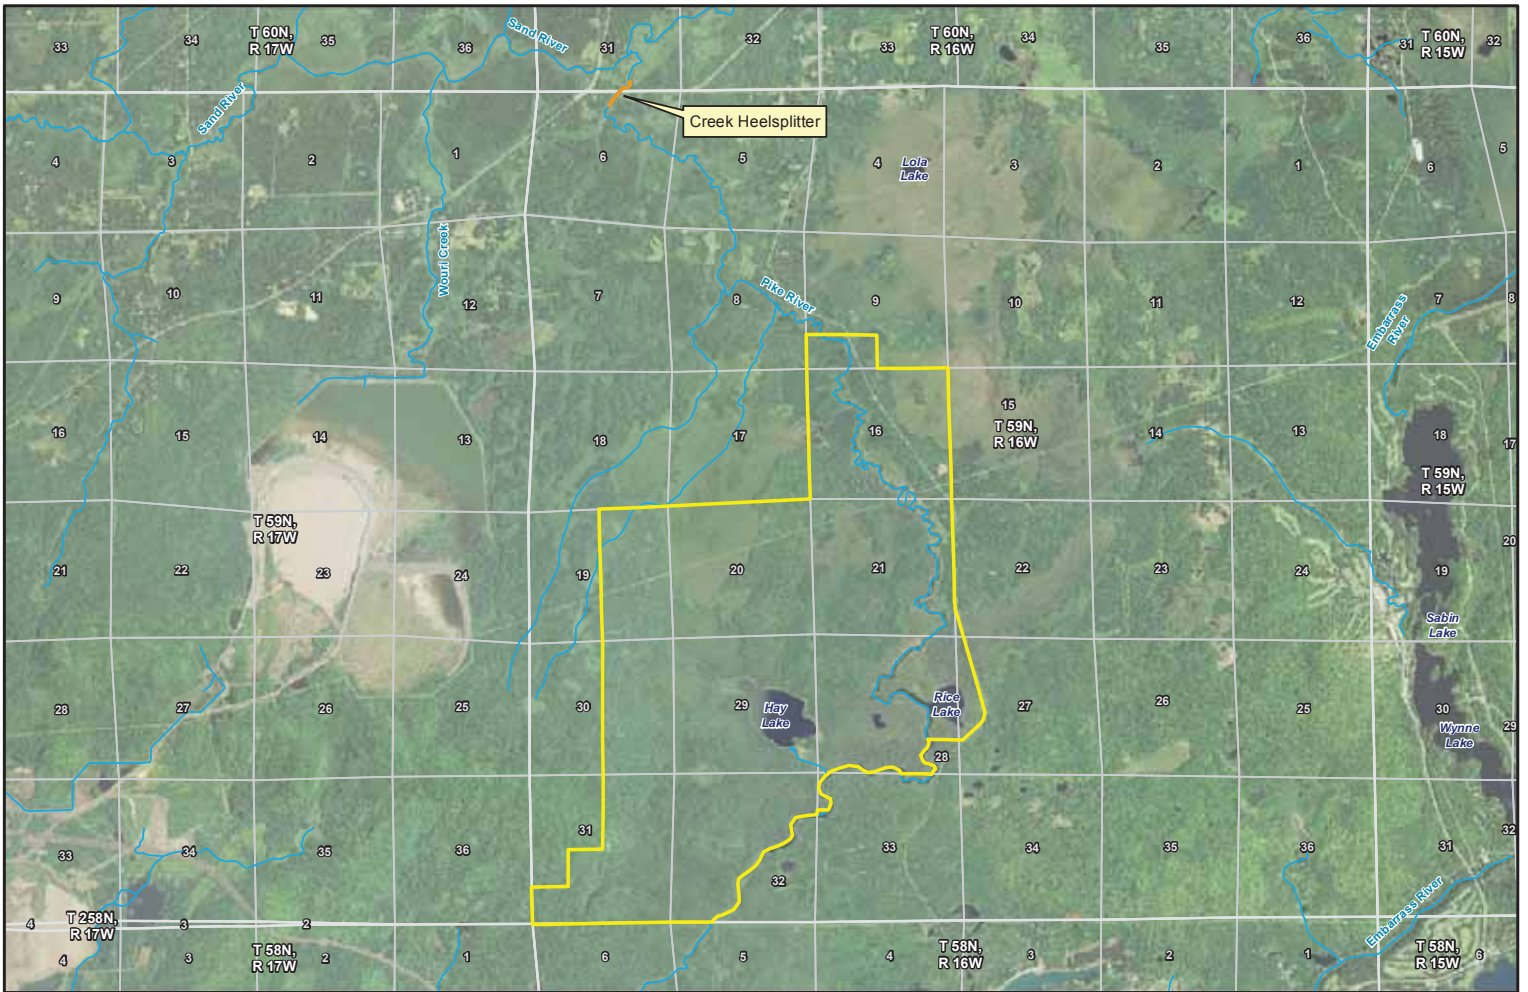

122 Suitable habitat likely exists for the creek heelsplitter in the third-order segments of the Pike
123 River within Tract 1, as the substrate likely contains adequate sand substrate and flow to provide
124 habitat for this freshwater mussel species. Additionally, this species has been documented 0.5
125 mile upstream of the Sand and Pike rivers confluence, where the Pike River becomes a fourth-
126 order stream (see Figure 4.3.6-2).

127 **Table 4.3.6-5 SGCN and RFSS Species Identified Within Portions of the Nashwauk**

DRAFT

133 **4.3.6.2.2 Tract 2 - Lake County Lands**

134 No lakes or waterbodies are known to exist within Tract 2 (AECOM 2011d); therefore, no fish or
135 macroinvertebrate habitats are present.

136 **4.3.6.2.3 Tract 3 - Wolf Lands**

137 **Surface Water Features**

138 Coyote Creek is the only surface water feature within the Wolf Lands 3 and 4. Wolf Lands 1 and
139 2 do not have surface water features. Coyote Creek is a headwater stream that begins in Wolf
140 Lands 3 where it flows north for 0.1 mile within the parcel boundary and includes approximately
141 32.8 acres of unmapped floodplain. Coyote Creek continues north and flows for 0.9 mile within
142 Wolf Lands 4 before continuing further north, and includes approximately 79.4 acres of
143 unmapped floodplain. The heavily vegetated riparian habitats and associated floodplains adjacent
144 to the river's edge likely provide important fish and macroinvertebrate habitats. Coyote Creek
145 flows through two of the three lakes in the McDougal Lakes chain and becomes a third-order
146 stream (see Figure 4.3.6-3) at its confluence with the Stony River approximately 4 river miles
147 downstream from the northern boundary of Wolf Lands 4. Wolf Lands 3 and 4 contain a
148 combined 16.1 ft of river frontage per acre. Aerial photograph review indicates a wide riparian
149 vegetative buffer with minimal human disturbance where emergent sedge-meadow wetlands are
150 adjacent to the creek within the Wolf Lands 3 parcel, and both emergent and scrub-shrub
151 wetlands are adjacent to the creek within the Wolf Lands 4 parcel (AECOM 2011c). The riparian
152 vegetative buffer adjacent to the creek segments offers shade, structure, and erosion control.

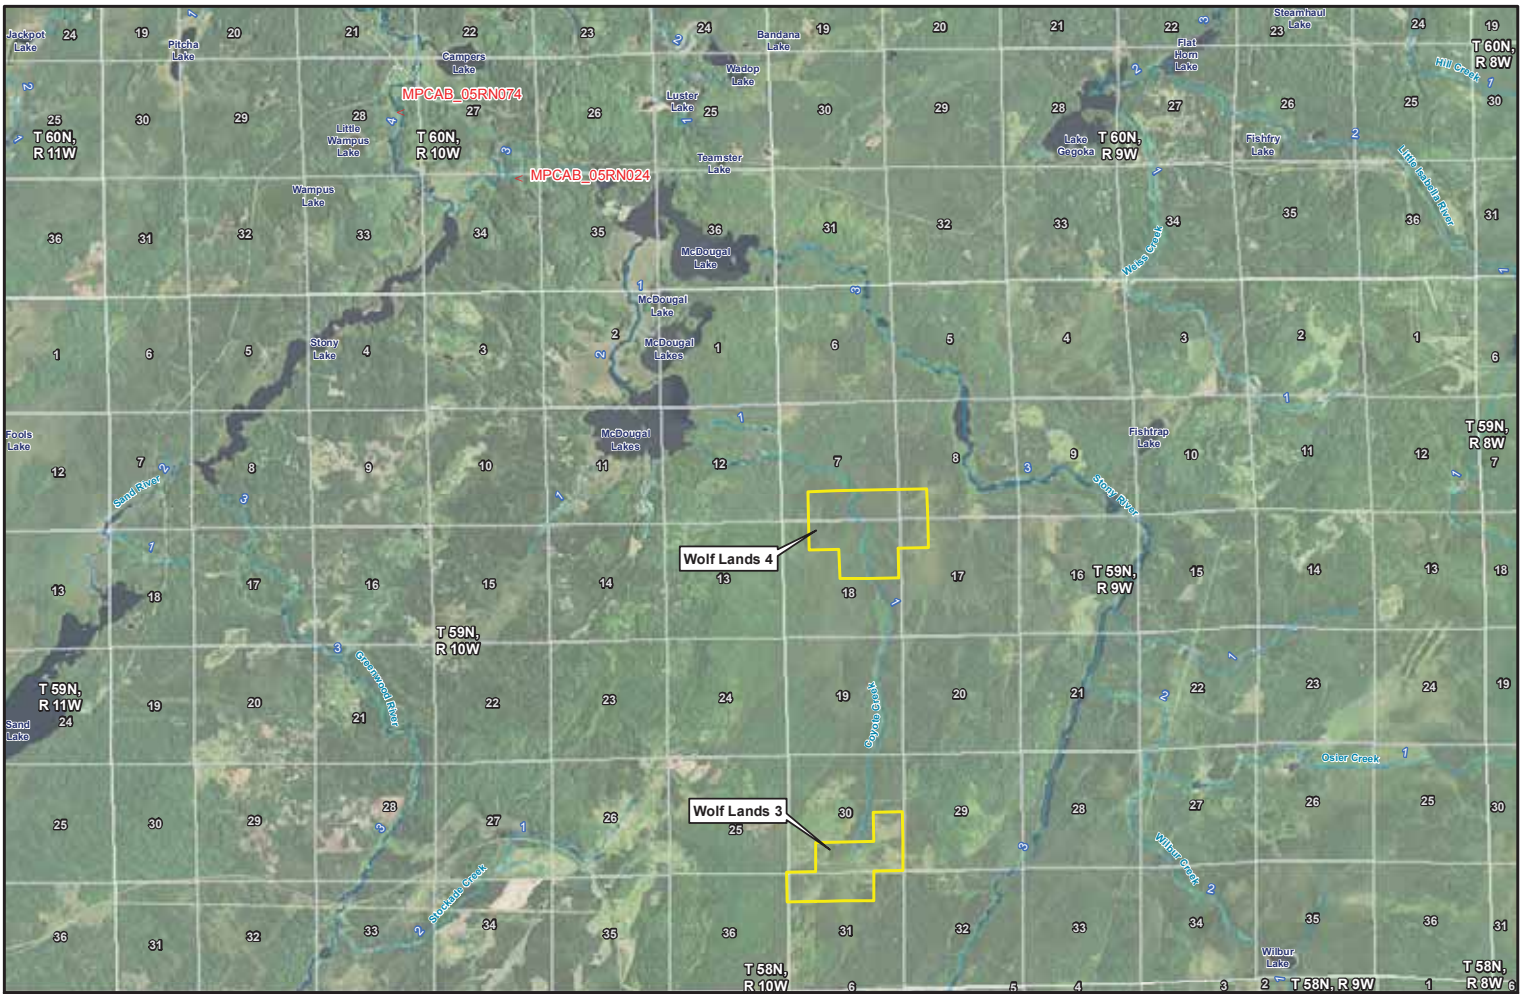

153 Much of the emergent wetlands adjacent to Coyote Creek within the Wolf Lands 3 parcel
154 exhibited 18 to 24 inches of standing water (AECOM 2011c), which could provide high-quality
155 headwater stream fish and macroinvertebrate habitats because wetlands provide nutrient-rich
156 environments that would be accessible to fish and macroinvertebrates at the documented water
157 depth. Additionally, these wetlands likely provide potential spawning habitat for some
158 warmwater fish species that require headwater wetland habitats for spawning.

159 The USFS MIH categories within the combined Wolf Lands parcels 3 and 4 boundaries include
160 approximately 10,560 linear ft of creek shoreline.

161 **Aquatic Biota Studies**

162 No fish or macroinvertebrate studies have been completed along Coyote Creek within the two
163 parcels; however, two MPCA aquatic biota studies (MPCAB_05RN024 and MPCAB_05RN074)
164 were completed within the third- and fourth-order stretches of the Stony River, approximately 2
165 river miles and 4 river miles, respectively, downstream of the Coyote Creek and Stony River
166 confluence, as indicated in Figure 4.3.6-3 (6 and 8 miles downstream of northern boundary of
167 parcel Wolf Lands 4) (MPCA 2011c). Results from the two sampling events are summarized
168 below in Table 4.3.6-6 and Table 4.3.6-7. The fish communities for both sampling sites
169 appeared diverse and abundance was high. IBI scores for each site were high, indicating good to
170 excellent fish habitat was likely present. Although high-quality fish habitat likely exists at the
171 Coyote Creek stream locations within Wolf Lands 3 and 4, some, but not all, of the fish species
172 observed at the Stony River sampling locations are likely present, as fish community diversity is
173 likely less in headwater stream habitats.

DRAFT

177 A qualitative assessment of the benthic macroinvertebrate data presented in Table 4.3.6-7
 178 indicates a diverse community with attributes indicating little human disturbance or
 179 sedimentation at the Stony Creek sampling sites. The Coyote Creek headwater stretches of
 180 stream likely exhibit more siltation due to slower moving water typically observed in headwater
 181 streams in the region and, therefore, likely offer less diverse habitats for benthic
 182 macroinvertebrates compared to the two sampling sites summarized below.

196 **Special Status Fish and Macroinvertebrates**

197 No SGCN, state, federal, or RFSS species are known to occur at or in the immediate vicinity of
 198 Tract 3. Of the species listed to potentially occur in the Laurentian Uplands ecoregion (see
 199 Figure 4.3.6-4) or Superior National Forest (see Table 4.3.6-8), the northern brook lamprey and
 200 creek heelsplitter are the most likely species to occur within Tract 3.

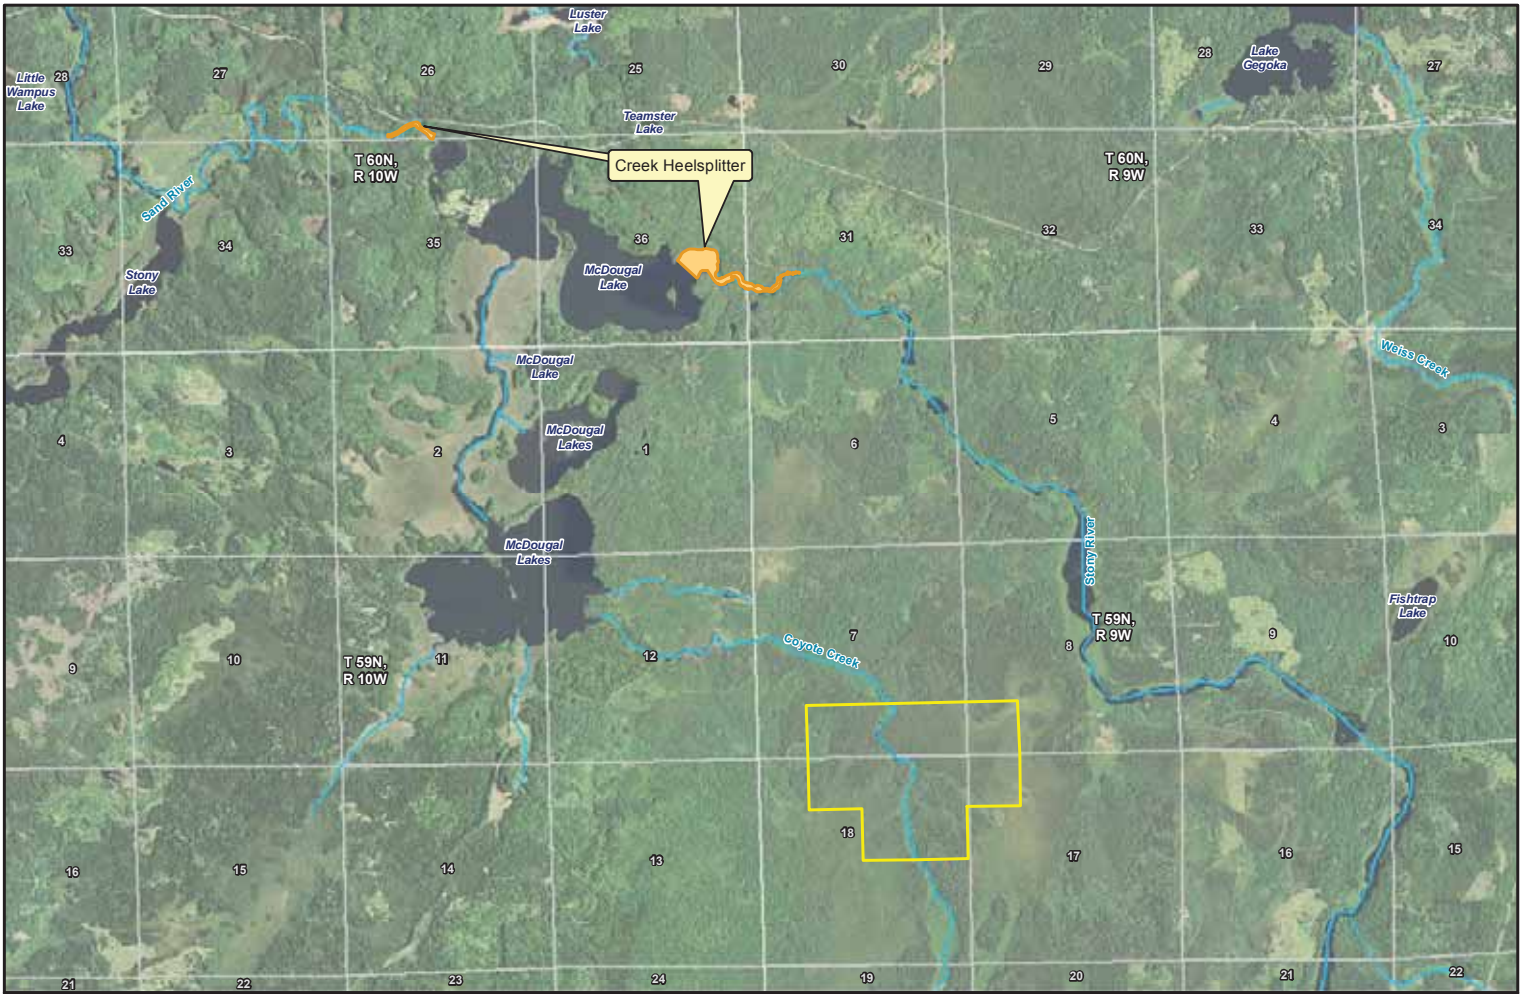

201 Suitable habitat for northern brook lamprey is likely to exist in Tract 3, although the nearest
 202 known occurrence of this species is more than 52 miles from the Wolf Lands parcels.

203 The creek heelsplitter has historically been found near the east and west confluence of the
 204 northernmost lake in the chain of McDougal Lakes and the Stony River in the third-order stretch
 205 of the Stony River (see Figure 4.3.6-5). The aquatic species habitat in the stretches of Coyote
 206 Creek within Wolf Lands 3 and 4 is unknown, but likely would display first-order headwater
 207 stream characteristics; it is unknown if the necessary aquatic species habitat for the creek
 208 heelsplitter is present on the parcels. However, the presence of the creek heelsplitter within the
 209 parcel boundary is possible but not likely, since Coyote Creek is a first-order stream.

210 Habitats for the other special status species described in Table 4.3.6-8 likely do not exist within
 211 the parcel boundary.

212 No invasive fish or macroinvertebrate species are known to exist on Tract 3.

219 Source: MDNR 2006d; USFS 2015a.

#### 220 4.3.6.2.4 Tract 4 - Hunting Club Lands

##### 221 Surface Water Features

222 No lakes or waterbodies are known to exist within Tract 4 (AECOM 2011d); therefore, no fish or  
223 macroinvertebrate habitats exist.

#### 224 4.3.6.2.5 Tract 5 - McFarland Lake Lands

##### 225 Surface Water Features

226 The only surface water feature within Tract 5 is the 990 ft of shoreline associated with  
227 McFarland Lake along the eastern parcel boundary. McFarland Lake is classified as an  
228 oligotrophic lake (MPCA 2011c) with a surface area of 384 acres and a maximum depth of 49 ft  
229 (MDNR 2011c). Aerial photograph review indicates minimal shoreline disturbance and a wide  
230 riparian vegetative buffer along the entire parcel boundary with McFarland Lake.

231 The USFS MIH represented in Tract 5 (MIH 14, Aquatic Habitats) would include 990 linear ft of  
232 lake shoreline.

##### 233 Aquatic Biota Studies

234 MDNR conducted a fishery assessment within McFarland Lake in 2003 and reported several  
235 game fish species including lake whitefish, northern pike, smallmouth bass, walleye, and yellow  
236 perch (MDNR 2011c). Tulibee and white sucker were also recorded. These species are typical  
237 for large and deep lakes within the region.

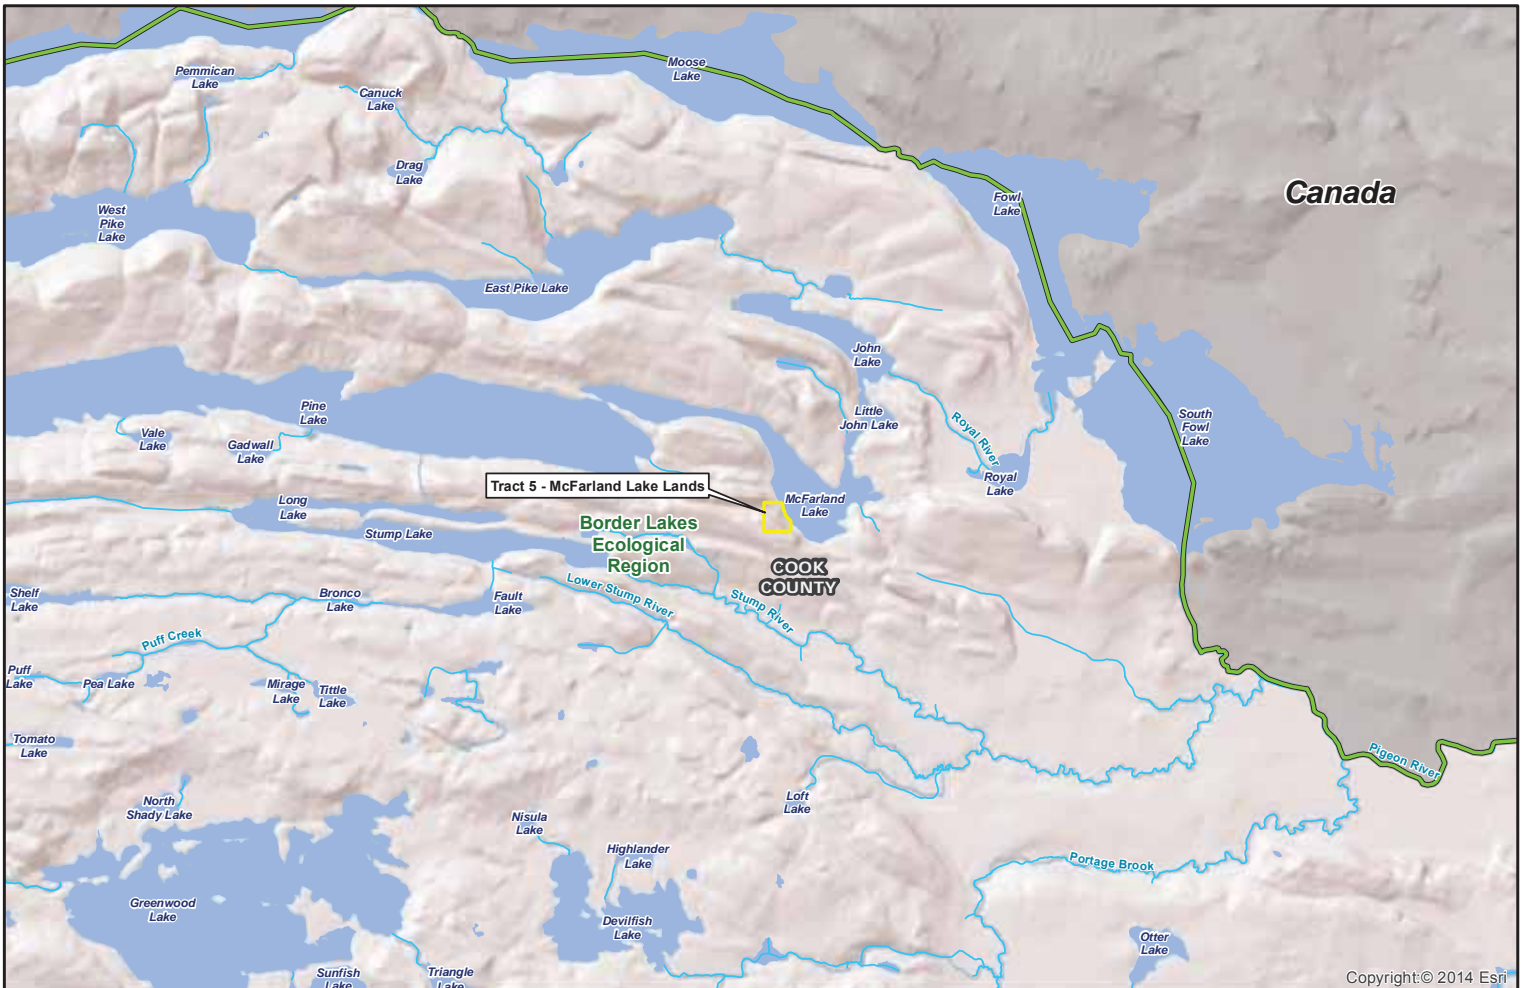

##### 238 Special Status Fish and Macroinvertebrates

239 No special status fish or macroinvertebrates are known to exist within Tract 5. A summary of the  
240 SGCN and RFSS species is provided in Table 4.3.6-9. The spoonhead sculpin, lake chub, and  
241 longear sunfish are known to occur within the Border Lakes ecoregion and could occur at Tract 5  
242 (see Figure 4.3.6-6). These species are described below. Due to limiting habitat requirements and

243 limited distribution, the remaining species listed in Table 4.6.3-9 likely are not present in  
244 McFarland Lake.

245 The invasive species, spiny water flea (*Bythotrephes longimanus*), has been documented in  
246 McFarland Lake. The spiny water flea is a species of zooplankton native to Europe and Asia that  
247 competes for food sources with other zooplankton species and fish.

252 Sources: MDNR 2006d; USFS 2015a.

253 ***Spoonhead Sculpin***

254 The spoonhead sculpin is a bottom dwelling fish that inhabits rocky areas of swift creeks and  
 255 rivers; however, this species can also be found in lakes. They primarily feed on planktonic  
 256 crustaceans and aquatic insect larvae and are native to Minnesota (Froese and Pauly 2011). Little  
 257 is known about the habitat and macroinvertebrates in McFarland Lake. Although the habitat  
 258 characteristics for McFarland Lake are not completely known, it is possible the spoonhead  
 259 sculpin species exists in McFarland Lake.

260 ***Lake Chub***

261 Lake chubs have a secure distribution in Lake Superior, but have shown declining distribution in  
 262 Minnesota inland lakes. Their preferred habitat includes shallow areas of deep lakes, especially  
 263 near river mouths (Stasiak 2006). Habitat for lake chub may exist in McFarland Lake.

264 ***Longear Sunfish***

265 The longear sunfish is found in lake and stream habitats, which include high-quality waters with  
 266 shallow (less than 3 ft) shorelines exhibiting firm, detritus rich substrates and extensive  
 267 submerged vegetation. Only 37 Minnesota lakes and streams have confirmed populations of this  
 268 fish species (Porterfield and Ceas 2008). Habitat for longear sunfish may exist in portions of  
 269 McFarland Lake.

DRAFT

1 **4.3.7 Air Quality**

2 Regional air quality, including for the federal and non-federal lands, is discussed in Section  
3 4.2.7. The federal lands of the Land Exchange Proposed Action are similar to the Mine Site  
4 previously discussed, but exclude the privately owned land bordering Dunka Road to the south  
5 of the Mine Site. The non-federal parcels are all privately owned and there are currently no  
6 activities on these parcels that affect ambient air quality.

DRAFT

-Page Intentionally Left Blank-

DRAFT

1 **4.3.8 Noise and Vibration**

2 **4.3.8.1 Federal Lands**

3 The topography and land cover of the federal lands in the Land Exchange Proposed Action and  
 4 the Land Exchange Alternative B are similar to that of the Mine Site, as previously discussed,  
 5 but extend further north and west (mostly wetlands) and exclude the privately owned land  
 6 bordering Dunka Road to the south of the Mine Site. Section 4.2.8.2 provides a discussion of the  
 7 existing noise and vibration conditions on the federal lands.

8 **4.3.8.2 Non-federal Lands**

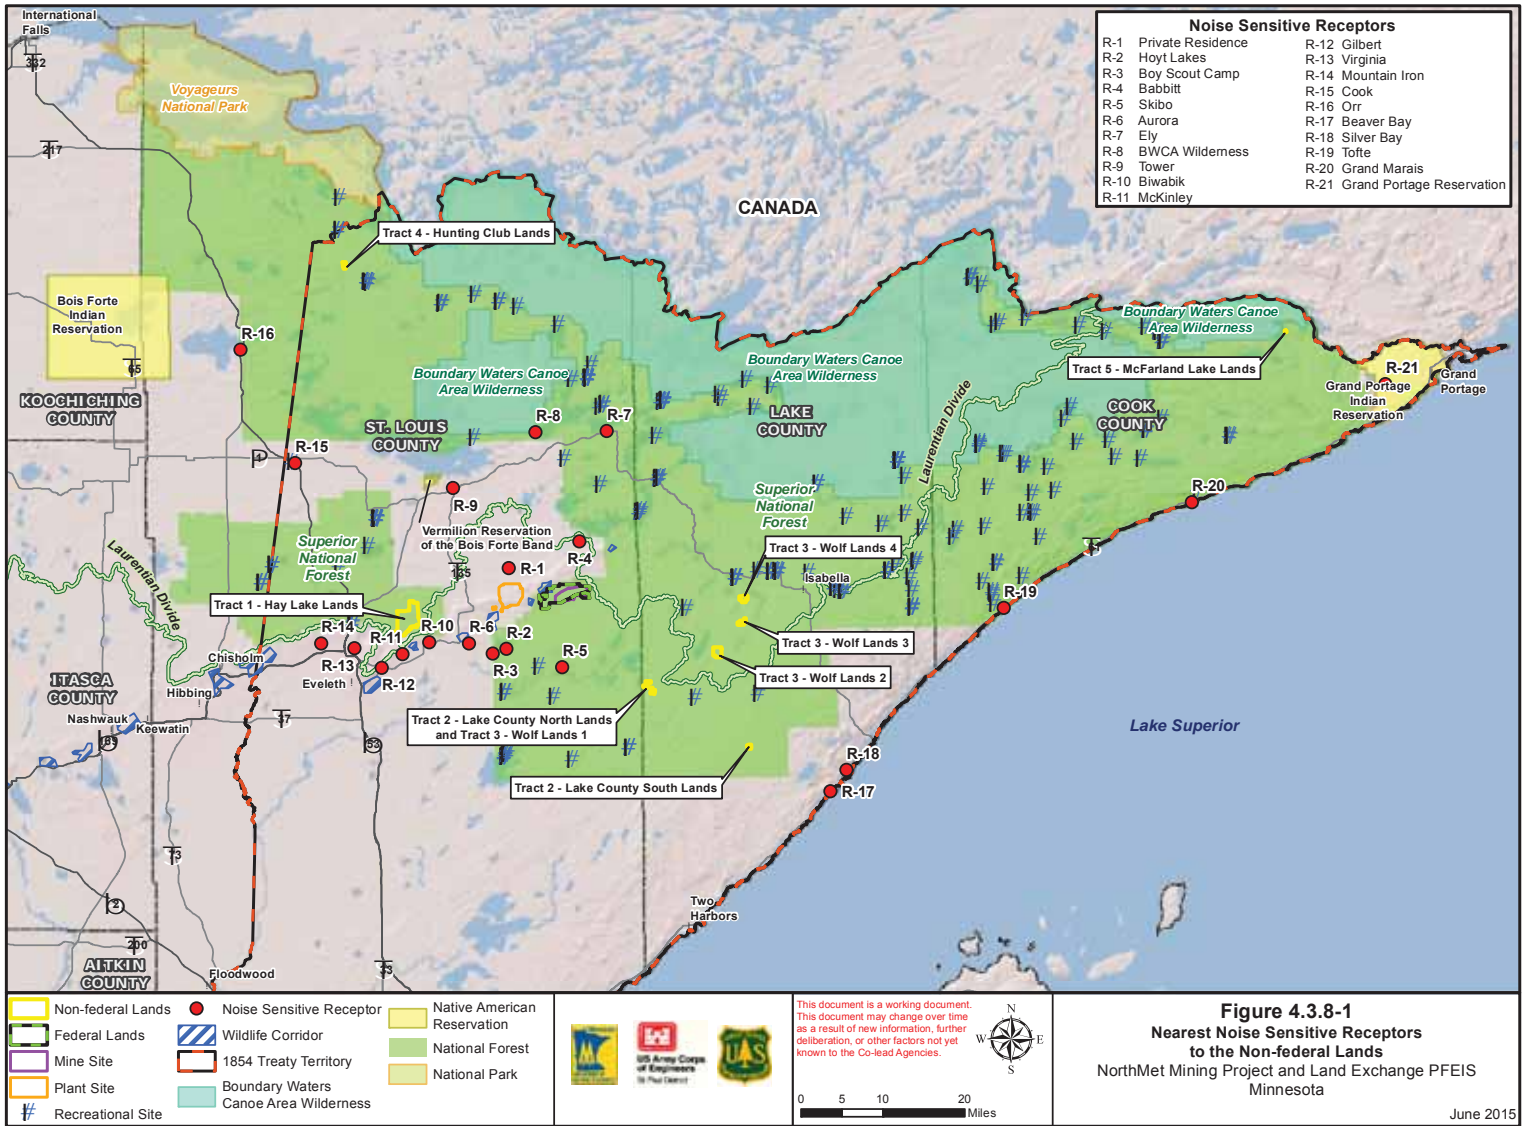

9 The non-federal lands in the Land Exchange Proposed Action consist of up to five tracts totaling  
 10 7,075.0 acres that are located within the Superior National Forest proclamation boundary, a  
 11 sparsely populated rural region in northeast Minnesota. The tracts are predominantly forest and  
 12 wetland habitat. Tracts 1, 2, and 3 are 13 to 27 miles from the federal lands, while Tracts 4 and 5  
 13 are 46 and 91 miles from the federal lands, respectively (see Table 4.3.8-1 and Figure 4.3.8-1).

14 **Table 4.3.8-1 Approximate Distances and Direction of Non-federal Lands to Federal Lands**  
 15 **and the Plant Site**

| Tract                    | Approximate Distance to Federal Lands (miles) | Approximate Distance to Plant Site (miles) | Direction from Federal Lands and Plant Site |

| Lake County North        | 13                                            | 20                                         | Southeast                                   |
| Lake County South        | 27                                            | 34                                         | Southeast                                   |
| Tract 3 – Wolf Lands     |                                               |                                            |                                             |
| Wolf Lands 1             | 14                                            | 20                                         | Southeast                                   |
| Wolf Lands 2             | 18                                            | 26                                         | Southeast                                   |
| Wolf Lands 3             | 18                                            | 26                                         | Southeast                                   |
| Wolf Lands 4             | 18                                            | 26                                         | East                                        |
| Tract 4 – Hunting Club   | 46                                            | 43                                         | Northwest                                   |
| Tract 5 – McFarland Lake | 91                                            | 100                                        | Northeast                                   |

16 Review of the most-up-to-date aerial maps indicates that there are no noise-sensitive areas or  
 17 receptors (e.g., residences, schools, campgrounds, or national wilderness areas) within the non-  
 18 federal lands. However, people currently hunt within Tract 1 and Tract 4 due to the presence of  
 19 wildlife. Wildlife species within each tract are described in Section 4.3.5. There are a few  
 20 residential receptors outside the non-federal lands. Figure 4.3.8-1 shows the locations of the  
 21 closest receptors to the non-federal lands.

DRAFT

DRAFT

25 The non-federal lands would be managed consistent with the adjacent forest lands (see Section  
26 4.3.1), and the USFS currently has no plans for operations on the non-federal lands. Since the  
27 non-federal lands are located in a forested and rural environment, the existing ambient  $L_{eq}$  at the  
28 five tracts has been assumed to be 5 dB lower than the levels shown in Table 4.2.8-2 for the  
29 Mine Site and Plant Site. This means that existing daytime and nighttime ambient  $L_{eq}$  for all non-  
30 federal lands are not expected to exceed 40 and 30 dB, respectively. The estimated  $L_{eq}$  for the  
31 statistical distribution was converted to other noise percentile metrics, such as  $L_{50}$  and  $L_{10}$ , using  
32 a USEPA calculation methodology (USEPA 1974). The calculation was based on an assumed  
33 standard deviation of 3 dB for the sound level statistical distribution. A summary of the  
34 estimated daytime and nighttime ambient  $L_{eq}$ ,  $L_{50}$ , and  $L_{10}$  levels expected at the tracts is  
35 presented in Table 4.3.8-2.

36 **Table 4.3.8-2 Summary of Estimated Existing Ambient Noise Levels at the Non-federal**  
37 **Lands**

| Ambient Noise Level Metric | Daytime (dBA) | Nighttime (dBA) |
|----------------------------|---------------|-----------------|
| $L_{eq}$                   | 40            | 30              |
| $L_{50}$                   | 39            | 29              |
| $L_{10}$                   | 42.8          | 32.8            |

38 Currently, no ground- or air-vibrating sources or activities (e.g., mine blasting or pile driving)  
39 exist within a 15-mile radius of the non-federal lands. The closest vibration-generating activities  
40 include operation of the coal and flux pulverizer and rotary hearth furnace at the Mesabi Phase I  
41 Plant in Hoyt Lakes (approximately 9 miles west of Tract 1, which is the closest non-federal  
42 tract) and blasting at the Northshore Mine (approximately 16 miles northwest of the closest tract  
43 [Tract 2]). Since ground and air vibration effects diminish with distance from the source, existing  
44 levels of vibration at the sensitive receptors are expected to be negligible.

DRAFT

1 **4.3.9 Cultural Resources**

2 **4.3.9.1 Federal Lands**

3 **4.3.9.1.1 Land Exchange Proposed Action**

4 The federal lands within the Land Exchange Proposed Action area is similar to the Mine Site  
5 portion of the NorthMet Project area previously discussed, but extends further north and west  
6 and excludes the privately owned land bordering Dunka Road to the south of the Mine Site. The  
7 Land Exchange Proposed Action APE for both direct and indirect effects consists of the entire  
8 land exchange boundary (Figure 4.2.9-1). Section 4.2.9 provides further discussion of the  
9 existing conditions on the Mine Site and associated federal lands. Cultural resources identified  
10 within the Land Exchange Proposed Action area consisted of archaeological sites and properties  
11 and natural resources of religious and cultural significance to the Bands.

12 As a result of Phase I cultural resources surveys and consultation with the Bands and the SHPO  
13 concerning the results of identification efforts for properties of religious and cultural significance  
14 to the Bands, three cultural resources have been identified within the Land Exchange area: the  
15 BBLV Trail Segment, NorthMet Archaeological Site, and Knot Logging Camp. For detailed  
16 property descriptions and discussions of eligibilities, please see Section 4.2.9.

17 The federal Co-lead Agencies continue consultation with the Bands and the Minnesota SHPO as  
18 determinations are made concerning NRHP eligibility of identified resources, NorthMet Project  
19 Proposed Action effects on historic properties, and resolution of any adverse effects.

20 The investigations completed to date in the Land Exchange Proposed Action area have identified  
21 cultural resources as summarized in Table 4.3.9-1 below.

22 **Table 4.3.9-1 Cultural Resources Identified in the Land Exchange Area**

| <b>Resource ID</b> | <b>Resource Name</b>            | <b>Resource Type</b> | <b>NRHP Determination by Co-lead Agencies</b> | <b>SHPO Concurrence with Co-lead Agencies' Findings</b> |
|--------------------|---------------------------------|----------------------|-----------------------------------------------|---------------------------------------------------------|
| SL-HLC-pending     | BBLV Trail Segment <sup>1</sup> | Archaeological Site  | Eligible                                      | Concur                                                  |
| 21SLpending        | NorthMet Archaeological Site    | Archaeological Site  | Not Eligible                                  | Concur                                                  |
| 21SLmn             | Knot Logging Camp               | Archaeological Site  | Not Eligible                                  | Concur                                                  |

23 Note:  
24 <sup>1</sup> USFS designation BBLV Trail Segment #1 (USFS #01-569).

25 The 1854 Treaty resources located within the Land Exchange Proposed Action would be similar  
26 to the Mine Site portion of the NorthMet Project area previously discussed in Section 4.2.9.  
27 Section 4.2.9 provides further discussion of the existing conditions on the Mine Site and  
28 associated federal lands.

29 An analysis of whether any particular property associated with the Bands' exercise of their  
30 usufructuary rights may be considered a TCP is limited by lack of available information

31 regarding Band members' traditional exercise of those rights. Determining how the Bands have  
32 traditionally conducted their usufructuary rights on or near the Land Exchange Proposed Action  
33 area would only be available through a detailed ethnographic study of individual Band members  
34 and their families. The cultural resources investigations included Band member interviews with  
35 Bois Forte, Fond du Lac, and Grand Portage, although only Bois Forte's results were made  
36 available. The results of the interviews and the cultural resources investigation did not find any  
37 natural resources that would be considered a TCP or other traditional cultural place.

#### 38 **4.3.9.1.2 Land Exchange Alternative B**

39 All of the cultural resources and 1854 Treaty resources identified and discussed in Section  
40 4.3.9.1.1 are located within the Land Exchange Alternative B.

#### 41 **4.3.9.2 Non-federal Lands**

42 There are no known cultural resources on the non-federal lands.

DRAFT

1 **4.3.10 Socioeconomics**

2 The Land Exchange Proposed Action study area for socioeconomics is the same as for the  
3 NorthMet Project Proposed Action: all of Cook, Lake, and St. Louis counties, as well as  
4 individual cities in St. Louis County (see Figure 4.2.10-1). This geography includes the federal  
5 and non-federal tracts. Socioeconomic data are not available, and thus are not reported, for the  
6 individual non-federal tracts and their parcels.

7 The federal lands are similar to that of the Mine Site previously discussed, but exclude the  
8 privately owned land bordering Dunka Road to the south of the Mine Site. Section 4.2.10.1  
9 provides additional discussion of the existing conditions on the federal lands. The socioeconomic  
10 information in Section 4.2.10.1 broadly applies to the study area, which encompasses all of the  
11 non-federal parcels involved in the Land Exchange Proposed Action. The following provides  
12 additional information as it relates to the federal and non-federal parcels.

13 **4.3.10.1 Economic Activity**

14 There is no ongoing forestry activity on the federal lands and no evidence of recent past forestry  
15 activity. The non-federal parcels are all privately owned or otherwise have no official public  
16 access. There is some evidence of timber harvesting on Tracts 2, 3, and 4; this activity could  
17 generate income, employment, or revenue.

18 **4.3.10.2 Recreation**

19 Recreation in national forests can generate direct revenue to the USFS and the state in the form  
20 of entry fees and hunting and fishing license fees, as well as via indirect economic activity  
21 related to the multiplier effect of such activity (e.g., purchase of fishing tackle and bait).

22 In 2006 (the most recent year for which data are available), there were approximately 1,376,000  
23 recreational visits to Superior National Forest (USFS 2012a). “Recreational,” as used in USFS  
24 2010, is very broadly defined, and primarily distinguishes (and excludes) transient visitors such  
25 as commuters or for restroom visits. On average, visitors to the forest spent \$643 per visiting  
26 party per day (i.e., the group participating in the visit, such as a family).

27 Currently, the federal lands are not easily accessible. The non-federal parcels are all privately  
28 owned or otherwise have no official public access, although evidence of recreational activity has  
29 been observed on some of these parcels. Such activity is discussed in Section 4.2.11.

30 **4.3.10.3 Other Socioeconomic Characteristics**

31 Currently, there is no demand for public safety services on the inaccessible federal lands and  
32 only limited demand on the non-federal lands. As described in Section 4.2.11, the non-federal  
33 parcels generally consist of undeveloped woodlands, wetlands, and other natural features. There  
34 is evidence of past extractive activity (quarrying and/or borrowing of sand and gravel) and  
35 ongoing private recreational hunting and fishing on Tract 1. Tract 5 was previously used by  
36 Wheaton College. In their current state, the non-federal parcels have minimal, if any, effect on  
37 public services and facilities.

38 Subsistence activity, as it relates to the federal lands, is described in Section 4.2.10.1.6. There is  
39 no available information that any of the non-federal tracts are being used for this purpose.

DRAFT

1 **4.3.11 Recreation and Visual Resources**

2 **4.3.11.1 Federal Lands**

3 **4.3.11.1.1 Land Exchange Proposed Action**

4 **Recreational Resources**

5 The federal lands fall within the Semi-Primitive Motorized and Roded Natural ROS  
 6 designations, as shown in Table 4.3.11-1. These designations are defined in Section 4.2.11.1.1.

7 **Table 4.3.11-1 Recreational Opportunity Spectrum Designations within the Land Exchange**  
 8 **Proposed Action and Land Exchange Alternative B**

| Recreational Opportunity Spectrum Designation      | Total Acreage |
|----------------------------------------------------|---------------|
| <b>Land Exchange Proposed Action Federal Lands</b> |               |
| Semi-Primitive Motorized                           | 5,528.4       |
| Roded Natural                                      | 967.0         |
| <b>Land Exchange Alternative B Federal Lands</b>   |               |
| Semi-Primitive Motorized                           | 4,276.5       |
| Roded Natural                                      | 476.1         |

9 **Visual Resources**

10 The visual resources surrounding the federal lands, visual receptors near the federal lands, and  
 11 SIO designation of the federal lands are discussed in Section 4.2.11.1.2. SIO designations are  
 12 also summarized in Table 4.3.11-2.

13 **Table 4.3.11-2 Scenic Integrity Objective Designations for Lands under the Land Exchange**  
 14 **Proposed Action and Land Exchange Alternative B**

| Scenic Integrity Objective Designation             | Total Acreage |
|----------------------------------------------------|---------------|
| <b>Land Exchange Proposed Action Federal Lands</b> |               |
| Low Scenic Integrity Objective                     | 6,495.6       |
| No Designation <sup>1</sup>                        | 30.5          |
| <b>Land Exchange Alternative B Federal Lands</b>   |               |
| Low Scenic Integrity Objective                     | 4,743.7       |
| No Designation <sup>1</sup>                        | 8.9           |

15 Note:

16 <sup>1</sup> USFS does not designate SIO for bodies of water, such as Mud Lake, which is part of the federal lands. Only a portion of Mud  
 17 Lake falls within the footprint of the Land Exchange Alternative B.

18 **4.3.11.1.2 Land Exchange Alternative B**

19 The recreational and visual conditions for the federal lands in Land Exchange Alternative B are  
 20 similar to the federal lands in the Land Exchange Proposed Action. Acreage of ROS and SIO  
 21 designations for the Land Exchange Alternative B are summarized in Tables 4.3.11-1 and  
 22 4.3.11-2.

### 23 **4.3.11.2 Non-federal Lands**

24 All of the non-federal lands are privately owned; those not already owned by PolyMet are under  
25 options to purchase by PolyMet. Thus, there are no current public recreation opportunities on any  
26 of the tracts. Observed and likely private recreational activity on the non-federal lands is  
27 described below, based on aerial photography, research, and field visits conducted in October  
28 2011. For reference, ownership surrounding the non-federal lands is shown in Figures 4.3.1-2,  
29 4.3.1-3, and 4.3.1-4.

#### 30 **4.3.11.2.1 Forest Service Recreation Designations**

31 The ROS designations for areas surrounding the non-federal lands are summarized in Table  
32 4.3.11-3. The Semi-Primitive Motorized and Roaded Natural ROS designations are defined in  
33 Section 4.2.11.1.1. The Semi-Primitive Non-Motorized designation is similar to the Semi-  
34 Primitive Motorized, except that motor vehicles are not permitted.

35 **Table 4.3.11-3 Recreational Opportunity Spectrum Designations in the Vicinity of Non-**  
36 **federal Lands**

| <b>Tract</b>             | <b>Adjacent/Nearby ROS Designations</b>                                                                                          |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| 1 – Hay Lake Lands       | Semi-Primitive Motorized, Semi-Primitive Non-Motorized, and Roaded Natural                                                       |
| 2 – Lake County Lands    | Semi-Primitive Non-Motorized (Lake County South); Semi-Primitive Motorized, and Semi-Primitive Non-Motorized (Lake County North) |
| 3 – Wolf Lands           | Semi-Primitive Motorized and Roaded Natural                                                                                      |
| 4 – Hunting Club Lands   | Semi-Primitive Motorized                                                                                                         |
| 5 – McFarland Lake Lands | Semi-Primitive Non-Motorized and Semi-Primitive Motorized                                                                        |

#### 37 **4.3.11.2.2 Regional Recreational Resources**

38 The Superior National Forest, including the BWCAW, and Voyageurs National Park are  
39 important recreation areas in northeastern Minnesota. The Superior National Forest includes  
40 approximately 3 million acres and provides recreation opportunities for camping, boating,  
41 fishing, hiking, viewing scenery, off-highway vehicle riding, wilderness related recreation,  
42 snowmobiling, and cross country skiing. Located 20 miles to the north of the NorthMet Project  
43 area, the million-plus-acre BWCAW is protected as part of the National Wilderness Preservation  
44 System. Voyageurs National Park is located approximately 50 miles north of the NorthMet  
45 Project area (see Figure 1.1-1). In addition, there are year-round recreation opportunities at  
46 Giants Ridge (approximately 15 miles east of the Mine Site) that include downhill skiing,  
47 snowboarding, cross-country skiing, snowmobiling, mountain biking, hiking, and golf. There are  
48 also opportunities for biking, hiking, roller-blading on the Mesabi Trail which spans 70 miles  
49 across the Iron Range.

#### 50 **4.3.11.2.3 Forest Service Scenic Integrity Designations**

51 The non-federal lands are all within the Superior National Forest proclamation boundary, and are  
52 surrounded by relatively flat terrain covered in forests and wetlands. Some of the tracts are  
53 located within a few miles of towns, mines, and active forestry activity. The Mine Site would not  
54 be visible from any of the non-federal tracts. SIO designations for portions of Superior National  
55 Forest surrounding the five tracts are summarized in Table 4.3.11-4. Definitions of the SIO  
56 designations are provided in Section 4.2.11.1.2.

57 **Table 4.3.11-4 Scenic Integrity Objective Designations in the Vicinity of Non-federal Lands**

| Tract                    | Adjacent/Nearby SIO Designations                                              |
|--------------------------|-------------------------------------------------------------------------------|
| 1 – Hay Lake Lands       | High, Moderate, Low                                                           |
| 2 – Lake County Lands    | Moderate (Lake County South); Low, Moderate (Lake County North)               |
| 3 – Wolf Lands           | Low (Wolf Lands 2, 4); Low, Moderate (Wolf Lands 1); Low, High (Wolf Lands 3) |
| 4 – Hunting Club Lands   | Moderate                                                                      |
| 5 – McFarland Lake Lands | High                                                                          |

58 **4.3.11.2.4 Tract 1 – Hay Lake Lands**

59 **Recreation**

60 Tract 1 exhibits evidence of recreational activity. Several trails cross the parcel, including trails  
61 that intersect with County Road 715; most of these trails are either bermed or gated and some  
62 have posted No Trespassing signs. Hay Lake and Rice Lake are accessible by canoe on the Pike  
63 River. Deer and evidence of bear were observed, as were two deer stands (others are believed to  
64 exist) (Lisson and Gawtry 2011). A sand and gravel pit in the northeastern portion of the parcel  
65 show evidence of use as a shooting range and/or hunting site. A boat landing and small parking  
66 area (not listed or mapped as a MDNR access point) are present near the southeastern corner of  
67 the parcel on Rice Lake.

68 **Visual Resources**

69 Tract 1 covers 4,926.3 acres that contain three lakes (see Figure 4.3.11-1). This tract is crossed  
70 by County Road (CR) 175 and CR 135 (both of which are known as Pike River Road) and the  
71 Pike River. Tract 1 can be viewed from Pike River Road and nearby Pike Mountain, as well as  
72 the waterways within the tract. Tract 1 is roughly 3 miles north-northwest of Biwabik; however,  
73 the flat terrain prevents the tract from being viewed from the town. The portions of Superior  
74 National Forest surrounding this parcel generally have Low SIO designations, with some  
75 Moderate designations near the northeastern and southwestern corners, and High designations to  
76 the north.

77

78

*Figure 4.3.11-1 The Hay Lake Tract: Looking North along the Pike River*

79

#### **4.3.11.2.5 Tract 2 – Lake County Lands**

80

##### **Recreation**

81

The Tract 2 parcels all have very limited access. There is no evidence of recreational activity or hunting on any of these parcels.

82

83

##### **Visual Resources**

84

Tract 2 consists of four individual parcels, referred to as Lake County North and Lake County South, totaling 381.9 acres. The three Lake County North parcels are located southeast of Pine Lake and approximately 13 miles southeast of the federal lands, and are not visible from Pine Lake Road, the nearest public road. The portions of Superior National Forest surrounding these parcels have Low and Moderate SIO designations (see Figure 4.3.11-2). The Lake County South parcel is approximately 27 miles southeast of the federal lands. Due to flat terrain and the remote nature of the southern site, it is not visible from public roads or other public areas. The portions of Superior National Forest surrounding this parcel have Moderate SIO designations.

95

#### **4.3.11.2.6 Tract 3 – Wolf Lands**

96

##### **Recreation**

97 The Tract 3 parcels all have very limited access. A rough forest road provides access to Wolf  
98 Lands 3, and a trail accesses Coyote Creek. No trails were observed on any of the other parcels  
99 during site visits, and there is no evidence of recreational activity or hunting on any of the Tract  
100 3 lands.

101

##### **Visual Resources**

102 Tract 3 consists of four separate parcels totaling 1,575.8 acres, and consists of level land  
103 containing wetlands, bogs, and forests. Wolf Lands 1 is located southeast of Pine Lake and may  
104 be visible from Nelson Road. The portions of Superior National Forest surrounding this parcel  
105 have Low and Moderate SIO designations. Wolf Lands 2 is due east of Greenwood Lake and  
106 may be visible from a private road to the east of the property. The portions of Superior National  
107 Forest surrounding this parcel have Low SIO designations. Wolf Lands 3 has recently been  
108 logged and may be visible from Forest Route 393 (see Figure 4.3.11-3). The portions of Superior  
109 National Forest surrounding this parcel have Low SIO designations, with a corridor of High SIO

110 land along the southeastern boundary. Wolf Lands 4 is visible from Forest Routes 103 and 393.  
111 The portions of Superior National Forest surrounding this parcel have Low SIO designations.

112

113 *Figure 4.3.11-3 The Wolf Lands, Looking Northwest along Coyote Creek*

114 **4.3.11.2.7 Tract 4 – Hunting Club Lands**

115 **Recreation**

116 Tract 4 is currently accessible via a private road. One trail passes close to the southern boundary  
117 of the site. There is no evidence of recreational activity or hunting on this parcel.

118 **Visual Resources**

119 Tract 4 is comprised of 160.2 acres and is approximately 50 miles northwest of the federal lands.  
120 It is level, remote, and surrounded by other forested lands (see Figure 4.3.11-4). There are no  
121 public roads leading into or directly around the parcel. Two small public roads are within two  
122 miles of the parcel but are screened from view by vegetation and terrain. The portions of  
123 Superior National Forest surrounding this parcel have Moderate SIO designations.

124

125

*Figure 4.3.11-4 Wetland on the Hunting Club Lands Parcel*

126

#### **4.3.11.2.8 Tract 5 – McFarland Lake Lands**

127

##### **Recreation**

128

Legal access to Tract 5 is limited to water access, although a private cart road exists at the edge of the property, as does a trail along the lake shore. There is no evidence of current recreational activity or hunting on this parcel; however, Tract 5 was previously owned by Wheaton College. A bunk house, fire pit, outhouse, and cistern (all unused and in disrepair) remain on site, indicating past use for recreational activities. All structures would be removed upon completion of the Land Exchange Proposed Action.

129

130

131

132

133

134

##### **Visual Resources**

135

Tract 5 encompasses 30.8 acres situated on the western shore of McFarland Lake (see Figure 4.3.11-5). The parcel is visible from the northern, eastern, southern, and portions of the western shore of McFarland Lake. County Road 74 and Woolys Bluff run along the southern and southeastern perimeter of McFarland Lake, but are substantially screened from viewing the parcel due to vegetation and flat terrain. A limited number of lakefront homes, private piers, and a public access point on the eastern shore of the lake have views of the McFarland Lake property. The portions of Superior National Forest surrounding this parcel have High SIO designations.

1 **4.3.12 Wilderness and Other Special Designation Areas**

2 **4.3.12.1 Federal Lands**

3 **4.3.12.1.1 Land Exchange Proposed Action**

4 The federal lands of the Land Exchange Proposed Action are similar to the Mine Site previously  
5 discussed, but exclude the privately owned land bordering Dunka Road to the south of the Mine  
6 Site. Section 4.2.12.1 provides a discussion of the existing conditions on the federal lands.

7 **4.3.12.1.2 Land Exchange Alternative B**

8 The federal lands included in the Land Exchange Alternative B are similar to the federal lands in  
9 the Land Exchange Proposed Action. Section 4.2.12.1 discusses the existing conditions on the  
10 federal lands.

11 **4.3.12.2 Non-federal Lands**

12 The non-federal lands comprise five tracts (groups of parcels) assembled by PolyMet for the  
13 purpose of the Land Exchange Proposed Action.

14 **4.3.12.2.1 Tract 1 – Hay Lake Lands**

15 Adjacent cRNAs include the Pike Mountain and Loka Lake cRNAs (southwest corner and  
16 northeast corner of the tract, respectively). Pike Mountain is a 709-acre research area located on  
17 top of the Mesabi Range, characterized by old growth northern hardwood communities (sugar  
18 maple and red oak), paper birch forest, and rock/talus communities. The Loka Lake cRNA is part  
19 of an extensive peatland dominated by stunted black spruce and tamarack with interspersed  
20 upland islands (USFS 2011h).

21 **4.3.12.2.2 Tract 2 – Lake County Lands**

22 There are no wilderness or other special designation areas in or adjacent to Tract 2.

23 **4.3.12.2.3 Tract 3 – Wolf Lands**

24 There are no wilderness or other special designation areas in or adjacent to Tract 3.

25 **4.3.12.2.4 Tract 4 – Hunting Club Lands**

26 There are no wilderness or other special designation areas in or adjacent to Tract 4.

27 **4.3.12.2.5 Tract 5 – McFarland Lake Lands**

28 This tract includes lakefront property on McFarland Lake, an entry point to the BWCAW.  
29 Access to the property is available by water from a landing off County Road 16 (Arrowhead  
30 Trail) approximately 10 miles north of Hovland, Minnesota. While near the BWCAW, this tract  
31 is located outside the BWCAW boundary. There are no other wilderness or other special-  
32 designation areas in or adjacent to Tract 5.

DRAFT

1 **4.3.13 Hazardous Materials**

2 There are no proposed operations or activities that involve the use of hazardous materials on the  
3 federal or non-federal lands associated with the Land Exchange Proposed Action. AOCs  
4 associated with contamination by hazardous materials from former activities and operations on  
5 these lands are discussed in Section 4.3.1.

DRAFT

DRAFT

1 **4.3.14 Geotechnical Stability**

2 The Land Exchange Proposed Action does not include the creation or modification of  
3 geotechnical features. As such, the current geotechnical conditions at lands proposed for  
4 exchange are not considered relevant to the EIS. The existing geotechnical conditions underlying  
5 the NorthMet Project Proposed Action stockpiles that would be located on federal lands  
6 proposed for exchange are discussed in Section 4.2.14.

DRAFT

## 1 **5.0 ENVIRONMENTAL CONSEQUENCES**

### 2 **5.1 INTRODUCTION**

3 Pursuant to the requirements of NEPA regulations at 40 CFR 1502.16 and *Minnesota Rules*, part  
4 4410.2300, Chapter 5 describes the potential environmental consequences of the NorthMet  
5 Project Proposed Action and Land Exchange Proposed Action on the affected environment as  
6 described in Chapter 4.

7 As defined in 40 CFR 1508.8, this chapter addresses the following types of effects:

- 8 • Direct effects, which are caused by the action and occur at the same time and place; and
- 9 • Indirect effects, which are caused by the action and are later in time or farther removed in  
10 distance, but are still reasonably foreseeable. Indirect effects may include growth-inducing  
11 effects and other effects related to induced changes in the pattern of land use, population  
12 density or growth rate, and related effects on air and water and other natural systems,  
13 including ecosystems.

14 Evaluation criteria and analysis methodology are identified where applicable for each resource  
15 topic. Environmental effects were determined based on qualitative and/or quantitative  
16 assessment.

17 As listed in Table 5.1-1, this chapter follows the same structure and order of resource topics as  
18 Chapter 4. Section 5.2 describes the environmental consequences of the NorthMet Project  
19 Proposed Action and the NorthMet Project No Action Alternative. Section 5.3 describes the  
20 environmental consequences of the Land Exchange Proposed Action, Land Exchange  
21 Alternative B, and Land Exchange No Action Alternative.

22 The proposed lands to be exchanged are described in below in Section 5.3; however, the ROD  
23 will require an updated and current appraisal, approved by the USFS, to verify equal value.  
24 Appraisal reports completed in 2013 indicate that the Land Exchange Proposed Action would  
25 meet federal value requirements if all five non-federal land tracts offered by PolyMet were  
26 exchanged for the federal lands. The appraisal reports also indicated that the Land Exchange  
27 Alternative B would meet the federal value requirements if non-federal Tract 1 offered were  
28 exchanged for the smaller federal parcel. Appraisals must conform to Uniform Appraisal  
29 Standards for Federal Land Acquisitions and the Uniform Standards of Professional Appraisal  
30 Practice of the Appraisal Foundation. The final proposed configuration of land would be  
31 determined after the market value of the parcels is determined by appraisals and the  
32 environmental analysis has been completed. This information will be presented in the ROD.

33 As previously indicated, the land exchange acreages used in the Project Description section are  
34 described in GLO acreages, while the acreages used in the Affected Environment and  
35 Environmental Consequences sections are described in GIS acreages. The environment  
36 consequences presented in Section 5.3 are based upon GIS data. GIS values indicate the size of  
37 the federal and non-federal parcels as computed geometrically using mapping software, which  
38 may be different than the GLO legal acreage. Unless noted as GLO acres, all values shown are  
39 derived from GIS data.

40 **Table 5.1-1 Resource Topic Areas Discussed in Chapter 5**

| <b>Resource Topic</b>                    | <b>NorthMet Project<br/>Proposed Action</b> | <b>Land Exchange<br/>Proposed Action</b> |
|------------------------------------------|---------------------------------------------|------------------------------------------|
| Land Use                                 | 5.2.1                                       | 5.3.1                                    |
| Water Resources                          | 5.2.2                                       | 5.3.2                                    |
| Wetlands                                 | 5.2.3                                       | 5.3.3                                    |
| Vegetation                               | 5.2.4                                       | 5.3.4                                    |
| Wildlife                                 | 5.2.5                                       | 5.3.5                                    |
| Aquatic Species                          | 5.2.6                                       | 5.3.6                                    |
| Air Quality                              | 5.2.7                                       | 5.3.7                                    |
| Noise and Vibration                      | 5.2.8                                       | 5.3.8                                    |
| Cultural Resources                       | 5.2.9                                       | 5.3.9                                    |
| Socioeconomics                           | 5.2.10                                      | 5.3.10                                   |
| Recreation and Visual Resources          | 5.2.11                                      | 5.3.11                                   |
| Wilderness and Special Designation Areas | 5.2.12                                      | 5.3.12                                   |
| Hazardous Materials                      | 5.2.13                                      | 5.3.13                                   |
| Geotechnical Stability                   | 5.2.14                                      | 5.3.14                                   |

41

DRAFT

## 1 **5.2 NORTHMET PROJECT**

### 2 **5.2.1 Land Use**

3 This section evaluates the NorthMet Project Proposed Action against existing and applicable  
4 land use plans. The specific focus is on the consistency of the NorthMet Project Proposed Action  
5 with accepted plans, zoning ordinances, or land use agency management plans. It also addresses  
6 the legacy contamination and how it would be affected by proposed activities.

#### 7 **Summary**

8 Components of the NorthMet Project Proposed Action are subject to the requirements of local  
9 comprehensive land use plans or the Superior National Forest Plan. In all cases, the NorthMet  
10 Project Proposed Action activities are consistent with the formally adopted plans. The NorthMet  
11 Project Proposed Action would decrease the amount of land available for public access and use,  
12 and would decrease portions of the 1854 Ceded Territory available for use by the Bands. Given  
13 the historic use of the federal lands within the Mine Site for mineral exploration and ongoing  
14 restrictions on public access (see Section 4.2.11), the NorthMet Project Proposed Action would  
15 result in little or no change in actual public use of these lands.

#### 16 **5.2.1.1 Methodology and Evaluation Criteria**

17 The USFS uses the management area framework to broadly define the desired conditions and  
18 activities on lands within national forests. Land use outside the Superior National Forest is  
19 governed by local zoning and comprehensive plans. The management area designations  
20 applicable to the Mine Site and portions of the Transportation and Utility Corridor, as defined in  
21 the Forest Plan, are described in Section 4.2.1, as are zoning designations for land outside of the  
22 Superior National Forest.

23 The NorthMet Project Proposed Action is evaluated against the following evaluation criteria:

- 24 • Compatibility of proposed land use with existing land use, land use plans, zoning ordinances,  
25 1854 Treaty obligations, and adjacent USFS management areas;
- 26 • Anticipated outcomes related to identified contaminated lands; and
- 27 • The degree to which past, ongoing, or planned investigation and remediation actions at  
28 legacy contamination sites would be affected by disturbance associated with the NorthMet  
29 Project Proposed Action.

#### 30 **5.2.1.2 NorthMet Project Proposed Action**

##### 31 **5.2.1.2.1 Consistency with Zoning and Comprehensive Plans**

32 The NorthMet Project area lies within the Mineral Mining zoning districts of the cities of Babbitt  
33 and Hoyt Lakes (Arrowhead 2014; Hoyt Lakes Planning Commission 2010), and an industrial  
34 use district of St. Louis County (St. Louis County 2011). Therefore, the NorthMet Project area is  
35 compatible with the zoning ordinance and draft revised Comprehensive Land Use Plan, and  
36 would not require an amendment of the respective zoning ordinances or Comprehensive Land  
37 Use Plans (Arrowhead 2014; City of Babbitt 1996). Both the county and municipal zoning  
38 districts surrounding the Plant Site are designated for industrial or mining use; the NorthMet

39 Project area is compatible with these designations and would not require amendments to current  
40 land uses. Privately owned parcels adjacent to the Mine Site fall under the same or similar  
41 zoning and land use designations; therefore, the NorthMet Project Proposed Action would not  
42 have the potential to conflict with surrounding land uses.

#### 43 **5.2.1.2.2 Consistency with Superior National Forest Plan**

44 The Mine Site is located within the Superior National Forest and on lands designated as a  
45 General Forest-Longer Rotation Management Area (USFS 2011a). In such areas, the USFS  
46 allows exploration, development, and processing of mineral resources under conditions where  
47 activities are consistent with sound environmental management so as to contribute to economic  
48 growth. In addition to managing project development, the USFS also requires preparation of  
49 associated reclamation plans to ensure the long term protection and restoration of the natural  
50 resources (USFS 2004b). The NorthMet Project Proposed Action would be consistent with these  
51 policies.

52 The NorthMet Project Proposed Action would represent a reactivation of the Transportation and  
53 Utility Corridor (including the Dunka Road and the associated rail line) for mining, which would  
54 be compatible with existing corridor land uses. Under the NorthMet Project Proposed Action,  
55 Dunka Road would remain private for mine operation use. Superior National Forest lands to the  
56 east, south, and southwest of the Transportation and Utility Corridor are accessible by forest  
57 roads and are not dependent on Dunka Road for access (see Figure 4.3.1-1), although Forest  
58 Road 113 connects Dunka Road to CR 110 near Skibo, Minnesota. The NorthMet Project  
59 Proposed Action represents no anticipated change in the level of public access to either of these  
60 adjacent Superior National Forest parcels.

#### 61 **5.2.1.2.3 Areas of Concern**

62 Upon the purchase of a portion of the site, PolyMet became responsible for 29 AOCs (see legacy  
63 contamination discussion in Section 4.2.1.4.2). Of these, six have already been closed or have  
64 received a No Further Action letter from the MPCA (see Table 4.2.1-2). Additional investigation  
65 would be required to determine whether the remaining AOCs require further action. The  
66 NorthMet Project Proposed Action offers no direct resolution for the 33 AOCs that are  
67 designated as the responsibility of parties other than PolyMet (see Table 4.2.1-2). The MPCA  
68 VIC program would be utilized to facilitate and oversee remediation activity for any remaining  
69 potential historical releases on the 29 AOCs under the NorthMet Project Proposed Action.

#### 70 **5.2.1.3 NorthMet Project No Action Alternative**

71 The NorthMet Project No Action Alternative would not result in any change in land management  
72 at the Mine Site or Transportation and Utility Corridor. Land at the Plant Site would continue to  
73 be managed in accordance with the existing closure plan and Consent Decree. The existing 1854  
74 Treaty obligations for the Mine Site and Plant Site would remain unchanged.

## 1 **5.2.2 Water Resources**

2 This section is organized into a description of the criteria used for evaluating NorthMet Project  
3 Proposed Action-related effects, the methodologies used to predict these effects, and a discussion  
4 of the effects resulting from the NorthMet Project Proposed Action. A summary of the primary  
5 effects of the NorthMet Project Proposed Action on water resources is provided below.

### 6 **Summary**

7 The NorthMet Project Proposed Action would be located in an historic mining area, known as  
8 the Mesabi Iron Range, and in the vicinity of other past, present, and potential future mining  
9 projects. Although the Mine Site would be on undeveloped land, PolyMet proposes to re-use  
10 many of the former LTVSMC facilities at the brownfield Plant Site, which is located about  
11 8 miles west of the Mine Site. While reusing the existing LTVSMC Tailings Basin for tailings  
12 deposition offers environmental benefits (e.g., reducing wetland effects and addressing legacy  
13 water quality issues), it does create challenges because the existing LTVSMC Tailings Basin is  
14 not lined and currently releases seepage with elevated concentrations of sulfate, TDS, and  
15 hardness, among other constituents. Many of the engineering controls proposed by PolyMet at  
16 the Plant Site are related to managing seepage from both the existing LTVSMC tailings and the  
17 future NorthMet tailings.

18 The NorthMet Project Proposed Action would have the potential to affect groundwater and  
19 surface water hydrology and quality in both the Partridge River and Embarrass River watersheds.  
20 These two rivers are both tributaries to the St. Louis River and within the Lake Superior Basin.  
21 They are not located within the Hudson Bay Basin and do not drain to or affect the water quality  
22 of the BWCAW.

23 The presence of perennial streams and watershed divides at both the Mine Site and Plant Site  
24 constrain the hydrologic effects of the NorthMet Project Proposed Action to the Partridge River  
25 and Embarrass River watersheds. There are two hydrologic barriers between the Mine Site and  
26 the Rainy River Watershed (which is hydrologically connected to the BWCAW), including:

- 27 • High ground north of the Partridge River that creates a watershed divide separating the  
28 Superior and Rainy River Watershed, and prevents surface water from passing between the  
29 two. This major watershed divide is included in the National Atlas, as well as USGS and  
30 MDNR data.
- 31 • Yelp Creek and the Partridge River encircle the northern, eastern, and southern sides of the  
32 Mine Site. These streams are thought to be hydrologic sink for groundwater and surface  
33 water originating at the Mine Site. Surface runoff or groundwater seepage leaving the Mine  
34 Site would follow a gradient into Yelp Creek or the Partridge River, as opposed to continuing  
35 towards the watershed divide. The position of the One Hundred Mile Swamp as continuous  
36 across this watershed divide does not imply that there is groundwater or surface water flow  
37 across the divide.

38 The NorthMet Project Proposed Action would represent the first copper-nickel-PGE mine in  
39 Minnesota, with the ore and waste rock containing various amounts of sulfide minerals. Sulfide  
40 minerals, when exposed to oxygen and water, have the potential to release soluble metals and  
41 sulfate and produce acid mine drainage. The sulfide sulfur (S) concentrations of the NorthMet  
42 waste rock would be relatively low compared to many other mines with sulfide-bearing rock

43 around the world. The NorthMet waste rock is predicted to average 0.15 percent sulfide S, while  
44 concentrations in other mines with sulfide-bearing rock can be as high as 40 percent (Minesite  
45 Drainage Assessment Group 2013).

46 Most of the bedrock in and around the NorthMet Deposit contains silicate minerals that have a  
47 small but measurable potential to neutralize acidity. Multi-year weathering tests demonstrate that  
48 the acid-generating potential of the Category 1 waste rock stockpile and the tailings (i.e.,  
49 material containing less than or equal to 0.12 percent sulfide S) would be low enough that these  
50 facilities would not produce acidic leachate (PolyMet 2015q).

51 Where the pore water pH remains near-neutral, metal mobility tends to be limited as some metals  
52 released by oxidation are removed from solution by adsorption or co-precipitation. The Category  
53 2/3 and Category 4 waste rock would have sulfide S concentrations that could produce acid  
54 drainage if exposed to oxygen and water; however, the mine plan calls for temporary storage  
55 (less than 12 years) of this waste rock in geomembrane lined stockpiles with a seepage collection  
56 systems, and then subaqueous disposal in the East Pit where oxidation would be very limited and  
57 acid drainage would not occur.

58 The sulfate released from the NorthMet waste rock and tailings is especially important because  
59 there are waters supporting the production of wild rice downstream from both the Mine Site and  
60 Tailings Basin. Research indicates that elevated sulfate concentrations can affect the growth and  
61 viability of wild rice. The MPCA has established a 10 mg/L sulfate water quality standard for  
62 waterbodies designated as waters used for production of wild rice. If the sulfate concentration in  
63 a water body used for production of wild rice currently exceeds the 10 mg/L water quality  
64 standard, MPCA requires that discharges to that water from a proposed activity cannot cause or  
65 contribute to an exceedance of the standard.

66 In MPCA staff-recommended wild rice waters along the Partridge River, the sulfate  
67 concentration currently exceeds the 10 mg/L standard about half of the time, largely due to  
68 sulfate loading associated with water discharges from the Northshore Mine operation located  
69 upstream of the proposed NorthMet Mine Site.

70 In MPCA staff-recommended wild rice waters along the Embarrass River, the sulfate  
71 concentration exceeds the 10 mg/L standard nearly all the time due to discharges from Cliffs Erie  
72 Area 5 NW mine pit to an upstream tributary of the Embarrass River. Given the 10 mg/L sulfate  
73 exceedances that occur on both the Partridge River and Embarrass River, it must be  
74 demonstrated that the NorthMet Project Proposed Action would not cause or contribute to  
75 exceedances of an effluent limit based on the 10/mg/L standard for permitting. In addition, for  
76 the Embarrass River and several of its tributaries at the Plant Site, the MPCA has developed  
77 supplemental requirements for acceptable sulfate concentrations and mass loadings.

78 As described in Section 2.3.2.1, the Co-lead Agencies prompted PolyMet to substantially modify  
79 the NorthMet Project Proposed Action between and the DEIS and SDEIS. Additional  
80 modifications were made between the SDEIS and the FEIS to further protect of water resources.  
81 The proposed engineering controls would provide a high degree of reliability and flexibility to  
82 ensure that the evaluation criteria would continue to be met in the future, when nearly all  
83 contact/process water at the NorthMet Project Proposed Action area would be treated at the  
84 WWTF or the WWTP before release to the environment.

85 At the Mine Site, the more reactive types of waste rock types (Category 2/3 and 4) and some of  
86 the less reactive Category 1 waste rock is now proposed for subaqueous disposal in the East Pit  
87 to limit oxidation of sulfide minerals and associated release of soluble metals. The majority of  
88 the less-reactive waste rock, Category 1 waste rock, would be permanently stored in a stockpile  
89 that is at the surface covered by a geomembrane with a vegetated soil cover (to reduce  
90 infiltration), and surrounded by a groundwater containment (capture) system.

91 The Category 1 containment system would consist of a barrier wall keyed into bedrock and an  
92 interior collection trench backfilled with permeable material and containing necessary pipes and  
93 pumps to remove the collected water. It is estimated that more than 98 percent of affected  
94 groundwater seepage from the Category 1 stockpile would be captured by the containment  
95 system or would migrate as groundwater into the West Pit and East Pit (PolyMet 2015h). The  
96 affected water collected by the containment system and mine pits would be pumped to a WWTF,  
97 treated to acceptable chemical concentrations, and either sent to the Plant Site for process water  
98 or discharged to the West Pit Outlet Creek that flows into the Partridge River. The WWTF would  
99 use chemical precipitation and filtration up to the end of reclamation (approximately mine year  
100 55) and then be converted to RO to provide water treatment during post-closure maintenance.  
101 For RO operation, a distillation process would reduce the concentrate to a moist solid that would  
102 be disposed of off site. After project operations, the only appreciable non-treated mine water  
103 leaving the Mine Site would be about 10 gpm of groundwater seepage in the surficial aquifer that  
104 would migrate south and eventually be released to the Partridge River.

105 At the Plant Site, it is estimated that the existing LTVSMC Tailings Basin produces about 200  
106 gpm of groundwater seepage and about 2,400 gpm of surface water seepage, most of which  
107 reaches the Embarrass River. While this seepage has a high sulfate load, it appears that most of  
108 the sulfate is sequestered by natural processes in wetlands between the Tailings Basin and the  
109 Embarrass River.

110 The surface water and groundwater seepage containment systems along the northern,  
111 northwestern, and western portions of the proposed NorthMet Tailings Basin would capture  
112 about 99 percent of the seepage from the Tailings Basin (i.e., 100 percent of surface seepage and  
113 greater than 90 percent of groundwater seepage). As a consequence, the flow of tailings water  
114 towards the Embarrass River would be reduced to zero surface seepage and about 20 gpm of  
115 affected groundwater. The water collected by the seepage containment system would be sent to a  
116 WWTP operating with an RO system, and the treated effluent would be sent either to the Mine  
117 Site to accelerate flooding of the West Pit or to tributaries of the Embarrass River to replace the  
118 flow captured by the containment system or both. On the eastern side of the Tailings Basin, a  
119 seepage containment system would be installed that due to the hydrogeologic conditions would  
120 be expected to capture 100 percent of tailings surface seepage and groundwater seepage.

121 On the Tailings Basin itself, PolyMet proposes bentonite amendments on the side slopes  
122 (installed as they are constructed during operations) and on the beaches after the end of  
123 operations to reduce infiltration and oxygen diffusion into the tailings. A layer of bentonite  
124 would also be placed at the bottom of the Tailings Basin pond to reduce leakage. The objective  
125 of the bentonite amendments is to reduce tailings seepage and its chemical load during  
126 reclamation and post-closure. This would have the long-term effect of reducing influent flow  
127 rates and chemical loads to the WWTP.

128 During post-closure, the WWTF and the WWTP (both mechanical treatment facilities) would  
129 continue operating until monitoring and pilot-testing demonstrated that a transition could be  
130 made to non-mechanical treatment systems, which may consist of constructed wetlands,  
131 permeable reactive barriers (PRBs), permeable sorptive barriers (PSBs), and/or other  
132 technologies to be identified. Based on the results of field demonstrations, non-mechanical  
133 treatment systems would be implemented only when monitoring at mine facilities indicated that  
134 the water quality and flow rates were amenable to these measures. In this FEIS, non-mechanical  
135 treatment systems are not described in detail because the potential effects of the NorthMet  
136 Project Proposed Action are based on mechanical treatment that would operate indefinitely.  
137 However, implementation of non-mechanical systems is considered a long-term goal for closure.

138 The objective of closure is to provide mechanical or non-mechanical treatment for as long as  
139 necessary to protect regulatory water quality at applicable groundwater and surface water  
140 compliance points. Both mechanical and non-mechanical treatments would require periodic  
141 maintenance and monitoring activities. Mechanical water treatment is part of the modeled  
142 NorthMet Project Proposed Action for the duration of the simulations—these are 200 years at the  
143 Mine Site and 500 years at the Plant Site, respectively. The duration of the simulations ensured  
144 that peak groundwater concentrations at the locations of release to surface water would occur  
145 during the model simulations..

146 Water quality modeling performed in support of the FEIS indicates that water treatment systems  
147 would be needed indefinitely at the Mine Site and Plant Site. The water models constructed to  
148 assess the potential effects from the NorthMet Project Proposed Action were not designed to  
149 predict the duration of treatment nor do they capture all the factors that influence the duration of  
150 treatment (e.g., potential future regulatory and technological changes). Therefore, the models  
151 cannot be used to predict when treatment would end. Actual treatment requirements would be  
152 assessed on a recurring basis throughout operations, reclamation, and closure considering  
153 influent and effluent water quality and monitoring results. Those periodic assessments would be  
154 carried out to ensure continuous protection of groundwater and surface water quality and  
155 compliance with water quality-based effluent limits. The periodic assessment process would rely  
156 on monitoring results coupled with predictive modeling rather than the results of the predictive  
157 modeling alone. Regardless of the precise duration of effects or water treatment at either the  
158 Mine Site or Plant Site, there are measures available to address impacts to natural resources, such  
159 as those identified in this FEIS. PolyMet would be held accountable for maintenance and  
160 monitoring required under any permit and would not be released from financial assurance until  
161 all permit conditions have been met.

162 Several groundwater, surface water, and water quality models (MODFLOW, XP-SWMM, and  
163 GoldSim, respectively) were used to predict the potential hydrologic and water quality effects of  
164 the NorthMet Project Proposed Action. GoldSim independently modeled 27 chemical parameters  
165 and provided values to further calculate two more chemical parameters, TDS and hardness.  
166 GoldSim uses probabilistic (Monte Carlo) simulations that take into account the uncertainty of  
167 the model inputs and generated outputs taking the form of cumulative probability distributions.  
168 The Co-lead Agencies have selected the 90<sup>th</sup> percentile probability (P90) as their evaluation  
169 threshold in determining whether the model results meet established evaluation criteria (i.e.,  
170 there is at least a 90 percent probability that a constituent would not exceed the water quality  
171 evaluation criteria) when the waterbody does not currently exceed the evaluation criteria. In  
172 instances where the waterbody exceeds the applicable evaluation criteria, the FEIS assesses

173 whether the NorthMet Project Proposed Action discharges would cause or contribute to the  
174 exceedance. A 5 percent frequency-of-exceedance criterion was used for metals with hardness-  
175 dependent evaluation criteria. The 5 percent threshold was selected because it is sufficiently  
176 conservative for purposes of identifying solutes where additional discussion is necessary to  
177 understanding potential environmental effects. Probabilistic chemical concentrations predicted  
178 by GoldSim were compared against water quality criteria and the Continuation of Existing  
179 Conditions (CEC) model results at eight groundwater and eight surface water evaluation  
180 locations at the Mine Site, and three groundwater and ten surface water evaluation locations at  
181 the Plant Site.

182 All of the 29 water quality parameters were screened against evaluation criteria to determine  
183 which ones require further analysis. A small subset of these parameters was identified for futher  
184 assessment in the FEIS that at an initial screening appeared to approach or exceed their  
185 respective evaluation criteria.. In the Embarrass River Watershed these parameters include  
186 aluminum, lead, and sulfate in surface waters and fluoride, manganese, sulfate, and TDS in  
187 groundwater. In the Partridge River Watershed, the parameters include aluminum and sulfate in  
188 surface water, with none for groundwater. In Colby Lake surface water, these include aluminum,  
189 arsenic, iron, and manganese.

190 For all solutes, the model predicted that the NorthMet Project Proposed Action would not cause  
191 any significant water quality impacts because: 1) exceedances of the P90 threshold did not occur,  
192 2) the NorthMet Project Proposed Action concentrations were no higher than concentrations  
193 predicted for the CEC scenario, or 3) the frequency of exceedances for NorthMet Project  
194 Proposed Action conditions was within an acceptable range or not attributable to NorthMet  
195 Project Proposed Action discharges or both.

196 Flow modeling indicated that the NorthMet Project Proposed Action would not result in any  
197 substantial changes at the Mine Site nor at the Plant Site to groundwater and surface water flows  
198 based upon established evaluation criteria when compared to the continuation of existing  
199 conditions.

200 Many of the lakes and rivers in the NorthMet Project Proposed Action area are classified as  
201 “impaired waters” by the MPCA because of elevated mercury in fish. There are several factors  
202 that cause elevated mercury in fish, including the increased availability of methylmercury. The  
203 production of methylmercury is dependent on sulfate concentrations and environmental  
204 conditions required for sulfate-reducing bacteria to live (e.g., sufficient organic carbon and lack  
205 of oxygen).

206 The NorthMet Project Proposed Action area is located within the Lake Superior Basin, so it is  
207 subject to the Great Lakes Initiative mercury water quality standard of 1.3 ng/L. The NorthMet  
208 ore and waste rock contain trace amounts of mercury, but mass balance modeling and analog  
209 data from other natural lakes and mine pit lakes in northeastern Minnesota suggest that the  
210 mercury concentration in the West Pit Lake would stabilize at approximately 0.9 ng/L.

211 There would also be mercury in the tailings, although about 92 percent of the mercury in the ore  
212 is predicted to remain in the ore concentrate and the mercury concentration in seepage from the  
213 Tailings Basin is expected to be less than the standard. Overall, the NorthMet Project Proposed  
214 Action is predicted to increase mercury loadings in the Embarrass River. The WWTF and the  
215 WWTP would be designed to meet water quality based effluent limits that are protective of the  
216 Great Lakes Initiative 1.3 ng/L mercury standard. Mercury loadings in the Partridge River would

217 decrease. The net effect of these changes would be an overall reduction in mercury loadings to  
218 the downstream St. Louis River upstream of the Fond du Lac reservation boundary. Therefore,  
219 the Fond du Lac mercury water quality standard of 0.77 ng/L would be protected.

220 PolyMet would be required by its permits to monitor the NorthMet Project Proposed Action's  
221 effects on hydrology and water quality in order to refine modeling to help predict future  
222 conditions. In the event that the monitoring identifies the potential for any water quality  
223 exceedances, PolyMet has proposed an Adaptive Water Management Plan (AWMP) that  
224 identifies additional measures that could be taken, if necessary, to prevent any exceedances of  
225 water quality standards (see Section 5.2.2.3.5).

### 226 **5.2.2.1 Evaluation Criteria**

227 In general, water resource evaluation criteria focus on groundwater and surface water hydrology  
228 and water quality and are defined as thresholds or changes in the existing physical, chemical, and  
229 biological environment with the goal of protecting overall waterbody health.

#### 230 **5.2.2.1.1 Groundwater**

231 This section discusses evaluation criteria for the effects of the NorthMet Project Proposed Action  
232 on groundwater hydrology (primarily groundwater levels) and water quality.

#### 233 **Hydrogeologic Evaluation Criteria**

234 There are no state or federal regulatory standards for the maximum allowable change in  
235 groundwater levels. It is recognized that groundwater elevations would be decreased within a  
236 small area around the mine pits. Groundwater elevations may also decrease near the Tailings  
237 Basin's containment system as a result of pumping on the basin's side of the cutoff wall. The  
238 significance of any changes in groundwater levels is evaluated in terms of its effects on other  
239 resources (e.g., wetlands) and these potential effects are discussed in the appropriate resource  
240 sections. The magnitude of any changes in groundwater levels are quantified in this section.

#### 241 **Water Quality Evaluation Criteria**

242 A total of 27 analytes were selected to be directly modeled because concentrations of those  
243 analytes could be altered by the NorthMet Project Proposed Action. The list of analytes was  
244 constructed considering host rock mineralogy and the results of geochemistry analyses. It  
245 includes the following analytes:

- Alkalinity
- Calcium
- Chloride
- Fluoride
- Sulfate
- Magnesium
- Potassium
- Sodium
- Aluminum
- Antimony
- Arsenic
- Barium
- Beryllium
- Boron
- Cadmium
- Chromium III
- Cobalt
- Copper
- Iron
- Lead
- Manganese
- Nickel
- Selenium
- Silver
- Thallium
- Vanadium
- Zinc

246 This suite of directly modeled solutes does not include hardness and TDS. Hardness was  
247 calculated from the directly modeled constituents calcium and magnesium. TDS was estimated  
248 by summing its constituent concentrations that were directly modeled, including calcium,  
249 chloride, fluoride, magnesium, potassium, sulfate, and a portion of alkalinity.

250 This FEIS assesses effects by comparing the predicted NorthMet Project Proposed Action-  
251 related water quality with a modeled existing water quality (as characterized by groundwater  
252 quality monitoring) and applicable Minnesota groundwater quality standards, which are based on  
253 Minnesota water use classifications (*Minnesota Rules* 7060, 7050, and 7052). Groundwater  
254 quality standards are USEPA primary MCLs (pMCL), USEPA sMCL, and MDH HRLs. The  
255 groundwater quality evaluation criteria, for the purposes of this FEIS, are defined as the strictest  
256 (i.e., lowest) concentration among the USEPA pMCLs, USEPA sMCLs, and the MDH HRLs,  
257 with the following exceptions:

- 258 • Human health-based primary drinking water standards for copper and lead are “at the tap”  
259 values applicable to treated water systems and not to “in situ” groundwater values (see Note  
260 3 to Table 5.2.2-2). *Minnesota Rules* addressing the water quality standards applicable to  
261 Class 1 waters used for domestic consumption specifically state that the primary drinking  
262 water standards for copper and lead do not apply to Class 1 surface waters or groundwater.  
263 The FEIS uses the USEPA sMCL of 1,000 µg/L as the groundwater evaluation criteria for  
264 copper. Modeling predictions for lead are presented but without a groundwater evaluation  
265 criterion because no sMCL or an HRL is available for this analyte.
- 266 • Natural (unaffected) groundwater concentrations for aluminum and iron at the Mine Site and  
267 Plant Site are greater than secondary drinking water standards. The concentrations for these  
268 two solutes in groundwater are heavily influenced by processes not readily captured in water  
269 quality models (e.g., site-specific redox reactions). Furthermore, these sMCLs were  
270 established by the USEPA as guidelines to assist public water systems in managing their  
271 drinking water for aesthetic considerations, and can be removed from groundwater with  
272 simple readily available treatment technologies, and are not enforced by the USEPA. For  
273 example, concentrations above the aluminum sMCL (200 µg/L) may result in colored water  
274 and concentrations above the iron sMCL (300 µg/L) may result in rusty color, metallic taste,  
275 and reddish or orange staining.
- 276 • Natural (unaffected) groundwater concentrations for beryllium, manganese, and thallium  
277 (bedrock unit only) at the Mine Site and beryllium and manganese at the Plant Site are  
278 greater than secondary drinking water standards and/or the HRL (see Table 5.2.2-1). These  
279 elevated concentrations are consistent with concentrations seen elsewhere in the Iron Range  
280 and northeast Minnesota. *Minnesota Rules*, part 7060.0600, subpart 8, states that “where the  
281 background level of natural origin is reasonably definable and is higher than the accepted  
282 standard for potable water and the hydrology and extent of the aquifer are known, the natural  
283 level may be used as the standard.”

284 The evaluation criteria for these solutes were set at either 1) the 95 percent Upper Prediction  
285 Limit, 2) the second-highest value when there was a limited number of measured concentrations  
286 above the detection limit, or 3) half the detection limit when there were no detected  
287 concentrations pursuant to USEPA guidance (USEPA 2009b) (see Table 5.2.2-1).

| Zinc                                | µg/L  | --              | 2,000                | 5,000              | 2,000                        |

300 Source: pMCLs (40 CFR 141), sMCLs (40 CFR 143), and HRLs (*Minnesota Rules*, part 4717.7500).

301 <sup>1</sup> Beryllium, manganese, and thallium (Mine Site bedrock unit only). The evaluation criteria differ by location (reported here as  
 302 Mine Site Surficial Aquifer/Bedrock Aquifer/Plant Site Surficial Aquifer) based on background water quality (see Table  
 303 5.2.2-1 above). Criteria are based on dissolved concentrations unless otherwise noted (MPCA 2014g).

304 <sup>2</sup> Boron. See MDH guidance: [www.health.state.mn.us/divs/eh/risk/guidance/gw/boron.html](http://www.health.state.mn.us/divs/eh/risk/guidance/gw/boron.html).

305 <sup>3</sup> Lead and copper. Lead and copper enter drinking water primarily through plumbing materials. In 1991, the USEPA published  
 306 the Lead and Copper Rule (USEPA 1991). This rule requires water systems to monitor drinking water at customer taps. The  
 307 1,300µg/L copper concentration and 15µg/L lead concentration represent action levels that, when exceeded at 10 percent of  
 308 customer taps, require the water system to take additional actions to control corrosion. Therefore, these values reflect  
 309 concentrations at the customer tap. Additionally, *Minnesota Rules*, part 7050.0221, subpart 1B, states that the primary drinking  
 310 water standards for copper and lead are not applicable to Class 1 groundwater.

311 <sup>4</sup> Aluminum and iron. These parameters were excluded from groundwater evaluation criteria due to baseline USEPA sMCL  
 312 standard exceedances in the Iron Range and Northeast Minnesota and because these concentrations are heavily influenced by  
 313 processes not captured in the proposed models (e.g., site-specific redox reactions). Further, standards for these parameters were  
 314 established for management of aesthetic conditions in treated drinking water and are readily removed from groundwater with  
 315 simple readily available treatment technologies. This policy was adopted by the Co-lead Agencies in the NorthMet EIS  
 316 Groundwater Impact Assessment Planning Final Summary Memo (June 27, 2011).

317 <sup>5</sup> Nickel and thallium. The MDH HRL is based on the salt form of this parameter. It is conservatively assumed, for purposes of  
 318 the FEIS, that the salt form is equivalent to the total concentrations of this parameter.

319 <sup>6</sup> Chromium III is used in the FEIS because it is the most likely form of chromium to be present at NorthMet Project Proposed  
 320 Action project site.

321 These groundwater quality evaluation criteria are assessed at the following evaluation locations  
 322 (see Figures 5.2.2-7 and 5.2.2-9):

- 323 • Partridge River Watershed:
  - 324 – Surficial Aquifer
    - 325 ■ East Pit and Category 2/3 Flowpath – at the Partridge River (coinciding with property
    - 326 boundary)
    - 327 ■ Ore Surge Pile Flowpath – at the Partridge River
    - 328 ■ WWTF Flowpath – at the property boundary
    - 329 Overburden Storage and Laydown Area Flowpath – at the old property boundary (a
    - 330 short distance south of Dunka Road) which is the FEIS Mine Site boundary

- 331       ▪ West Pit Flowpath – at the property boundary
- 332       – Bedrock
- 333       ▪ East Pit Bedrock Flowpath – at the property boundary
- 334       ▪ West Pit Bedrock Flowpath toward SW-004 – at the property boundary
- 335       ▪ West Pit Bedrock Flowpath toward SW-004a – at the property boundary
- 336       • Embarrass River Watershed (all surficial aquifer, see Section 5.2.2.2.3):
- 337       – North Flowpath – at the north property boundary
- 338       – Northwest Flowpath – at the northwest property boundary
- 339       – West Flowpath – at the west property boundary

#### 340 **5.2.2.1.2 Surface Waters**

341 This section discusses evaluation criteria for the effects of the NorthMet Project Proposed Action  
342 on surface water hydrology and quality.

#### 343 **Hydrologic Alteration of Streams and Lakes Evaluation Criteria**

344 Hydrologic evaluation criteria include a comparison of proposed hydrologic changes with both  
345 existing natural conditions and historic hydrologic alterations from permitted mining practices,  
346 an assessment of present and predicted channel stability, and review of any appropriate physical  
347 or biological stream data. Evaluation criteria for streamflows in the Partridge River Watershed  
348 and changes in lake or reservoir levels in the NorthMet Project Proposed Action area are those  
349 developed by (Richter et al.1996; 1998) related to alteration of hydrology and were adopted by  
350 the Co-lead Agencies during the IAP process (MPCA 2011d). The main parameters  
351 recommended for this “range of variability” approach include:

- 352       • Annual mean daily flow by month;
- 353       • Annual maximum 1-day, 3-day, 7-day, 30-day, and 90-day flows;
- 354       • Annual minimum 1-day, 3-day, 7-day, 30-day, and 90-day flows;
- 355       • Number of high pulses (i.e., the number of times per year the mean daily flow increases  
356       above the 75<sup>th</sup> percentile of all simulated mean daily flows);
- 357       • Number of low pulses (i.e., the number of times per year the mean daily flow falls below the  
358       25<sup>th</sup> percentile of all simulated mean daily flows);
- 359       • Duration of high pulses (i.e., the number of days per year with mean flows above the 75<sup>th</sup>  
360       percentile of all simulated daily mean flows);
- 361       • Duration of low pulses (i.e., the number of days per year with mean flows below the 25<sup>th</sup>  
362       percentile of all simulated daily mean flows);
- 363       • Mean duration of high pulses (i.e., the ratio of duration of high pulses to number of high  
364       pulses);

365

366 • Mean duration of low pulses (i.e., the ratio of duration of low pulses to number of low  
367 pulses); and

368 • Annual mean, annual maximum, and annual minimum lake levels in Colby Lake and  
369 Whitewater Reservoir.

370 The magnitude of deviation from existing conditions in the hydrologic parameters, based on XP-  
371 SWMM modeling prepared for the Partridge River watershed, helps determine the degree of  
372 potential effect on stream ecology. These values are not expressed as compliance standards, but  
373 would assist in monitoring effects and recommending potential mitigation measures as  
374 appropriate.

375 Flow characteristics for different reaches of the Embarrass River and selected tributaries were  
376 estimated by extrapolating flows from USGS gaging station 04017000 (located just downstream  
377 of PM-12.3) on a unit-area basis. Flow parameters estimated in the Embarrass River Watershed  
378 include groundwater baseflow, annual 1-day minimum flow, annual 1-day maximum flow, and  
379 annual daily mean flow.

380 The MDNR also has recommended maintaining surface flows within plus or minus 20 percent  
381 of existing conditions in NorthMet Project Proposed Action-affected streams to maintain existing  
382 aquatic ecology (Chisholm 2006). See section 5.2.6 for more details.

383 **Water Quality Evaluation Criteria**

384 This FEIS assesses effects on water by comparing the predicted water quality under the  
385 NorthMet Project Proposed Action against evaluation criteria based on the State of Minnesota  
386 water quality standards and use classifications (*Minnesota Rules 7050 and 7052*). Applicable use  
387 classifications of the primary surface waters potentially affected by the NorthMet Project  
388 Proposed Action are described in Section 4.2.2 and are summarized in Table 5.2.2-3.

389 **Table 5.2.2-3 Applicable Use Classifications of the Primary Surface Waters in the NorthMet Project Proposed Action Area**

| Watershed | Stream Name           | Domestic Consumption |    | Aquatic Life and Recreation |     | Industrial Consumption |    | Agriculture and Wildlife |    | Aesthetic Enjoyment | Other uses     |
|-----------|-----------------------|----------------------|----|-----------------------------|-----|------------------------|----|--------------------------|----|---------------------|----------------|
|           |                       | 1B                   | 2A | 2B                          | 2Bd | 3B                     | 3C | 4A                       | 4B | 5                   | 6              |
| Partridge | Partridge River       |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Partridge | West Pit Outlet Creek |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X <sup>1</sup> |
| Partridge | Wetlegs Creek         |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Partridge | Longnose Creek        |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Partridge | Wyman Creek           | X                    | X  |                             |     | X                      | X  | X                        | X  | X                   | X              |
| Partridge | Colby Lake            | X                    |    |                             | X   |                        | X  | X                        | X  | X                   | X              |
| Embarrass | Embarrass River       |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Embarrass | Trimble Creek         |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Embarrass | Mud Lake Creek        |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Embarrass | Second Creek          |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |
| Embarrass | Unnamed Creek         |                      |    | X                           |     |                        | X  | X                        | X  | X                   | X              |

390 <sup>1</sup> The WWTF would discharge to the West Pit Outlet Creek.

391 In *Minnesota Rules* part 7050.0221, the USEPA primary and secondary drinking water standards  
392 are adopted for Class 1B waters (i.e., those treated with simple chlorination for domestic  
393 consumption). The USEPA primary drinking water standards (40 CFR 141) set mandatory  
394 MCLs for drinking water contaminants to protect the public from consuming water that presents  
395 a risk to human health. The USEPA has also established secondary drinking water standards (40  
396 CFR 143) for 15 contaminants that are intended to assist public water systems in managing their  
397 drinking water for aesthetic considerations such as taste, color, and odor. These contaminants are  
398 not considered a risk to human health.

399 The same suite of solutes was modeled for surface waters as described above for groundwater.  
400 As mentioned above, hardness and TDS concentrations were not directly modeled.

401 Because the NorthMet Project Proposed Action area is located in the Lake Superior Basin, the  
402 Great Lakes Initiative (Lake Superior) water quality standards also apply (*Minnesota Rules*  
403 chapter 7052). These Lake Superior standards can differ from the water quality standards for the  
404 same parameters in *Minnesota Rules* chapter 7050. Where different, the 7052 standards  
405 supersede the 7050 standards, even if the 7052 rules are less stringent. For parameters not listed  
406 in chapter 7052, the standards from chapter 7050 apply.

407 Surface water standards are “in-stream” standards applicable at the surface water in question,  
408 which includes the Partridge River and its tributaries for the Mine Site, Transportation and  
409 Utility Corridor, and the Plant Site, and the Embarrass River and its tributaries for the majority of  
410 the Tailings Basin.

411 Applicable surface water quality evaluation criteria, for the purposes of this FEIS, are listed by  
412 use classification in Table 5.2.2-4, with the strictest (i.e., lowest) concentration from the  
413 applicable water use classifications applying.

414 It should be noted that the water quality standards for metals are expressed for total metals in the  
415 table, but are applied as dissolved metal criteria for application to surface waters (*Minnesota*  
416 *Rules*, part 7050.0220). For the majority of metals, the ratio of the total metal criteria to the  
417 dissolved metal criteria is sufficiently close to one such that the total standard is adequately  
418 representative of the applicable criteria.

419 **Table 5.2.2-4 Surface Water Quality Evaluation Criteria Applicable to Different Classes of Surface Water**

| Parameter                       | Units | Class 1B<br>pMCL | Class 1B<br>sMCL | Class<br>2A        | Class<br>2Bd <sup>3</sup> | Class<br>2B <sup>3</sup> | Class<br>3B <sup>4</sup> | Class<br>3C <sup>4</sup> | Class<br>4A <sup>5</sup> | Class<br>4B <sup>5</sup> | Class 5 | Class 6 |

421 All values represent total concentration unless otherwise noted.

422 <sup>1</sup> Based on *Minnesota Rules*, part 7052.0100, *Water Quality Standards Applicable to Lake Superior Basin*, which supersedes standards listed in *Minnesota Rules*, part 7050.0140.

423 <sup>2</sup> The quality of Class 4A waters of the state shall be such as to permit their use for irrigation without significant damage or adverse effects upon any crops or vegetation usually  
424 grown in the waters or area... The following standards shall be used as a guide in determining the suitability of the waters for such uses... Sulfates (SO<sub>4</sub>) - 10 mg/L, applicable  
425 to water used for production of wild rice during periods when the rice may be susceptible to damage by high sulfate levels.

426 <sup>3</sup> *Minnesota Rules*, parts 7050.0222 and 7052.0100.

427 <sup>4</sup> *Minnesota Rules*, part 7050.0223.

428 <sup>5</sup> *Minnesota Rules*, part 7050.0224.

429 <sup>6</sup> Water quality standard for this metal is hardness dependent. The listed value assumes a hardness of 100 mg/L.

430 <sup>7</sup> Standards for metals are expressed as total metals, but must be implemented as dissolved metal standards. Factors for converting total to dissolved metals are listed in *Minnesota*  
431 *Rules*, parts 7050.0222 and 7052.0360.

432 <sup>8</sup> Lead and copper enter drinking water primarily through plumbing materials. In 1991, USEPA published the Lead and Copper Rule  
433 (<http://www.epa.gov/safewater/lcrrm/index.html>). This rule requires water systems to monitor drinking water at customer taps. The 1,300-µg/L copper concentration and 15-  
434 µg/L lead concentration represent action levels that, when exceeded at 10 percent of customer taps, require the water system to take additional actions to control corrosion.  
435 Therefore, these values reflect concentrations at the customer tap. Additionally, *Minnesota Rules*, part 7050.0221, subpart 1B, states that the primary drinking water standards  
436 for copper and lead are not applicable to Class 1 surface waters.

437 ***Surface Water Quality Evaluation Locations***

438 These surface water evaluation criteria are assessed at the following surface water evaluation  
439 locations (see Figures 4.2.2-8 and 4.2.2-16):

- 440 • Partridge River Watershed
- 441 – Partridge River – at SW-002, SW-003, SW-004, SW-004a, SW-004b, SW-005, and  
442 SW-006; and
- 443 – Colby Lake.
- 444 • Embarrass River Watershed
- 445 – Embarrass River – at PM-12, PM-12.2, PM-12.3, PM-12.4, and PM-13 (note that model  
446 results for evaluation locations PM-12.3 and PM-12.4 did not show anything different so  
447 are not discussed further in the FEIS);
- 448 – Mud Lake Creek – at MLC-2 and MLC-3;
- 449 – Trimble Creek – at TC-1 and PM-19; and
- 450 – Unnamed Creek – at PM-11.

451 ***Relationship of Hardness to Evaluation Locations***

452 There are six metals evaluated whose surface water quality standards vary with hardness  
453 concentrations: cadmium, chromium III, copper, lead, nickel, and zinc. Calcium and magnesium  
454 ions that contribute to water hardness generally lower metals toxicity (i.e., as hardness  
455 concentration increases, the water quality standard for these metals also increases). In the case of  
456 the FEIS, as hardness increases, evaluation criteria increase simultaneously. Within the water  
457 quality modeling, estimated concentrations for these six metals are compared to hardness-based  
458 evaluation criteria at each model evaluation location and each model time step to determine the  
459 frequency of evaluation criteria exceedances. See Section 5.2.2.2.3 for more information.

460 ***Downstream Water Quality Standards***

461 The Fond du Lac Band has promulgated water quality standards that are protective of specific,  
462 designated, or beneficial uses for waterbodies on the Fond du Lac Reservation, which is located  
463 approximately 70 miles downstream of the NorthMet Project Proposed Action area on the St.  
464 Louis River. These standards were approved by the USEPA in December 2001. They apply to all  
465 waters, including wetlands, within the Reservation. The Fond du Lac water quality standards  
466 include determination of designated or beneficial uses, narrative and numeric criteria to support  
467 or sustain those uses, and anti-degradation provisions. The FEIS analyzes compliance with their  
468 mercury standard.

469 Based upon results of Fond du Lac Band water quality monitoring, as well as additional resource  
470 investigations, the Reservation's reach of the St. Louis River is attaining all of its beneficial uses  
471 and meeting all applicable water quality standards with the exception of mercury. In-stream  
472 mercury concentrations in the St. Louis River, measured by the Fond du Lac Band, have been  
473 below the Great Lakes Initiative Chronic Wildlife Standard of 1.3 ng/L, but exceed the Fond du  
474 Lac Band's human health chronic standard of 0.77 ng/L. For this reason, the Fond du Lac Band  
475 is especially concerned about any new or expanded discharges to the St. Louis River upstream of

476 the Reservation that may adversely affect mercury bioaccumulation in fish in the St. Louis River  
477 (Schuldt, Pers. Comm., March 6, 2012).

478 The MDNR conducted studies in the St. Louis River in 2012, which included an unusually wet  
479 spring and early summer followed by a long dry period (Berndt et al. 2014). They found that Hg  
480 concentrations in filtered samples collected in Cloquet were 3.5 ng/L in May, increased to 7 ng/L  
481 in July, and then fell gradually through the rest of the summer to 1.4 ng/L by late October.  
482 Upstream from the Partridge River, Hg concentrations over the same period ranged from 5.2  
483 ng/L up to a peak of 11.8 ng/L in late June, eventually decreasing only to 2.3 ng/L by late  
484 October when the study ended. Thus, Hg was never below the 1.3 ng/L standard during these  
485 study periods. These results indicate the importance of considering seasonal variability when  
486 evaluating Hg concentrations in rivers.

### 487 ***Mercury Evaluation Criteria***

488 Mercury numeric standards are based on total (particulate plus dissolved) concentrations. For the  
489 Lake Superior Basin, in which the NorthMet Project Proposed Action area is located, the Class  
490 2B (aquatic life and recreation) numeric chronic standard for mercury in the water column  
491 protective of wildlife is 1.3 ng/L. This is the evaluation criteria used and is consistent with the  
492 Great Lakes Initiative standard. The criterion is applied at in-stream surface water evaluation  
493 locations and to modeled WWTF and WWTP effluent. The FEIS also considers the 0.77 ng/L  
494 standard at the Fond du Lac Reservation. Mercury was not included in GoldSim modeling and  
495 was evaluated separately. There is a relationship, only partially understood, between sulfate  
496 concentration and the conversion of inorganic mercury by sulfate-reducing bacteria into  
497 methylmercury. The MDNR has been conducting numerous studies in the region that indicate a  
498 strong contextual component is needed when considering impacts of sulfate on methylmercury  
499 production and transport (Berndt et al. 2014). When, how, and where the sulfate is added to a  
500 stream or watershed must be considered to evaluate impacts to the mercury cycle.

501 Methylmercury is more bioavailable than inorganic mercury, and it can bioaccumulate in the  
502 aquatic food chain (e.g., fish, wildlife, and humans) to concentrations of concern. Currently,  
503 there is no State of Minnesota surface water quality standard for methylmercury, or for sulfate in  
504 the context of its potential for effect on methylmercury concentrations, as the production of  
505 methylmercury is not only dependent on sulfate concentrations, but also on environmental  
506 conditions required for sulfate-reducing bacteria to live (e.g., sufficient organic carbon and lack  
507 of oxygen). However, the State of Minnesota has a fish tissue water quality standard for mercury  
508 of 0.2 milligram per kilogram (mg/kg), which was amended in *Minnesota Rules*, chapter 7050, in  
509 2008. In 2006, the MPCA also developed a *Strategy to Address Indirect Effects of Elevated*  
510 *Sulfate on Methylmercury Production and Phosphorus Availability*, which identifies policies and  
511 review procedures for evaluating the potential of proposed projects to produce methylmercury.  
512 This strategy includes recommendations to avoid or minimize the discharge of water with  
513 elevated sulfate concentrations to methylmercury “high-risk” situations (MPCA 2006a).

514 The *Minnesota Rules* fish tissue standard for mercury of 0.2 mg/kg is lower than the USEPA  
515 criterion of 0.3 mg/kg (wet weight, per USEPA criteria) to adjust for the higher per capita  
516 consumption of wild-caught fish in Minnesota. Based on the results of scientific investigations,  
517 this criterion assumes that all fish tissue mercury is in the methylmercury form.

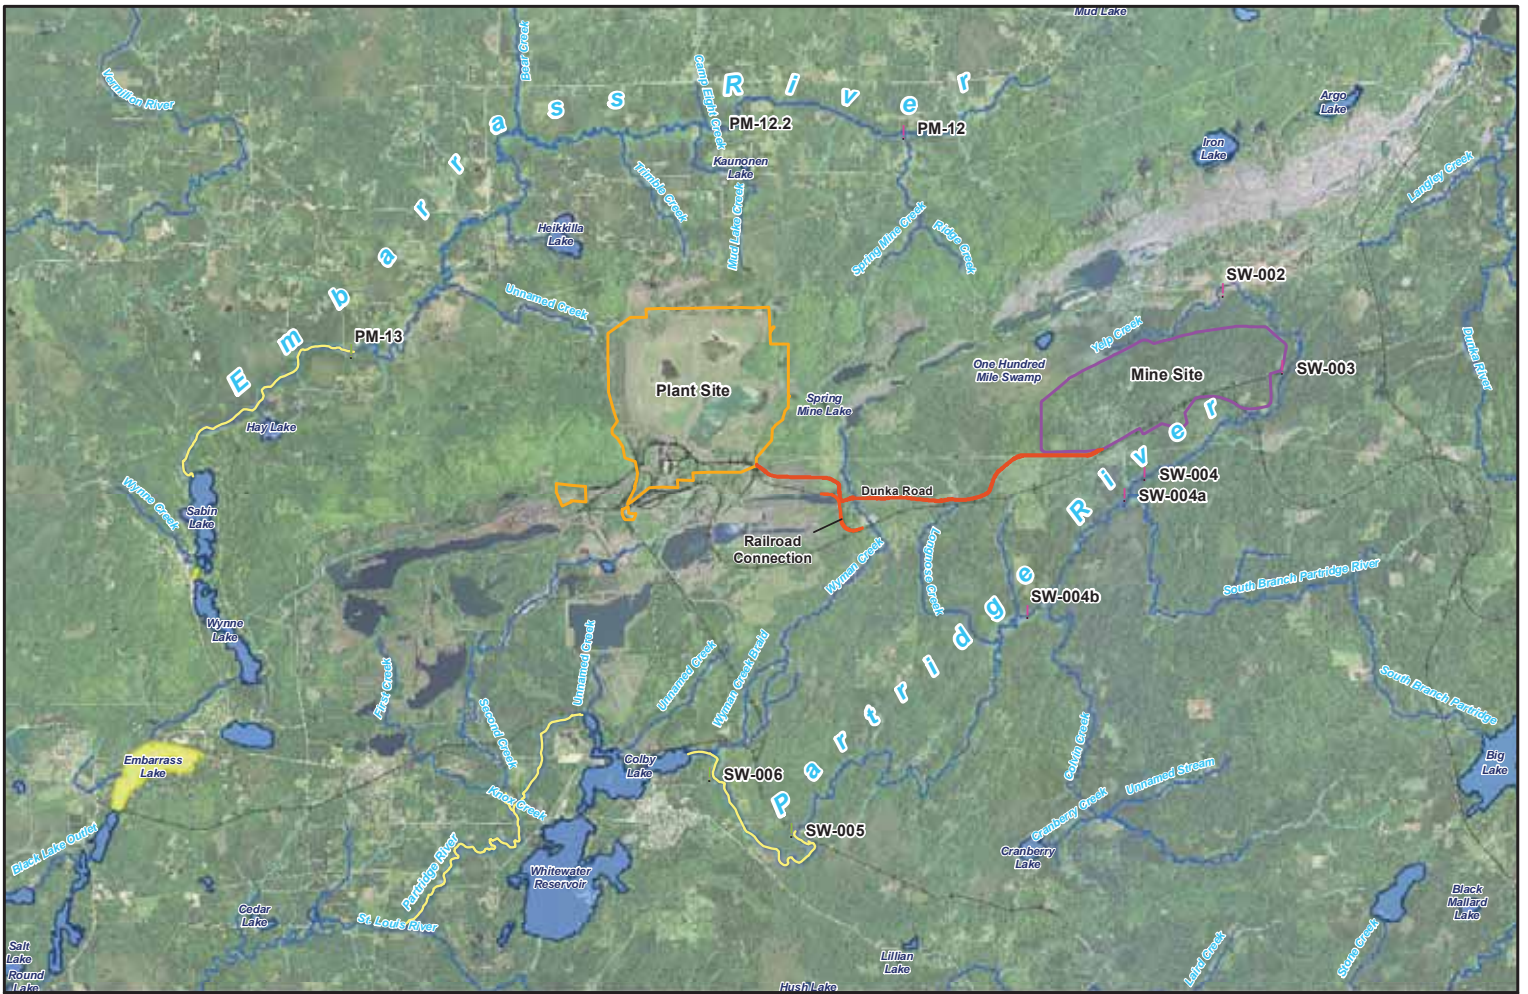

518 Research suggests that total mercury concentrations in streams and methylmercury content in  
519 fish are roughly proportional within individual watersheds (USGS 2010), such that an increase in  
520 total mercury in water would be expected to result in an increase in mercury content in fish  
521 within that watershed. MPCA's Mercury Risk Estimation Method (MMREM) was used to assess  
522 the potential changes in fish mercury concentrations in nearby lakes (Barr 2015f). The MMREM  
523 relies on empirical fish contamination data combined with the principle of proportionality  
524 between mercury in fish and atmospheric deposition (MPCA 2006c). The potential incremental  
525 change in fish mercury concentration is discussed further in Section 6.2.6.3.3.

#### 526 ***Waters Used for the Production of Wild Rice Evaluation Criteria***

527 *Minnesota Rules*, part 7050.0224, defines the Class 4A water quality standards for the  
528 Agriculture and Wildlife Use Classification, which includes a 10 mg/L sulfate standard  
529 "applicable to water used for production of wild rice during periods when the rice may be  
530 susceptible to damage by high sulfate levels." Application of this standard is therefore dependent  
531 on the identification of specific waters used for the production of wild rice. When evaluating any  
532 facility or project with potential effects on wild rice production, the MPCA considers all  
533 available information to determine on a case-by-case basis which surface waters are used for the  
534 production of wild rice (MPCA 2012b). For the NorthMet Project Proposed Action, the MPCA  
535 considered available) lists of wild rice beds not promulgated by rule assembled by the MDNR,  
536 the 1854 Treaty Authority and the Wild Rice Management Workgroup (a coalition of federal,  
537 state, and tribal resource managers and other wild rice stakeholders), and the results of site-  
538 specific wild rice field surveys conducted in 2009, 2010, and 2011 in the Partridge and  
539 Embarrass rivers. To date within the NorthMet Project Proposed Action area, MPCA (2012b)  
540 has reached a draft staff recommendation that the following are "waters used for the production  
541 of wild rice" (see Figure 5.2.2-1):

- 542 • Within the Embarrass River Watershed:
  - 543 – That segment of the Embarrass River from MN Highway 135 bridge to the inlet to Sabin
  - 544 Lake;
  - 545 – The northernmost tip of Wynne Lake (Embarrass River inlet); and
  - 546 – Embarrass Lake north of the railroad crossing
- 547 • Within the Partridge River Watershed:
  - 548 – That portion of Upper Partridge River from river mile approximately 22, just upstream of
  - 549 the railroad bridge near Allen Junction, to the inlet to Colby Lake;
  - 550 – That portion of Lower Partridge River from the outlet of Colby Lake to its confluence
  - 551 with the St. Louis River; and
  - 552 – That portion of Second Creek from First Creek to the confluence with Partridge River.

553 Therefore, of the surface water quality evaluation locations identified in Figure 5.2.2-1, the wild  
554 rice evaluation criterion is applied at PM-13 on the Embarrass River, and at SW-005 and  
555 SW-006 on the Partridge River. The MPCA may, in the near future and as part of its ongoing  
556 rule revision process, propose additional or alternate waters to be protected for wild rice;  
557 however, this process is not yet complete. Therefore, the above-described 'waters used for  
558 production of wild rice' evaluation criteria will be used for the analyses presented in the FEIS.

- MPCA Staff-Recommended Wild Rice Water
- MPCA Staff-Recommended Wild Rice Water
- MDNR Designated PWI Stream/River
- Non MDNR Designated PWI Stream/River
- MDNR Designated PWI Lake/Wetland
- Existing Railroad
- Partridge River or Embarras River Evaluation Location
- Evaluation Location Where Wild Rice Evaluation Criteria Applies
- Mine Site
- Plant Site
- Transportation and Utility Corridor

 NorthMet Mining Project and Land Exchange PFEIS  
 Minnesota  
 June 2015

DRAFT

561 **5.2.2.2 Methodology**

562 There have been substantial changes to the methodology used for predicting NorthMet Project  
 563 Proposed Action effects on groundwater and surface flow and quality since the DEIS.  
 564 Terminology necessary to understand the differences between the DEIS and FEIS impact  
 565 assessment methodologies is provided in Table 5.2.2-5. For example, the DEIS evaluated water  
 566 quality at the Mine Site using three deterministic cases (i.e., low-, medium-, and high-flow  
 567 conditions), in an attempt to capture uncertainty associated with some of the input values. This  
 568 was supplemented by limited uncertainty analysis to help assess whether the deterministic  
 569 modeling produced conservative values. The uncertainty analysis in the DEIS indicated mixed  
 570 results regarding the conservatism of the deterministic modeling.

571 **Table 5.2.2-5 Definition of Terminology used in this FEIS**

| <b>Term</b>              | <b>Definition</b>                                                                                                                                                                                                                                                                   |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Uncertainty              | Incomplete knowledge of a process, quantity, value, or outcome, which can be quantified as a cumulative probability distribution.                                                                                                                                                   |
| Variability              | There is no single correct absolute value; values vary in time and/or space.                                                                                                                                                                                                        |
| Deterministic Simulation | Prediction is made based on a model for which all input parameters are represented as single values; i.e., no uncertainty is applied to the inputs. The model results are expressed as a set of fixed outcomes.                                                                     |
| Probabilistic Simulation | Prediction is made based on a model that incorporates the uncertainty of model inputs; i.e., the cumulative probability distributions of input parameters are incorporated into the calculations. The model results are expressed as a set of cumulative probability distributions. |

572 For the FEIS, a probabilistic modeling approach was used for predicting NorthMet Project  
 573 Proposed Action effects on water resources. Probabilistic modeling is a statistical method that  
 574 estimates the probability of a given outcome using inputs in a form of probabilistic distributions.  
 575 It is different than deterministic modeling, where all inputs have single (deterministic) values and  
 576 the model always produces a single result without explicitly accounting for uncertainty. The  
 577 probabilistic approach not only enables prediction of effects on groundwater and surface water  
 578 from the NorthMet Project Proposed Action, but it also helps quantify the probability of the  
 579 effects occurring. Table 5.2.2-6 compares the modeling approach used in the DEIS with the  
 580 approach used in the FEIS.

581 **Table 5.2.2-6 Comparison of EIS Modeling Approaches**

| <b>Previous DEIS</b>                               | <b>Current FEIS</b>                                                   |
|----------------------------------------------------|-----------------------------------------------------------------------|
| Stand-alone model components                       | Linked source-to-evaluation location                                  |
| Discrete points in time with interpolation         | Continuous through time until or near steady-state conditions reached |
| Deterministic with three cases                     | Probabilistic, including uncertainty and variability                  |
| Separate uncertainty analysis of select components | Fully integrated uncertainty analysis of entire model                 |

582 The effects of the NorthMet Project Proposed Action on groundwater and surface water quality  
 583 within the Partridge River Watershed were evaluated using MODFLOW for groundwater  
 584 hydrologic modeling, XP-SWMM for surface water hydrologic modeling and GoldSim for water  
 585 quality modeling. MODFLOW and XP-SWMM were used as deterministic models, while  
 586 GoldSim was run in a probability mode. Detailed descriptions of how these models were applied

587 to the Mine Site are provided in the Mine Site Water Modeling Data Package (PolyMet 2015m)  
588 and Mine Site Water Modeling Work Plan (Barr 2012c). At the Plant Site, the modeling  
589 consisted of MODFLOW, GoldSim, and a spreadsheet compilation of streamflows for different  
590 watersheds based on Embarrass River stream gauging data. Detailed descriptions of how these  
591 models were applied to the Plant Site are provided in the Plant Site Water Modeling Data  
592 Package (PolyMet 2013j) and Plant Site Water Modeling Work Plan (Barr 2012d). Each of the  
593 three model types is summarized below.

#### 594 **5.2.2.2.1 Groundwater Hydrologic Modeling**

595 Regional (large-scale) and site-scale (local-scale) modeling of groundwater flow systems was  
596 performed using MODFLOW, a public-domain, numerical, finite-difference groundwater flow  
597 model that can simulate three-dimensional saturated flow in heterogeneous media (McDonald  
598 and Harbaugh 1988). Input to the model included delineation of the areal and vertical extent of  
599 geologic materials, hydrologic characteristics of those materials (e.g., hydraulic conductivity),  
600 meteoric recharge, and alignment of hydrologic boundaries (e.g., perennial stream channels).  
601 MODFLOW provided estimates of hydraulic head distributions, groundwater flows/directions in  
602 the surficial aquifer and bedrock units, and groundwater releases to perennial streams  
603 (groundwater baseflow). By adjusting hydraulic conductivity and recharge inputs, the  
604 MODFLOW models were calibrated to measured hydraulic heads in monitoring wells and  
605 estimated groundwater baseflows in the Partridge River.

606 MODFLOW modeling results and site characterization data were used to delineate groundwater  
607 flowpaths at the Mine Site and Plant Site. The flowpaths were used to model groundwater flow  
608 and solute transport from mine facilities to groundwater evaluation locations and to locations  
609 where groundwater releases to surface water. Those flowpaths were programmed into the Mine  
610 Site and Plant Site water quality models.

#### 611 **Mine Site**

612 For the DEIS, a Regional MODFLOW model was developed to evaluate aerially distributed  
613 recharge, hydraulic head distributions, and groundwater flow directions (Barr 2007c). The  
614 regional model contained two layers—one for the surficial deposits and one for bedrock. The  
615 model boundary conditions were mostly regional drainage divides (treated as no-flow  
616 boundaries) and perennial streams (treated as prescribed head boundaries). Revisions to the XP-  
617 SWMM model since the DEIS provided groundwater baseflow estimates at different locations  
618 along the Partridge River. By varying areal recharge and material hydraulic conductivities, the  
619 regional model was roughly calibrated to hydraulic heads measured in monitoring wells.

620 An important calibration constraint was that the predicted hydraulic head in the surficial aquifer  
621 would not be above ground surface.

622 To evaluate groundwater flowpaths and the hydraulic effects of Mine Site features in more  
623 detail, a site-scale MODFLOW model of the Mine Site was developed that was essentially an  
624 internal “window” within the regional model. The site-scale MODFLOW model contained eight  
625 layers—one for the surficial aquifer and seven for bedrock. Where not coincident with perennial  
626 streams or drainage divides, the prescribed head conditions along the external boundaries of the  
627 Site model were taken from the head distributions predicted by the regional model. The  
628 footprints and vertical extent of the mine features were modified from the DEIS model to reflect

629 the current Mine Plan. The aerial extent of the site-scale MODFLOW model and simulated  
 630 hydrologic features are shown on Figure 5.2.2-2 and Figure 5.2.2-3.

631 Revisions to the XP-SWMM model since the DEIS resulted in different groundwater baseflow  
 632 estimates for the Partridge River. Using the revised XP-SWMM groundwater baseflow  
 633 estimates, the site-scale MODFLOW model was calibrated using target groundwater baseflow  
 634 values of 0.41, 0.51, and 0.92 cfs at SW-002, SW-003, and SW-004, respectively. This  
 635 calibration was performed by varying hydraulic conductivity and stream conductance values, but  
 636 not aerial recharge. In addition, groundwater elevations measured at Mine Site monitoring wells  
 637 MW-1 through MW-18 were included as calibration targets. The automated-inverse modeling  
 638 code PEST (Watermark 2005) was used to complete the model calibration. That calibration  
 639 involved varying the horizontal and vertical hydraulic conductivities of the different geologic  
 640 subunits and the conductance of river cells representing the Partridge River to achieve a best fit  
 641 between predicted and measured hydraulic heads and target groundwater baseflows. The  
 642 automated PEST calibration used field-measured hydraulic conductivities to help constrain the  
 643 range of allowed hydraulic conductivities in the model. An important calibration constraint was  
 644 that predicted hydraulic heads in the shallow aquifer would not be significantly above ground  
 645 surface. Information on calibration of the site-scale MODFLOW model is provided in PolyMet  
 646 (2015m).

647 The calibrated site MODFLOW model provided optimized values for the horizontal and vertical  
 648 hydraulic conductivities of different subunits of the surficial aquifer and bedrock, which are  
 649 summarized in Table 5.2.2-7. Specific storage set in the model is  $3 \times 10^{-6} \text{ ft}^{-1}$  for both surficial  
 650 deposits and bedrock. Specific yield was 0.25 for both surficial deposits and bedrock.

651 For the surficial aquifer in the Site MODFLOW model, the meteoric recharge flux was 1.8  
 652 inches per year (in/yr) for glacial drift and 0.36 in/yr for wetland deposits. The areally-averaged  
 653 meteoric recharge flux was about 0.75 in/yr, which equates to a groundwater baseflow yield of  
 654 0.055 cubic feet per square mile (cfs/mi<sup>2</sup>).

655 **Table 5.2.2-7 Mine Site Hydraulic Conductivities Based on Calibration of the MODFLOW**  
 656 **Model and Field Testing**

| Major Unit          | Subunit                | Horizontal Hydraulic Conductivity |                |                   | Vertical Hydraulic Conductivity |
|---------------------|------------------------|-----------------------------------|----------------|-------------------|---------------------------------|
|                     |                        | Minimum<br>ft/day                 | Mean<br>ft/day | Maximum<br>ft/day |                                 |

DRAFT

664 Figure 5.2.2-7 shows surficial groundwater flowpaths with the potential to transport mine-  
665 affected groundwater from identified source areas to designated evaluation locations. These  
666 surficial groundwater flowpaths were delineated using the results of a steady-state MODFLOW  
667 model simulation of existing conditions. The hydrologic characteristics of each surficial flowpath  
668 are summarized in Table 5.2.2-8. Three bedrock flowpaths the Partridge River were also  
669 delineated in the model: West Pit to SW-004, West Pit to SW-004a, and East Pit to SW-004. Due  
670 to the low bulk hydraulic conductivity of Duluth Complex rocks that comprise these bedrock  
671 flowpaths, the groundwater flow rates to the Partridge River are very small and travel times are  
672 very long. The three bedrock flowpaths are included in the GoldSim water quality model, but  
673 results show that these flowpaths do not provide a mine-related chemical load to the Partridge  
674 River over the 200 year simulation.

675 A sequence of steady-state MODFLOW model simulations was used to evaluate groundwater  
676 inflows into the West Pit that would occur during its flooding. Figure 5.2.2-4 and Figure 5.2.2-5  
677 shows groundwater inflow rates into the West Pit and East Pit estimated by transient  
678 MODFLOW model simulations of the mine operations. Figure 5.2.2-6 shows a plot of inflows  
679 versus water surface elevation in the West Pit.

685

686

687

*Figure 5.2.2-6 Groundwater Inflow Rate vs Pit Water-Level Elevation for the West, Central, and East Pits*

688 The West Pit and Central Pit are surrounded by a low permeability Duluth Complex rock. As a  
689 consequence, the model simulated groundwater inflow rates are relatively low. The north wall of  
690 the East Pit is excavated into the higher permeability Virginia Formation, and this caused higher  
691 estimated inflow rates into the East Pit.

692 The following key time events during mine operations were represented in transient model  
693 simulations and analysis:

| 694 | <b>Mine Year</b> | <b>Key Event</b>                                               |
|-----|------------------|----------------------------------------------------------------|
| 695 | 1 – 10           | East Pit and West Pit mined and dewatered                      |
| 696 | 11               | East Pit reaches a maximum depth                               |
| 697 | 12               | Start of backfill placement in East Pit                        |
| 698 | 10 – 20          | Continuation of West Pit and Central Pit mining and dewatering |
| 699 | 20               | East Pit backfilled and re-saturated                           |
| 700 | 20               | Start of West Pit flooding                                     |

701 Bedrock flowpaths and evaluation locations were also evaluated, but because the bedrock  
702 (primarily the Duluth Complex) is highly competent with very low hydraulic conductivities (see  
703 Table 5.2.2-7), very little groundwater transport occurs within the bedrock flowpaths and travel  
704 times to evaluation locations are predicted to be in the thousands of years. Attachment B of the  
705 Mine Site Water Modeling Data package (PolyMet 2015m) provides a complete description of  
706 the Mine Site MODFLOW model.

707 Concerns have been raised that fractures or faults may exist at the Mine Site that could function  
708 as high-permeability conduits for groundwater over long distances through the bedrock. Such  
709 features have been identified elsewhere on the Canadian Shield. Most of these features, however,  
710 have been associated with tectonic events occurring more than 1.6 billion years ago. These  
711 events would not be relevant to the Duluth Complex as they predate its emplacement, which  
712 occurred during the Mid-Continent Rift approximately 1.1 billion years ago. A few studies have  
713 identified the presence of fracturing and faults in the Duluth Complex, but these structures are  
714 believed to have formed during emplacement of the Duluth Complex and are unlikely to transmit  
715 water. Where fractures were found, they were largely filled with gouge (Foose and Cooper 1979;  
716 1981), or relate to an unusual cleavage pattern known to occur in one location west of Duluth,  
717 about 70 miles from the Mine Site (Foster and Huddelston 1986).

718 At the Mine Site and Plant Site, there is no field evidence to suggest that bedrock faults or  
719 fracture zones provide enhanced groundwater flow to the Partridge and Embarrass Rivers. It is  
720 possible that structural features with enhanced groundwater flow exist, but they are improbable  
721 given the body of evidence for the Project Site and other mines sites in the Iron Range with  
722 similar geology. Further, if such features do exist, it is highly unlikely that they could be  
723 intercepted and characterized by any reasonable field program of exploratory boreholes. This  
724 FEIS documents the need for a robust monitoring program during operations and closure to  
725 provide direct or indirect evidence on the existence of, or lack of, hydrologically significant  
726 faults. If significant faults are identified (that is, faults which could lead to violation of water  
727 quality standards or dewatered wetlands), then contingency mitigation measures would be  
728 employed to mitigate the fault-related effects.

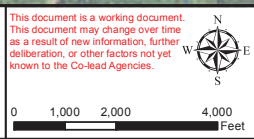

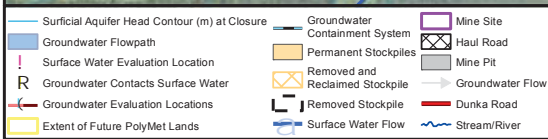

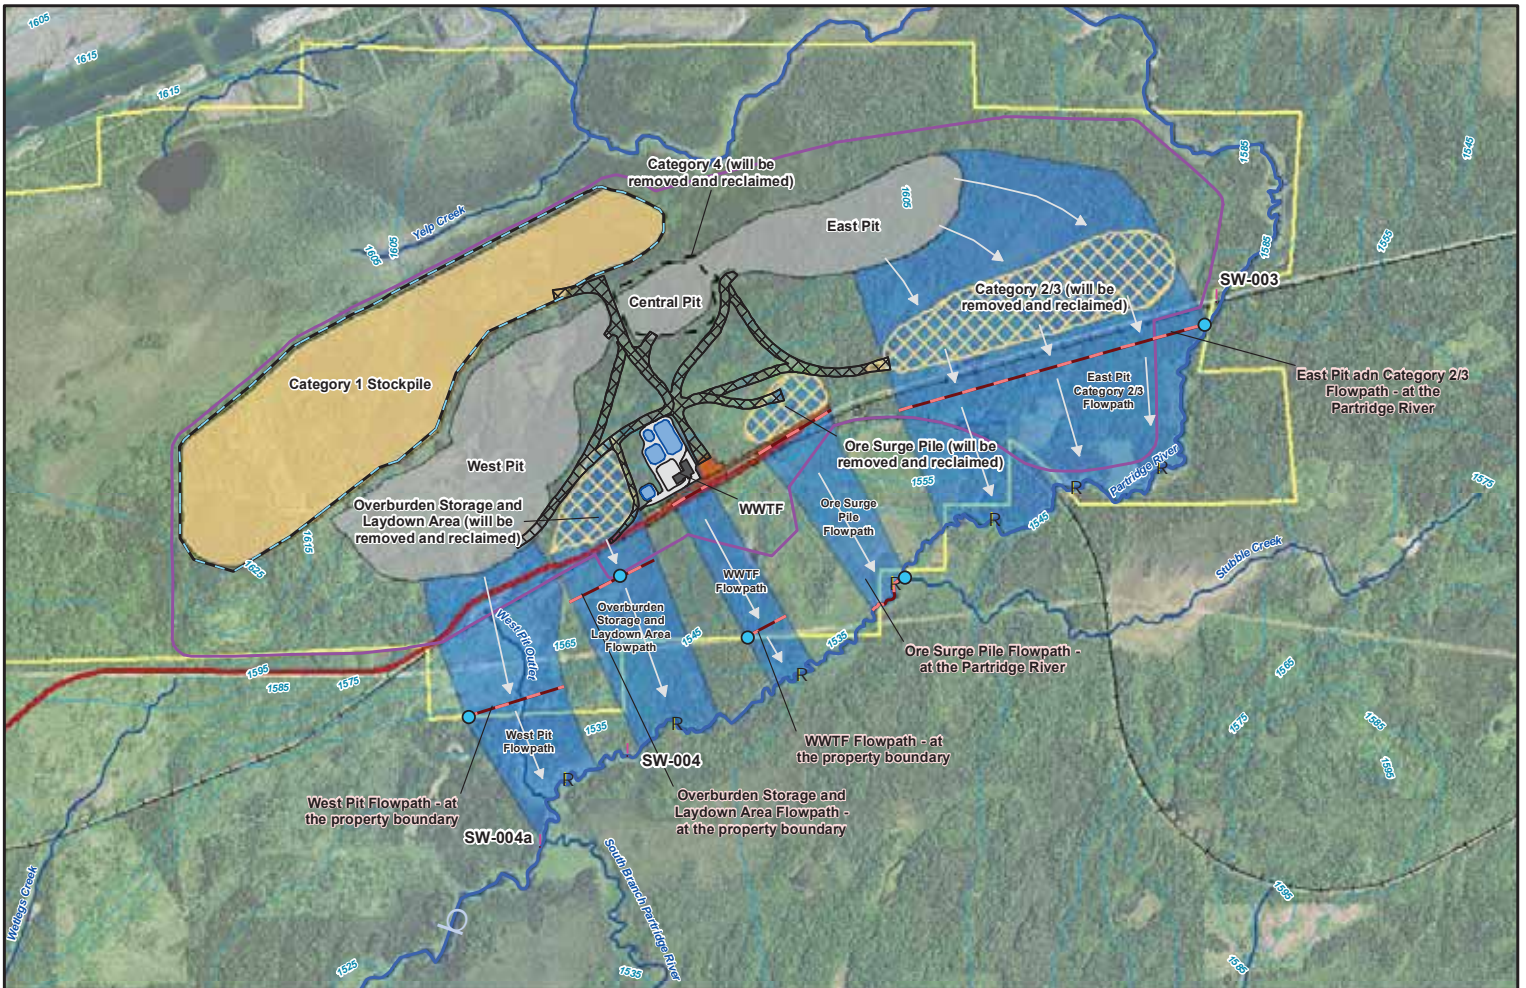

729 Boring log data indicates that the bedrock appears competent, with only few fractures present  
730 near the surface. Hydrogeologic investigations have indicated that the bulk hydraulic  
731 conductivity of bedrock at the Mine Site is very low. See Section 4.2.2.2.1 for additional  
732 information.

733 The effects of this limited fracturing are incorporated into the bulk hydraulic conductivity values  
734 used to characterize bedrock for the water quality impact assessment modeling (discussed in  
735 Section 5.2.2.2.3). This is common practice in large-scale evaluations of bedrock hydraulics. The  
736 Mine Site GoldSim model was updated for this FEIS to better represent the likelihood of the  
737 presence of an upper bedrock zone that is more fractured than deeper bedrock.

738 Site characterization data (see Section 4.2.2.2.1 and 4.2.2.3.1) indicate that the bulk hydraulic  
739 conductivity of upper bedrock is two to three orders-of-magnitude lower than the hydraulic  
740 conductivity of the surficial aquifer. Thus, groundwater flow and transport at both the Mine Site  
741 and Plant Site are dominated by the hydraulics of the surficial aquifer and that bedrock plays a  
742 negligible role in transporting site-derived contaminants to the Partridge and Embarrass Rivers.

743 Neither the Mine Site model nor the Plant Site model represents explicitly buried stream  
744 channels. It is acknowledged that such channels could exist within surficial deposits. However,  
745 given their small thickness, it is unlikely that buried channels (if present at all) would have  
746 materials much higher in permeability than adjacent materials. Variation in the hydraulic  
747 conductivity of surficial deposits (like that provided by potential buried stream channels) is  
748 accounted for by the probabilistic approach used in the GoldSim model, where hydraulic  
749 conductivity is input as a probability distribution rather than as a fixed, deterministic value.

753 Note: Brackets indicate closure value (after facility is decommissioned).

754 <sup>1</sup> Pit water level rises above base of surficial aquifer.

755 <sup>2</sup> Infiltration of meteoric water at top of facility.

756 <sup>3</sup> Liner leakage at bottom of facility.

757 <sup>4</sup> Category 2/3 stockpile and East Pit release affected water into the same flowpath at different times.

758 <sup>5</sup> Includes East Pit discharge into flowpath.

759 **Plant Site**

760 A series of numerical groundwater models were developed for the Tailings Basin's area. All  
761 those model versions are collectively referred to as the Plant Site MODFLOW model. The  
762 primary objectives for that modeling were to estimate:

- 763 • Seepage loss from the LTVSMC Tailings Basin ponds under various conditions;
- 764 • Average annual infiltration rate;
- 765 • Seepage rates for each of the groundwater flowpaths represented in the GoldSim model;
- 766 • Hydraulic conductivities of natural surficial materials, tailings, and bedrock;
- 767 • Areal recharge;
- 768 • Specific yield;
- 769 • Distribution of tailings seepage to different segments of the Tailings Basin perimeter;
- 770 • Depth of the phreatic surface; and
- 771 • The rate of contaminated groundwater flow at which it would bypass the Tailings Basin  
772 seepage containment system.

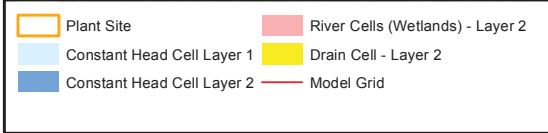

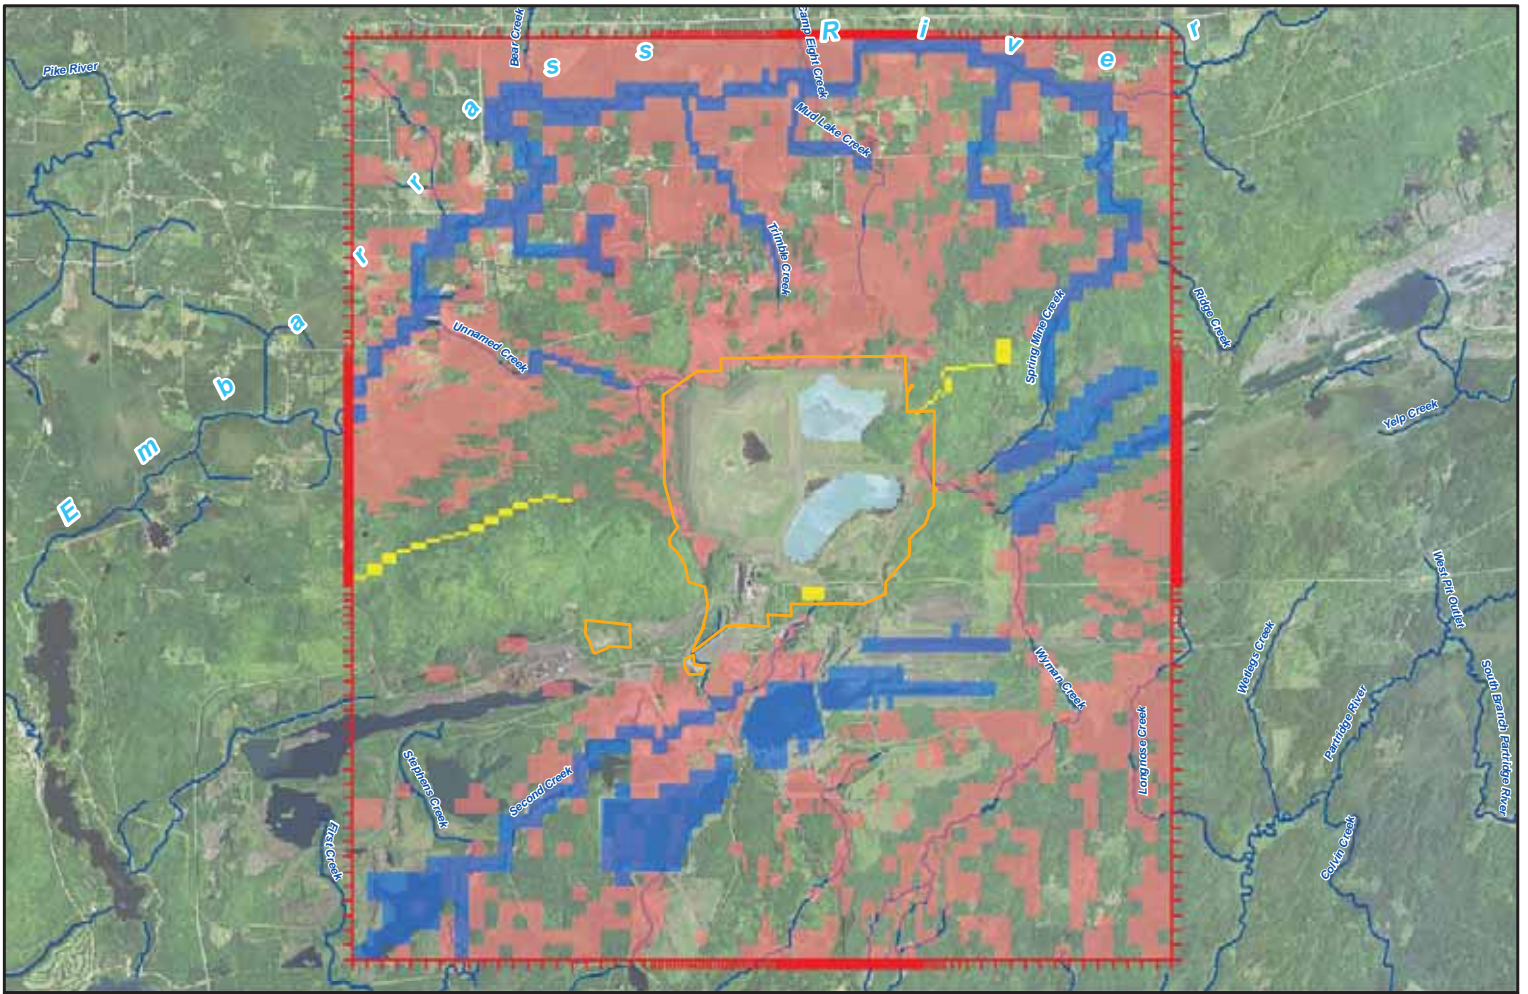

773 The Plant Site MODFLOW model's areal extent and simulated hydrologic features are shown on  
774 Figure 5.2.2-8.

775 The initial Plant Site MODFLOW model was constructed with two layers. The upper layer  
776 represented the current LTVSMC tailing, while the lower layer represented surficial deposits and  
777 bedrock outcrops. The model simulated groundwater flow in tailings materials and in the  
778 underlying shallow groundwater system. It did not have layers to represent bedrock below  
779 surficial deposits. Thus, the base of surficial deposits was treated as a no-flow boundary. This  
780 was justified in view of the fact that the bulk hydraulic conductivity of the upper bedrock is  
781 estimated to be about two orders-of-magnitude lower than the hydraulic conductivity of the  
782 surficial aquifer. Further, interpretation of available data indicates that deeper bedrock has  
783 substantially lower hydraulic conductivity than shallow bedrock. The upper model layer, layer 1,  
784 was set inactive outside of the Tailings Basin's footprint.

785 The areal extent of the Plant Site MODFLOW model and model-simulated hydrologic features  
786 are shown on Figure 5.2.2-8.

DRAFT

791 The original versions of the model were calibrated to simulate steady-state conditions. They did  
792 not simulate changes in water levels within the basin. An initial steady-state model calibration  
793 was using water level data collected through 2002, measured seepage rates, and leakage from  
794 ponds 1E and 2E estimated using water balance analysis. The calibrations were performed by  
795 varying input hydraulic conductivities, specific yields, and recharge, such that the model-  
796 predicted hydraulic heads reasonably match water levels measured in monitoring wells. One of  
797 the emphases of that calibration was to prevent the model from computing water levels that are  
798 significantly above the ground surface.

799 After LTVSMC operations and deposition of tailings ceased in 2001, the groundwater mound  
800 beneath the Tailings Basin began to dissipate, and the quantity of seepage leaving the Tailings  
801 Basin area has decreased. The original model was calibrated to represent the changing (transient)  
802 conditions developing from the time of LTVSMC closure until present and to simulate the  
803 observed dissipation of the groundwater mound beneath the basin. Transient model calibration  
804 was accomplished using water levels measured in years 2002 – 2013 and the observed seepage  
805 flow rates. The results of that calibration included refined horizontal and vertical hydraulic  
806 conductivities of various materials present within the Tailings Basin pond area, and their specific  
807 yield, and refined recharge rates.

808 The thickness of surficial deposits at the Plant Site is interpreted to vary below and adjacent to  
809 the Tailings Basin. The interpretation relies upon 1) a preconstruction topographic map of the  
810 area, 2) a 2014 geotechnical investigation conducted along the Tailings Basin perimeter  
811 (PolyMet 2015i), and 3) an interpreted map for the top of the underlying bedrock (PolyMet  
812 2015j). This information allows for the model to at least partially represent the presence of  
813 buried stream channels. The variable thickness of surficial deposits interpreted from this data  
814 was incorporated into the Plant Site MODFLOW model.

815 A description of the MODFLOW model and calibration process is provided in the Water  
816 Modeling Data Package, Volume 2 – Plant Site (PolyMet 2015j, Attachment A). The  
817 MODFLOW-calibrated hydraulic parameters for different geologic units and tailings types are  
818 summarized in Table 5.2.2-9 and Table 5.2.2-10.

827 <sup>1</sup> Cells 1E and 2E receive 0 in/yr recharge at the ponds. Outside the pond extents, recharge zones are based on the underlying  
 828 native materials, whether surficial deposits or bedrock outcrops.

829 The calibrated Plant Site MODFLOW model was used in a predictive mode to evaluate  
 830 groundwater conditions associated with the NorthMet Project Proposed Action. These predictive  
 831 simulations evaluated the growth/dissipation of the groundwater mound below the Tailings  
 832 Basin, pond leakage changing over time, the distribution of groundwater flows, and flow changes  
 833 over time, from sub-areas of the Tailings Basin to the northern, northwestern, western, southern,  
 834 and eastern toes of the Tailings Basin. The Plant Site MODFLOW model was not calibrated to  
 835 groundwater baseflow in the Embarrass River, nor was the model used to estimate groundwater  
 836 baseflow.

837

838 All the model calibrations and predictive simulations were carried out considering the following  
 839 time benchmarks:

- 840 • 2002 – Shortly after the LTVSMC operations ended, the groundwater mound beneath the  
 841 Tailings Basin pond, pond leakages and seep flows are at their maximum.
- 842 • 2002 – 2013 - groundwater mound beneath the LTVSMC Tailings Basin pond is dissipating,  
 843 pond leakages and seep flows are decreasing.
- 844 • 2015 – The start of NorthMet Tailings Basin tailings disposal.
- 845 • 2015 to 2035 (mine years 1 to 20) – Slurried NorthMet tailings are deposited in Cells 1E and  
 846 2E, ponds increase in size, elevation of the surface of tailings and ponds systematically  
 847 increase. As new tailings are added to Cells 1E and 2E, groundwater mound beneath the  
 848 Tailings Basin develops causing an increase of seepage at and outside of the Tailings Basin’s  
 849 toes.
- 850 • 2035 (mine year 20) – Disposal of NorthMet tailings stops. Cells 1E and 2E reach the  
 851 maximum height, groundwater mound begins to dissipate.
- 852 • 2075 (mine year 55) – NorthMet reclamation is complete.

853 **Table 5.2.2-11 Results of Steady-State Model Predictive Simulations**

| Time (Mine Year) | Number of FTB Tailings Model Layers | Elevation of Pond 1E (amsl) | Elevation of Pond 2E (amsl) | Total Model Layers <sup>2</sup> | Pond(s) Boundary Condition |
|------------------|-------------------------------------|-----------------------------|-----------------------------|---------------------------------|----------------------------|
| 1                | 2                                   | 1,657.8                     | 1,578.75                    | 4                               | Head                       |
| 7                | 5                                   | 1,657.8                     | 1,651.75                    | 7                               | Head                       |
| 8                | 5                                   | 1,660.25                    | 1,660.25                    | 7                               | Head                       |
| 18               | 6                                   | 1,710.25 <sup>(1)</sup>     | 1,710.25 <sup>(1)</sup>     | 8                               | Head                       |
| 20               | 6                                   | 1,717.25 <sup>(1)</sup>     | 1,717.25 <sup>(1)</sup>     | 8                               | Head                       |
| 55+ (Closure)    | 6                                   | 1,717.25 <sup>(1)</sup>     | 1,717.25 <sup>(1)</sup>     | 8                               | River Cell <sup>(3)</sup>  |

854 <sup>1</sup> Ponds 1E and 2E combine.  
 855 <sup>2</sup> Includes one layer for LTVSMC Tailings and one layer for surficial deposits and bedrock outcrops’ bottom.  
 856 <sup>3</sup> Conductance term in the model’s river cells simulate low hydraulic conductivity (bentonite) layer placed at the bottom of pond  
 857 during reclamation to achieve a leakage rate of about 6.5 in/year.

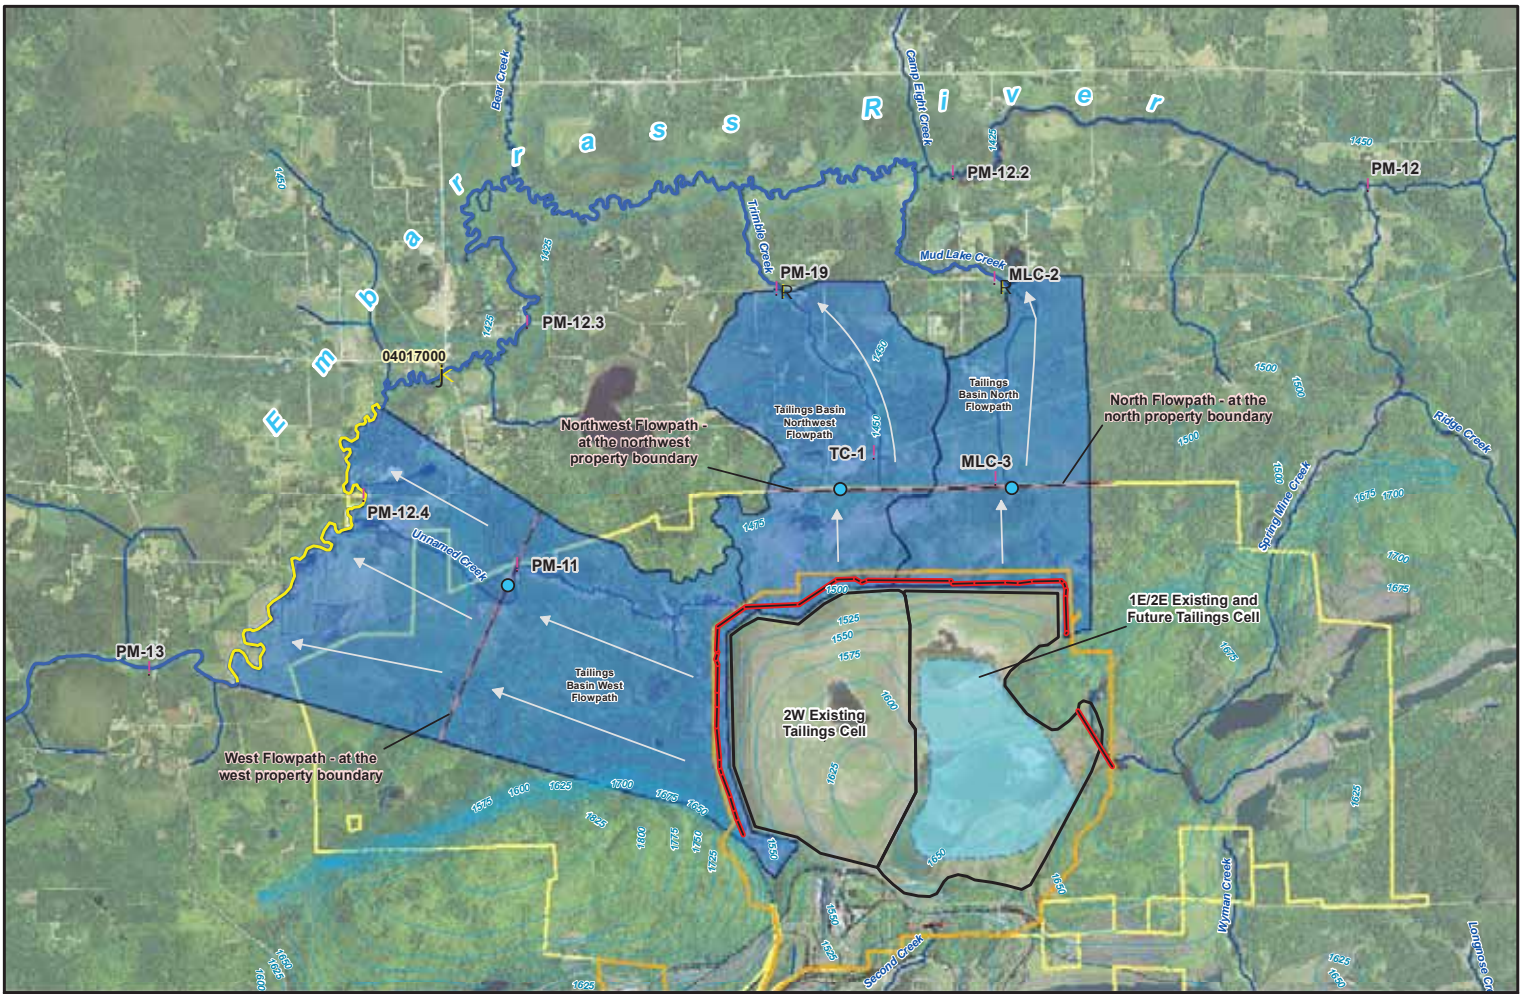

858 Figure 5.2.2-9 was constructed using the results of MODFLOW model simulations. It shows  
 859 surficial groundwater flowpaths that have the potential to transport Tailings Basin-affected  
 860 groundwater from contaminant source areas to the Embarrass River or its tributaries. This figure  
 861 also shows the groundwater evaluation locations (property boundary) used to assess compliance  
 862 with evaluation criteria. The hydrologic characteristics of each surficial flowpath were estimated  
 863 based on a combination of MODFLOW results and site characterization information.  
 864 Deterministic model inputs include length, average width, saturated thickness, hydraulic gradient  
 865 (essentially ground slope), and effective porosity. Uncertain inputs are hydraulic conductivity  
 866 and recharge to aquifer.

DRAFT

872 Summary information for the groundwater flowpaths is provided in Table 5.2.2-12. Using  
873 deterministic inputs and 50<sup>th</sup> percentile probability (P50) values for uncertain inputs (including  
874 hydraulic conductivity and recharge) produces the model-estimated total release rate of flowpath  
875 groundwater into the Embarrass River or its tributaries of approximately 306 gpm for all project  
876 phases (operation, reclamation, and closure).

877 Another set of groundwater models were developed to help estimate the rate of seepage from the  
878 Tailings Basin that may bypass its containment system and that system's capture effectiveness  
879 (see discussion in Section 5.2.2.2.3). Three cross-sectional MODFLOW models simulated  
880 groundwater flow along the three Tailings Basin flowpaths: north, northwest and west. These  
881 flowpaths originate at the Tailings Basin dams and terminate at the Embarrass River. Seepage  
882 from the Tailings Basin to each flowpath was set using results of the Plant Site MODFLOW  
883 model simulations. Each of the three models was developed in three versions, assuming different  
884 thickness of the fractured bedrock: 25, 50 and 100 ft. The fractured bedrock medium is  
885 represented in the model as an "equivalent porous medium". Its hydraulic conductivity was set  
886 equal to 0.14 ft/day, which is a geometric mean value derived from packer tests conducted in  
887 borings near the Tailings Basin (see discussion in Section 4.2.2.3.1).

888 Steady-state model simulations were completed for each flowpath under both operations and  
889 closure conditions. In total, 18 model simulations were completed. Model results indicate that all  
890 seepage from the Tailings Basin would be captured along the north and northwest flowpaths  
891 under all assumptions of the bedrock fractured zone thickness. All the seepage would be  
892 captured also along the west flowpath, except when the thickness of fractured zone is assumed to  
893 be 100 ft. Under this one particular scenario, the model-computed rate of seepage bypassing the  
894 Tailings Basin containment system is the model-predicted 8 gpm for the operations conditions,  
895 and 7 gpm for the closure and long-term maintenance conditions. These results indicate that the  
896 Plant Site GoldSim model assumption (that groundwater seepage is equal to 10 percent of the  
897 aquifer's transmissive capacity bypasses the Tailings Basin Containment System) is  
898 conservative. The modeling shows that the seepage bypassing the system represents no more  
899 than 7 percent of the aquifer's transmissive capacity (see discussion in Section 5.2.2.2.3)(Barr  
900 2015b).

907 **5.2.2.2.2 Surface Water Hydrologic Modeling**

908 This section describes the methods used to model surface water hydrology in the Partridge River  
 909 and Embarrass River watersheds. The Plant Site represents a very small portion of the natural  
 910 (pre-LTVSMC Tailings Basin) Second Creek Watershed and, as a consequence, Second Creek  
 911 was not included in the surface water hydrologic modeling. However, the loss of natural  
 912 watershed flow to the headwaters of Second Creek is addressed as an impact.

913 **Partridge River Watershed**

914 Surface water flow within the Partridge River Watershed was modeled using XP-SWMM, a  
 915 model that estimates stormwater runoff, streamflow, and groundwater-controlled baseflow for a  
 916 network of streams. Input to the model includes sub-drainage delineation, ground conditions,  
 917 stream channel alignments, and a rainfall database. XP-SWMM estimates monthly average  
 918 streamflow rates at different locations along the Partridge River and its important tributaries. To  
 919 improve the results, the model inputs were adjusted so that flow estimates were calibrated to

920 available measured flow rates in the Partridge River at USGS hydrometric station 04015475 in  
 921 the Partridge River above Colby Lake (Table 5.2.2-13). A description of the XP-SWMM model  
 922 for the Mine Site is provided in the Mine Site Water Modeling Data Package (PolyMet 2015j). A  
 923 summary of the model results for seven Partridge River monitoring stations (see Figure 4.2.2-12)  
 924 is provided in Table 5.2.2-13.

925 **Table 5.2.2-13 Mine Site Surface Water Flows for Existing Conditions Based on XP-SWMM**  
 926 **Model Results Adjusted to Match USGS Stream Gaging Data**

928 <sup>1</sup> Average annual 30-day minimum.

929 <sup>2</sup> 10-year values are based on individual model year flow statistics not published in Attachment J of PolyMet 2015m. Values in  
 930 Attachment J represent averages of the 10-year model period.

931 <sup>3</sup> Long-term average.

### 932 **Embarrass River Watershed**

933 Flow characteristics for different reaches of the Embarrass River and selected tributaries were  
 934 estimated by extrapolating flows from USGS gaging station 04017000 (located just downstream  
 935 of PM-12.3) on a unit-area basis. A summary of the flow results for different stations on  
 936 Embarrass River, Mud Lake Creek, Trimble Creek, and Unnamed Creek is provided in Table  
 937 5.2.2-14. Flow contributed by the Tailings Basin seepage is separated from the flows derived  
 938 using the unit-area basis in the table to provide greater clarity of water origins. Tailings Basin  
 939 flows presented in the last column of Table 5.2.2-14 can be added to the annual flow  
 940 characteristics presented in the table to determine the appropriate flow volume.

941 **Table 5.2.2-14 Plant Site Surface Water Flows for Natural Conditions Based on Embarrass River Stream Gaging Results Applied**  
 942 **to Contributing Watersheds and Additional from Tailings Basin Seepage and Flowpath Discharge**

943 Source: Barr 2015i.

944 <sup>1</sup> Based on USGS record applied to watershed area, flow from the Tailings Basin (last column) is in addition to the flow values presented.

945 <sup>2</sup> Long-term average.

946 <sup>3</sup> PM-13 values differ from those in Table 4-5 of the Plant Site Water Modeling Data Package (Barr 2015j), which were based on the historical drainage area of 88.3 mi<sup>2</sup>.

947 <sup>4</sup> 5.77 cfs (2,590 gpm) is the estimated total seepage from the Tailings Basin.

### 948 **5.2.2.2.3 Water Quality Modeling (GoldSim)**

949 GoldSim is a commercially available “systems” model that allows for probabilistic simulations  
950 and was used by PolyMet to simulate time-varying surface water and groundwater quality.  
951 GoldSim was programmed with a suite of algorithms to estimate the release of contaminants  
952 from mine facilities (i.e., “sources”) and their transport to groundwater and surface water  
953 evaluation locations. An overview of the modeling of contaminant release and transport in  
954 GoldSim is provided below. The sections below provide a geochemistry overview of the waste  
955 rock and tailings, and describe the methodology used to estimate contaminant release and  
956 transport at the Mine Site (Partridge River Watershed) and Tailings Basin (Embarrass River  
957 Watershed).

958 Several decisions were made while setting up the GoldSim models. An approach was taken not  
959 to represent in those models the interactions between bedrock groundwater and surficial deposits  
960 groundwater, or between groundwater and wetlands. Instead, an extensive monitoring was  
961 proposed during mine operations and closure to assess if such interactions occur and if they  
962 would raise concerns for permitting agencies. If monitoring data indicate trends toward permit  
963 non-compliance, adaptive mitigation measures would be implemented to prevent or eliminate  
964 what is expected to be a small transport-related bedrock impact relative to surficial flows. See  
965 FEIS Section 5.2.2.3.5 for more information on adaptive mitigation measures and Section  
966 5.2.2.3.6 for more information on monitoring

967 The pH in leachate from the various mining features was not predicted by the GoldSim model.  
968 The permanent storage facilities (Category 1 stockpile and tailings basin) would contain material  
969 that is not expected to produce acidic leachate. The non-acid generating waste was identified  
970 using multi-year kinetic tests (humidity cells) on NorthMet rock samples. Waste rock with 0.12  
971 percent sulfide S or less is the threshold for selecting non-acid generation mine waste and is  
972 supported by long-term humidity cell tests on NorthMet waste (i.e., 42 samples of Category 1  
973 waste rock, with tests now run for over 450 weeks; and 33 humidity cell tests (NorthMet tailings)  
974 run between 84 and 304 weeks (PolyMet 2015q).

975 These tests demonstrate that tailings and Category 1 waste rock materials would not generate  
976 acidic leachate, and acid generation rates decreases over time as sulfide S minerals are depleted.  
977 The NorthMet Project design thus prevents the introduction of acidic leachate to surface water  
978 that could affect fisheries.

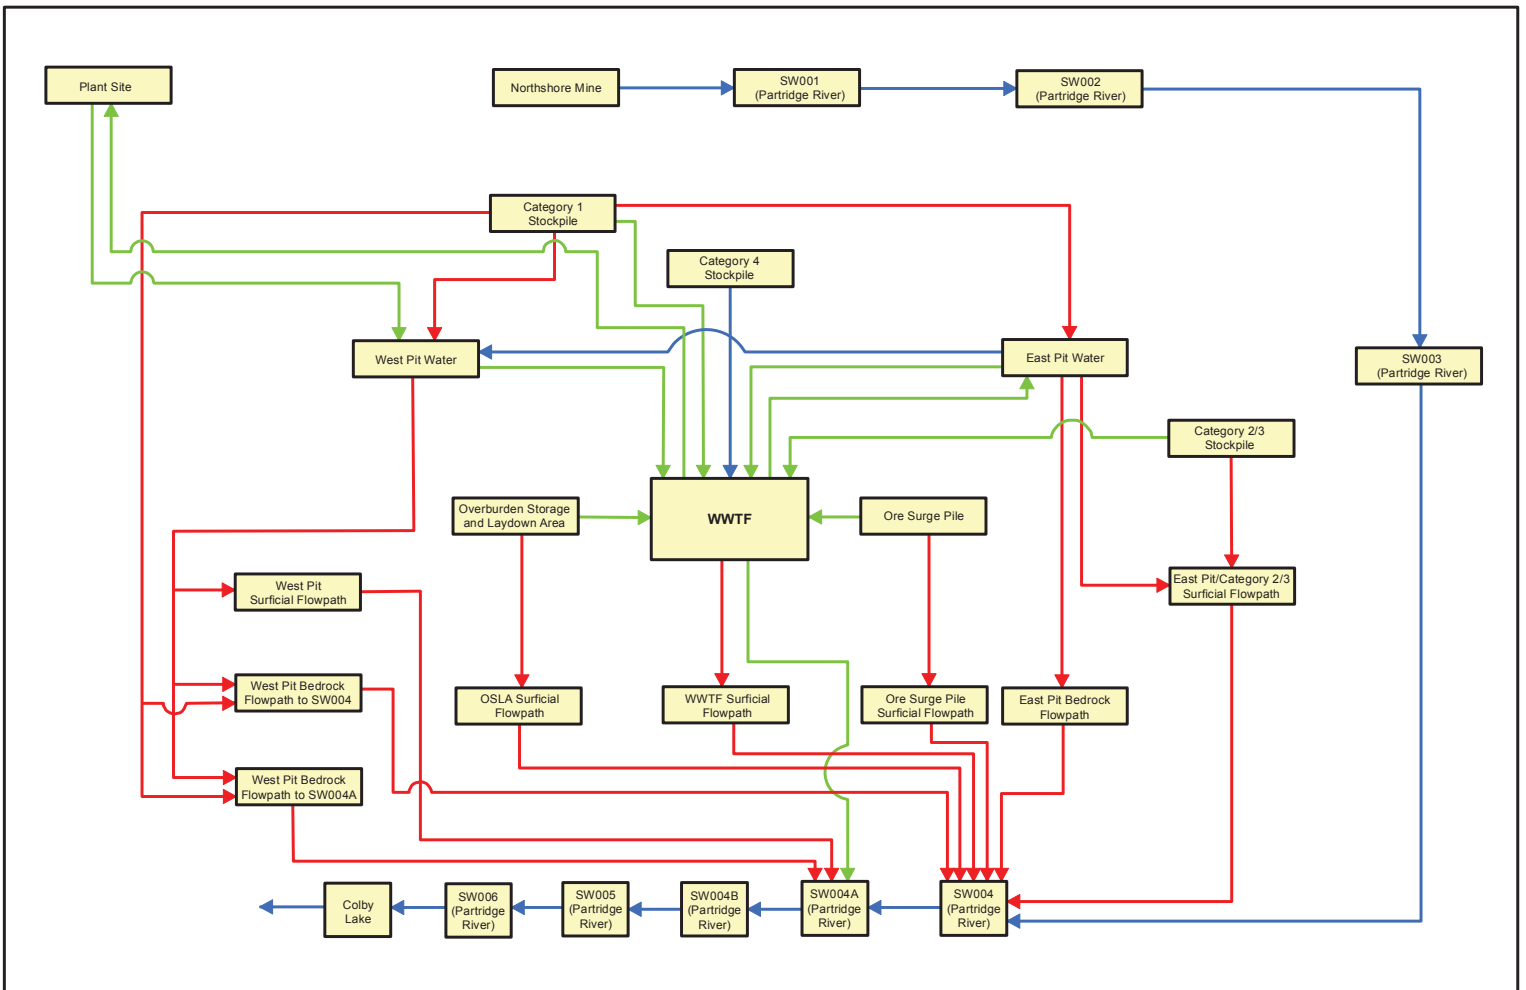

979 Regarding the tailings in particular, the pH values in the tailings humidity cells have been  
980 observed to be stable or increasing (becoming less acidic) between 100 and 300 weeks of  
981 humidity cell testing. However, pH of the tailings in the GoldSim model is not directly based on,  
982 or extrapolated from, the observed pH in the humidity cells. This is because the neutralization  
983 mechanism for NorthMet tailings is understood to be silicate mineral dissolution, not carbonate  
984 weathering.

985 As noted above, the humidity cells provide information on rates of acid producing and acid  
986 neutralizing reactions, which are similar for tailings and Category 1 waste rock due to the similar  
987 sulfur content of these materials. A separate geochemical model was used to estimate long-term  
988 pH resulting from these reactions, including the conservative assumption that CO<sub>2</sub> is elevated  
989 above atmospheric levels throughout the tailings.

990 ***Partridge River Watershed***

991 This section describes the geochemistry of the NorthMet Deposit waste rock and the factors  
992 affecting contaminant release and transport from the various contaminant sources at the Mine  
993 Site. An overall flowchart of the Mine Site GoldSim model is provided as Figure 5.2.2-10.

996 ***NorthMet Waste Rock Geochemistry***

997 The mechanism most responsible for the release of solutes from waste rock is oxidation of  
998 sulfide minerals, primarily pyrrhotite (FeS) in NorthMet Deposit rock. The sulfide-oxidation  
999 reaction produces sulfuric acid, and releases soluble metals (e.g., cobalt, copper, iron, and nickel)  
1000 that were bound in sulfide minerals. Secondary effects include leaching of some metals  
1001 (primarily nickel and chromium) from silicate minerals, particularly where acidic pore waters  
1002 increase silicate solubility. Mine-related blasting and excavation dramatically increases the  
1003 surface area and porosity of the rock, which allows rapid introduction of atmospheric oxygen and  
1004 flushing of solutes by water. Within the pit walls, the blasting effects are limited in terms of  
1005 lateral extent and do not have much effect on solute transport in bedrock. Where the pore water  
1006 pH remains near-neutral, metal mobility can be limited as some constituents released by  
1007 oxidation are removed from solution by adsorption, co-precipitation, or solubility-controlled  
1008 precipitation of secondary minerals. The onset of acidic pore water is also of concern, as these  
1009 conditions cause the rate of sulfide oxidation to increase and the concentration of metals to  
1010 increase as precipitates dissolves. However, when oxidation is fast enough to overcome acid-  
1011 neutralization reactions and the pore water becomes acidic, the solubility of most metals  
1012 increases, previously precipitated metals can re-dissolve, and the rate of sulfide-mineral  
1013 oxidation increases.

1014 Key environmental characteristics of the NorthMet waste rock include the following:

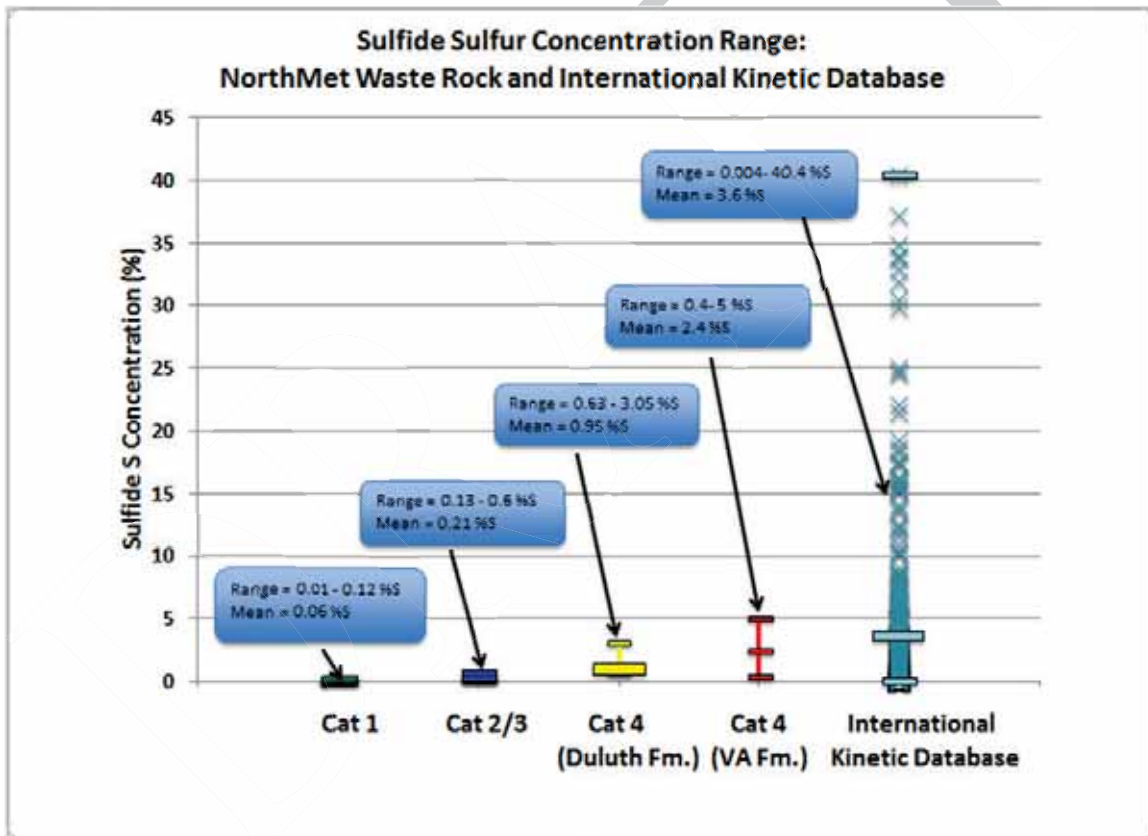

- 1015 • Most of the waste rock and pit wall rock would contain some sulfide S, mainly as mineral  
1016 pyrrhotite, which can produce acid leachate and soluble metals when it oxidizes;
- 1017 • There are essentially no acid-neutralizing carbonate minerals in NorthMet waste rock, but  
1018 silicate minerals—including plagioclase feldspar ( $[\text{Na,Ca}][\text{Si,Al}]_4\text{O}_8$ ), olivine  
1019 ( $[\text{Mg,Fe}]_2\text{SiO}_4$ ), and pyroxenes (e.g., diopside,  $\text{MgCaSi}_2\text{O}_6$ )—neutralize some acid, which  
1020 would delay acid onset in some rock and would prevent entirely the onset of acidic  
1021 conditions in rock with less than 0.12 percent sulfur;
- 1022 • In rock with less than 0.12 percent sulfur (S), the oxidation rate is slow enough that all acid  
1023 produced during weathering would be completely neutralized by reaction with silicate  
1024 minerals, so this low-sulfur rock (classified at Category 1 waste rock in the NorthMet Project  
1025 Proposed Action) is predicted to never generate acidic leachate;
- 1026 • Sulfide-bearing rock from the NorthMet Project Proposed Action may oxidize for several  
1027 years before producing acidic leachate;
- 1028 • The rate of sulfide mineral oxidation in excavated NorthMet waste rock would be  
1029 approximately proportional to the total sulfur content of the material, and the rate could  
1030 increase several fold if the pore water were to become acidic;
- 1031 • Chemical reactions, including mineral precipitation and surface adsorption, would limit the  
1032 concentration of many contaminants in non-acidic waste-rock effluent and thus would reduce  
1033 the rate at which contaminants were released; and
- 1034 • If the pore-water pH were to shift from neutral to acidic, then the rate of sulfide mineral  
1035 oxidation and associated release of some metal cations (e.g., nickel and copper) would  
1036 increase dramatically (e.g., average increase in oxidation upon onset of acidic conditions is a  
1037 factor of 8.2 relative to non-acidic conditions [Table 8-4 in PolyMet 2015q]).

1038 • The environmental classification of NorthMet waste rock is based primarily on the sulfur  
1039 concentration, and the distribution of sulfur through the deposit is based on spatial  
1040 interpolation between 24,861 analyses of rock samples collected as part of the exploration  
1041 drilling (SRK 2007a). Rates of oxidation and contaminant release are based on 78 “humidity  
1042 cell” tests, which measured solute concentrations in leachate as rocks were subjected to over  
1043 4 years of simulated weathering cycles. These include tests on 75 samples of Category 1  
1044 through Category 4 waste rock, and 3 samples of ore from the NorthMet Deposit (PolyMet  
1045 2015q, Attachment C, Table 2). In addition, splits of 7 waste rock samples were subjected to  
1046 duplicate humidity cell tests, but these were stopped in 2009 when results indicated good  
1047 reproducibility in trends of reaction rates and solute release. Estimates for changes in  
1048 oxidation rates and solute release during long-term weathering were supplemented with 17  
1049 independent tests conducted by the MDNR on rock from a similar proximal deposit (the  
1050 Dunka Blast Hole). These tests on Dunka rock used smaller fragment size rock (termed  
1051 “MDNR Reactors”), and results were used to refine estimates of oxidation-rate changes  
1052 during weathering (PolyMet 2015q, Attachment A, Table 3). Total leachable metal  
1053 concentrations are based on 61 analyses of metals extracted from waste rock by acidic  
1054 digestions (SRK 2007b). For constituents that are assumed to be released in proportion to  
1055 dissolution of another constituent (e.g., copper and zinc were always modeled as being  
1056 released in proportion to sulfide sulfur oxidation), the concentration ratios were estimated  
1057 using the average total constituent concentrations measured in all available assayed samples  
1058 of either Category 1, Category 2/3, or Category 4 waste rock; ore, or Category 4 Virginia  
1059 Formation (i.e., approximately 18,800 total whole-rock analyses, see Large Table 2 and  
1060 Section 8.1.2.3 in PolyMet 2015q). Finally, the concentration of metals in mineral phases  
1061 was based on electron microprobe analysis, which measured the concentration of metals in  
1062 630 individual mineral grains (74 oxides, 268 sulfides, and 288 silicates [SRK 2007b; SRK  
1063 2007c]).

1064 These environmental characteristics have been used to classify NorthMet waste rock into the  
1065 following four environmental categories (PolyMet 2015q, Figure 4-8 to 4-10):

- 1066 • Category 1: Sulfide S range is less than or equal to 0.12 percent, and would not produce  
1067 acidic leachate.
- 1068 • Category 2: Sulfide S range is greater than 0.12 percent and less than or equal to 0.31  
1069 percent, and could produce acidic leachate if allowed to weather for several years.
- 1070 • Category 3: Sulfide S range is greater than 0.31 percent and less than or equal to 0.60  
1071 percent, and could produce acidic leachate if allowed to weather for several years.
  - 1072 – Categories 2 and 3 are combined to produce the Category 2/3 stockpile with sulfur  
1073 content greater than 0.12 percent and less than or equal to 0.60 percent, could produce  
1074 acidic leachate if allowed to weather for several years.
- 1075 • Category 4 (Duluth Complex): Sulfide S range is greater than 0.60 percent, and would  
1076 produce acidic leachate if allowed to weather for several years.
- 1077 • Category 4 (Virginia formation): Sulfide S range is from 0.4 to 5.0 percent, and would  
1078 produce acidic leachate immediately upon weathering.

- 1079 • Ore would behave similar to Category 4 Duluth complex waste rock, but other than residual  
1080 ore in pit wall rock, would not remain on the surface for any extended periods. Ore would  
1081 move in and out of the Ore Surge Pile (a lined facility) throughout operations.
- 1082 • The sulfide S concentration of the NorthMet waste rock is relatively low compared to many  
1083 other mines with sulfide-bearing rock around the world. Data from the International Kinetic  
1084 Database, which includes humidity cell test results from 71 mines, shows sulfide S  
1085 concentrations ranging as high as 40 percent, with an average of 3.6 percent (see Figure  
1086 5.2.2-11) (Mine Site Drainage Assessment Group 2013). In comparison, most (70 percent) of  
1087 the NorthMet waste rock would be the low-sulfur, non-acid-generating Category 1 material  
1088 (i.e., average sulfur would equal 0.06 percent, and range from 0.01 to 0.12 percent). The only  
1089 NorthMet waste rock that would contain greater on average than 1 percent sulfide is the  
1090 Virginia Formation waste rock, which has an average sulfide S concentration of 2.43 percent,  
1091 but it would only comprise about 1.8 percent of the total NorthMet Deposit waste rock. It  
1092 should be noted, however, that not all sulfide S has the same potential for release.

1093  
1094 **Figure 5.2.2-11 Comparison of NorthMet Project Waste Rock Sulfide Sulfur**  
1095 **Concentrations with Other Mines**

1096 **Constituent Release from Waste Rock**

1097 The GoldSim model simulates constituent release from waste rock by applying scaling factors to  
1098 laboratory tests to provide quantitative estimates of loading that are then combined with  
1099 hydrologic estimates to predict solute concentrations. The predictive models assume that the

1100 entire mass of waste rock in each of the stockpiles is oxygenated and is thus capable of reacting  
1101 with air (some waste rock stockpiles can have zones with lower than atmospheric oxygen  
1102 concentrations, so this assumption tends toward producing higher rates of pollutant release than  
1103 may exist). Field oxidation rates are then estimated by scaling from lab rates to account for  
1104 effects of temperature (oxidation is slower at the lower temperatures), differences in pH  
1105 (potential acidification), fragment size (waste rock fragments would be larger than rock tested in  
1106 the lab, and would thus react more slowly), pore-water pH (oxidation rates in NorthMet rock are  
1107 assumed to increase when pore water becomes acidic), and the fraction of rock flushed by  
1108 percolating water (some fraction of waste rock under field conditions is hydraulically isolated).

1109 For the Category 1 waste rock (i.e., the waste rock with the lowest sulfide sulfur content, but  
1110 which would remain stored permanently on the surface after closure), instead of using lab tests,  
1111 the rate of oxidation and constituent release in the field was estimated from lab release rates that  
1112 were scaled using the results of studies of seepage release measured in Dunka Mine rock, which  
1113 is a nearby source of waste rock with similar chemical composition that has been monitored  
1114 under field conditions. The rate of contaminant release is modeled as a load rate (e.g., mg  
1115 contaminant per month), estimated as the product of the mass of the waste (kg waste) and the  
1116 rate of contaminants are released (mg contaminant per kg waste per month).

1117 This transport simulation assumes that solutes released by oxidation can dissolve when contacted  
1118 by rain and snowmelt percolating through the waste rock, and dissolved constituents are flushed  
1119 immediately through the rock. Where the concentration of contaminants in percolating water is  
1120 not limited, the entire load released over a time step can dissolve in any available water. In this  
1121 case, decreasing the water flow would still collect the entire contaminant load, producing a more  
1122 concentrated leachate, but the same solute load rate. In most NorthMet waste rock, however,  
1123 contaminant concentrations are limited by “concentration caps”—empirical upper-concentration  
1124 values. Concentration caps are estimated in part using measured behavior of laboratory tests on  
1125 waste rock from the NorthMet Deposit, but rely heavily on concentrations of dissolved  
1126 constituents measured in effluent from field-scale facilities of similar waste rock (including rock  
1127 from the Amax and Dunka mine deposits in Minnesota, and the Whistle and Vangorda mines in  
1128 Canada (PolyMet 2015q). When solute concentrations are capped in modeling then solute loads  
1129 are proportional to flow rate, so that reduced flow rates would result in a proportional reduction  
1130 in solute load to the environment. The Category 1 Stockpile is the clearest example of this effect,  
1131 because solutes would be released over time by oxidation, but the pore water would maintain at a  
1132 near-neutral pH, where many solutes have limited solubility. The effect of concentration caps in  
1133 the Category 1 Stockpile would be further enhanced in closure and long-term maintenance, when  
1134 a proposed geomembrane cover would reduce infiltration, producing a proportional reduction in  
1135 the load rate of those solutes at their pore-water concentration caps. The GoldSim model tracks  
1136 the total mass of these capped solutes, so that constituents removed from solution to meet  
1137 concentration caps are retained in the model for later release when solute concentrations would  
1138 otherwise decrease below the concentration caps. In contrast, for the more acid-generating  
1139 materials, including the ore and Category 4 waste rock, concentration caps are much higher or  
1140 may not attain the cap value, and load to the environment is more closely related to the rate of  
1141 solute release regardless of water flow rate through the waste.

1142 Detailed descriptions of the assumptions and algorithms used to estimate solute release from  
1143 mine-related facilities is provided in the Waste Characterization Data Package (PolyMet 2015q).

1144 ***Contaminant Transport in Groundwater from Waste Rock***

1145 At the Mine Site contaminated groundwater would seep from the East and West Pits along the  
1146 surficial aquifer and bedrock groundwater flowpaths. Such seepage would become  
1147 environmentally important when water levels in the pits would rise above the base of the  
1148 surficial aquifer. In addition, leakage from the Category 2/3 Stockpile, Ore Surge Pile,  
1149 Overburden Storage and Laydown Area, and WWTP Ponds would also enter groundwater  
1150 flowpaths within the surficial aquifer. Finally, water by-passing the Category 1 Stockpile's  
1151 containment system at a small rate would enter the bedrock groundwater flowpath too.  
1152 Contaminated water would migrate along the groundwater flowpaths to the property boundary  
1153 and, ultimately, to the Partridge River.

1154 At the Mine Site, five surficial groundwater flowpaths were identified, as described previously.  
1155 Groundwater flow rates and flow directions in the GoldSim model were taken directly from the  
1156 MODFLOW results or were programmed to be consistent with the MODFLOW results. Time-  
1157 varying surface water flow rates were taken either from the XP-SWMM results or were  
1158 estimated from stream gaging data.

1159 Site characterization data that indicate the bulk hydraulic conductivity of upper bedrock is two to  
1160 three orders-of-magnitude lower than the hydraulic conductivity of the surficial aquifer. Thus,  
1161 groundwater flow and transport at the Mine Site are dominated by the hydraulics of the surficial  
1162 aquifer. Bedrock plays a negligible role in transporting site-derived contaminants to the Partridge  
1163 River.

1164 Still, contaminated waters entering the groundwater bedrock flowpaths were also programmed  
1165 into GoldSim. However, due to the very low bulk hydraulic conductivity of bedrock,  
1166 groundwater flow rates in these flowpaths were not large enough to affect water quality at the  
1167 groundwater and surface water evaluation locations.

1168 Solutes, while migrating along the groundwater flowpaths (either at the Mine Site or Plant Site),  
1169 would be subject to attenuating processes reducing their concentrations. Attenuating processes  
1170 slow solute transport by adsorption or sorption onto mineral surfaces in the aquifer. Table 5.2.2-  
1171 15 defines fate and transport mechanism terminology in this FEIS.

1172 Among those attenuating processes would be:

- 1173 • Mechanical dispersion, which would spread out the leading front of the contaminant plume;  
1174 and
- 1175 • Mixing with meteoric water recharging the aquifer.

1176 In addition, over time the concentration of contaminants leaking from the sources would  
1177 decrease, as the sources would gradually degrade, diminishing in strength. Those, and other  
1178 processes would result in contaminant concentrations decreasing with time and distance from the  
1179 source.

1180 Given these attenuating processes, contaminant transport to evaluation locations can be described  
1181 by noting the time the contaminant arrives at that point and the time when the contaminant  
1182 concentration reaches its peak.

1184 **Table 5.2.2-15 Definition of Fate and Transport Mechanism Terminology used in this FEIS**

| <b>Term</b>                             | <b>Definition</b>                                                                                                                                                                                                                       |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Adsorption (Sorption)                   | The process by which ions of a solute are attracted to and accumulate at the interface between a solid phase and an aqueous phase.                                                                                                      |
| Attenuation                             | In groundwater transport this refers to mechanisms that reduce a solute's concentration or rate of migration in groundwater, such as adsorption, degradation, dispersion or dilution.                                                   |
| Constituent-loading                     | The rate at which a constituent is added or released (mass per unit time).                                                                                                                                                              |
| Groundwater Plume                       | The spread of contaminated groundwater downgradient of the source.                                                                                                                                                                      |
| Mechanical Dispersion                   | The process whereby solutes spread out because of differences in the groundwater movement's velocity at the pore level and within different sediment/rock strata.                                                                       |
| Partition Coefficient (K <sub>d</sub> ) | The ratio of the sorbed metal concentration (expressed in milligrams of chemical per kilograms of sorbing material) to the dissolved chemical concentration (expressed in milligrams of chemical per liter of solution) at equilibrium. |

1185 Some of the constituents modeled as un-attenuated in the GoldSim model may in fact be subject  
 1186 to some attenuation due to adsorption onto surfaces in the surficial and bedrock aquifer. The  
 1187 peak concentrations of these solutes would arrive at the evaluation locations later than estimated  
 1188 in the GoldSim model, and the peak concentrations of such late-arriving solutes would be lower  
 1189 than the concentrations estimated under the assumption in the FEIS of un-attenuated transport.

1190 In the NorthMet Project Proposed Action GoldSim water quality model, four solutes are assumed  
 1191 to be attenuated by adsorption in the aquifer: arsenic, antimony, copper, and nickel. Definition of  
 1192 the metal partition coefficient (K<sub>d</sub>) controlling this process is provided in Table 5.2.2-15. Higher  
 1193 K<sub>d</sub> values represent higher sorption capacity of the aquifer, and thus slower apparent migration of  
 1194 a solute in groundwater.

1195 Literature values are available for estimating metal partition coefficients (USEPA 1996; 2005).  
 1196 These values have been adopted by MPCA as part of its risk-based guidance for State Superfund  
 1197 and VIC program sites (MPCA 1998). In addition, PolyMet conducted site-specific sorption  
 1198 testing on soil samples collected from the most permeable zone of two borings at the Mine Site.  
 1199 Batch sorption tests were conducted in the laboratory generally using standard ASTM procedures  
 1200 (Barr 2009h). Table 5.2.2-16 presents the USEPA literature values, the results of the site-specific  
 1201 sorption testing, and the K<sub>d</sub> values accepted for use in groundwater modeling. The lower K<sub>d</sub>  
 1202 values for antimony reflect greater uncertainty regarding antimony sorption in the scientific  
 1203 literature and site-specific testing.

1205 **Table 5.2.2-16 Comparison of Site-specific and Literature Sorption Values at the**  
 1206 **Mine Site**

| Parameter | USEPA $K_d$               | Site-specific Sorption ( $K_d$ ) Values <sup>1</sup> |                     |                | $K_d$ used in GoldSim Model  | Associated Retardation Factor used in GoldSim Model <sup>2</sup> |
|-----------|---------------------------|------------------------------------------------------|---------------------|----------------|------------------------------|------------------------------------------------------------------|
|           | Value Used in DEIS (L/kg) | Boring RS-22 (L/kg)                                  | Boring RS-24 (L/kg) | Average (L/kg) |                              |                                                                  |
| Antimony  | 45                        | 1.6                                                  | 22                  | 12             | 1.3, 1.6, 6.1 <sup>(3)</sup> | 7.5, 9.0, 31 <sup>(3)</sup>                                      |
| Arsenic   | 25                        | >52                                                  | 590                 | ~320           | 25 <sup>(4)</sup>            | 126 <sup>(4)</sup>                                               |
| Copper    | 22                        | 1,047                                                | 463                 | 755            | 22 <sup>(4)</sup>            | 111 <sup>(4)</sup>                                               |
| Nickel    | 16                        | 73                                                   | 40                  | 56             | 16 <sup>(4)</sup>            | 81 <sup>(4)</sup>                                                |

1207 <sup>1</sup> Modified from: Barr 2009h.

1208 <sup>2</sup> Assuming porosity of 0.3 and dry bulk density of 1,500 kg/m<sup>3</sup>.

1209 <sup>3</sup> Uncertain input with triangular distribution. Minimum, mode, and maximum values, respectively.

1210 <sup>4</sup> Deterministic value.

1211 The attenuation effect resulting from sorption is significant enough that arsenic, copper, and  
 1212 nickel are not predicted to travel from source areas to any groundwater evaluation locations or  
 1213 the Partridge River within the 200-year model simulation period (PolyMet 2014v). Analytical  
 1214 calculations suggest that the travel times for these solutes would be on the order of thousands of  
 1215 years.

1216 Antimony, which is modeled with lower  $K_d$  values, reaches the groundwater evaluation location  
 1217 in the East Pit Category 2/3 Surficial Flowpath at about 23 years, but the predicted concentration  
 1218 increase is very small. Model results indicate that the 90th percentile concentration of antimony  
 1219 for the West Pit Surficial Flowpath at Dunka Road peaks at the 164<sup>th</sup> year of model simulation  
 1220 and is below the evaluation criterion of 6.0 µg/L. That concentration would be reduced when the  
 1221 peak arrives at the property boundary due to attenuation processes.

1222 The seepage capture efficiency at the Category 1 Stockpile of the surrounding containment  
 1223 system, West Pit, and East Pit was assessed using a separate three-dimensional MODFLOW  
 1224 model (PolyMet 2015h). The model predicted that during mine operations, when portions of the  
 1225 stockpile would be uncovered, some uncollected affected seepage could migrate north of the  
 1226 Category 1 Stockpile at a flow rate of less than or equal to 0.2 gpm, and this groundwater could  
 1227 be released to bedrock and/or surficial deposits adjacent to the stockpile. Given that this small  
 1228 flow would be distributed over the 2 mile length of the stockpile, it would be unlikely to cause  
 1229 any measureable impact to groundwater or surface water. After operations, when the stockpile is  
 1230 fully covered, the uncollected north seepage from the stockpile is predicted to be less than equal  
 1231 to 0.01 gpm. As such, a north surficial groundwater flowpath was not included in the GoldSim  
 1232 model. During operations and closure, groundwater monitoring would be conducted at three  
 1233 locations adjacent to the north side of the Category 1 Stockpile, and if NorthMet Project  
 1234 Proposed Action effects on groundwater were greater than predicted, mitigation measures would  
 1235 be implemented.

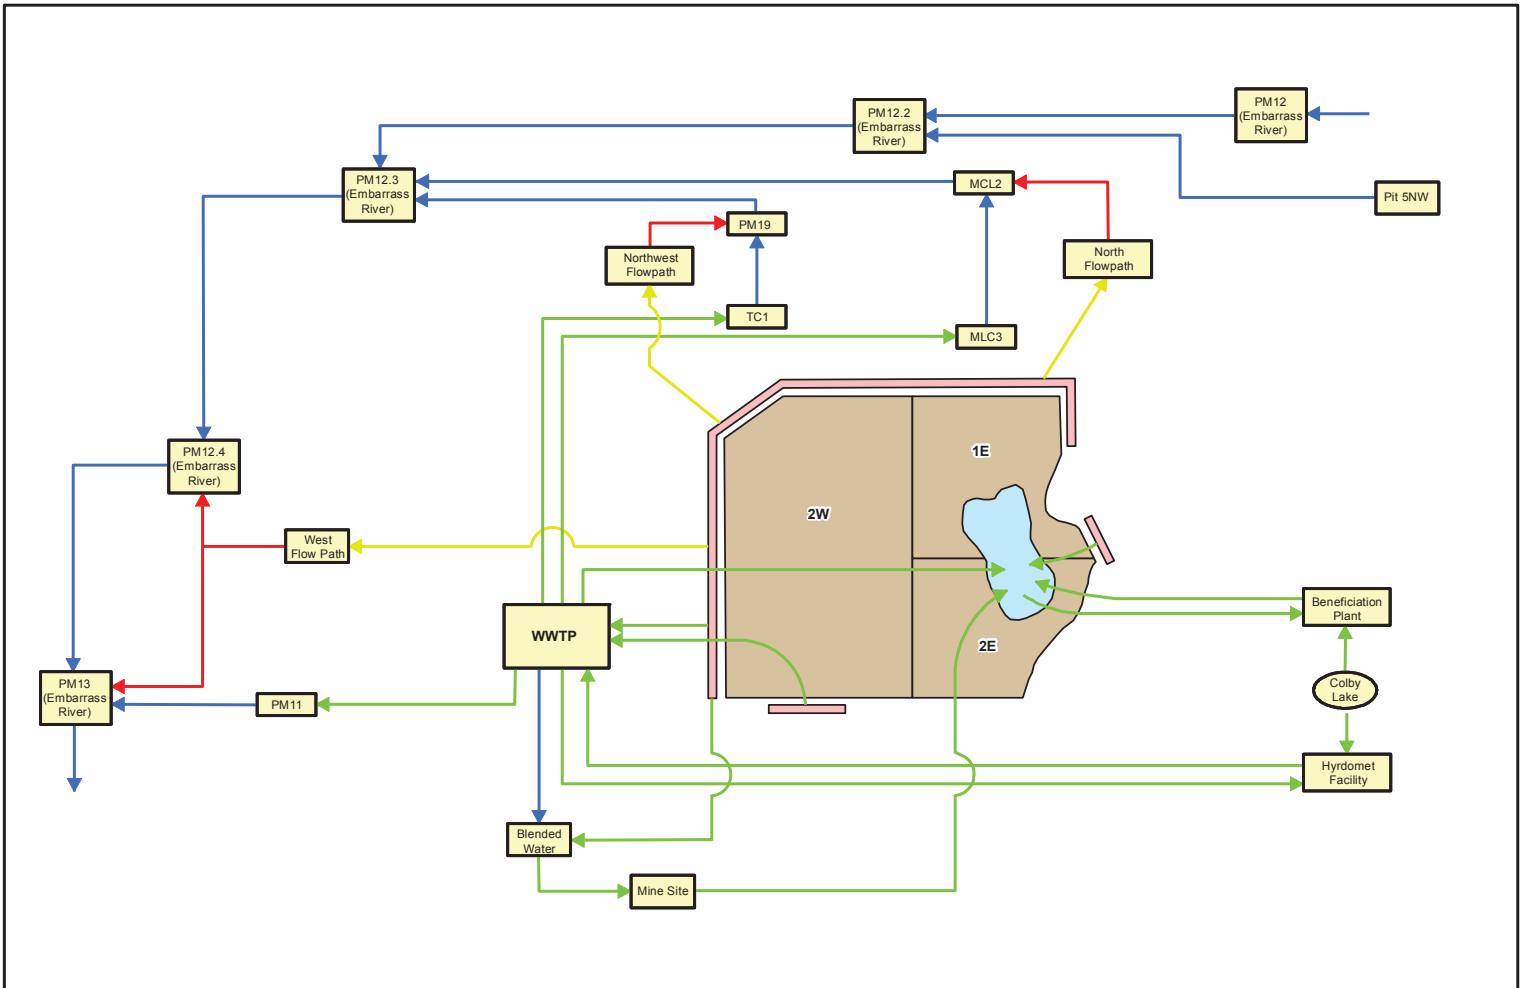

1236 **Embarrass River Watershed**

1237 GoldSim has been programmed to incorporate surface water flow, contaminant release from  
 1238 tailings, groundwater transport of bypass from the containment system to the Embarrass River  
 1239 system, water transfers between mine facilities, and discharge of WWTP-treated effluent to the  
 1240 Embarrass River tributaries for flow augmentation. An overview flowchart of the GoldSim

1241 model is provided as Figure 5.2.2-12. The sources identified above are the only NorthMet  
1242 Project Proposed Action containment sources considered. The Hydrometallurgical Residue  
1243 Facility, due to its engineering, is not expected to be a contaminant source. This section describes  
1244 the geochemistry of the NorthMet Project Proposed Action tailings and the factors affecting  
1245 contaminant release and transport from the Tailings Basin.

DRAFT

1249 ***NorthMet Tailings Geochemistry***

1250 Figure 5.2.2-13 is a base map of the Plant Site showing the tailings facilities that have the  
1251 potential to be contaminant sources to groundwater and surface water, including Cell 2W, Cell  
1252 1E/2E, and a Tailings Basin pond of varying surface area that would continue to exist on top of  
1253 Cell 1E/2E. The current tailings in Cell 2W and Cell 1E/2E are referred to as LTVSMC tailings  
1254 and new tailings that would be generated by the NorthMet Project Proposed Action are referred  
1255 to as NorthMet tailings.

1256 The NorthMet Project Proposed Action tailings are predicted to have less than 0.12 percent  
1257 sulfur, which kinetic tests demonstrate is low enough that it would never produce acidic leachate  
1258 (PolyMet 2015q). The bulk sulfide flotation process used in handling the ore would maintain the  
1259 sulfide S below 0.12 percent in the tailings discharged to the Tailings Basin.

1260 The assumptions regarding the environmental behavior of the tailings are based on 21 humidity  
1261 cells (14 for coarse tailings and seven for fine tailings) generated in the pilot-plant processing  
1262 tests conducted to refine the metal recovery process. The tailings samples were analyzed to  
1263 determine concentrations of total metals, acid-generating sulfur, and acid-neutralizing carbonate  
1264 carbon, and were then subjected to humidity cell testing (PolyMet 2015q Attachment F, Table 1).  
1265 The oxidation rates in tailings are based on multi-year humidity cell tests (individual test  
1266 durations ranged from 74 to 271 weeks), where solute release rates were used to extrapolate back  
1267 to estimate the initial oxidation rate in the sample before any of the sulfide sulfur was depleted.  
1268 In the final waste characterization report used to support this FEIS, the total duration of the  
1269 humidity cell tests ranged from 113 to 311 weeks (PolyMet 2015q).

1270 Tailings samples subjected to humidity cell tests included a range of sulfide S concentrations  
1271 (0.06 to 0.14 percent S) and size fractions selected to represent the ranges expected under various  
1272 depositional environments in the Tailings Basin (PolyMet 2015q, Attachment C, Table 4):

- 1273 • Coarse (greater than 0.150 mm [“+100 mesh”]),
- 1274 • Median (less than 0.150 mm and greater than 0.076 mm [“-100+200 mesh”]), and
- 1275 • Fine (less than 0.076 mm [“-200 mesh”]).

1276 The NorthMet Tailings Basin dam would be constructed with coarse tailings from the LTVSMC  
1277 facility, which has a size distribution that is approximately 87 percent greater than 0.076 mm  
1278 (PolyMet 2014x, Table 4-3 Summary of Index Properties of LTVSMC coarse tailings).

1279 Results of the humidity cell tests on pilot-plant tailings had similar results to Category 1 waste  
1280 rock, with sulfate release rates increasing roughly in proportion to total sulfur, and declining  
1281 sulfate production over time as the sulfide minerals are consumed (PolyMet 2015q Attachment  
1282 F, Figure 5). The GoldSim model estimates the moisture content in the tailings and dams  
1283 materials through time, and uses this to estimate the quantity of tailings oxidizing, the oxidation  
1284 rate of sulfide minerals, and the associated release of solutes.

1285 The predicted concentration of contaminants in tailings seepage is limited by “concentration  
1286 caps.” Concentration caps are empirical upper-concentration values based primarily on measured  
1287 effluent from field-scale waste rock facilities that are chemically similar to the NorthMet  
1288 Deposit. For solutes modeled at their concentration caps, the load leaving the tailings would be  
1289 proportional to water flow; but the GoldSim model tracks the mass of contaminants stored in the

1290 tailings, so reductions in predicted seepage loading due to concentration cap limits are balanced  
1291 by a longer total duration of contaminant release.

1292 The pH of effluent from oxidizing tailings ranges between 6 and approximately 8.3, though the  
1293 pH in effluent from tailings with sulfur similar to that of the Tailings Basin (sulfur approximately  
1294 0.12 percent) is generally above 7 (PolyMet 2015q). Humidity cell test results indicate that under  
1295 oxygenated conditions at room temperature, tailings material oxidation releases about 5 mg SO<sub>4</sub>  
1296 per kg tailings per week (see Tables 1-13 and 1-14 in PolyMet 2015j), and the range in most tests  
1297 is between approximately 2 and 8 mg SO<sub>4</sub> per kg tailings per week (PolyMet 2015q, Attachment  
1298 F). In those samples where the oxidation rate was high enough to reduce pH, most showed an  
1299 associated increase in the concentrations of some metal cations, such as nickel. By the end of the  
1300 longest humidity cell tests (420 weeks), much of the original sulfide S in the tailings (e.g., ~20 to  
1301 40 percent) had been oxidized, and the reacted sulfur leached out as soluble sulfate.

1302 These multi-year humidity cell tests on NorthMet tailings yield two important results. First, the  
1303 rate at which sulfide minerals oxidize is approximately proportional to the concentration of  
1304 sulfide remaining in the sample, so that the oxidation rate (and thus the acid-production rate)  
1305 decreases over time as the sulfide S is consumed (PolyMet 2015q, Attachment C [2015 Update  
1306 on Kinetic Test Data], Attachment A [Graphs]). Second, at some time between approximately  
1307 100 and 200 weeks after starting the kinetic tests, the pH of the effluents reaches a minimum,  
1308 and thereafter the pH becomes steady or increases slightly (becomes less acidic) (PolyMet  
1309 2015q, Attachment F Update on Tailings Humidity Cell Test Data). These long-term weathering  
1310 tests demonstrate empirically that the NorthMet tailings would oxidize without ever producing  
1311 acidic leachate. The GoldSim model used to estimate solute release from tailings does not  
1312 include a prediction of specific pH over time in the tailings effluent. However, the concentration  
1313 caps of some metals were simulated as being dependent on pH. Thus, the GoldSim model for the  
1314 tailings incorporates an estimated range for pH, but not a temporal trend. Based on the measured  
1315 pH in multi-year weathering tests on tailings (and also results from tests on Category 1 waste  
1316 rock, which also contains <0.12% sulfide S), and incorporating a small correction for the  
1317 possibility that CO<sub>2</sub> pressure may be higher in the tailings than in the atmosphere, the PolyMet  
1318 tailings effluent over the long-term (i.e., 50-100 years, and beyond) should range between pH  
1319 values of ~7.1 and 7.7, and the general trend should be for pH values to increase from the low  
1320 end to the high end of this pH range with increasing time (PolyMet 2015q, Figure 8-18 Modeled  
1321 Category 1 Waste Rock pH).

1322 Finally, acid base accounting and humidity cell tests were also conducted on the existing  
1323 LTVSMC tailings, which would underlie the NorthMet Project Proposed Action tailings. These  
1324 were produced from a separate deposit and contain enough carbonate minerals to be net-  
1325 neutralizing so they have a low risk of producing acidic leachate. Concentrations of specific  
1326 carbonate minerals in the LTVSMC tailings, based on X-ray diffraction analyses on 16 samples,  
1327 included from 0.1 to 1 percent calcite (CaCO<sub>3</sub>), from 2 to 7 percent ankerite  
1328 (Ca(Fe<sup>2+</sup>,Mg,Mn)(CO<sub>3</sub>)<sub>2</sub>), between 2 and 8 percent siderite (FeCO<sub>3</sub>; Table 5-1 in SRK 2007c).

1329 Leachate from humidity cell tests produced stable pH (between 7.3 and 8.1) and stable release  
1330 rates for the primary constituents of concern, which were used as the basis of predicting solute  
1331 release under field conditions (PolyMet 2015q, Attachment F). The LTVSMC tailings have been  
1332 in place for years, so the model estimates for effluent release from the LTVSMC tailings are  
1333 constrained by measured solute concentrations in the receiving waters (e.g., wells GW-001 and  
1334 GW-012 for release to the north, GW-006 for release to the northwest, and GW-007 for release

1335 to the west; Figure 4.2.2-16). The initial model extrapolation of laboratory constituent-release  
1336 rates measured on LTVSMC tailings overestimated the concentrations of sulfate and several  
1337 other constituents relative to field measurements, even when the release rates were adjusted for  
1338 scale factors (primarily oxygen concentration in pore gas, and temperature; PolyMet 2015q).  
1339 This discrepancy was rectified in part by applying an empirical “correction factor,” which  
1340 reduced the modeled sulfate release from the LTVSMC tailings by factors of approximately 2 to  
1341 3 (see Figures 10-4 and 10-5 in PolyMet 2015q). Even after reducing sulfate release rates to  
1342 match observed concentrations downgradient of the Tailings Basin, the water quality model  
1343 overestimated the concentrations of several solutes, including many metals. In response, the  
1344 LTVSMC tailings model was further adjusted by applying empirical “calibration factors” to all  
1345 remaining constituents that were also overestimated relative to observed concentrations. These  
1346 calibration factors (listed in PolyMet 2015j, Attachment B, Table 1-21) reduced the  
1347 concentration of 11 constituents by greater than 90 percent relative to the uncorrected model  
1348 estimates, including reduction by greater than 99 percent the predicted concentration of seven  
1349 constituents. The fact that measured solute release rates need to be corrected down an order of  
1350 magnitude for the model to match observed constituent concentrations in down-gradient waters  
1351 suggests that there are additional attenuation effects that are not completely accounted for in the  
1352 NorthMet water quality model.

1353 Pathways within the tailings, from the surface and through the unsaturated and saturated tailings  
1354 areas, were estimated using groundwater flow models, and these pathways were used to route the  
1355 solutes released by oxidation in the tailings.

### 1356 ***Contaminant Release from the Tailings Basin***

1357 GoldSim is programmed with algorithms for estimating the release of solutes from the tailings  
1358 sources areas. For the NorthMet Project Proposed Action, a groundwater and surface water  
1359 containment system would be constructed at the beginning of operations along the northern,  
1360 northwestern, western, and portions of the eastern perimeters of the Tailings Basin to intercept  
1361 affected water seeping from the facility. The physical and material characteristics of each source  
1362 area are summarized in Table 5.2.2-17. In GoldSim, the overall Tailings Basin is divided into  
1363 sub-areas that are described in Table 5.2.2-18. For each sub-area, the contaminant release is  
1364 associated with a particular material including different types of LTVSMC tailings and NorthMet  
1365 tailings. The release rate in each sub-area is based on characteristics of the underlying material  
1366 and the rate of atmospheric oxygen diffusion into the tailings. The proposed bentonite  
1367 amendments to surface material during operations and closure are intended to reduce oxygen  
1368 diffusion into the sub-surface and thereby decrease contaminant release rates from the underlying  
1369 materials. Using the GoldSim model for existing conditions, the contaminant release parameters  
1370 for LTVSMC tailings were calibrated to measured water quality in current tailings seepage and  
1371 groundwater. For the future NorthMet tailings, contaminant release parameters are based on a  
1372 combination of laboratory tests and water quality observations at similar tailings facilities in  
1373 northern Minnesota. The time-varying chemistry of the tailings pond water is computed during  
1374 the GoldSim simulation based on evaporation and mixing of rainwater, stormwater runoff, and  
1375 NorthMet Project Proposed Action-related water transfers to and from the other mining facilities.

### 1393 ***Contaminant Transport from the Tailings Basin***

1394 At the Plant Site, most groundwater flow occurs in surficial deposits that constitute a surficial  
 1395 aquifer of about 7 meter saturated thickness. Below the surficial deposits is a low-permeability  
 1396 fractured bedrock, mainly the Giants Range batholith. Groundwater flow rates in the bedrock are  
 1397 much lower than in the overlying surficial deposits. As at the Mine Site, it is assumed that most  
 1398 of the contaminants released, travel in the same direction at the same rate of flow as surficial  
 1399 groundwater flow (accounting for some dispersion) and ultimately emerging in Downgradient  
 1400 surface water. Groundwater flow rates and flow directions in the model were taken directly from  
 1401 the MODFLOW results, or were programmed to be consistent with the MODFLOW results.  
 1402 Unlike at the Mine Site, however, PolyMet proposes to install a containment system along the  
 1403 northern, northwestern, and western perimeters of the Tailings Basin, and at the proposed dam  
 1404 along a portion of the eastern side of the Tailings Basin. This containment system would  
 1405 intercept the seepage migrating away from the Tailings Basin toe via surficial deposits and  
 1406 shallow bedrock. See Figure 5.2.2-14 and Figure 5.2.2-15. The south-side containment system  
 1407 capture efficiency would be improved.

1408 Design and performance modeling of the containment system predict that it would achieve  
 1409 complete capture of approaching seepage-affected groundwater moving via the surficial aquifer  
 1410 and upper bedrock (PolyMet 2015i). In GoldSim, the containment system is conservatively  
 1411 assumed to be 90 percent efficient in the model, which means that 10 percent of the approaching  
 1412 groundwater bypasses the system and continues to migrate toward the Embarrass River. This  
 1413 affected groundwater migrates in the flowpaths to the north, northwest, and west, and

1414 concentrations change progressively as the groundwater approaches downgradient evaluation  
1415 locations. The affected groundwater ultimately reaches and emerges directly into the Embarrass  
1416 River (West Flowpath) or into its tributaries (Northwest and North flowpaths). Performance  
1417 modeling has indicated that the proposed systems would provide complete capture of bedrock  
1418 groundwater to depths of 100 ft below the top of bedrock. Containment systems are assumed to  
1419 capture 100 percent of tailings surface seepage, which consists of toe seepage and groundwater  
1420 that upwells to ground surface between the Tailings Basin and the containment system.

1421 Detailed descriptions of the assumptions and algorithms used to estimate solute release from the  
1422 Tailings Basin are provided in the Waste Characterization Data Package (PolyMet 2015q).

1437 ***GoldSim Model Operations and Output***

1438 Within the GoldSim program are utilities for performing probabilistic simulations addressing the  
1439 uncertainty of inputs. For this method, selected “uncertain” inputs are entered into the program  
1440 as cumulative probability functions rather than single fixed values. The probability functions are  
1441 selected considering the variability of measured data, professional judgment, or both. Figure  
1442 5.2.2-18 is an example of the cumulative probability function of a hypothetical input. Point A on  
1443 the figure indicates that there is a 10 percent probability that the true input value is less than or  
1444 equal to 14. Point B (median) indicates a 50 percent probability that the true input is less than or  
1445 equal to 22, and Point C indicates a 90 percent probability that the true input is less than or equal  
1446 to 30.3. At the beginning of a model run, GoldSim selects a random probability number between  
1447 zero and 100 percent for each uncertain input and uses the associated cumulative probability  
1448 distribution to determine the numerical input value. If for example, the program-selected random  
1449 probability is 38.1 percent, the input value for the hypothetical input on Figure 5.2.2-18 would be  
1450 20.3 (Point D). For some inputs, such as annual rainfall, the random sampling is performed at the  
1451 beginning of each simulation year as the program progresses through time. With the resulting  
1452 suite of inputs, a single transient model run is performed (referred to as a “realization”) and the  
1453 results are saved. The process of statistical sampling is then repeated using new, randomly  
1454 selected input values and the next realization is run.

1455 The GoldSim model uses a Monte Carlo simulation approach, where the model is run 500 times,  
1456 with each of the 500 realizations based on a unique suite of statistically sampled inputs. At the  
1457 end of the Monte Carlo simulation, the multiple model run results are compiled for each monthly  
1458 timestep. Consider, for example, a model estimate of contaminant concentration at a particular  
1459 evaluation location at month 1,200 (year 100). The GoldSim model will provide 500 numerical  
1460 values for this result, one for each realization. This suite of resulting values is ordered and used  
1461 to construct a cumulative frequency plot (see Figure 5.2.2-15), which is interpreted in a manner  
1462 similar to the input plots. The contents of Figure 5.2.2-15, for example, show that there is a 90  
1463 percent probability that the concentration at year 100 would be less than or equal to 120.8 (Point  
1464 C). For results that change over time, a convenient way to present the probabilistic results is to  
1465 prepare a time-series plot showing the 10, 50, and 90 percent probability results, as shown on  
1466 Figure 5.2.2-16. Consider point C on the 90 percent probability line on this plot. At a simulation  
1467 time of 100 years, the value on the curve is 120.8, indicating a 90 percent probability that the  
1468 true result would be less than or equal to 120.8, which is consistent with Point C on the 100-year  
1469 frequency plot shown on Figure 5.2.2-15.
